All the calatheas thrive in a moist tropical house in a temperature that does not go below 65° F., with a rise during the day to 90° or 95° F. For general purposes, the best compost in which to grow them is made of equal parts of good turfy loam, leaf-mold and sand. Some of the more delicate species are best grown in leaf-mold and sand only. Stagnation of the soil must be particularly avoided by abundance of drainage, as they require to be kept rather moister at the roots than most stove plants The close moist atmospheric conditions that these plants require can be secured

only by constant syringing and damping down amongst the plants; therefore the need for abundance of drainage is apparent, whether they are grown in pots or planted out in a border. It is only by planting them out with a free root-run that calatheas may be had in their full beauty; and when so grown a collection of these plants forms one of the most beautiful examples of tropical foliage. Particular attention should be given to protecting them from all strong sunshine, the thin texture of their leaves rendering them especially liable to damage from this cause. Most of the species are of easy culture providing the above conditions are followed. Many of them spread rapidly and make quick growth; therefore they require to be potted or overhauled every spring, but when once well established, they may be fed with liquid manure once a week — Propagation is by dividing the crowns, or by cuttings

735.
Calathea Veitchii.
(x 1/2)

in those kinds that make secondary growths, these cuttings being taken just below the nodes. In spring, just before growth begins, is a good time for this work. Tubers may be used, if produced

In Florida, calatheas grow exceedingly well in shady lath plant-houses. The soil should be leaf-mold and very old cow-manure added to the original natural soil. Commercial fertilizer should never be used. In very cold weather they should be covered with pine branches or leaves or pine-needles. All the kinds soon form very beautiful clumps. All of them need much water while they are growing, but not in the winter if they are planted out in beds. Each spring they must be replanted in fresh soil. Then the clumps may be divided, or if large specimen plants are desired, they may be left intact. (Nehrling.)

The calatheas are a confusing group to the horticulturist, because the differences that he knows he mostly in characters of leaf and habit and these are variable. The size of leaf and plant depends much on the treatment, and in some species the juvenile leaves are different from the mature ones. The coloration of the foliage depends much on the age, and the way in which the plants are grown. However, we may roughly throw the species into two groups,—the small-

leaved and the large-leaved, although it is a question where to place such intermediate kinds as *C. Veitchiana*, *C. insignis*, *C. leopoldina*, *C. Sandervana*, *C. nigricans*, and some others; or we may arrange them in two groups by the red-marked kinds (of foliage), and by the green-, gray- and white-marked kinds, but this would not account for the juvenile and adult stages of *C. leopoldina*, *C. imperialis*, *C. Chantierii*, *C. ornata*, and others. The botanical classification by floral characters would be of little use to the general horticulturist. Some plants known in collections as calatheas are likely to be marantas, phryniums, monotagmas, eteanthe, or others. The radical tufted leaves and capitate inflorescence of Calathea, and the zigzag stems and branched inflorescence and small flowers of Maranta are general characters of separation between these two genera. In the present account, the attempt has been made to draw the characters as much as possible from cultivated specimens apparently authentically named.

A. Markings of lf. (upper surface) in red or brown, at least in part.

1. *roseo-picta*, Regel (*C. roseo-lanceata*, Hort.? *Maranta roseo-picta*, Lind. M. Wagneri, Hort.). Dwarf. lvs nearly orbicular, purple beneath, the upper side dark green, the midrib red, and an irregular red zone (sometimes two zones) two-thirds of the distance from the midrib toward the margin. Amazon. FS 16:1675-6 Gn. 2, p 3

2. *Pavonii*, Kern. (*C. tubespata*, Hook f.). Two feet or less high. lvs. obovate-elliptic, short-acuminate or cuspidate, thin, greenish beneath, lively green above, and marked midway between the rib and the margin with lighter green and squarish patches of brown. Peru. B.M. 5542.

3. *angustifolia*, Kern. (*Maranta discolor*, Hort.). Habit loose, erect, only slightly spreading at apex: growths bearing 1-4 lvs. from 1-5 ft. high; blade lanceolate, unequilateral, $\frac{3}{4}$ -2 ft. long, rich light green with fine lines of purple-red above, rich shining red beneath, petiole erect, stout, 1-3 ft. high, rich dark red, heavily marked with light green tuberculate spots, sheath extending from one-third to one-half its length. in the juvenile form the whole of the plant is densely covered with reddish brown hairs, but in the adult plant, the blade is almost entirely glabrous. Cent Amer. B.M. 8149

AA. Markings of lf. mostly on the order of green or white (exceptions in juvenile stages of Nos. 35, 36, 37 and others).

B. Lf.-blades small or short, usually less than 12 in. long.

C. Under side of lvs. green, grayish, or yellowish (violet in forms of No. 14).

4. *micans*, Kern. (*Maranta micans*, Math. *Phrynium pumilum*, Klotzsch). Very small: lvs. 2-3 in.

long, and 1 in. wide, oblong-lanceolate, somewhat acuminate, green and shining above, the rib in a feathered white stripe, paler beneath. Brazil—Probably the smallest cult Calathea.

5. *chimboraensis*, Lind. Dwarf: lvs. oblong-ovate, 8-12 in. long, acuminate, green above and below, with a very dark green white-margined band running lengthwise the blade midway between the rib and each margin. Neighborhood of Mt. Chumborazo. I.H. 17:6.

6. *Wiotiana*, Makoy (*Maranta Wiotii*, Morr.). Habit dwarf, spreading: rhizomes branching freely: growths bearing only a single lf. each; blade linear-

736. Tuber of calathea. ($\times \frac{1}{2}$)

lanceolate, slightly oblique, 4-12 in. long, undulate, acute, upper side silvery gray with a narrow band of light green around the margin; midrib green, with a row arranged pinnately, along either side of the midrib, of dark olive-green blotches or stripes; under side dull grayish green finely striated all over

between the principal veins with patches of light yellowish green; petiole 3-15 in. long, erect or spreading, light green, terete sheath entirely absent. Probably Brazil—A most beautiful species; thrives best in leaf-mold and sand.

7. *trifasciata*, Kern. (*Phrynium propinquum*, Poepp. & Endl.). Habit dwarf, spreading, with short free-branching rhizomes. growths bearing 1 lf. only, blade cordate-ovate, unequilateral, 3-12 in. long, apex acute, and half twisted around, upper side silvery gray shading to green at the margins and with a row on either side of the midrib of dark green stripes arranged pinnately, under side light green, prominently striated on both upper and lower sides with a network of fine veins connecting all the principal lateral veins, midrib pale yellowish brown on the under side and covered with dark brown hairs in the lower half and extending for an inch or more on the apex of the petiole, petiole 3-12 in. long, light green, glabrous except in the upper inch or so; scale lvs reddish brown. Guiana—A companion plant to *C. Wiotiana*, to which it is closely allied, but differs in the broader and paler color of the lvs. Of easy cult.

8. *fasciata*, Regel & Kern. Habit dwarf, compact: lvs 10-18 in. long, reflexed; growths bearing 1-3 lvs.; blade broadly ovate or orbicular, acute or obtuse, glabrous 5-10 in. long, slightly undulate; upper side rich dark olive-green alternately marked by transverse bars of silvery white; under side dull grayish green; petiole 4-8 in. long, spreading, dull green, covered with short and minute brownish hairs; sheath extending up to one-half the length of the petiole, upper part terete. Brazil Gn. 2, p. 3—Considered by some to be a variety of *C. rotundifolia*, Kern. *C. farnosa* and *C. ovalifolia* are probably stages in the development of this plant or perhaps slight varieties.

9. *Luciana*, Hort. Habit medium to strong, compact, more or less tufted: growths with 2-5 lvs. usually with 3, arching over at the tips and $\frac{1}{2}$ -3 ft. high; blade elliptic, oblique, glabrous, acute, slightly undulate, 3-12 in. long, upper side light pea-green feathered along the midrib with pale greenish white and with a concentric zone of the same shade near the margin of the lf., under side dull grayish green; petiole erect, slender, rigid, pale green, glabrous or nearly so; sheath extending from one-half to nearly the entire length of the petiole, upper part oval, slightly flattened on each side: infl. a short few-fl. spike; peduncle 1-3 in. long; bracts spreading or erect, ovate, light reddish brown, $1\frac{1}{2}$ in. long; fls. in pairs, yellow; sepals thin, linear, one-third the length of the tube; corolla yellow; petals elliptic, $\frac{3}{4}$ in. long, spreading, acute; the 2 petaloid aborted stamens obovate, $\frac{1}{2}$ in. long, bright yellow,

and striped or blotched with bright red; style curved, $\frac{1}{2}$ in. long, yellow. Trop. Amer.

10. *flavescens*, Lindl. Habit tufted, glabrous in all parts. growths with 3-5 lvs, 1-2 $\frac{1}{2}$ ft high, blade elliptic, slightly oblique, 6-12 in long, acute, light green above, soft grayish green below, petiole 12-18 in long, pale yellowish green finely spotted with darker green, sheath one-third to one-half the length of the petiole, upper part oval infl. a dense globose short raceme, peduncle less than an inch; bracts large, elliptic, outer ones 2 in long, bracteoles smaller, linear or lanceolate; fls in pairs, sessile or nearly so, an inch diam, sepal primrose, equal, lanceolate; petals large, bilobed, obovate, bright yellow. Brazil. B R 932 —Perhaps to be referred to *C. grandiflora*, Schum.

11. *Sagoreana*, Hort (*Maranta Sagoreana*, Hort). Habit dwarf and compact growth bearing 2-4 lvs, usually with 3, and from 6-18 in high, erect at first, arching towards the apex, blade lanceolate, unequilateral, 4-9 in long, pale yellowish green with a row on either side of the midrib of arrowhead-shaped blotches of dark green which give this plant a distinct and pretty appearance, the under side in plain yellowish green, petiole slender, erect, 6-12 in long; sheath extending only to about a quarter of its length, upper part terete.

12. *vittata*, Koen (*C. albo-lanceata*, Hort *C. ornata* var. *albo-lanceata* and *Maranta albo-lanceata*, Hort). Habit dwarf, compact, $\frac{1}{2}$ -2 ft high. growths with 2-5 lvs, blade elliptic-lanceolate, slightly oblique, 3-12 in long, glabrous, acute, upper side light green, pinnately striped with white from apex to base, underside pale dull green shaded between the veins with slightly lighter yellowish green, petiole slender, erect or spreading, 3-15 in high, light green, glabrous, sheath extending from one-third to one-half its length, upper part terete. Probably Colombia.

13. *Wallsii*, Regel (*Maranta Wallsii*, Lindl.). Habit strong, but neat and graceful, branching and forming numerous growths bearing from 2-7 lvs, and 1-4 ft high, blade broadly ovate, acute or obtuse, 6-12 in long, rich light velvety green along the margin and midrib and with a row on either side of the midrib of dark irregular blotches of olive-green, under side soft grayish green, petiole erect, slender, sheath, extending to half the length of the petiole, and covered with soft hairs, upper part terete with the exception of the sheathing lower half of the lf-stalks, the whole plant is glabrous. Peru —One of the commonest species in cult. and of very easy culture. A useful and decorative pot-plant.

14. *virginialis*, Lindl. Lvs soft-hairy below, broad-oval, rather blunt, 7-9 in long, 4-6 in broad, upper surface light green, and below, in the common form, whitish green and lighter zones shown, as on the upper surface,—or in another form, which has been distributed in gardens as *C. (Maranta) Marcellii*, under side shaded a light violet and without zones. Brazil. A F 7-611 —Allied to *C. Veitchiana*, but has bracts with indurated tips rather than membranaceous.

cc Under side of lvs. violet, purple, or suffused with red.

15. *Albertii*, Hort (*Maranta Albertii*, Pynaert & Van Geert). Habit dwarf, spreading, less than a foot high. growths bearing 2-5 lvs, erect or spreading; blade oblique, elliptic, undulate, acute, 4-9 in. long, glabrous, upper side dark green feathered on either side of the midrib with a band of pale yellowish green, under side dull green suffused with light purple-red: infl. a few-fl. terminal spike; peduncle 3-4 in. long, pale green; floral bracts half reflexed outwards, orbicular or broadly ovate, $\frac{3}{4}$ in. long; bracteoles 4-6, white, scarious, fls. in pairs, pure white; sepals half the length of the tube; petals lanceolate, $\frac{1}{2}$ in. long, tube $\frac{3}{4}$ in. long; 2 petaloid stamens slightly longer than the

petals, obovate, fertile stamen hooded and curved over the stigma; style and stigma short curved, white.

16. *Makoyana*, Nichols. (*Maranta Makoyana*, Morr. *M. olivaris*, Hort.). One to 4 ft. lvs. broad-oblong, obtuse or somewhat short-pointed, the stalks red, the lf olive-green or cream-colored above but marked against the midrib with outspreading, dark green blotches of oblong, oval or pyriform shape, the under surface similarly marked, but in red. Brazil. F S 20 2048-9. G C 1872.1589 Gn 4, p 87.

17. *nitens*, Bull. Habit dwarf, blade elliptic, acute, glabrous, upper side bright green, with oblong acute bars of dark olive-green, alternate long and short, on either side of the midrib, under side dull green tinted with dull red. Brazil —Distinct and pretty.

18. *crocata*, Morr. & Joris. Whole plant 12 in high lvs sub-distichous, petiole 2-3 in long, sheathing most of its length, blade 4-5 in. long, erect, ovate-lanceolate, acuminate, somewhat undulate, dark green and veined above, rose-purple beneath spike short, the bracts bright saffron-yellow. Brazil. B M 7820 G C III. 28 113. G M 53 265. J H. III. 60:329 G 32.263 F.W. 1876.161 —A free bloomer and showy when in flower.

19. *Veitchiana*, Hook f. Fig 737. Habit strong, loose, and spreading, 1-4 ft high: growths with 2-8 lvs, usually with 3; blade ovate or elliptic-ovate, oblique, acute, undulate, glabrous, 4-12 in long, upper side rich dark glossy green, feathered along either side of the midrib with an irregular band of pale green and with an inner zone of dark olive-green blotches and an outer one of pale yellowish green (often shading to white) between the midrib and margin; under side similarly blotched, but in shades of purple-red and rosy red; petiole $\frac{1}{2}$ -3 ft long, stout, green and glabrous above, tinted with reddish brown and hairy in lower part; sheath extending from one-third to one-half the length of the petiole, upper part terete: infl.

737. *Calathea Veitchiana*.

on erect densely fld. spike on peduncle 4-6 in. long; spike 2-3 in. long, with a rosette 2 in. diam., of large green foliaceous erect or capped spreading bracts; floral bracts erect, spreading at the tips, ovate, an inch long, outer ones covered in lower part with brown hairs; fls. in pairs, primrose-white, tube $\frac{3}{4}$ in. long, slender; sepals erect, $\frac{1}{2}$ in. long, lanceolate, petals elliptic $\frac{1}{2}$ in. long, reflexed; fertile stamens hooded, small, 2 aborted petaloid ones longer than the petals, obovate, bilobed, with a bright violet blotch on the front; style and stigma small, curved. Peru. B M 5535. G C 1870:924. Gn 2, p 545 F S 16:1655-8.—A dwarf var *Föxi*, Raffill, has recently been intro into cult from Venezuela. It differs from the type in its dwarf habit, rarely exceeding 10-12 in. high: lvs. broader, more reflexed, and with a bright rose or red midrib, the color of the markings of the lf. are darker and of a slightly different shape, the dark inner zone of green being more broken in outline, and running into the midrib inf. smaller, but the fls. in size and color are the same as in the type.

20 *illústris*, Nichols. (*Maránta illústris*, Lindl.). Habit dwarf and compact, 6-9 in high lvs spreading, growths bearing 2-5 lvs 6-9 in. long, blade oblique, ovate, acute, undulate, 4-6 in. long, 2-5 in broad, upper side rich dark shining olive-green, with a bluish metallic luster over the whole, the midrib being feathered on either side with dull silvery white and an irregular zone of the same color running the complete circle of the blade, under side dull purplish red; petiole 2-3 in long, spreading, dull greenish brown; sheath extending to one-half the length of the petiole, upper part terete; petioles, lf.-scales and under side of the midrib covered with minute brown hairs inf. an erect, capitate, few-fld. spike, on slender peduncle 4-6 in long; bracts of two kinds, the upper 3 or 4 green, foliaceous ovate, spreading over the floral bracts, and curving upward at the tips; lower bracts scarious, orbicular, light brown and shading to bright red at the point of attachment to the rachis, bracteoles 2-4, lanceolate, shorter than the bract fls. in pairs, sepals white, two-thirds length of the tube, tube $\frac{3}{4}$ in. long, petals lanceolate, white, spreading, $\frac{1}{2}$ in long; 2 aborted petaloid stamens larger than the petals, obovate, lower one heavily blotched with purple; stamens hooded; style and stigma white, curved, $\frac{1}{2}$ in. long; ovary minute, white. Ecuador. F S 16:1691-2.—By some regarded as derived from *C. roseo-picta*.

21. *Louise*, Chantrier (*Maránta Louise*, Hort.). Habit tufted, 2-3 ft. high: growths with 2-5 lvs; blade elliptic, only slightly oblique, glabrous, acute margins plain or slightly undulate, 6-12 in. long, upper side light pea-green, feathered along the midrib with white, changing with age to a soft greenish white; under side light green tinted with pale purple-red; petiole $\frac{1}{2}$ -2 $\frac{1}{2}$ ft. long, slender, erect, green, covered with soft minute brown hairs, sheath extending from one-third to one-half the length of the petiole, upper part terete: inf. an erect spike, elliptic in outline, on a leafy peduncle 4-12 in. long; bracts creamy white, reniform, obtuse or acute, bracteoles numerous, white, scarious; fls. in pairs; sepals linear, cream, half the length of the tube, tube $\frac{3}{4}$ in. long; petals lanceolate, reflexed; hp elliptic, with bright yellow disk reflexed with scarious margins; column white or cream, linear curved towards the lip

22. *Vandenheckei*, Regel (*Maránta* and *C. Goultii*, Hort.). Habit dense and tufted, 1-2 $\frac{1}{2}$ ft. high: growths with 1-3 lvs, usually 2; blade oblique, elliptic or elliptic-ovate, 3-9 in. long, acute, upper side glabrous, rich dark green, marbled with silvery white along the midrib and an irregular undulating line of the same color running the complete circle of the blade, the intervening tissue in some cases will be also entirely composed of this silvery white colored tissue and the

green part reduced to a marginal ring $\frac{1}{4}$ in. diam.; these two strikingly distinct forms of lvs. will often be found on a single plant in adjoining growths; in this case it is not that either of them represent the adult stage, as both are of frequent occurrence on the same plant and both produce inf.; under side, dull purple-red; petiole erect or spreading, dull reddish brown; sheath reaching from one-third to one-half its length, upper part terete or oval inf. an erect narrow spike, sometimes sessile but more commonly on a peduncle 3-15 in. high; bracts erect, ovate, green tinted with brown, closely adpressed and forming a narrow cone-like mass some 3-5 in. long, the upper pair of bracts always being enlarged and spreading outwards like 2 small elliptic lvs; fls. in pairs, white; sepals half the length of the tube; tube $\frac{3}{4}$ in. long, petals elliptic spreading; column curved, white with brown stripe.—A fine stove plant for large or small pots, and on account of its tufted habit is of great use for decoration. Of very easy cult.

23. *Lietzei*, E. Morr. (*Maránta conspicua*, Bull. M. Neuberth, Hort.). Habit dwarf, spreading by means of runners: growths bearing from 1-7 lvs $\frac{1}{2}$ -2 ft. high; blade obliquely elliptic, acute, undulate, glabrous, 3-9 in. long, upper side soft velvety green, striped along the principal veins with dark olive-green and feathered between the veins with splashes of yellowish green, lower side dull purple-red, midrib brown, petiole 3-15 in. long, softly tomentose in lower part, sheath extending from one-half to nearly the entire length of the petiole inf. borne upon long slender leafy sts, which later become swollen and root at the nodes and change to runners, thus forming an easy means of prop. few-fld, bracts green, ovate, fls. in pairs in axil of each bract, pure white, $\frac{1}{2}$ in. diam; sepals linear, petals obovate. Brazil B H. 25 273.

24. *picta*, Hook. f. (*Maránta picta*, Hort.) Habit dense and compact, covered in all parts with soft velvety hairs growths with 4-10 lvs and $\frac{1}{2}$ -3 ft. high, blade elliptic, undulate, acute, 6-15 in. long, upper side rich velvety olive-green, feathered on either side of the midrib, pale yellowish green, under side rich purple-red, petiole 3-18 in. long, dull red, sheath extending nearly the entire length of the petiole, the upper inch or two being terete, and rather brighter in color than the lower part: inf. a dense cone-like spike, borne on long slender terete sts. 1-3 ft. long and bearing 1 or more lvs. which change into runners after the fls. are over, becoming fleshy and rooting at the nodes, forming a ready means of prop; bracts 1-2 in. long, erect, elliptic or ovate, pale primrose tinted with rose or violet; fls. in pairs, 1 in. diam; primrose tinted with violet. Brazil. B M. 7674 G C III 22.293.

25. *noctiflora*, Hort. (*Maránta noctiflora*, Regel & Korn. M. *gracilis*, Hort.). Habit loose and spreading, 1-2 $\frac{1}{2}$ ft. high: growths with 2 or 3 lvs; blade elliptic or elliptic-ovate, 6-12 in. long, pendulous or horizontal, upper side pale yellowish green, pinnately striped with rich dark green bars along the principal veins, lower side light green faintly suffused with dull red, the principal veins being more strongly marked with a deeper shade of red; petiole erect, rigid, 6-18 in. long; sheath, extending to half its length, upper part terete, green. Probably Brazil.—Perhaps a true *Maranta*.

26. *eximia*, Korn. (*Phrynium eximium*, Koch). Habit loose and spreading. growths bearing 1-3 lvs, usually 2, and from 1-3 ft. long; blade elliptic or elliptic-ovate, acute, 6-15 in. long, upper surface alternately striped with rich olive-green and light silver tissue, and arranged in the form of a feather, midrib channeled pale yellowish green, under side rich dark wine-red, glabrous above, softly tomentose with brown hairs beneath; petiole spreading, stout, 1-2 ft. long, lower part light green, reddish brown above, beneath extending from one-third to nearly the entire length of

the petiole, upper part oval or terete. Cent. Amer. Gt. 686.—One of the finest and most beautiful members of the genus.

27. *rufibárba*, Fenzl. Habit erect, densely tufted: growths with 3-7 lvs. $1\frac{1}{2}$ -4 ft long; blades linear-lanceolate, 6-12 in. long, rich shining green, suffused with purplish red below, undulate, acute, petiole $\frac{3}{4}$ -2½ ft long, terete above the sheath, sheath extending from 2-10 in. of the base of the lf., dull red heavily spotted with green. Probably Brazil. B.M. 7560.—Densely hairy in all its parts.

28. *Lindeniana*, Wallis (*C. Lindenii*, Wallis & André). Lvs. elliptic-oblong, short-acuminate (12 in. or less long), deep green above with an olive-green zone either side of the midrib, and beyond which is a darker zone of green, the under side counterstaining the upper side, but with purplish zones. Brazil. I II 18 '82.—By some considered to be a form of *C. roseo-puncta*.

29. *princeps*, Regel (*Maranta princeps*, Lind.). Lf. elongated or elliptical-lanceolate, 7-10 in. long, 3-3½ in. broad, light green above, with broad black-green, flaming, broken band along the middle nerve, violet-purple below. Amazon.

30. *Legrelliana*, Regel Lf. elliptical, pointed, 5-6 in. long, 2-3½ in. broad, above shining green, with broad, white, flaming, broken middle band along the middle nerve and numerous broken white linear small bands between the side nerves, lower surface whitish green and marked with red and green. Colombia, Ecuador.—A neat species.

bb. Lf. blades larger, mostly upwards of 12 in. long.

c. Under side of lvs green (red in juvenile states of Nos 34 and others and in No. 37 and perhaps No. 45)

31. *crotalifera*, Wats. RATTLE-SNAKE PLANT. Lvs oval, abruptly acute at each end, 1½-2 ft long, and 10-12 in. broad, yellowish green, with a white-margined midrib, paler underneath; petiole 2-3 ft long, curved, sheathing; peduncles 1 or 2, 8-10 in. high, bearing distichous yellow-fid spikes. Guatemala.—Offered in Fla. The spikes suggest the rattle of a rattlesnake (*Crotalus*) whence the specific name.

32. *Allodia*, Lindl. Habit erect: growths bearing 4-10 lvs 2-4 ft long, blade 1-2 ft long, elliptic, arching in upper half, light green above, pale silvery gray below, margins slightly undulate; petiole erect, often as much as 2 ft. long, green, striped with dull red on each side, the sheath extending up to within 2-3 in. of the apex, where it becomes terete. W. Indies.—*Allodia* is a native Carib name.

33. *leopardina*, Regel (*Maranta leopardina*, Bull.). Habit strong and vigorous, quickly forming a large and fine specimen: growths bearing 3-7 erect or spreading lvs, often as much as 5 ft. high, and arching over at the tip; blade to 20 in. long, elliptic, slightly oblique, acute, slightly undulate, and glabrous in all parts, upper side rich green in the adult stage; in the juvenile stage the lvs. are dark olive-green in the center, with an irregular outer band of paler green, forming a complete zone between the dark green center and margin; under side light green; petiole 1-4 ft. high, rigid, erect; sheath extending from one-third to one-half the length of the petiole, upper part terete, glabrous, shining light green. Brazil.—A near ally of *C. Chantrieri*, but not so brightly colored in the markings of the lf.

34. *Chantrieri*, Hort. (*Maranta Chantrieri*, André). Habit strong and vigorous, erect, spreading and arching above: growths bearing 3-4 lvs and reaching as much as 6 or 7 ft. high in the adult stage, blade elliptic, glabrous; in the juvenile stage the larger part of the upper side of the lf. is a pale yellowish green with a dark green irregular band running around the margins and along the midrib, the under side is rich purplish red, in the adult stage the color on both sides of the lf. is all lost and becomes a rich dark green, the intermediate stages of development are marked by a gradual loss of the light yellowish green on the upper side and purple-red of the lower and the gradual encroachment of the dark green color which predominates in the adult stage; petiole $1\frac{1}{2}$ -5 ft. long, downy when young,

glabrous when old, spreading outward, sheath extending from one-half to three-fourths of its length, upper part terete. Brazil.—A near ally, if not a variety of the older *C. leopardina*, Regel.

cc. Under side of lvs in shades of purple or red (or perhaps green in No. 45).

35. *ornata*, Koen (*Maranta ornata*, Lind. M. *regalis*, Hort.) Habit vigorous, erect, spreading with age: growths bearing 1-4 lvs, blade elliptic or elliptic-ovate, acute, 1-3 ft. long, rich shining green above (in the adult stage), dull purple-red below, the lvs in the juvenile stage all beautifully striped between the principal veins with rose or pink, which in the intermediate stage changes to white and disappears entirely in the adult; petiole erect spreading with age,

often as much as 4 ft long and thick in proportion; sheath extending from one-third to one-half its length, upper part terete, slightly downy, especially in the lower part. Guiana to Ecuador. F S 4 413-14.—The forms this plant assumes during the different stages of its development have been distinguished by some nurserymen who have distributed them under separate names, *C. regalis*, *C. majestica*, and *C. roseo-striata* all being stages of the one plant. To add to the confusion they are also known in the trade under the generic name of *Maranta*. The plant known as *C. albo-lineata* or *Maranta albo-lineata*, has been referred by some authors to this species, but it has no near affinity and is a different plant from *C. ornata*, *C. imperialis* or *C. Sanderiana*.

36. *imperialis*, Hort. (*Maranta imperialis*, Hort.) Habit vigorous, erect, spreading in the adult stage: growths with 2-7 lvs 6 in. to 5 ft. long, blade as much as 2 ft. long when adult, elliptic-ovate, acute, entire, shiny green above, rich purple-red below, petiole stout, erect or spreading, dull green; sheath developed about half its length, upper part terete.—One of the best species for decorative effect. This species presents a striking dissimilarity between the juvenile and adult stages of growth. The juvenile stage is much the better for horticultural purposes as the lvs. are then striped with bright rose or pink between the principal lateral veins. This color gradually changes as the plant grows stronger and becomes vigorous, the stripes on the lower lvs. first becoming white and gradually disappearing on the lvs. that are developed after the plant reaches the adult stage, until a stage is reached when all the color and stripes on the upper side of the lvs. are lost and the lvs. are a rich shining green color. The high color is again developed as soon as the plant is disturbed at the roots either for prop or by injury.

738. *Calathea zebrina*.

derivatives. *C. crenatiflora* seems to have left its impress most distinctly on the greenhouse forms. The calceolarias are grown for the variously colored and often spotted slipper-like flowers. The shrubby forms, grown much in England, do not thrive in the heat of the American summer.

The cultivation of the herbaceous and the shrubby kinds of calceolarias is about the same, with the difference that the herbaceous kinds are nearly always grown from seeds, while the shrubby varieties are often grown from cuttings.—Seeds may be sown from the end of March until the first of September, according to the size of the plant required. Those sown early are more easily carried through the hot months than any that are propagated in the end of May or in the month of June. Sow the seeds in shallow pans with good drainage in a compost of equal parts of sand and of

739 *Calceolaria herbeohybrida*.

the peat which is shaken out of fern-root that is to be used for potting orchids, adding about one-fourth of charcoal. All this should be sifted through a fine sieve. This material should be well mixed and placed an inch in depth in the receptacle that the seeds are to be sown in. The surface should be made as level as possible, and the seeds, after being thinly scattered over the same, may be pressed gently into the compost, covering them very lightly with sphagnum moss sifted through a very fine sieve. Water by dipping the pan in a tank of water, allowing it to soak through the holes in the bottom of the pan. This mode of watering is not so liable to disturb the small seeds, as an overhead watering with a fine rose on the watering-pot. A temperature of 60° will cause calceolaria seeds to germinate, but the sun should not strike them until the cool of autumn comes. A greenhouse with a northern aspect is best for them until the end of September, giving all the air possible day and night. From the first of October until the end of March, the plants will stand the full sun, and should then be grown in a night temperature of 40°, allowing 10° or 15° of rise during

the day. For a first potting (which may be to 2-inch pots) the same mixture in which the seeds were sown is the best, and the seedlings should be big enough to be easily held between the finger and thumb; and as the plants are moved along into larger pots, equal parts of fibrous loam, fern-root, leaf-mold, sand and dried cow-manure may be used, always having this compost in as lumpy a state as can be equally and conveniently packed around the plant. When the plants are well rooted in their flowering pots, they may be watered with manure water. An ordinary handful of green cow-manure to about three gallons of water may be used, and if any of the commonly used fertilizers are to be employed for a change, the same amount of fertilizer to an equal amount of water is about right; but always water with clean water twice between these applications.—If cuttings are to be used for the propagation of calceolarias, they should be rooted in a temperature of 45° to 50°, kept shaded from the sun. Cuttings may be procured from the plants that are trimmed into shape during their growing period (in August or September) and should have two leaves attached and another joint to go in the sand. When rooted, treat them as described above for the seedlings. The varieties of the rugosa section are largely used for bedding plants in Europe.—Calceolarias are very subject to attacks of green- and white-fly, the best means of keeping these pests in check is by fumigation with hydrocyanic gas. In the evening is the best time to fumigate, and the foliage of the plants should be perfectly dry; in fact, it is better if possible to use no water at all in the greenhouse the day they are to be treated. In the hot months of summer, a cool evening should be selected and one-quarter of an ounce of cyanide of potassium, one ounce of sulfuric acid and two ounces of water to every 1,000 cubic feet contained in the greenhouse may be used (See *Fumigation*.) The house at this season of the year should be opened up in forty-five minutes after the cyanide has been dropped into the liquid. Repeat at intervals of about three weeks. In winter the quantity may be doubled to the same cubic feet of space, and the house may be kept closed until morning. When opening the ventilators after fumigating in this manner, do not breathe in the greenhouse until the air has changed, say about half an hour after, as the gas is deadly to human beings. Fumigating with tobacco will kill the green-fly, but it has no effect on the white-fly. (Geo F Stewart)

A. *Herbaceous calceolarias, some of them parents of the florists' varieties of this country.*

B. *Lvs. simple.*

C. *Fls. essentially yellow.*

1. *crenatiflora*, Cav. (*C. pendula*, Sweet. *C. mirabilis*, Knowl. & Wesc.). One to 2 ft., the st. soft-hairy, terete; radical lvs ovate and long-petioled (the petioles winged at top), undulate and dentate, sometimes obscurely lobed, rugose and pubescent, paler beneath, often purplish toward the tip; st-lvs. shorter-petioled and becoming sessile above. fls in a forking corymb, the slipper large, oblong or oblong-obovate, furrowed or crenate, hanging, yellow, with orange-brown dots. Chile. B.M 3255.—From this species we appear to have derived the spots of calceolaria fls.

2. *corymbosa*, Ruiz & Pav. (*C. Wheeleri*, Sweet). One to 3 ft. high, the st. 4-angled: radical lvs. ovate and sometimes cordate, obtuse or nearly so, doubly crenate, rugose and hairy, whitish beneath: st.-lvs. smaller and narrower, somewhat clasping, opposite: fls. small (about half as large as in *C. crenatiflora*), in a broad, somewhat loose corymb, the slipper somewhat short-oblong, clear yellow outside and marked with red lines inside. Chile. B.M. 2418.

3. *biflora*, Lam. (*C. plantaginea*, Smith. *C. suberecta*, Hort. *C. Morrisonii*, Don). Herbaceous, stemless:

lvs. ovate-spatulate, toothed at top, scapes many, few-fl'd, fls. large, yellow, lower lip large and the upper one small and notched, the under side of the slipper dotted with red. Chile, Argentina. B.M. 2805. L.B.C. 15:1402. F.S.R. 2:312.

740. *Calceolaria integrifolia* var. *viscosissima*. (X 1/4)

infl. paniculate, terminal, large and handsome; fls. rich golden-yellow and marked in throat with brown, and about 1 in. diam. Peru. B.M. 4525. G. 27:663. J.H. III. 50:489. J.F. 1, pl. 32.—One of the parents of several handsome hybrids.

5. *Burbidgei*, Hort. (*C. hybrida* var. *Burbidgei*, Gumbel). A garden hybrid raised at Trinity College, Dublin, by Burbidge between *C. Pavonii* on the one side and *C. deflexa* (*C. fuchsiaefolia*) or possibly *C. amplexicaulis* on the other: plant erect: sts. hairy, terete; lvs. light green, lanceolate, 5-9 in. long, serrate, winged along the petiole: infl. large, in terminal free-branching panicles; fls. 1 in. diam., rich golden yellow. G. 25:547. Gn. 47:306.—One of the finest of cool greenhouse kinds and valuable also as a bedding plant as it grows into a fine large specimen as much as 6 ft. high and branches freely from the base. Readily prop. by cuttings.

cc. Fls. purple.

6. *purpurea*, Graham (*C. Herbertiana*, Lindl.). Sta. erect, pubescent, 1-2 ft.: radical lvs. spatulate and acuteish, with a strong midrib, sparsely hairy, rugose, dentate; st.-lvs. broad-cordate and clasping, less toothed: fls. in loose corymbs, small, purplish or reddish violet, the slipper somewhat furrowed. Chile. B.M. 2775. B.R. 1313.—Supposed to have entered largely into purple-fl'd. varieties.

7. *arachnoidea*, Graham. St. a foot or two high, terete, branchy, woolly, with appressed hairs: lvs. oblong or lingulate, narrowing into long-winged petioles, clasping, obscurely toothed, rugose, woolly

on both sides: peduncles in pairs, forking; fls. small, dull purple, the slipper nearly globular and furrowed. Chile. B.M. 2874. L.B.C. 16:1557.

BB. Lvs. compound, or essentially so.

8. *scabiosaeifolia*, Sims (*C. pinnata*, Ruiz & Pav. *C. heterophylla*, Willd.). Often 2 ft., the st. terete, hairy, and leafy: lvs. opposite, with clasping petioles, cut nearly or completely to the midrib; lfts. varying from lanceolate to broad-oval, acuminate, ciliate, dentate: fls. very small, in small hairy corymbs, pale yellow, the slipper nearly orbicular in outline. Chile, Peru, Ecuador. B.M. 2405.—This is sold by seedmen as an annual bedding plant.

9. *pinnata*, Linn. Often reaches 3 ft. or more: lvs. pinnatifid or completely compound, the divisions short and nearly entire, obtuse or nearly so: fls. small, sulfur-yellow. Chile, Peru, Bolivia. B.M. 41.—The first known garden species, still sold as an annual.

10. *herbceohybrida*, Voss (*C. hybrida*, *C. herbacea*, *C. Youngii*, Hort, and others). Derivatives of the herbaceous calceolarias: mostly dwarf or small (2 ft. or less), in many colors, usually with well-inflated slippers.

AA. Sticky calceolarias.

B. Fls. yellow.

11. *integrifolia*, Murr. (*C. rugosa*, Ruiz & Pav. *C. salmafolia*, Pers.). Two to 6 ft. high, branchy and bushy: lvs. glabrous, oval-lanceolate, crisped and dentate, the short petioles winged fls. in terminal clusters, small, yellow. Chile. L.B.C. 10 942 B.R. 744, 1083.—Variable. Probably the chief source of shrubby calceolarias. Var. *viscosissima*, Hort (Fig. 740), is a sticky-hairy form with sessile lvs. and showy fls.

12. *thyrsiflora*, Graham. More shrubby: lvs. linear and clustered, toothed, sessile, not hairy. fls. small, yellow, in a close, terminal cluster. Chile. B.M. 2915.

13. *amplexicaulis*, HBK. A foot or two high: lvs. cordate-ovate to ovate-lanceolate, long-acuminate, pubescent, woolly beneath and deep-rugose above, clasping. fls. small, in an upright corymb, pale yellow and spotted, the slipper hoof-shaped. Ecuador, Peru.

BB. Fls. white.

14. *alba*, Ruiz & Pav. Shrubby, erect, branched, the branches opposite: lvs. linear, toothed above, with fascicles of fls. in axils: fls. small, white, of 2 very unequal lips, the upper one being very small, the throat closed. Chile. B.M. 4157. G.C. III 22:141 Gn. 51:60; 75, p. 6 J.H. III 61:419.—A most beautiful species in England when planted out in a soil rich in humus, but should be shaded from hot sun. The plant dislikes pot culture. This species has recently been used by the hybridist in order to secure a race with white fls. The new hybrid *C. Veitchii* is likely to prove a great acquisition to gardens, and is partly derived from this species.

15. *fruticohybrida*, Voss (*C. ascendens*, Hort, not Lindl. *C. dentata*, and *C. integrifolia*, Hort, for the most part). Here may be grouped the shrubby garden calceolarias that are derivatives of most other species. They are marked by the prevailing under-color of yellow, orange or orange-red; sometimes they are yellowish white or dull red.

C. andina, Benth. (*C. Herbertiana* var. *pallidiflora*, Lindl.). Shrubby, glandular-pubescent: lvs. orbicular-ovate, thick, rugose, hairy fls. small, yellow, the slipper crenate. Chile. B.M. 7329. B.R. 1370.—*C. bicolor*, Ruiz & Pav. Shrubby: lvs. ovate, dentate: fls. small, the slipper sulfur-yellow above and white below. Peru. B.M. 3036. L.B.C. 18:1783.—*C. cana*, Cav. Herbaceous, tufted, scapeose, 1-1 1/2 ft.: lvs. radical, oblong-lanceolate, spatulate or obovate fls. white with small purple or rose-colored lines and blotches. Chile. B.M. 8416.—*C. Chibrana*, Hort.—*C. profusa*, F.E. 28:143.—*C. deflexa*, Ruiz & Pav. (*C. fuchsiaefolia*, Hemsl.). Shrubby: lvs. lanceolate fls. yellow, pancelled, the upper lip very large. Peru. B.M. 6431. G.C. III 15:209 Gn. 15:258.—*C. ascendens*, Ruiz & Pav. shrubby at base: lvs. large-ovate, coarsely crenate-dentate fls. rather large, clear yellow, with very large

green calices. Peru. B.M. 5154 F.S. 22 2331—*C. Forstii*, Skan Undershrub, 1-1½ ft., slender lvs ovate, obtuse or somewhat acute, serrate fls small, pale yellow with a large reddish brown blotch inside the lower lip. Peru. B.M. 8436—*C. furbacoides*, Hemsl.—*C. deflexa*—*C. Hénrici*, Hook. Shrubby evergreen, lvs willow-like, small-toothed fls panicle, clear yellow, the upper lip large. Peru. B.M. 5772—*C. hyssopifolia*, HBK. Shrubby lvs crowded, small, lanceolate and toothed, or at top of inf. and entire, margins revolute fls rather large, in many-fld corymbs, pale sulfur-yellow, the slipper obovate-orbicular and crenate Ecuador—*C. Jeffreyi*, Hort. as a hybrid group between herbaceous greenhouse kinds and *C. integrifolia*, produced about 10 years ago in England, 2-6 ft., with branching panicles bearing fls about 1 in. across of few colors—*C. kewensis*, Hort. Cross of *C. Jeffreyi* with herbaceous varieties more compact and larger-fld than *C. Jeffreyi*, colors of wide range plant 1-2½ ft. high and about as broad when in good bloom. G.C. III 39—*C. lobata*, Cav. Herbaceous lvs triangular-ovate, palmately 5-7-lobed, dentate fls in terminal clusters, clear, pale yellow, and spotted on the up-curved slipper. Peru, Bolivia. B.M. 1525, 9330—*C. merceda*, Benth. is a small-fld., pale yellow species hardly in England annual lower lvs 3-parted or lobed, the upper ones pinnatisect Mts, Mex., Costa Rica—*C. pycnostachya*, Cav. (*C. floribunda*, Lindl.) Herbaceous lvs ovate, the lower ones wing-toothed, toothed, rugose fls yellow in loose panicles, the lips convex (Chile—*C. pycnostachya*, Meyen. Shrubby lvs ovate-cordate, nearly or quite obtuse nearly sessile, irregularly crenate, margins reflexed fls large, orange varying to red, the slipper up-curved. Peru. B.M. 5077—*C. piliphysa*, Cav. A dwarf and tufted species from Patagonia, with dark yellow purple-bronzed fls herbaceous, capsule lvs crowded, lanceolate. S. Chile, Patagonia. For rockwork—*C. profusa*, Hort. (*C. Chirami*, Hort.) On the order of *C. Burbridgei* A garden form of free-flowing habit—*C. Stuebelii*, Hook. Herbaceous, half-hardy, 6 in. high lvs ovate or orbicular, small fls small, blue or flesh-colored, spotted within, the 2 lips nearly equal, not sacrate. New Zealand B.M. 6797. Now referred to lowlanders (1. Suedland, Krnzl.)—*C. tenella*, Poepp. & Endl. Herbaceous, half-hardy, 6 in. high lvs ovate or orbicular, small (1½ in. long), nearly or quite sessile fls yellow, spotted within. Chile B.M. 6231—*C. Veitchii*, Hort. Hybrid of *C. alba* and a garden variety 3-5 ft. erect and branched fls many, rather small, pale lemon-yellow. G.C. III 71, Suppl. June 1. Gr. 76, p. 271 (See No. 14)—*C. rubra*, Cav. (*Isotria medeoloides*, Don) Shrubby lvs small, ovate-cordate, deep-toothed, stalked fls yellow-salmon, spotted within and without, the two lips not sacrate. Chile B.M. 4924—*C. virgata*, Ruiz & Pav. Bushy, 1½ ft. lvs ovate, short-stalked fls rather small, numerous, white. Peru, Bolivia. G.C. III 51 50 C.

L H B

CALÉNDULA (Latin, *calende* or *calends* throughout the months) *Compositae*. Flower-garden plants.

Small herbs, the common cult. species annual, others perennial, with alternate simple lvs., mostly large heads with yellow or orange rays, glabrous incurved achenes, plane naked receptacle, pappus none, and involucre broad, with scales in one or two series, their margin usually scariosus—Some 15 species from Canary Isls to Persia.

officinalis, Linn. POT MARIGOLD. Fig. 741. Annual 1-2 ft. high, more or less hairy lvs. oblong and more or less clasping, entire, thickish heads solitary, on stout stalks, large with flat spreading rays, showy, closing at night. S. Eu. B.M. 3204. V 5 44, 16 165—One of the most universal garden fls., running into many vars., distinguished by size, color, and degree of doubling. The color varies from white-yellow to deep orange. This is the marigold of Shakespeare's time. The fl.-heads are sometimes used in cookery, to flavor soups and stews. The calendula is of the easiest culture in any warm, loose soil. The seeds are usually sown where the plants are to stand, but they may be sown indoors or in a frame and the plants transplanted. The achenes are large and germinate quickly. The plant blooms the whole season, particularly if the fls. are picked. It is a hardy annual, and in the southern states will bloom most of the year. In the N. it blooms up to the first frosts, sometimes beyond. Sown in summer or autumn, it makes a good winter bloomer. Florets are used in medicine as a vulnerary and anti-emetic. The flowering plant was formerly used for removing warts.

741. *Calendula officinalis*, double-flowered. (×3½)

suffruticosa, Vahl (*C. Noëana*, Boiss.) More diffuse, annual lvs. sessile, lanceolate, somewhat dentate: heads bright yellow, not doubled, very numerous, on long peduncles. W. Medit. region.—Seeds are sold by American dealers.

C. Pöngelii, Hort., and *C. plusvalis*, Lann., will be found under *Dimorphotheca*.

L. H. B.

CALICO BUSH. *Kalmia*

CALIFORNIA POPPY: *Eschscholzia*

CALIFORNIA YELLOW BELLS: *Emmenanthe penduliflora*.

CALIMERIS (Greek, beautiful arrangement). *Compositae*. Good daisy-like border plants.

Calimneris comprises about 10 Asian herbs, now mostly united with *Aster*, but horticulturally distinct, and differing from that genus in the hemispherical involucre of few nearly equal scariosus-margined bracts, and broad convex receptacle, achene flat and hairy. Hardy perennials of low growth, suited to the border in front of stronger plants. *C. latruncula* described in the genus *Heteropappus*.

incisa, DC (*C. incisaefolia*, Hort? *Aster incisus*, Fisch.) One to 2 ft., erect, corymbose at the summit: lvs. lanceolate, remotely incise-dentate; scales of involucre red-margined fls. large, purple-rayed or almost white, and yellow-centered—Of easy cult. in any good soil, making a display throughout July and Aug. The commonest species in cult.

altica, Nees (*Aster alticaeus*, Willd.) Lower, pubescent or hispid lvs linear-lanceolate and entire scales of involucre pubescent and white-margined, rays narrow, blue.

L. H. B.

CALIPERURIA: *Calliperuria*

CÁLLA (ancient name, of obscure meaning). *Ariceae*. A monotypic genus, containing a native bog-plant with a white spathe.

Herb, with creeping rhizomes and 2-ranked lvs. Differs from *Oxotium* in the parallel secondary and tertiary veins of the lf-blade, as well as in having a prominent more or less fleshy persistent spathe enveloping the spadix, and in the absence of perianth; lower fls. perfect, upper staminate; fr. a red berry. See *Zantedeschia* for *C. æthiopica*, *C. albo-maculata*, and others. The calla of florists, or calla lily, is *Richardia* of recent books, but is properly *Zantedeschia*, where it is described and the culture given in this work.

palustris, Linn. **WATER ARUM**. Fig. 742. Rhizome bearing many distichous lvs. one year, the next only 2 lvs. and the peduncle: petioles cylindrical, long-sheathed; blade cordate: spathe elliptical, or ovate-lanceolate, white. Eu, N.

Asia, and E. N. Amer. V. 2:197; 14. 244. B.M. 1831. —An interesting little perennial plant, useful for outdoor ponds.

JARED G. SMITH.

CALLIÁNDRA (Greek, *beautiful stamens*). *Leguminosae*. Evergreen shrubs and trees of greenhouse culture, planted in the open far south.

742. *Calla paucistris*.

Leaves bipinnate; fls numerous: fls usually in globose heads or clusters, corolla small, obscured by the numerous, long, silky, purple or white stamens.—About 120 species, widely distributed in tropics. Distinguished from *Acacia* by the presence of a thickened margin on the pod.

Propagation is by cuttings placed in sand over bottom heat. Keep in warm-house, with the exception of those from Mexico.

Benth (*Acacia Lambertiana*, D. Don) Unarmed; branches terete; lvs. puberulous-villous; pinnae 2-3-yoked; fls. 9-12-yoked, oval-oblong, obtuse at both ends, peduncles 3-5, racemose, heads roundish, stamens 20-25, pink. Mex. B.R. 721.

tetragona, Benth (*Acacia tetragona*, Willd.) Unarmed; branches tetragonal pinnae 5-6-yoked fls. 16-29-yoked, linear, acute, the outer larger: heads pedunculate, axillary, fls. white. Trop. Amer.

portoricensis, Benth. (*Acacia portoricensis*, Willd.). Unarmed shrub or small tree. pinnae 2-4-yoked; fls. 15-25-yoked, linear, obtuse, closing at evening, branchlets pubescent: heads globose, pedunculate, axillary, the white fls. opening as lvs. close; calyx ciliate on the margin; stamens 20-25, filaments long, white: pod straight, linear, tapering at base. W. Indies.—Endures temperatures as low as 24° F in Calif. Var. *major*, a splendid form, is known abroad. B.M. 8129.

Twedyi, Benth. Unarmed shrub, lightly pubescent pinnae 3-4-yoked, fls. 20-30-yoked, linear, obtuse, shining: peduncles axillary, 1-2 in. long, from large scaly buds, calyx and corolla silky, lobes erect; stamens long, numerous, purple. Brazil. B.M. 4188.

C. californica, Benth. A stiff, hairy, much-branched shrub cult. in Calif. It is native near Magdalena Bay and is the most northerly known representative of the genus.—*C. caracasana*, Benth. (*Mimosa caracasana*, Jacq.) differs from *C. portoricensis* in having purple stamens, but is probably not distinct.—*C. grandiflora*, Benth. Not over 10 ft. foliage glaucous fls. scarlet. Intro by Francisco.—*Mimosa grandiflora*, L. Her. (?)—*G. Saman*, Griseb., = *Pithecolobium Saman*.

HARVEY MONROE HALL.

CALLIÁNTHEMUM (Greek, *beautiful flower*). *Ranunculaceae*. Two or 3 little herbs of the mountains of Eu. and Cent. Asia, allied to *Anemone*, sometimes mentioned for outdoor planting. Lvs. radical (very small or none on the st.), decomposed fls. terminal, white or rose-color, sepals 5, deciduous; petals 5-15, showy, with nectaries at the base. The species apparently intergrade. **C. anemonoides**, Endl. Three to 10 in. high, blooming in spring: lvs. as broad as long, triangular in outline, bipinnatifid. fls. 1½ in. or less across; sepals broad; petals narrow: rhizome somewhat fleshy. Tyrol. Useful in rockwork.

CALLICARPA (Greek, *beauty and fruit*). *Verbenaceae*. Ornamental woody plants cultivated chiefly for their brightly colored berry-like fruit appearing late in autumn; also for the attractive flowers which appear in summer.

Flowers perfect; calyx short-campanulate, truncate or slightly 4-toothed, rarely 4-parted, corolla with short tube, 4-lobed; stamens 4, of equal length; ovary 4-celled, cells 1-ovuled. fr. a subglobose berry-like drupe with 2-4 stones.—More than 30 species in tropical and sub-tropical regions of Asia, Austral., N. and Cent. Amer.

Callicarpas are shrubs or trees, often with stellate hairs, with opposite, usually serrate, deciduous leaves and small pink, bluish or whitish flowers in axillary clusters, followed in autumn by small berry-like blue, violet or red, rarely white fruits. The hardest are *C. duhoultonii*, *C. japonica* and *C. gracilis*, which may be grown even North in sheltered positions, if somewhat protected during the winter. If killed to the ground, young shoots spring up vigorously, and will produce flowers and fruit in the same season. If grown in the greenhouse, they require a sandy compost of loam and peat, and plenty of light and air. Propagation is readily effected by greenwood cuttings in spring or summer under glass, also by hardwood cuttings, layers and seeds.

A. Lvs. tomentose beneath.

americana, Linn. Shrub, 3-6 ft., with scurfy, downy tomentum. lvs. cuneate, elliptic-ovate, acuminate, obtusely serrate, 3-6 in. long. cymes short-stalked; corolla bluish, glabrous fr. violet. July, Aug. Woods and rich soil. Va. to Texas and W. Indies.—One of the handsomest in fr., but more tender than the Japanese species. Var. *alba*, Hort., has white fr.; very conspicuous in fall and early winter.

AA. Lvs. not or slightly pubescent below and glandular. corolla glandular outside

B. Peduncles longer than petioles lvs. glabrous or nearly so below

japonica, Thunb. (*C. Mimurazaki*, Sieb.) Fig. 743 Shrub, 2-5 ft. lvs. cuneate, elliptic or ovate-lanceolate, long-acuminate, serrulate, 2½-5 in. long; cymes peduncled, many-fl'd; fls. pink or whitish. fr. violet. Aug. Japan. S.I.F. 1.70. G.C. 1871:173. P.F.G. 2, p. 165. H.F. 1861:12. Var. *leucocarpa*, Sieb. With white fr.

dichotoma, Koch. (*C. gracilis*, Sieb. & Zucc.) *C. purpurea*, (Luss.) Shrub, 1-4 ft.: lvs. cuneate, elliptic or obovate, crenately serrate above the middle, entire toward the base, 1½-3 in. long:

743. *Callicarpa japonica*. (×¼)

cymes peduncled, few- or many-fl.; fls. pink: fr. lilac-violet. Aug. Japan, China. Gn 23:540.—Closely allied to the former, but smaller in every part.

nn. *Peduncles shorter than petioles.*

Girálzii, Hesse. Shrub: lvs. broadly elliptic or elliptic-ovate to elliptic-lanceolate, 2-4 in. long, dentate, glandular beneath, and sparingly stellate-pubescent; petioles slender, $\frac{1}{2}$ - $\frac{1}{2}$ in long fls. pink in dense cymes on pubescent stalks shorter than the petioles: fr. violet. W. China.

C. edna, Linn. Shrub. lvs. broadly elliptic, shining above and whitish-tomentose beneath fr. deep purple. E. India, China, Philippines. Isls. B M 2107.—**C. longifolia**, Linn. Shrub lvs. oblong-lanceolate or lanceolate, narrowed at both ends, 3-5 in long, stellate pubescent and glandular beneath cymes short-peduncled, fls. pink or purple. fr. white. Himalayas, China. R. H. 10 864. F E 2 133.—**C. mollis**, Sieb & Zucc. Shrub, to 4 ft. lvs. oblong-lanceolate, rounded at the base, tomentose beneath fls. and fr. pink. Japan. S. F. 1 70.—**C. pedunculata**, R Br (C. lanata, Schau, not Linn.) Shrub lvs. oblong-ovate, nearly sessile, and rounded at the base, green and slightly tomentose beneath cymes slender-peduncled. E. India Austral. Sieb. Flor. d. Jard 4 07.—**C. rubella**, Landl (C. dichotoma, Hort., not Juss.) Shrub or small tree, to 20 ft. lvs. coriaceous-oblong, tomentose beneath fr. purple. Himalayas, China. B. R. 11 883. F. S. 13.1359. I. H. 6 202. G. C. 1859, 96. R. H. 1859, p 106, 107.

ALFRED REHDER.

CALLICHRŌA: *Laya*

CALLIŌPSIS: *Coreopsis*.

CALLIPHŪRIA (Greek, *beautiful prison*; referring to the spathe inclosing the flowers). Written also *Caliphuria*. *Amaryllidaceæ*. Tender bulbs.

Distinguished from *Eucharis* by the stamens, the filaments being petaloid, with 3 large linear teeth on top, the middle one bearing the anther. The fls. appear with the lvs., perianth funnel-shaped, spreading upward, stamens inserted at the throat of the tube caps tardily splitting.—Three species from Colombia.

Calliphurias are warmhouse plants and should be grown in a rich soil of loam, peat or leaf-mold and sand. Propagated by offsets.

Hartwegiana, Herb. Bulb ovoid, 1 in. thick, stoloniferous, with brown membranous tunics. lvs. bright green, firmer and more closely veined than in *Eucharis*, with an oblong-acute blade 4-5 in. long, 2 in. broad, narrowed into a petiole, which is flat above and round beneath scape slender, 1 ft. long, fls. 6-8, in an umbel, white, perianth 1 in. long and wide. Andes of Bogota.—B. M. 6259. B. R. 30, p 87, desc. Intro. in 1879 by Reasoner.

C. subdentata, Baker= *Eucharis subdentata*.

CALLIPRŌA. *Brodiaea* N. TAYLOR.†

CALLIPSYCHE (Greek, *beautiful* and *butterfly*) *Amaryllidaceæ*. Three bulbous plants from Ecuador and Peru, the lvs. produced after the yellow or greenish yellow fls., probably not in the horticultural trade. Leaves thin, oblong and stalked: fls. many in an umbel on a hollow peduncle or scape; perianth funnelliform with short tube, the segments all equal and oblanceolate to oblong, stamens 6, much exserted, attached at the throat. fr. a deeply 3-lobed caps, with many seeds. They require the general treatment given *amaryllis*. **C. mirabilis**, Baker, has an oblong bulb 2 in. diam.: lvs. 1 or 2, blade 5 or 6 in. broad peduncle 2-3 ft.; fls. greenish yellow, about 30 in a dense umbel, stamens three times as long as perianth and widely spreading. July, Aug. **C. aurantiaca**, Baker, has an ovoid bulb 1 in. diam.: lvs. few. peduncle $\frac{1}{2}$ -2 ft.; fls. bright yellow, 6-8 in the umbel, stamens green, twice the length of perianth. Autumn and winter. B. M. 6841. L. H. B.

CALLIPTERIS (Greek, *beautiful fern*). *Polypodiaceæ*. Ferns allied to *Asplenium* and *Diplazium*, with elongate sori formed on both sides of the veins, and the veins uniting to form meshes or areoles.—Some 15 species are known from the warmer parts of both hemispheres

The following is the only one in cult. Culture the same as for tropical aspleniums

prolifera, Bory (*Asplenium decussatum*, Swartz). Lvs 3-6 ft. long, the stalks 1-2 ft. long, the pinnae numerous, 6-12 in. long, 1-2 in. wide, with deeply crenate margins and frequently with bulblets in the axils; veins pinnate, with the branches of contiguous veins uniting. Polynesia and Malaya.

L. M. UNDERWOOD.

CALLIRHOË (Greek mythological name). Written also *Callirhoe Malvaceæ*. Hardy showy herbs, for outdoor planting.

Perennials or annuals lvs. alternate, with lobed or cleft blades or more finely dissected, fls. showy, axillary or sometimes in terminal racemes, the petals irregularly cut at the apex or truncate, differing in this from the notched petals of *Malva*, involucrel of 1-3 bracts, or wanting.—Nine species, native.

The *callirhoes* are of the easiest culture, and deserving of a much greater popularity. They are chiefly propagated by seeds, but the perennial species may also be propagated by cuttings

744 *Callirhoe pedata*.

A Annual involucrel absent

pedata, Gray. Fig 744. Height 1-3 ft. st. erect, leafy, radical and lower lvs. round-ovate, palmately or pedately 5-7-lobed or -parted, the lobes coarsely toothed or incised, upper 3-5-cleft or -parted, usually into narrow divisions fls. red-purple, cherry-red, varying to lilac. On plains and in sand, S. U. S., spring and summer. R. H. 1857, p 430

AA Perennial: involucrel present.

involucrāta, Gray. Height 9-12 in., plant hirsute or even hispid. root large, napiform sts. procumbent: lvs. of rounded outline, palmately or pedately 5-7-parted or -cleft, the divisions mostly wedge-shaped, incised, the lobes oblong to lanceolate: fls. crimson-purple, cherry-red or paler. All summer. Minn. to Texas. R. H. 1862:171 (as *C. verticillata*).

Var lineariloba, Gray (*C. lineariloba*, Gray). Less hirsute than the type: sts ascending: lvs. smaller, 1-2 in. across, the upper or all dissected into linear lobes. fls. lilac or pinkish. Texas and adjacent Mex.—An excellent trailer, especially for rockeries. Thrives even in very dry soils, the root penetrating to a great depth. A sunny position is preferable.

C. Papaver, Gray. A perennial decumbent or ascending plant with 3-5-lobed or -parted lvs. and involucrel purple-red fls. S. U. S.—Useful for very dry sandy places.

N. TAYLOR †

CALLISTA: *Dendrobium*.

CALLISTEMON (Greek, *kallos*, beauty; *stemon*, a stamen; in most of the species the stamens are of a beautiful scarlet or crimson color). *Myrtaceae* BOTTLE-BRUSH. Ornamental shrubs, thriving without irrigation in California, where they are hardy and much used; also planted to some extent elsewhere in warm climates and occasionally seen under glass. Page 3566

Leaves alternate, entire, lanceolate or linear, mostly with oil- or resin-dots and fragrant when crushed. fls. in dense cylindric spikes, at first terminal but the axis growing out as a leafy shoot; calyx-teeth 5; petals 5, deciduous; stamens indefinite in number, not united; anthers versatile, the cells parallel and bursting longitudinally; ovary inferior, maturing into a caps. which persists for several years.—About 25 species, natives of Austral., where they inhabit arid districts. Distinguished from *Melaleuca* only by the stamens, which in that genus are united into bundles. Hall, Univ. Calif. Pub. Bot. 4:22.

The showy flower-clusters, resembling bottle-brushes in shape, and so giving the common name to the genus, are highly colored and render these shrubs very ornamental. The quantity of bloom may be much increased by judicious autumn pruning. The various species are recommended for parks, depot-grounds, school-yards, and also for smaller yards if kept well pruned. Hardy only in warm-temperate districts but enduring temperatures less than 20° F.

Propagation from seeds is satisfactory: these are gathered during the summer months by allowing the capsules to open in boxes or on sheets of paper kept in a warm place, sow in early spring in finely sifted mixture of sand, leaf-mold, and loam, and cover very lightly; the ordinary cool greenhouse is warm enough. Some nurserymen state that plants from cuttings of ripened wood or of wood which is getting firm at the base will blossom earlier than seedlings; others find no advantage in this method. Although adapted to nearly every variety of soil, these plants make but slow growth in heavy clay

745. *Callistemon lanceolatus*. (× 3/4)

♂ Stamens $\frac{3}{4}$ –1 in. long.

lanceolatus, DC. (*Metrosideros semperflorens*, Lodd.). Fig. 745. Height 6–12 ft.: lvs. lanceolate, $\frac{1}{4}$ – $\frac{2}{3}$ in. long, about $\frac{1}{4}$ in. wide, acute, reddish when young; midrib and lateral veins prominent; spikes 2–4 in long, bright red, less dense than in the following species; fr. ovoid, contracted at summit. Jan.–June. B.M. 260

(as *M. citrina*). Maiden, Fl. Pl. and Ferns of New S. Wales, 8.—Attains 30 ft. in Austral. where the hard and heavy wood is used for wheelwrights' work and for mallets. Garden hybrids between this and other species have been developed, especially in Eu.

speciosus, DC. Large shrub: lvs. narrowly lanceolate, obtuse or acute, $1\frac{1}{2}$ –4 in. long, about $\frac{1}{4}$ in. broad; midrib prominent but lateral veins obscure. spikes 2–6 in long, bright red, very dense. fr. nearly globose, the summit scarcely contracted. March–June. B.M. 1761. —The most highly colored callistemon, the golden anthers contrasting well with the dark red filaments. There are many garden forms varying in color, habit, and size

viminialis, Cheel. Tall slender tree of pendulous habit: lvs. linear-oblong. stamens slightly shorter; rim of fr. thinner.—A handsome, graceful tree, very showy when in full bloom. Grown at Santa Barbara, Calif. (Formerly referred to *C. speciosus*, of which this may be a form.)

rigidus, R. Br. (*C. linearifolius*, DC.). Lvs. narrowly linear, rigid, sharp-pointed, 2–5 in long, about $\frac{1}{4}$ in. wide; midrib and marginal ribs prominent; cross-nerve often hidden by oil-dots. spikes deep red, large, dense March–July. B.R. 393. —Stiffly branched shrub, the branches inclined to become rangy; best form and bloom secured by means of autumn pruning. In order to have fine specimen plants, cult well and now and then give an application of commercial fertilizer

linearis, DC. Scarcely more than an extreme form of *C. rigidus* with very narrow lvs. channeled above, the midvein quite obscure; fr. more globular and contracted at opening.

AA Stamens $\frac{1}{2}$ in. or less long.

salignus, DC. Tall shrub or small tree: lvs. lanceolate, acute, $1\frac{1}{2}$ –3 in long, $\frac{1}{4}$ – $\frac{3}{4}$ in wide (much narrower in one variety), very distinctly pinniveined. spikes yellow or light pink, 1–2 in long fr. nearly globose, with rather large opening. Apr., May. B.M. 1821 Var *viridiflorus*, F v M Lvs. only 1–2 in long, thicker, rigid; veins obscure fls. greenish yellow B.M. 2602.

brachyandrus, Lindl. Slender shrub, young shoots soft-hairy or whole plant gray with a soft pubescence lvs. rigid, nearly terete, $\frac{3}{4}$ – $1\frac{1}{2}$ in. long; spike 2–3 in. long, the filaments dark red but nearly obscured by the golden yellow anthers.—The slender habit, gray foliage, and golden bloom render this shrub very desirable for ornamental planting

HARVEY MONROE HALL.

CALLISTEPHUS (Greek words for *beautiful crown*, said to be in allusion to character of fruit) *Compositae*. CHINA ASTER. (See page 419, Vol. 1.) One species in China and Japan. The genus *Callistemma*, also erected by Cassini, is older than *Callistephus*, but the latter is one of the "nomina conservanda" of the Vienna code, retained because accepted and in general use for fifty years following its publication. Under both these generic names, Cassini described the China aster as *C. hortensis*. It was first named by Linnaeus, however, as *Aster chinensis*, and Nees subsequently transferred this name to *Callistephus*, so that the plant now would better bear the name *Callistephus chinensis*, Nees.

Callistephus is closely allied to *Aster*, from which it differs, among other things, in its pappus, which is minute and forming a crown in the outer series, and of slender longer barbellate and caducous bristles in the inner series: annual, erect, hispid-hairy branching herbs, with showy terminal fl.-heads: lvs. alternate,

XXII. Carnations.— Types of the American winter-flowering varieties. (Half size.)

broadly ovate or triangular-ovate and deeply and irregularly toothed; blade decurrent into a petiole, those on the upper parts becoming spatulate or narrower; heads in wild plant heterogamous and radiate, the ray-florets in 1-2 series and pistillate, the disk-florets perfect and fertile; involucre hemispherical, the bracts imbricated in many series and the outer ones large and green, fr. a compressed achene. The rays become much multiplied under cult., and they are also variable in size, shape and color. The colors are violet, purple, blue and white, the rays never being true yellow. Widely variable under cult., and one of the best of the garden annuals, growing from 6 in. to 2½ ft. high. It is the Reine-marguerite of the French and the Sommeraster of the Germans. L. H. B.

CALLITRIS (from the Greek for beautiful). Including *Frenela* and *Widdringtonia*. *Pinaceae*. Evergreen trees or shrubs, not quite hardy in the open in England, but thriving well in the southernmost parts of the United States; allied to Thuja.

Leaves scale-like or awl-like, in whorls of 3 or 4 on jointed branches, or sometimes alternate; monocious; sterile catkins cylindrical or ovoid, the stamens in whorls of 3 or 4, the scales broad and sometimes peltate, fertile cones of 4-8 scales, and borne on short and thick peduncles, either solitary or clustered, usually ripening the second year and often persisting after the seeds have fallen.—About 15 species in Austral., New Caledonia and Afr. Little known in cult. here.

A. Cone 6-valved

robusta, R. Br. (*Frenela robusta*, Cunn.). **CYPRESS PINE**. Ranging from a shrub to a tree 90 ft. high: branchlets crowded, short and erect; sterile catkins ¼ in. or less long, solitary or in 3's; cones solitary or few-clustered, nearly globular, about 1 in. diam.; seeds usually 2-winged. **Austral**.—Trees about 80 years old are said to be growing at Santa Barbara. In S. Fla. it makes good specimens, in 5 years becoming 10-12 ft. high. The tree somewhat resembles red cedar, and is reported as useful for tall hedges and windbreaks. This is one of the "pines" of Austral., the wood being used in building and for the making of furniture.

rhomboidea, R. Br. (*Frenela rhomboidea*, Endl.). Smaller, reaching 25-50 ft. branches somewhat slender and often drooping, angled when young; cones usually only one-half the diam. of those of *C. robusta*, globular, the 6 valves alternately larger and smaller, the larger valves having a broadly rhomboidal apex with a protuberance at the center. **Austral** and **Tasmania**.—Timber used for telegraph poles and in construction.

AA. Cone 4-valved.

quadrivalvis, Vent. (*Thuja articulata*, Vahl). **ANAR-TREE**. **SANDARACH**. **GUM TREE**. Small tree, with fragrant hard durable wood, branches jointed and spreading lvs. very small, flattened, distichous, reduced to scales at the nodes. cone 4-sided, small, the valves oval and with a protuberance near the tip. N. Afr., in the mts. L.B.C. 9.844.—Furnishes varnish resin (gum sandarach).

Whitei, Engler (*Widdringtonia Whitei*, M. Wood). The wood is dull reddish white, strongly aromatic, and locally used for furniture and for doors and windows. Tree attaining a maximum height of 140 ft., with a diam. of 5½ ft. at a point 6 ft. above the ground, the trunk being clear for 90 ft.: lvs. on ultimate branchlets, deltoid and closely appressed opposite; on other branchlets usually linear-lanceolate, spreading at the tips, alternate. In seedling stage linear, spreading and about 1 in. long; cones 4-6 together, about ¼ in. long and ¾-1 in. wide when open. S. E. Afr.—It grows at an altitude of 5,000-7,000 ft. on Mt. Milanji in Nyassaland and is known as the Milanji cypress or cedar. Apparently hardy in parts of Cent. Calif. L. H. B.

CALLÓPSIS (*Calla*-like). *Araceae*. A single species from German E. Afr. *C. Völkensii*, Engler. Spathe like that of a little calla, snow-white, 1¼ in. long by 1 in. broad, the spadix partly united to it (and yellow); lvs. crowded, cordate-ovate, 5 in. long, shining, the petiole about 2 in. long, semi-epiphytic, with creeping rhizome. Probably cult. only in botanic gardens or other collections.

CALLUNA (Greek, to sweep, the branches are sometimes used for making brooms). *Ericaceae*. **HEATHER**. Low evergreen shrubs cultivated chiefly for their bright rosy pink, rarely white flowers appearing in great profusion late in summer.

Leaves scale-like, opposite, in 4 rows, the branchlets therefore quadrangular; fls. in terminal, 1-sided spikes; corolla campanulate, 4-parted, shorter than the 4-parted colored calyx, stamens 8, with 2 reflexed appendages; fr. a septicide, 4-celled, few-seeded caps.—One species in W. and N. Eu, also in Asia Minor; in E. N. Amer. in some localities naturalized. The genus differs from the closely related *Erica* in its deeply 4-parted colored calyx, longer than the 4-parted corolla. For culture, see *Erica*.

vulgäris, Salisb. (*Erica vulgäris*, Linn.). Fig. 746. From ½-3 ft.: lvs. oblong-linear, obtuse, sagittate at the base, glabrous or pubescent. fls. small, in long, erect, rather dense racemes, rosy pink, sometimes white. Aug., Sept.—Some of the most distinct of the numerous named varieties are the following: **Var. alba**, Don (and **var. alba Hämmondi**), with white fls.; **var. Alpörtii**, Kirchn., of more vigorous growth, with rosy carmine fls.; **var. carnea**, Hort., with flesh-colored fls.; **var. plena**, Regel, with double rose-colored fls.; **var. hirsuta**, Gray (var. *tomentosa*, Don), the branchlets and lvs. with grayish tomentum; **var. nana**, Kirchn. (var. *pigmaea*, Hort.), forming low moss-like tufts, **var. rubra**, Kirchn., with deep rosy carmine fls.; **var. prostrata**, Kirchn., with the branches spreading and partly prostrate, fls. pink; **var. Scärlei**, Hort. (var. *alba Scärlei*, Hort.), fls. white, appearing late in autumn.—The heather is a very handsome small shrub, well adapted for borders of evergreen shrubberies, or for dry slopes and sandy banks and preferring sunny positions; it is also found growing well in swamps and in partly shaded situations. Cut branches keep their life-like appearance for many months.

746. *Calluna vulgaris*. (Plant × ½)

ALFRED REHDER.

CALOCHÓRTUS (Greek for beautiful and grass). *Liliaceae*. Incl. *Cycloböthra*. **MARIPOSA LILY**. **STAR TULIP**. **GLOBE TULIP**. West American cormous plants, the occidental representatives of Tulipa, useful as border plants and to some extent for indoor culture.

Stem usually branched, and from a coated corm, more or less leafy; perianth of unequal segms., the outer ones the smaller and more or less sepal-like, the 3 inner ones large and showy and bearing glands and hairs; stigmas 3, sessile and recurved, stamens 6; fls. showy, shallow-cupped on the inner segms., arching.—From 40-50 species, mostly on the Pacific side of the con-

tinent from Wash. to Mex., and some of them in the interior country. Nearly all the species are in cult. Monogr. by J. G. Baker, Journ. Linn. Soc. 14:302-10 (1875); and by S. Watson, Proc. Amer. Acad. Arts and Sci. 14:262-8 (1879). See also Calochorti in the Sierra Nevada,

by George Hansen, Erythea, 7:13-15, A. Davidson, Erythea, 2:1-2, 27-30; Mallett, Gn. 1901, 60:412, vol. 61, pp. 185, 203, 220; Carl Purdy, Proc. Calif. Acad. Sci., 3d ser., vol. 2, No. 4 (1901).

Calochortuses extend into British America, and a few, belonging to a peculiar group, are found in Mexico, the remainder are natives of the United States, from Nebraska to the Pacific Ocean.

While the generic characteristics are unmistakable, the species and even varieties have the most variable inclinations as to soil, exposure and climate. The Colorado Desert and the summits

of the Sierra Nevada, the heavy clay lands of Californian valleys, the volcanic soils of the foothills and the meadows of the Northwest, each has its own representatives of this beautiful tribe. The character of the genus can be treated better under the various groups. Nearly every known species is in cultivation to some extent. Some are readily grown, others present considerable cultural difficulties, but while there are some that probably will always be difficult to cultivate, there are many species—and the number includes the very best—that can be grown successfully by anyone who is willing to give a little special care to them; and there are a few that possess such vigor and hardiness as to be adapted to extensive cultivation.

All calochortuses are hardy in the sense of withstanding extreme cold, but they will not endure alternate thawing and freezing nearly so well; and thus there is the paradox of their going safely through severe eastern or European winters and suffering the loss of foliage in mild ones. They should be planted in the fall, and it is better to plant late, so that leaf-growth is delayed until spring. Diverse as are their natural habitats, one soil will answer the needs of all. A light loam, made lighter with sand or sawdust, powdered charcoal, or spent tan-bark, is best. Excellent results have been secured with a mixture of equal parts of a good light loam and spent tan-bark, with a little broken charcoal. Wallace, one of the most successful English growers, recommends making a bed sloping to the south, composed of leaf-mold and road grit in equal parts, with a smaller proportion of sharp sand. The idea is to have a light and porous, not too stimulating soil, with perfect drainage. Wallace recommends covering the beds with reeds to throw off the heavy rains. The same end may be attained by such thorough drainage that the rains pass through quickly. In New York, they have been carried through the winter safely under a covering put on before the ground freezes hard. It is well to keep a few leaves about the shoots for a time and to have extra leaves at hand to be used when frost threatens. It is better to lift the bulbs as soon as

they ripen, and replant in the fall. Water sparingly at all times. Under suitable conditions they are hardy and tenacious of life, but excessive moisture, either in air or ground, is not to their liking after the flowering season arrives. Theoretically, all calochortuses of Section A (star and globe tulips) should have shade, and all mariposas (AA) sunshine; but the light shade of a lath-house suits all alike, giving much finer bloom in the mariposas. The flowering season extends over three months, according to species.

They take well to pot culture with similar soils and treatment. While not to be forced rapidly, they considerably anticipate their out-of-door season. The same treatment can be used in coldframe culture, but they must not be coddled too much.

A. Blossoms or fr more or less nodding (unless No 4) inner perianth-segms strongly arched lvs long and glossy, not channeled. (Eucalochortus)

B. Fls. subglobose, nodding st usually tall and branching GLOBE TULIPS—These have a single long and narrow shining fl from the base, and slender, flexuous, leafy sts., the perfection of grace in outline. The fls are exquisite in delicacy of tints Woodland plants

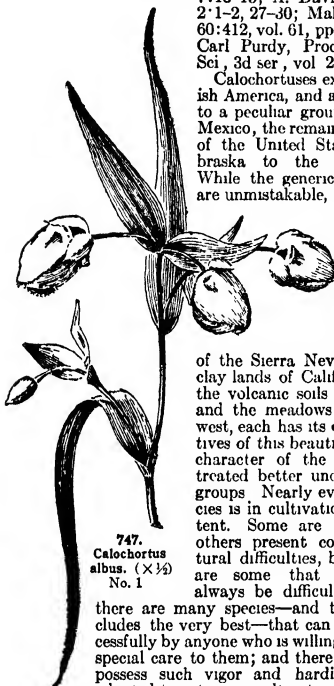

1. *albus*, Douglas (*Cycloböthra alba*, Benth.) Fig 747. Strong, 1-2 ft. high, glaucous. fls globular, pendent, 1 in across, of a satiny texture, delicately fringed with hairs, very strongly inarched or practically closed. Calif B.R. 1661 F.S. 11, 1171—Chaste and delicate. The form from the Coast Range is the Pearl calochortus of gardens; the form from the Sierras with fls less strongly inarched and at length opening slightly is the *C. albus* of horticulture.

Var. *amoenus*, Hort (*C. amoenus*, Greene) Like *C. albus*, but rose-colored, lower and more slender fls opening in full bloom. Fresno and Tulare Co. Calif.

2. *pulchellus*, Douglas (*Cycloböthra pulchella*, Benth.) Stout, glaucous, 8-16 in, usually branching fls yellow, strongly inarched but parts not overlapping, sepals shorter than petals, ovate-acuminate, yellow tinged with brown on the back, petals ovate, obtuse, 1 in. or less long, canary-yellow, with long silky hairs above the gland. Cent. Calif. B.R. 1662

3. *amabilis*, Purdy. Habit like *C. albus* sts stout, usually branching in pairs. petals clear yellow, very strongly inarched so that the tips overlap each other much like a child's pin-wheel; gland lined with stiff hairs that cross each other; petals margined with a line of stiff hairs. Cent. and N Calif.

4. *Goidyi*, Watkins. Possibly *C. Benthani* x *C. amabilis* Sts several, freely branching, bearing 15-20 fls.: lvs. narrow-lanceolate: fls erect, 1 in across, straw-yellow, inner surfaces covered with long silky sulfur-tinted hairs and a few shorter crimson hairs deep down in the cup; petals rounded and very hooded. Apparently of garden origin.

BB. *Fls. bell-shaped, erect when open, mostly lined with hairs, the pedicels becoming recurved: st. mostly low, and fls. often more or less umbellate.* **STAR TULIPS** proper.—Like the globe tulip, but smaller as a rule, and the fls. dainty open cups. All of the species resemble each other, and were first included under the name *C. elegans*.

5. **Maweanus**, Leitch! Plant low (3–10 in.), very slender, usually branched: fls. white, purplish at the base, filled with silky hairs, the gland covered by a broad semi-circular scale; caps long-elliptic. Calif., north. B. M. 5976 (as *C. elegans*)—Variable. Var. **majior**, Hort. Twice as large in all its parts. fls. lighter colored. Var. **roseus**, Hort. Fls. tinged rose.

6. **Benthāmii**, Baker Sts 7 in. high, very flexuose, dividing into pairs: lvs. linear-lanceolate fls. nearly erect, yellow, the segments $\frac{1}{2}$ in. long and brown at the base. Sierra Nevada, in Calif. B. M. 6475, J. H. III, 30 519. Var. **Wallacei** (*C. Wallacei*, Hort.). Claw of the petal dark red or nearly black.

7. **carleus**, Wats. Similar to small plants of *C. Maweanus*, but lined and dotted with blue: low, 2–5-fld., the pedicels very slender; perianth ciliate inside caps nearly or quite orbicular. Calif., in the Sierras. Not variable.

8. **elegans**, Pursh. Similar to the last: petals greenish white and purplish at base, bearded, little or not at all ciliate gland covered by a deeply fringed scale. Ore., Idaho.

Var. **nānus**, Wood (*C. Ljallii*, Baker). Subalpine, dwarf and very slender petals delicate cream-color, narrow and usually more acute, more hairy and ciliate. Mts. Calif., N.

9. **Löbblii**, Purdy (*C. elegans* var. *Löbblii*, Baker). St. 3–5 in. high petals white tinged green, broadly rhombic-ovate, very deeply pitted and with the pit showing as a prominent knob on back of petal. Mt. Jefferson, Ore.

10. **umbellatus**, Wood (*C. collinus*, Lemm.). Low and branching, 3–15 in., flexuose fls. 5–10, white; petals broadly fan-shaped, nude excepting for many white hairs just above the scale. In open grassy places around San Francisco Bay.

BBB *Fls. bell-shaped like BB, but tall (1 ft or more), and stoutly erect, with several fine, erect cups, similar to C. Maweanus.* **GIANT STAR TULIPS**—In this splendid group the very dainty silky fls. and handsome glossy lvs of the star tulip are shown with a stout st. a foot or two high, and large fls. Unlike the others, they grow naturally in open places, and have a vigor and health which are a high recommendation.

11. **Tölmiei**, Hook & Arn Stout, a foot high, generally branched petals often more than an inch long, tinged lilac, with purple and white hairs. gland without a scale caps broad-elliptic, acutish. Mt. Shasta, N.—Remains a long time in bloom.

12. **apiculatus**, Baker. Taller and stouter, 12–18 in., with umbellate straw-colored fls. N. Idaho.

13. **Purdyi**, East Glabrous and glaucous, 8–16 in., rather stout, branching, 2 to many-fld fls. creamy white or purple-tinged, filled with blue hairs, gland absent. S. Ore. G. C. III. 23 395.—Very handsome.

BBBB. *Fls. bell-shaped, the petals naked or hairy only at the base: low: lf. solitary.* **MEADOW TULIPS**—These calochortuses are natives of wet meadows. *C. uniflorus* and *C. Vestii* grow well in all soils so long as well drained, and, as garden plants, thrive everywhere. In habit they are low, flexuose and leafy. The cups are open, erect and numerous, an inch or so in diam.

14. **nōdus**, Wats. Low, 2–4 in., delicate: lf. solitary: fls. 1–6, umbellate, small, greenish white or pale lilac,

nude except for a tuft of 2 or 3 short hairs at each extremity of scale, denticulate. Calif., in the Sierras.

15. **uniflorus**, Hook. & Arn. (*C. blacinus*, Kell.). Handsome species, 4–8 in. high. fls. 4–10, on long pedicels, clear lilac, hairy only at base: caps elliptic, obtuse. B. M. 5804—Grows naturally in wet meadows, and makes offsets very freely. Often seen in a depauperate starved form, but responds at once to good treatment.

AA. *Blossoms on stout, erect pedicels, the sts. stout and strict: fls. open-bell-shaped.* **MARIPOSA TULIPS**.—Excepting in B, the mariposa or butterfly tulips have slender, grassy, radical lvs., stiff, erect sts. bearing cup-shaped fls. and sparingly leafy and with an erect caps. Bulbs small.

B. *Caps. oblong, acute-angled or winged: fls. lilac or white.* These are hardy species, growing in the meadows from Ore to Mont., where they endure much cold. They form a connecting link between the giant star tulips and the true mariposas. Their lvs. are like those of the star tulips—long, broad and glossy. Like the star tulips, also, the seed-pod is handsome, 3-cornered and winged. The sts. are stiffly erect the fls. cup-shaped, not so brilliant as the true mariposas, but very delicate the plants are hardy, healthy and vigorous, and are to be highly recommended for cold climates.

16. **nifidus**, Douglas Scape erect, but not stiff lf. solitary, glossy, narrow fls. 1–3, large and showy, lilac, yellowish, or white, with a deep indigo blotch in the center, lined with yellow hairs. Meadows, E. Ore to Mont. and N. E. Nev. Specimens from Yellowstone Lake are yellow.—Very beautiful and showy.

17. **Greenei**, Wats. St. stout and branching, 1 ft., 2–5-fld.: sepals with a yellowish hairy spot, petals lilac barred with yellow below, and somewhat purplish, loose-hairy, not ciliate caps beaked. Calif. and Ore.

18. **longebarbatus**, Wats. Slender, about 1 ft. high, bulb-bearing near the base, with 1 or 2 narrow radical lvs., 2-branched and usually 2-fld. fls. erect or nearly so, lilac with yellow at base, scarcely hairy except the long-bearded gland. Wash.

19. **Höweli**, Wats. St. erect, 1 ft or more, 1–2-fld.: lvs. very narrow sepals ovate, short-acuminate; petals yellowish white, 1 in. long, denticulate, slightly ciliate near the base, brown-hairy inside, the gland yellow-hairy. Ore.

BB *Caps. oblong, obtuse-angled.*

c. *Color yellow or orange or orange-red, more or less marked with brown and purple (except in forms of C. luteus): in cult. forms running into other colors.*

20. **Weedii**, Wood Radical lf. single, glossy, broad: st. tall, leafy, bearing large orange-colored fls. dotted with purple. petals triangular, square-topped gland small, hairy: bulb heavily coated with fiber. S. Calif. B. M. 6200 (as *C. citrinus*). G. C. III. 16. 183.—Varies to white.

Var. **purpurascens**, Wats. (*C. Plummerae*, Greene). Similar, but lilac or purple and very showy. Calif. G. C. III. 16: 133. J. H. III 29: 289. Gn. 47: 80—A fine form with fl. of large size and full outline, lined with long, silky yellow hairs.

Var. **vestus**, Purdy. Petals much more truncated and curiously fringed with brown hairs; reddish brown. Santa Barbara.

Var. **obispoensis**, Purdy (*C. obispoensis*, Lemm.). Fig. 748. Tall and slender, branching, very floriferous: petals yellow, verging to red at the tip and less than half the length of the orange-brown sepals. Calif. G. F. 2: 161 (adapted in Fig. 748).—Odd and bizarre.

21. *Kennedyi*, Porter. Bulb small and ovoid; st. very low, 1-4 in.; lvs. linear, tufted from the branching of the st.; fls. 2-4, in an umbel; sepals broad with a purple spot; petals red-orange to vermilion, not ciliate nor prominently hairy, purple-spotted at the center. Desert species of S. Calif. B M. 7264. Gn. 43:108. —Brilliant and desirable, but difficult to grow.

22. *atrusus*, Wats. Low, 4-6 in., with a single carinate radical lf.; petals yellow, not hairy, the hairy gland purple-bordered. S. Utah.

748. *Calochortus obispoensis*. No. 20 var. ($\times \frac{1}{2}$)

23. *clavatus*, Wats. Petals yellow lined with brown, the lower part bearing club-shaped (clavate) hairs, the gland deep and circular; anthers purple. Calif.—In this excellent sort we have the largest-fl. and stoutest-stemmed of all mariposas. The bulb is very large, the single bare lf. 1 or 2 ft. long; the st. is heavy, stout and zigzag. The fls. are shaped like a broad-based bowl, sometimes 5 or 6 in. across. The color is a deep, rich yellow, and the lower half is covered thickly with stiff yellow hairs, each tipped with a round translucent knob, and in the light look like tiny iceles. There are various strains: Eldorado, the largest, not so deep yellow; Ventura, very stout, deep yellow; Obispo, like the last, but the upper half of the back of each petal is olive-brown, which shows through the deep yellow of the inside, giving changeable shades.

24. *côncolor*, Purdy (*C. luteus* var. *côncolor*, Baker). Bulb large reddish. lvs. narrow, glaucous; st. 1-2 ft., umbellate, if more than 1-fl.; not zigzag; petals a rich deep yellow, tending toward orange, lower third densely hairy with long yellow hairs above an oblong gland. A desert species of S. Calif. Much like *C. clavatus* in general aspect.

25. *luteus*, Douglas. BUTTERFLY TULIP. St. 1-10-fl., bulb-bearing near the base. lvs. very narrow; sepals narrow-lanceolate, with a brown spot; petals 2 in. or less long, yellow or orange, brown-lined, slightly hairy below the middle, the gland densely hairy. Calif. B.R. 1567.—Variable. Some of the forms are sold as *C. venustus*.

Var. *citrinus*, Wats. (*C. venustus* var. *citrinus*, Baker). Petals lemon-yellow, with a central brown spot.

Var. *oculatus*, Wats. (*C. venustus* var. *oculatus*, Hort.). Petals pale or white, lilac or yellowish, with a dark spot.

Var. *robustus*, Purdy (*C. venustus* var. *robustus*, Hort.). A very bulbiferous form having white fls. luridly tinged in browns and purples. Very beautiful and also one of the hardest.

26. *Vesta*, Purdy. BUTTERFLY TULIP. Tall and large-fl. with petals more narrowly cuneate than in *C. luteus* var. *oculatus*, and the gland narrow and doubly lunate, color from white tinged through lilac to pink and blue-purple; fl. often laciniately gashed, above the gland bearing rich maroon pencillings and markings. N. W. Calif. in adobe soil.—One of the largest-fl., showiest and most easily grown of mariposa tulips. Named by its author in compliment to his wife

cc. Color prevailing white or lilac, but sometimes running into yellows.

27. *venustus*, Benth. BUTTERFLY TULIP. Stout, 6-36 in.; petals white or pale lilac, with a reddish spot at top, a brown-yellow center, and brown base; gland large and oblong, usually densely hairy. caps. 1-2½ in. long. Calif. B.R. 1669. F.S. 2 104 (Gn. 46, p. 395).—Very variable. The yellow forms (as var. *sulphureus*, Hort.) are often treated as forms of *C. luteus*. To this group of calochortuses is properly applied the Spanish name mariposa (butterfly), for their brilliantly colored fl., with eye-like spots on each petal and sepal, and other delicate markings with dots, lines and hairs, which are strongly suggestive of the wings of a brilliantly colored butterfly. Botanists have variously divided this great group of allied forms between *C. luteus* and *C. venustus*. Botanically all may be considered as either strains of one variable species or as a number of closely allied species.

Var. *Eldorado*, Purdy. The finest strain of *C. venustus* in cult. It occurs naturally in a wonderfully varied mixture, in color from pure white through pink, to deep glowing reds and through lilac to deep purples. In one locality a few may vary to light yellow. Some of these forms have been named var. *pectus* for the white form, var. *sanguineus* for the blood-red. The purple forms are entirely distinct from *C. venustus* var. *purpurascens*. Sierran foothills from Eldorado County to the far South. Altogether these plants comprise the loveliest group of the mariposa tulips.

Var. *purpurascens*, Wats. Petals deep lilac or purplish, darker at center, the fl. fully 3 in. across. Coast Range. Strong grower. Gn. 46:394.

Var. *roseus*, Hort. (*C. roseus*, Hort.). Creamy white or lilac, with an eye midway and a rose-colored blotch at apex. Gn. 46:394.

Var. *sulphureus*, Purdy. Taller than the type: petals light warm yellow with eye, and with a rose-colored blotch at top. Lower part of San Joaquin Valley, Calif.

28. *splendens*, Douglas. Tall and slender, 1-2 ft.; fls. 1-1½ in. across, deep purple with a dark spot on the claw and with or without a gland covered with matted hairs. San Diego Co., Calif. Known in horticulture as *C. splendens* var. *atrovolaceus*.

Var. *major*, Purdy. Strong and tall, 1-2 ft.; fls. 2-3 in. across; petals large, clear lilac, paler below, with a

darker claw and scattered long white hairs below the middle. Coast Ranges, Monterey Co., Calif.

Var. *montanus*, Purdy. More slender than the type, often bulbiferous: lilac to salmon-pink, densely hairy with short yellow hairs about the gland. High mts., S. Calif.

Var. *rubra*, Purdy. Large, with deep-seated reddish bulb, 1-3 ft.: fls. reddish lilac, pink or purple; petals quite hairy, with short hairs on the lower third. Lake Co., Calif.

749. *Calochortus Gunnisonii*. ($\times \frac{1}{2}$)

29. *flexuosus*, Wats. Related to *C. splendens*, but with sts. so weak as almost to be said to creep. The fls. are large and very brilliant, a dazzling purple, with a darker purple eye, and yellow hairs below. S. Utah.—Intro. by Purdy in 1897.

30. *Palmieri*, Wats. St. 1-2 ft. very slender and flexuous, 1-7-fld, bulb-bearing near the base; sepals with long, narrow, recurved tips, spotted; petals 1 in. or less long, white (or yellowish below), with a brownish claw and bearing scattered hairs about the gland; caps very narrow. S. Calif.—The *C. Palmieri* of dealers is sometimes *C. splendens* var. *montanus*.

31. *catalinae*, Wats. (*C. Ligonii*, Wats.). Habit of *C. splendens* st. 1-2 ft., branching; fls. white to lilac, or deep lilac, very large and handsome, a large round black spot at base of each petal—A lovely species between *C. splendens* and *C. venustus*. Remarkable for blooming with the star tulip section, fully a month before other mariposa. Native to Santa Catalina Isl., off S. Calif., also to Calif. coast

32. *Nuttallii*, Torr & Gray. SEGO LILY. St. erect and stiff, 1-2 ft., bulb-bearing at base, usually with only 1 cauline lf., 1-5-fld: sepals ovate-lanceolate, often dark-spotted, petals 1-2 in. long, white tinged with greenish yellow or lilac, with a purplish spot or band above the yellow base and hairy about the gland; anthers obtuse. Dak and Neb to Calif. and New Mex., having the widest range of any calochortus—There are no more exquisitely beautiful plants than these sego lilies (the Mormon name) of the Great Basin. Most of them are plants of the sage-brush deserts. The lvs. are an ashy green, the foliage scant, but the great fls. are wonderful in tintings. There are shades in blue, pink, lilac, and yellowish; also white. The sego lily is the State flower of Utah.

33. *Leichtlinii*, Hook. f. Slender alpine species (5-6 in. high), by some regarded as a form of *C. Nuttallii*. fls. smoky white, banded with green and marked with dark brown. Sierra Nevada. B.M. 5862. F.S. 20 2116.

34. *Gunnisonii*, Wats. Fig. 749. Much like *C. Nuttallii*. anthers acuminate. fls. light blue or almost white, delicate yellowish green below the middle, purple-banded at the base, and bearing a band of green hairs across each petal. Rocky Mts., Wyo. to New Mex.

35. *macrocarpus*, Douglas. GREEN-BANDED MARIPOSA LILY. St. stiff, the cauline lvs. 3-5: fls. 1 or 2; sepals acuminate, sometimes spotted; petals 2 in. or less, acute, lilac with a greenish midvein, somewhat hairy. B.R. 1152. N. Calif. to Wash. and Idaho.—This fine species forms a group by itself. It has a very large bulb, a stout almost leafless st.; and a large fl. of an exquisite pale lavender, banded down the back with green. Petals long, narrow and pointed.

BBB. Caps. linear, not winged or prominently angled.

36. *flavus*, Schult. f. (*Cyclobolthra flava*, Lindl.). St. slender, 1-2 ft., forked: lvs. 2 or 3 below the

fork, linear, long-acuminate: fls. yellow, upright; petals and sepals acute, rhombic-oblong, with a darker somewhat hairy gland, the petals hairy and usually denticulate. Mex.

37. *Bonplandianus*, Schult. f. (*C. purpureus*, Baker. *Cyclobolthra purpurea*, Sweet). Rather stout, 3 ft.: st.-lvs. short, acuminate-lanceolate: fls. yellow and purple: the sepals with a purple pit and the petals purple outside; gland naked. Mex.

CARL PURDY.
L. H. B.

CALODENDRUM (Greek, *beautiful tree*). *Pallasia*, Houtt, which is the older name *Rutaceae*. One of the handsomest deciduous trees at the Cape of Good Hope; cultivated in northern greenhouses, and outdoors in southern California and southern Florida.

The great panicles of white or flesh-colored fls. are sometimes 7 in across and 6 in deep. It is a symmetrical tree, with attractive evergreen foliage and many interesting features. Called "wild chestnut" in Afr. Prop. by cuttings of half-opened wood under glass in heat. A monotypic genus.

capensis, Thunb. CAPE CHESTNUT. Height in Afr. 70 ft.. branches opposite, or in 3's lvs. simple, decussate, ovate, obtuse retuse or acute, parallel-nerved, 4-5 in. long, studded with oil-cysts, which look like translucent spots when held to the light. panicles terminal, peduncles usually trichotomous; calyx deciduous, petals 5, linear-oblong, $1\frac{1}{2}$ in long, 2 lines wide, sprinkled with purple glands, stamens 10, 5 alternate, sterile, and petaloid: seeds 2 in each cell, larger than a hazelnut, black and shining. G.C. II. 19:217. Also written *Calodendron capense*.

CALONYCTION (Greek, referring to the beauty of the flower, and the night-blooming habit). *Convolvulaceae*. MOONFLOWER. Twinning perennial herbs with large night-blooming flowers.

Flowers white or purple, fragrant, showy; sepals 5, the outer ones with horn-like tips, corolla salverform, the limb more or less flat, the tube very long and not dilated at the throat; stamens 5, exserted; style capitate and obscurely 2-lobed, ovules 4: lvs. broad, alternate.—Three species in Trop. Amer., two of which are widely cult. By some, the genus is united with *Ipomoea*, but it is well distinguished by the salverform rather than funnelliform or bell-shaped corolla, by the exserted stamens and style, and by the night-blooming habit.

aculeatum, House (*C. speciosum*, Choisy. *Ipomoea Bona-nox*, Linn.). MOONFLOWER. Fig. 750. St. 10-20 ft. high, with milky juice. lvs. 3-8 in long, cordate to hastate, angular or 3-lobed, acute, glabrous; peduncles 2-6 in. long, 1-7-fld, equaling the petioles; corolla 3-6 in. long, 3-6 in. wide, trumpet-shaped, white, sometimes with greenish plaits; fls. fragrant, usually closing in the morning, sometimes remaining open till noon. Aug., Sept. B.M. 752. B.R. 11:889, 917 (as *Ipomoea latiflora*). Gn. 21, p. 259; 27, p. 473. V. 10:359. Known in gardens chiefly as *Ipomoea Bona-nox* var. *grandiflora*, Hort. (*I. grandiflora*, Roxbg. and Hort., not Lam.), which does not differ materially from the type. Most of the large-fld. and very fragrant forms in cult. may be referred here. Var. *grandiflora*, Hort., is sold under the following names: *Ipomoea Chlidias*,

750. Moonflower—*Calonyction aculeatum*. ($\times \frac{1}{2}$)

I. noctiphylon, *I. noctiflora*, *I. mexicana grandiflora*, *I. mexicana grandiflora alba*, *I. mexicana grandiflora vera*. These trade names represent strains of varying excellence. (*C. grandiflorum*, Choisy, is *Ipomoea Tuba*.) A form with variegated lvs. is offered. Var. *heterophyllum*, has lvs. 3-5-lobed and subhastate.—The moonflower is most popular as a garden plant, but it also does well trained along the roof of a low house or against a pillar. It is excellent for cut-fls. in the evening. Little grown in the open N. because it does not mature in the short seasons. It grows wild in swamps and thickets in peninsular Fla., and is probably indigenous there. Widespread in tropics of both hemispheres.

muricatum, G. Don. (*Convolvulus muricatus*, Linn. *Ipomoea muricata*, Jacq. *Calonyction speciosum* var. *muricatum*, Choisy). Fls. purple, smaller than those of *C. speciosum*, the tube very slender and the expanded part of the tubenot over 3 in. broad.—Tropical regions; extensively cult. in Japan and India, and often seen in American conservatories

C. fastense, House (*Ipomoea fastense*, Brandegee), is the third species of *Calonyction*. It is native to Lower Calif., and not in cult. *C. grandiflorum*, Choisy, = *Ipomoea Tuba*. L. H. B.

CALOPHACA (Greek, *kalos*, beautiful, and *phaka*, lentil). *Leguminosae*. Ornamental plants cultivated chiefly for their bright yellow flowers appearing in summer

Deciduous shrubs or herbs, with alternate, odd-pinnate, pubescent, and often glandular lvs.: stipules scarious or herabaceous, adnate to the petiole; fls. papilionaceous, solitary or in racemes; calyx tubular with 5 nearly equal teeth; standard upright; wings oblong, free, as long as keel; ovary sessile with many ovules; pod pubescent and glandular, cylindrical.—About 10 species from S. Russia to E. India.

The two cultivated species are low, prostrate shrubs, with grayish green foliage, and rather large yellow flowers in erect axillary racemes, followed by decorative reddish pods. They prefer a well-drained soil and sunny position, and are well adapted for borders of shrubberies and sandy or rocky slopes. Propagated by seeds sown in spring; the young seedlings should have plenty of light and air, as they are very liable to damp-off if kept too moist and shady. Sometimes grafted high on *Carragana* or *Laburnum*, forming a very attractive small standard tree with pendulous branches.

volgarica, Fisch. Fig 751. Two to 3 ft.: pubescent and glandular lfts 11-17, roundish-ovate or oval, $\frac{1}{2}$ - $\frac{3}{4}$ in. long; racemes long-peduncled, with 4-7 fls.; corolla over $\frac{3}{4}$ in. long. June, July. S. Russia, Turkey-

751.
Calophaca
volgarica.
($\times 2$)

tan. *C. grandiflora*, Regel, is similar, but lfts. 17-25; racemes 10-16-fld.; corolla 1 in. long. S. Russia. Gt. 35:1231.

ALFRED REHDER.

CALOPHYLLUM (Greek, *beautiful-leaved*). *Guttiferaceae*. Woody plants of the Old World and American tropics, with shining leathery leaves, sometimes planted South.

Leaves parallel-veined at right angles to the midrib; fls. polygamous in many axillary or terminal clusters; sepals and petals 4-12, in 2-3 series; stamens very numerous. fr. a drupe with a single erect seed—Sixty species. Closely related to *Garcinia*, which, however, has only 4-8 sepals.

In India, several species are of considerable economic importance, especially *C. tonophyllum*, which is the source of a gum, and the seeds of which contain the well-known domba oil used extensively for lighting purposes. They must be grown in a warmhouse and in a rich well-aerated soil.

Calaba, Jacq. **CALABA TREE**. A tree, to 60 ft.: lvs. variable, dark glossy green, 3-10 in long; fls. in axillary racemes, white, rarely produced in cult, the petals about 3 lines long; fr. about 1 in. diam. W. Indies, perhaps intro. from the Old World. Timber and oil

inophyllum, Linn. A medium-sized tree, with gray smooth bark; lvs. 4-8 in long, 3-4 in wide, shining on both surfaces; racemes in the upper axils, the fls. about $\frac{3}{4}$ in. diam. and pure white; inner sepals petal-like; fr. about 1 in. diam, yellow, smooth, almost fleshy. Trop. Asia. N. TAYLOR.

CALOPOGON (Greek, *beautiful beard*, in allusion to the fringed or bearded lip). *Orchidaceae*. A very attractive native orchid, sometimes planted in bog-gardens and rock-gardens.

Flowers magenta-cinnamon, varying to white, in a loose raceme on a naked scape, sepals and petals all distinct and spreading, the lip narrow at base but broader and hairy above, column winged at summit, not attached to other parts; pollinia 2 in each anther cell—One species, in bogs and moist meadows, Newfoundland to Fla. and westward. *Cathea* is an older name, but, because of its general acceptance, *Calopogon* is retained in the "nomina conservanda" of the Vienna code.

A moist and shaded position and very porous soil are most suitable for this pretty plant, although it may do admirably in a rock-garden only slightly shaded at midday. If the plants are watered very freely every day during hot or dry weather. Propagated by offsets, separated from the old tubers, but the old established plants should not be disturbed very often. Collected clumps of many native orchids are offered at very reasonable figures, and these give immediate results, while the small offsets would not be strong enough to flower for several years, and require much attention during the first year, or perhaps longer (J. B. Keller)

pulchellus, R. Br. (*Lumodorum tuberosum*, Linn. in part). Height 12-18 in, from a solid bulb or corn, bearing a single grass-like lf. at the base; scape 2-12-fld.; lip bearded with white, yellow, and purple club-shaped hairs; pretty. G.F. 10:505. J.H. III. 35:45. B.M. 116. L. H. B.†

CALOSCÓRDUM: *Nothoscordum*.

CALOTHAMNUS (Greek, *beautiful bush*). *Myrtaceae*. Australian shrubs (more than twenty species) somewhat similar to *Callistemon* but more graceful in habit; evergreen greenhouse subjects, and hardy out-of-doors in California.

Leaves long, alternate; fls. showy, usually red, in lateral clusters; stamens united in bundles opposite the petals; anthers erect, attached by the base, oblong or linear; cells parallel, turned inwards, opening by longitudinal slits. For cult., see *Callistemon*.

quadrifidus, R. Br. Height 2-4 ft.: lvs. narrow, terete or slightly flattened, heath-like, glandular-dotted: fls. rich crimson, 4-merous; calyx 2-lobed in fr.; staminal bundles nearly equal, of 15-20 or more filaments. W. Austral. B. M. 1506.

C. rapistris, Schau. Evergreen shrub, the branches densely covered with needle-like small lvs. fls. in small clusters on previous year's growth, stamens with crimson filaments and yellow anthers. B. M. 7906.

J. BURTT DAVY.

CALOTROPIS (from Greek words referring to the beauty of parts of the flower). *Asclepiadaceæ*. Milkweed-like shrubs, or small trees, grown in the American tropics and one species offered in southern California.

Branching, glabrous or tomentose-canescens: lvs. opposite, subsessile, broad, fls. with 5-parted calyx glandular inside, corolla bell-shaped or somewhat rotate, 5-parted with broad lobes; crown of 5 narrow fleshy sepals adnate to the staminal tube and free and recurved at the base; pollinia solitary in each cell, obovate-oblong and compressed, hanging from the apex fr. short horned gibbous acuminate pods mostly in pairs, seeds with silky hairs.—Three species in Trop. Asia and Afr., sometimes grown under glass in collections but in this country practically confined to the tropics. The bark of *C. gigantea* produces a strong fiber, and the acrid milky juice dries into a substance like gutta-percha. The silk on the seeds is used in fabrics by natives, that of *C. procera* is said to be exported from the Cape Verde Is. as kapok (kapok is usually from the cotton or silk-cotton tree).

gigantea, R. Br (*Asclepias gigantea*, Willd.). GIANT MILKWEED. Tree-like, 8-15 ft., with pale bark and woolly shoots. lvs. obovate to broad wedge-shaped, entire, woolly beneath fls. rose and purple, in simple or compound umbels with involucre scales, the corolla-segments bent downwards and twisted with age; fr. 3-4 in. long; seeds broadly ovate. B. R. 58. India, and planted or escaped in W. Indies.

procera, Dry (*Asclepias procera*, Ait.) Shrub or bush, to 15 ft. lvs. more oblong and acute than those of *C. gigantea*, grayish: fls. white and purple in long-peduncled cottony umbels; corolla-lobes erect: fr. 4-5 in. long, recurved; seeds ovoid. B. R. 1792. India.—Offered in S. Calif., and said to be known in Porto Rico as Algodon de seda.

L. H. B.

CALPURNIA (after Calpurnius, an imitator of Virgil, because these plants are allied to Virginia) *Leguminosæ*. Trees and shrubs from tropical and southern Africa, cultivated out-of-doors in southern California and other subtropical regions.

Leaves odd-pinnate with numerous lfts.: racemes long, axillary and terminal, the peduncles often paniculate, giving rise to a splendid showy inf.; fls. yellow, the calyx bell-shaped; petals pea-like; pods membranous-winged on one side, often flattish.—Ten species.

syriatica, Mey. Shrub, 6-10 ft. high: lvs. 2-6 in. long; lfts. in 3-10 pairs, membranous, obovate-elliptical, retuse or obtuse: fls. $\frac{1}{2}$ in. long; ovary glabrous. Caffraria.—Also rarely cult. N. as a greenhouse shrub.

lasiogyne, Mey. (*C. alicia*, Benth.). A taller shrub, very rarely tree-like, with larger evergreen lvs., more coriaceous, more pubescent, and exactly elliptical or oblong lfts: fls. racemose, much like Laburnum, appearing in winter, as do the fls. of most S. African plants. The silky ovary at once distinguishes it. Natal.

N. TAYLOR.†

CÁLTHA (Latin name of the marigold). *Ranunculaceæ*. Beautiful hardy blooming marsh plants, the largest and best of which are used about water-gardens and moist parts of borders.

Succulent perennial herbs, glabrous, with a fascicle of strong, fibrous roots: lvs. simple, rather rounded-cordate at base: fls. yellow, white or pink; sepals large,

deciduous, petal-like; petals none; stamens numerous: carpels sessile, becoming follicles, with 2 rows of seeds.—About 10 species of temperate and frigid regions. Monogr. by G. Beck, in Kaiserlich-Königliche Zool. Bot. Gesellschaft (Vienna, 1886), 36:347-363; E. Huth, Monogr. in Helios 9:60-74.

Calthas flourish best in wet places near running water. Though naturally bog-plants, they succeed admirably well in an ordinary border in rather rich soil. They should be introduced more liberally into the flower-garden, where they bloom very freely year after year, and usually mature a second quite abundant crop of bloom in the fall. The flowers last a long time in water, and sell readily in the cut-flower market.

The propagation is naturally accomplished by roots and by seed. The roots divide easily and several of the species send out rootstalks. The divisions may be made best in late fall or mild winter weather. If seeds are used, they must be fresh and given a moist, cool place in partial shade.

biflora, DC. No true st.: scape slender, usually 2-fld.: lvs. as in *C. palustris*: sepals 6-9, nearly white or sometimes bluish: follicles at maturity distinctly stalked. Spring. Calif. to Alaska.

leptosépala, DC. Stout scape, 8-12 in. lvs. all basal or barely 1 on st.; nerves at base nearly parallel, otherwise like those of *C. biflora*: sepals 7-10, oblong, becoming narrower, white; fls. solitary: follicles scarcely stalked. May, June. Alaska to Wash. and Colo. Gn. 30.340.

palustris, Linn. MARSH MARIGOLD. St. hollow, 1-2 ft., branching, several-fld. lvs. cordate or reniform, dentate, crenate or entire fls. bright yellow, 1-2 in. broad; sepals 5 or 6, rarely 7: follicles compressed, $\frac{1}{2}$ in. long. Apr.-June. Wet ground. Carolinas to Canada and westward. (t 47, p 630. Gn. 59, p 166.—Used before flowering in the spring as "cow-slip greens.") Var **monstrósa-pléno**, Hort (var. *flóre-pléno*, Hort.) An improvement on the above: fls. larger, of greater substance, and often much doubled. Very beautiful. Var. **Tjermanni**, Hort. A dwarf form with golden fls. G. M. 52:415.

polypétala, Hochst. Two ft. high: lvs. 10-12 in. across: fls. 3 in. across. Caucasus and Asia Minor.—The plant spreads rapidly by stolons and may thus be easily prop. Gn. 69, p 269.

C. elata, Duthie. Fls. smaller than in *C. palustris*, golden yellow with orange-colored filaments and black anthers. Himalaya. Gn. W. 21 696, desc.

K. C. DAVIS.

CALTROPS: *Trapa*

CALVÔA (apparently a personal name). *Melastomaceæ*. A half-dozen or more herbs and shrubs in Trop. Afr., often succulent, with terete or 4-angled branches, enlarged nodes, long-petioled ovate 3-5-nerved lvs., and red, rose or violet fls. in scorpioid cymes. None of them is likely to be in commerce for cult., although *C. orientalis*, Taub., is known in botanic gardens. It is a small shrub with 4-angled stls. producing aerial roots: lvs. nearly ovate, shining green and veined red at the base, the petioles red: fls. red, becoming violet, less than $\frac{1}{4}$ in. across.

CALYCANTHUS (*Kalyx* and *anthos*, flower; the calyx is large and conspicuous). Syn *Bulbœria*. *Calycanthaceæ*. CAROLINA ALLSPICE. SWEET-SCENTED SHRUB. Ornamental shrubs, cultivated chiefly for their fragrant flowers.

Winter-buds small, without bud-scales, hidden by the base of petiole before the lvs. fall: lvs. opposite, petioled, entire: fls. with numerous imbricate sepals and no distinct petals; stamens many, short with imbricate anthers, pistils many, inclosed in a hollow receptacle: fr. caps. like, formed like the rose-hip by the calyx-tube and containing numerous achenes.—Four species in N. Amer.

These are deciduous shrubs of aromatic fragrance, with opposite rather large leaves usually rough above and brown or brownish usually fragrant flowers, terminal on leafy branchlets followed by a large capsule-like dry fruit. Except *C. occidentalis*, the species are hardy or nearly hardy North. They grow in almost

752. *Calycanthus floridus*.

any well-drained and somewhat rich soil, and succeed as well in shady as in sunny positions. Propagated by seeds sown in spring; also increased by layers put down in summer, and by suckers or division of older plants

A. Lvs. densely pubescent beneath.

floridus, Linn. Fig. 752. Three to 6 ft. lvs oval or broad-ovate, acuminate, dark green above, pale or grayish green beneath, $1\frac{1}{2}$ –3 in long fls dark reddish brown, fragrant, about 2 in broad Va to Fla. B. M. 503 Gn 21, p 184, 33, p. 392—This species is much cult for its very fragrant fls and is the hardiest of all. Var **ovatus**, Lav (*C. ovatus*, Ait.). Lvs ovate to ovate-oblong, rounded or subcordate at the base. L.I. 24.

AA. Lvs. glabrous beneath or nearly so; fls. slightly or not fragrant.

fertilis, Walt. (*C. feras*, Michx. *C. laevigatus*, Willd. *C. nana*, Lousel.). Three to 6 ft: lvs usually elliptic or oblong, acute or acuminate, green beneath, 2–5½ in. long fls reddish brown, $1\frac{1}{2}$ in broad; anthers oblong; fr. ovoid, contracted at the mouth as in the preceding species. Alleghany, from Ga to N. C. and Ala. B.R. 6:481—Roots, lvs and bark used for their antiperiodic properties. Fr. said to be poisonous to sheep. Var. **glauca**, Schneid (*C. glauca*, Willd.) Fig 753. Lvs usually ovate or oblong-ovate, acuminate, glaucous beneath; fls paler B.R. 5:404. Var **oblongifolius**, Nutt., with oblong-lanceolate lvs glaucous beneath.

occidentalis, Hook. & Arn. (*C. macrophyllus*, Hort.). To 12 ft. lvs. usually rounded at the base, ovate or oblong-ovate, green beneath and sometimes slightly pubescent, 4–6 in. long; fls light brown, 3 in. broad; anthers linear; fr. campanulate, not contracted at the mouth. Calif. B. M. 4808. F.S. 11:1113. R.H. 1854: 341. Gn 33, p. 392.

C. Mohri, Small. Shrub, 2–6 ft.: lvs. ovate to oblong-ovate at the base, rounded to subcordate or broadly cuneate, densely pubescent beneath, 2–7 in long fls. purple, fragrant, more than 2 in. across Tenn. and Ala. Little-known species, very similar to *C. floridus* var *ovatus*, but the fr. campanulate and not contracted at the mouth. It has proved hardy at the Arnold Arboretum—*C. praecox*, Linn.—*Morata praecox*.

ALFRED REHDER.

CALYCOCARPUM (Greek, *cup-fruit*, alluding to the stone). *Menispermaceae*. A tall-climbing vine. genus monotypic. *C. Lyonii*, Nutt., in rich woods, Ky. to Kans and south: woody twiner; lvs large and broad, simple, deeply palmately 3–5-lobed, the lobes pointed; fls. small, greenish, in long racemose panicles, in May and June: fr. a globular drupe, the stone or pit hollowed out on one side, ripe in Aug.

CALYCOTOME (*Kalyc*, and *tome*, a section or cut; calyx looks as if cut off). *Leguminosae*. Ornamental shrubs chiefly grown for their profusely produced yellow flowers, also used for low hedges.

Leaves 3-foliate, without stipules fls papilionaceous; calyx turbinate, truncate, colored; standard upright; keel obtuse, curved, shorter than standard; stamens 10 with the filaments connate; ovary sessile, many-ovuled; pod linear-oblong, along the upper suture winged or strongly thickened, 2-valved—Five species in the Medit. region.

Calycotomes are low spiny shrubs with small 3-foliate deciduous leaves and fascicled or solitary yellow papilionaceous flowers. Hardly only in warmer temperate regions. They prefer a sunny position and well-drained soil. For propagation, see *Cytisus*.

villösa, Link. Two to 4 ft: branchlets grayish tomentose lfts obovate to oblong-obovate, densely silky beneath, under $\frac{1}{2}$ in long fls $\frac{1}{2}$ in long, 3 or more, fascicled; pod villous. May, June—It is excellent for dense low hedges.

spindosa, Link. Closely allied, but somewhat larger in every part, and with glabrous branchlets and pods; fls. solitary or few. B.R. 32:55. ALFRED REHDER.

CALÝPSO (from the Greek goddess, whose name signifies concealment, referring to its rarity and beauty). *Orchidaceae*. One of the rarest and most prized native orchids.

A delicate bog-plant, 3–4 in. high, with a small bulb, 1 roundish or ovate striated lf., and 1 pink fl. with a spotted sac. For culture, see *Calopogon*, but more difficult to grow than that plant. A monotypic genus.

bulbosa, Oakes. Fig. 754. Lf. an inch wide and long; scape 3–4 in. high, with about 3 sheaths; sepals and petals similar, ascending, linear-ovate, acuminate, pink; lip larger than the rest of the fl., with brown spots in lines and purple and yellow markings, woolly-hairy

753. *Calycanthus fertilis* var *glauca*. ($\times \frac{1}{2}$)

within; column petal-like, ovate, bearing the lid-like anther just below the apex. Maine to Minn. and N.; also Eu. Abundant in parts of Ore. and Wash. B.M. 2783. G.C. II. 16:656.

CALYPTRÓGYNE (from *calyptra*, hidden, and *gyne*, woman, in allusion to the half-hidden gynœceum). *Palma*ceæ, tribe *Geonomæ*. Short, almost completely stemless and unarmed palms with unequally pinnate terminal leaves.

Stems frequently stoloniferous, when present, ringed below. lvs. numerous, often with the pinnate segms joined together, in extreme youth 4-parted instead of bi-partite as in most related genera, lfts somewhat irregularly disposed on the rachis, broadly or narrowly scythe-shaped, running at the tip to an abrupt point, at the base revolute, petiole very short or practically none. spadix simple or sometimes branched at the base, long-stalked, spathe 2, fls. a little unequal, with 3 sepals, 3 petals and 6 stamens, the style half immersed in the spadix fr oblong or obovovl, 1-seeded.—About 4 species, all from Trop N Amer. From *Geonoma*, a near relative and horticulturally a much more important genus, *Calyptrogyne* is distinguished only by the almost stemless habit, and the purely technical character of having prominently arrow-shaped anthers. In *Geonoma* the anthers are pendulous, but not sagittate.

*Calyptrogyne*s are hard-ome palms, seldom seen outside of large collections. Special care must be given to the soil so that it will be sweet and porous, especially after the plants leave the seed-pan. Well-drained pots and a little chemical mixed with the soil, and the plants kept in a uniformly moist state, are conditions essential to the healthy growth of the plants. In this genus, *C. Ghiesbreghtiana* is the most widely known species, another garden name for which is *Geonoma Verschaffeltii*. These are shade-loving palms, having leaves of comparatively thin texture, and consequently are subject to attacks of red spider unless properly cared for in regard to moisture. *Calyptrogyne*s are most useful in a small state, old plants in general being rather leggy and poorly furnished. (G. W. Oliver and W. H. Taphin.)

754. *Calypso borealis*.

glauca, H. Wendl. (*Geonoma glauca*, Oerst.) Practically stemless: lvs 4-5 ft long, the sheathing petiole brownish, about 1 ft long; lfts numerous, about 2-3 in. apart, with 4 principal nerves, and scarcely any secondary ones: spadix simple, differing from the following species in which the spadix is often branched, 2-3 ft. long, the pistillate fls half hidden in tiny pits. Cent. Amer. G.C. III. 30 179.—Not a common species, but young plants are specially attractive.

Ghiesbreghtiana, H. Wendl. (*Geonoma Ghiesbreghtiana*, Lindl. & H. Wendl. *G. magnifica* and *G. Verschaffeltii*, Hort.) St short or almost none: petiole 5 ft long: lvs elongate-oval; segms in 6 pairs, unequal, almost opposite, rather remote, lanceolate, very long-acuminate, falcate, the 2 uppermost on each side very wide. spadix often branched below, the fls half hidden in tiny pits. Chiapas, Mex B.M. 5782.

755. *Camarotis rostrata*.

C. variegatensis, H. Wendl. St short lvs 6 ft long Costa Rica. G.C. III. 29 217, desc.—*C. speciosa*, H. Wendl. St evident lvs, irregularly pinnate, 3 ft or less long, the stalks flat on upper side. Guatemala.—*C. Swartzii*, Hort., is a *Geonoma* N. TAYLOR.

CALYPTROSTIGMA. *Diervilla Muddendorffiana*.

CALYSTEGIA. *Convolvulus*

CAMARÔTIS (a vault, in reference to the cavity in the apex of the lip) *Orchidaceæ*. Epiphytic hothouse orchids.

Stems elongated, with short lvs., and many-fld. racemes sepals and petals similar, spreading, lip spurred, 3-lobed, rostellum and anther beaked, pollinia 2, upon long thin stipes.—Species 2, in E India.

rostrata, Reichb. (*C. purpurea*, Lindl. *Sarcophyllum purpureum*, Benth.) Fig 755 Sts 2-3 ft long, climbing lvs oblong-linear, bihd at apex, 3-4 in long; racemes longer than lvs; fls. crowded, about 1 in. diam, rose-purple, the lip somewhat darker. India. P.M. 7:25.—A scarce plant, now offered in American lists. Free-growing plant with aerial roots similar to some epidendrums. The treatment accorded to the vandas and saccolabiums with similar roots will suit the *camarotiss*.

GEORGE V. NASH.

CAMÁSSIA (*Quamash* or *Camass* is the Indian name). Sometimes written *Quamasa*. *Liliacæ*. CAMASS. West American spring-flowering bulbs.

Leaves all radical, long-lance-shaped, sheathing, from a true bulb that is pointed and with a rounded rather flattened base: sts. erect, 2-3 ft., bearing many bracted blossoms that open from the bottom of the raceme upward, in long succession. fls. blue, purple, white or cream, with 6 spreading 3-7-nerved segms.,

6 thread-like filaments, filiform style, and 3-angled, 3-valved, several-seeded caps.—Five or 6 species in the temperate regions of W. N. Amer. from Cent. Calif. to Brit. Col. and east to Texas and Ark. They have resemblances to *Scilla*, but are much handsomer. The bulbs produce no offsets unless wounded. All the

756. *Camassia Cusickii*. (fls. $\times \frac{1}{2}$)

species vary greatly in width of lvs, size and number of fls., so that definite figures mean little. The large bulb and broad bluish lvs of *C. Cusickii*, the heavy st., regular fls., and twisted old segms. of *C. Leichlinii*, the irregular fl. and drooping segms. of *C. Quamash*, and the time of flowering of *C. Howellii*, are good general characters to distinguish them.

Camassias are natives of rich meadows, very wet in winter and spring but dry in summer. Water often stands on the surface at flowering time. While the very best success can perhaps be attained by giving them a rather heavy soil with abundant moisture in the early season, they are most amenable to cultivation and thrive in any loam (only avoiding too rank manures), and they are perfectly hardy. They have been thoroughly tested throughout the region from Illinois east. Plant in early fall, from 3 to 4 inches apart and 3 to 6 inches deep, and do not disturb thereafter. As cut-flowers, they are excellent as they open in long succession. Seeds grow readily, but from three to four years are required to make flowering plants.

Cusickii, Wats. Fig 756. Bulbs very large (weighing 4-8 ozs.). lvs. numerous, broad, glaucous, somewhat undulate (15 in. long by $1\frac{1}{2}$ in. wide); st. often 3 ft. high; fls. 30-100, very pale delicately blue; segms. spreading, crinkled at base, faintly 3-5-nerved. Ore. G.F. 1:174 (adapted in Fig. 756)—The very large bulb and broader and more numerous lvs. easily distinguish this species. Very easily grown.

Quamash, Greene (*C. esculenta*, Lindl.). **COMMON CAMASSA**. Fig. 757. This species varies greatly; some forms are low and slender, others 2-3 ft. high, stout and many-flid; it can be distinguished by the irregular perianth in which 5 segms. are more or less on one side and 1 on the other; lvs $\frac{3}{4}$ in. broad or less. fls. 10-40, varying from almost white to intense ultramarine in the varieties; segms. 3-5-nerved and a little longer than the stamens, narrow and channeled at the base; pedicels not exceeding the fls.; caps. ovate-oblong, obtuse, transversely veined. Calif. to Utah and north to Brit. Col. B.R. 1486. F.S. 3 275. Gn. 46 338 and p. 339—Bulb cooked and eaten by the Indians. The fls. vary to white. The large ultramarine form is the one in the trade. The withered segments fall down about the pedicel irregularly.

Leichtlinii, Wats. Stout, often 3 ft. or even more in height; fls. white, cream-colored, blue or purple, nearly regular; stamens and style ascending; segms. broad and flattened at the base, usually 5-7-nerved; caps. oblong-ovate, emarginate, obliquely veined. The withered segms. of the perianth twist about the caps like bonbons; this is an infallible distinctive mark of the species. *C. Leichtlinii* is not common, but is distributed from Mendocino Co., Calif., to Brit. Col. B.M. 8287 (as *C. esculenta* var. *Leichtlinii*, Baker).—In Mendocino Co., a clear blue form grows rarely in mountain meadows. In the Umpqua Valley, Ore., the type is clear cream approaching white. In the same region and farther north, a very large deep blue or purple form is found, while in Brit. Col., the cream-colored form again appears but is rare. At their best, the sts. are stiff and heavy, the fls. large and many, and the masses of bloom approach the *Eremurus* in beauty and are even finer in separate fls. *C. Leichtlinii* is the finest of all camassias. Several color forms are described, as var. *atrorubra*, deep purple, and others.

Howellii, Wats. Bulb rather small lvs few, 1 ft. long and less than $\frac{1}{2}$ in. wide. st. often 2 ft. high, many-flid, with spreading pedicels twice or more the length of the linear bracts fls. pale purple, opening in the afternoon, the segms. $\frac{1}{2}$ in. long, 3-5-nerved; pedicels longer than the fls. caps. small, broadly ovate and very obtuse. S. Ore. Intro by Pilkington & Co., 1892.

esculenta, Robins. (*C. Fraseri*, Torr.). Scap. 12-18 in. high lvs keeled fls. light blue, smaller than in *C. Quamash*; segms. 3-nerved; pedicels mostly longer than fls. Pa., west and south. B.M. 1574 (as *Scilla esculenta*).

Var. angusta (*C. angusta*, Hort.). Very slender, and lvs narrower ($\frac{1}{4}$ in. wide); fls. smaller, $\frac{1}{4}$ or $\frac{1}{2}$ in. long. La. and Ark. to Texas. CARL PURDY.

757. *Camassia Quamash*. ($\times \frac{1}{2}$)

CAMELLIA (after George Joseph Kamel or Camellus, a Moravian Jesuit, who traveled in Asia in the seventeenth century). *Ternstroemiaceae*. **CAMELLIA** Woody plants, chiefly grown for their showy white or red flowers and also for their handsome evergreen foliage.

Evergreen trees or shrubs with alternate short-petioled serrate lvs. and large terminal or axillary white or red fls. followed by subglobose woody caps: fls. sessile, upright; sepals many, imbricate, deciduous; petals 5 or more; stamens numerous, more or less connate; ovary 3-5-celled, with slender styles connate, at least be-

758. *Camellia japonica*—*Abby Wilder*.

759. *Camellia japonica*—*Lucida*.

low: fr. a dehiscent caps., with few large subglobose seeds—About 10 species in tropical and subtropical Asia. Often united with *Thea*, which differs in its nodding and stalked fls with a persistent calyx consisting of 5 nearly equal sepals. There is a monograph of this genus by Seemann in *Trans Linn Soc* 22:337-352 (1859) and by Koehrs in *Engler Bot. Jahrb.* 27:577-634 (1900). Illustrated monographs of the horticultural varieties are Curtis, *Monogr. of the genus Camellia* (1819); Baumann, *Hollweiler Camelliensammlung* (1828); Chandler, *Camelliae* (1831); Berlèse, *Monogr. du genre Camellia* a (1839); Verschaffel, *Nouvelle Monographie du Camellia* (1848-1860) the last with 576 and the previous one with 300 colored plates.

Camellias grow like natives on sandy lands and even on high pine land in central Florida, but they flower best in half-shady somewhat moist places. The half-double varieties of *Camellia japonica* do best, while the very double kinds often drop their buds entirely. The flowers suffer very much from the sun and cannot be grown much farther south than central Florida. *Camellia Sasanqua*, single, half-double and double kinds, grow much more satisfactorily than the varieties of *C. japonica*. They begin to flower late in October and early November, and the double white *C. Sasanqua* is a mass of pure white usually at Christmas time. All the varieties of *C. Sasanqua* have somewhat fragrant flowers. *C. reticulata* does equally well in Florida. It is very distinct in foliage from the two former species which have glossy leaves, while the leaves of *C. reticulata* are dull green. All the camellias are extremely slow growers if not carefully cultivated and fertilized. A mulch of old cow-manure, now and then a little commercial fertilizer, and thorough watering during the dry season several times a week start the bushes into a vigorous and healthy growth. They are so extremely beautiful when in flower that all the care given them is well repaid. (H. Nehring.)

A. Ovary and lvs. perfectly glabrous.

japonica, Linn. (*Thea japonica*, Nois.). Figs. 758-761. Shrub or tree, sometimes to 40 ft., glabrous: lvs

very shining and dark green above, ovate or elliptic, acuminate, sharply serrate, 2-4 in. long; fls. red in the type, 3-5 in. across, petals 5-7, roundish. China, Japan. B.M. 42. S.Z. 82. F.S. 20:2121. S.I.F. 1:73. Gn. 24, p. 411: 28, p. 203, 36, p. 241. Var. **alba**, Lodd. Fls. white. L.B.C. 7 636. Gn. 54, p. 243. J.H. III. 54:227; 64:397. Var. **alba-plena**, Lodd. Fls. white, double L.B.C. 3 269. Gn. 53, p. 244. Var. **anemoniflora**, Curtis. Fls. red, with 5 large petals, the stamens changed into numerous smaller and narrow petals; the whole fl. resembling that of a double anemone. L.B.C. 537. B.M. 1654. Gn. 44, p. 329. Var. **magnoliiflora**, Hort. Fls. pale rose, semi-double, with 12-15 petals, rather narrow and half upright. Gn. 76, p. 31. Var. **apucæformis**, Rehd. (*C. apucæformis*, Jacob-Mackoy) Lvs. bifid at the apex—For the numerous other garden forms, see the above-mentioned monographs; also, *Flore des Serres*, l'illustration *Horticoles*, and other older horticultural publications contain a large number of varieties with illustrations.

AA. Ovary and lvs. on the midrib above pubescent.

reticulata, Lindl. (*Thea reticulata*, Pierre) Large shrub, glabrous: lvs. dull green, not shining above, reticulate, flat, elliptic-oblong, acuminate, serrate, 3-5 in. long; fls. 5-7 in. across, purplish rose; petals 15-20, obovate, loosely arranged. China. B.R. 13:1078. B.M. 2784. P.M. 3:101. G.M. 35: suppl. Apr. 2. F.W. 1880-321. G. 25:59. Var. **plena**, Hort. Fls. with twice as many petals, and more regularly arranged. B.M. 4976. F.S. 12: 1279-80.

760. *Camellia japonica*—*H. A. Downing*.

Sasanqua, Thunb. (*Thea Sasanqua*, Nois.). Shrub of loose, straggling habit, and with the branches pubescent when young. lvs. elliptic to oblong-ovate, bluntly pointed at the apex, crenate-

ALFRED REHDER.

CAMPOËNSIA (Louis Camoens, Portuguese poet). *Leguminosæ*. Two species of climbing shrubs from W. Trop. Afr., with digitately 3-foliate lvs. and large papilionaceous fls. Calyx top-shaped; petals with long claws, the standard orbicular or nearly so; stamens free; ovary stipitate, with many ovules, the stigma small and capitate fr. a broad-linear flattened 2-valved pod. *C. maxima*, Welw. has recently been offered by an English firm. Described by Baker as "a magnificent species" and by Bull as "one of the most gorgeously beautiful of tropical climbers." fls. obovate-oblong, 5-6 in. long, cuspidate. fls. milk-white tinged with gold and frilled on the edges of the petals, in short-stalked 6-8-fld. axillary racemes; standard projecting 4 in. beyond the calyx, 3-4 in. broad, other petals shorter and not more than 1 in. broad, pod 6-8 in. long. Trans. Linn. Soc. 25 '36. B.M. 7572. G.C. III. 20, pp. 5597.

L. H. B.

CAMPANULA (Latin, *little bell*, from the shape of the corolla in some species). *Campanulaceæ*. **BELL-FLOWER HAREBELL BLUEBELL**. A large group of attractively flowering herbs, containing some of the most popular garden plants, especially of hardy herbaceous perennials.

Annual, biennial or perennial, mostly the last, often small and tufted; root-lvs. usually larger than the st-lvs., and often of different shape and more or less transitory; fls. blue, violet or white, sometimes yellow; calyx 5-fld; corolla 5-lobed or 5-fld; stamens 5, free; filaments wide at the base, membranaceous, stigmas 3 or 5, filiform; caps 3-5-valved, dehiscent on the sides or (as in Fig 762) at the base by 3-5 small valves; seeds ovate, complanate or ovoid. — Probably 250 species, nearly all in the northern hemisphere with the center of distribution in the Medit. region, about a dozen species are N. American. The species mostly inhabit swamps or moist ground, or alpine and boreal regions. Allied genera of garden value are *Adenophora*, *Jasione*, *Lightfootia*, *Michauxia*, *Ostrowia*, *Phyteuma*, *Platycodon*, *Specularia*, *Symphyantra*, *Trachelium*, and *Wahlenbergia*, in which genera many species originally described as campanulas may be sought. Of these, perhaps the two best known cases are *Platycodon grandiflorum*, the "balloon flower," with its characteristic inflated buds, dark green, glossy, leathery lvs.; and *Specularia Perfoliata* (*C. Speculum*), "Venus' looking-glass," a pretty annual, which grows in the grain fields of S. Eu. and is cult. for its violet fls. with a white eye. The calyx-tube of *Specularia* is relatively much longer than in any campanula. The most prominent campanulas now in cult. seem to be the forms of *C. Medium*, *C. carpatica*, *C. persicifolia*, *C. pyramidalis*, *C. punctata*, *C. pusilla* (*æspiosa*), *C. rotundifolia*.

Botanically, campanulas fall into two important groups, based on the presence or absence of calyx appendages. The subgenus *Medium* has the appendages, and *Eucodon* lacks them. These appendages are often small and disguised. The genus may also be

762. Capsule of Campanula with basal dehiscence.

thrown into two broad groups based on the dehiscence, —the subgenus *Medium* with capsule opening near the base, and *Rapuncululus* with the openings near the top. For the horticulturist, the most serviceable classification is based on the use that he makes of the plants, —whether as a garden vegetable, as border plants, or as rock-garden or alpine subjects, and this is the division attempted here. In cultivation, campanulas tend to become taller and more robust, less hairy, more branched, and more floriferous. Blue is the prevailing color in the genus. A very few have white or yellowish flowers, with no blue or violet tints. Any blue or violet-flowered form is likely to have white varieties, and double and semi-double forms are common in three or four of the most popular species. All flowers tend to become larger and more numerous on a stem. In cultivation, the three-celled species are likely to have five stigmas instead of three, and five-celled capsules, often along with normally constructed flowers on the same plant. The height is the most variable feature of all, and in the scheme below *C. carpatica*, *C. punctata* and forms of *C. glomerata* especially will seem wrongly placed to many. But the characters used by botanists are well-nigh useless to the gardener, and nothing but a distinction of height can bring out the two important cultural groups of campanulas. For a recent garden monography of dwarf campanulas, see Corneval, "The Garden," '59 (1901) pp. 276, 450, 60, pp. 51, 64, 111, 161, 218.

Cultivation. —The genus *Campanula* is extraordinarily rich in flowering garden plants of merit. The alpine section is distinguished by a charming grace both in character of growth and size and bearing of flowers. The peach-leaved class (*C. persicifolia*) is characterized by the noble and beautiful form of single and semi-double blossoms carried by thin erect stems 2-3 feet high. The luster and clearness of tints of the bushy biennial *Medium* and calycanthera type are remarkable, while the rambling habit and the marvelous floriferousness of the varieties *C. isophylla* and its descendant *C. Mayi*, indicate the wide range of ornamental usefulness of bellflowers. Considering the good lasting qualities in a cut state and the great popularity of the flowers of long-stemmed sorts for indoor decoration, it is safe to say that campanulas will steadily gain in importance as material upon the florists' counter as well as for garden planting. The greatest curiosities are *C. punctata*, *C. macrostyla*, *C. Zoysii* and *C. rotundifolia* var. *soldanellaeflora*. For exhibition and for pot culture and also for large single specimens, *C. pyramidalis* is most used. For edgings, *C. carpatica* is perhaps the favorite. Of all wild forms, the best known is certainly *C. rotundifolia*, the true harebell, or "blue bells of Scotland." It is native in North America as well as in Europe, on rocky banks and shores. —Wherever rock-gardens are planned, alpine campanulas have become indispensable. The greater part of typical mountain inhabitants chiefly available for this purpose being spring-flowering plants, the summer flowers of campanulas are especially welcome. One of the best bellflowers for rock-gardens is *C. carpatica*, blue and white, with its var. *compacta* also in blue and white, var. *caelestina*, sky blue, var. *pelyiformis*, light blue, and var. *Riversley* with large dark-blue bells; but there are a number of other very handsome species possessing commercial value that deserve the attention of progressive growers. The demand is for a plant material easy to handle, resistant and free-flowering. As such may be recommended for rockeries, *C. garganica* and *C. garganica* var. *hirsuta*, both 4 inches high, flowers light blue. *C. pusilla*, in white and blue, is regarded as the hardest low-growing alpine bellflower. Excellent effect may be secured from a number of the garden hybrids, when rightly employed; plantations of *C. Wilsoni*, cross between *C. pusilla* and *C. turbinata*, dark blue, 6 inches tall, and *C. Fergusoni* and *C. Hem-*

derosum, 12 to 18 inches, all blooming freely from late in June to early August, are good examples. *Campanula glomerata* var. *acaulis*, a clustered-flowering low-growing form, violet-blue, June and July, answers the same purpose, while *C. glomerata* var. *dahurica*, 12 to 18 inches, dark violet-blue and white, very free-flowering, is valuable also as a border plant. Other good rocky kinds are *C. fragilis* (which needs protection, but makes a good pot-plant), *C. pulla* in sheltered position, *C. Portenschlagiana*, and *C. rotundifolia*. Many of the larger-growing kinds are also good for the rock-garden.

The best two representatives of the biennial class, are *C. Medium* and *C. calyculthema*, both standard garden flowers. In the northern states, especially, they do exceedingly well. When used for mass effects, their full bloom becomes a prominent feature of June. The delicate shades of pink and pale lavender, the purity of the white, and the rich tints in purple and blue are a revelation. They transplant very easily, even in an advanced state of growth, and readily respond to mild forcing under glass in spring. In a cut state, they show remarkably good lasting qualities and are of excellent value as material for filling vases. A few other good biennials are *C. sibirica*, *C. primulefolia*, *C. spicata*, (p. 650), *C. thyrsoidea*.—The peach-leaved section comprises the most perfect forms of the bellflower family, although *C. persicifolia* has been surpassed in popular favor by the more vigorous *C. grandiflora* varieties in white and blue, which are really platycodons. *C. isophylla*, native of Italy, is not hardy in Maine and must be overwintered under glass. It is a very effective basket- and balcony-box plant, its long hanging vines being covered with large and attractive flowers in July and August. The color is a delicate light blue, while the bells of its garden descendant *C. Mayu*, have a deeper shade. For the South, both are valuable acquisitions for rockeries.—Of the perennial species, according to Robert Cameron, the best border plants are the following: *C. carpatia* and vars. *alba* and *turbinata*, *C. glomerata*, especially var. *dahurica*, *C. lactiflora*, *C. latifolia*, especially its vars. *erocarpa* and *macrantha*, *C. nobilis* (about 2 ft in height), *C. persicifolia* and its numerous vars., especially the white kinds; *C. punctata* (about 1½ ft.), *C. pyramidalis*, a very showy plant when well grown, but not quite reliable in the eastern states as to hardiness, making a good pot-plant for the cool greenhouse, *C. rapunculoides*, which spreads rapidly and must be so placed that it will not crowd out the other plants that are near it; *C. rotundifolia*; *C. Trachelium*, *C. Van Houttei*, a hybrid, and one of the best bellflowers.—Campanulas are raised from seed and also by division or cuttings. Seeds should be started early under glass. Cover very shallow, and place the shallow seed-pans near the light in an average temperature of 60°. Shade at midday while in process of germinating; avoid over-watering and "sticky" atmosphere. Transplant seedlings into flats as soon as they can be handled. Harden young plants gradually and transfer them to the open ground in May. *C. Medium*, *C. calyculthema*, and all the *C. persicifolia* varieties, when grown for the cut-flower trade, should be placed on beds where they are intended to be flowered and cropped the next season. They thrive best in a rather light well-manured garden soil. Some of the alpine species require a sandy humus with additions of fine limestone material. When grown for floral garden effect, the open sunny position is preferable throughout the North, while for the South half-shade at midday is likely to prolong the flowering season. Seedlings of single varieties come true to color to a high percentage. Of the semi-double and double *C. persicifolia* sorts, propagation is usually by division in September. *C. isophylla* and *C. Mayu* are shy seeders and are propagated by cuttings in spring. For winter protection, a light covering of straw, leaves or evergreen boughs is sufficient south of New York. In more

northern parts, hardy campanulas require a uniform layer of leaves 2 to 3 inches thick. The annuals can be raised in the border by seeds sown late in April or May, or raised in the greenhouse and then transferred to the border. The best of the annuals are *C. ramossissima* and var. *alba*, *C. drabifolia*, *C. Erinus*, *C. macrostylo*, and *C. americana*. (Richard Rothe.)

C. primulefolia and *C. spicata* will be found in the supplementary list, p. 650

GROUP I. Kitchen-garden vegetable: roots radish-like: a salad plant

1 *Rapunculus*, Linn. (*Rapunculus versus*, Fourr.). RAMBON. FIG. 763. Biennial or perennial, 2-3 ft.; root spindle- or long-radish-shaped, 3 in thick, white; st. erect sulcate lower lvs. obovate, short-petioled, somewhat crenate, st. lvs. linear-lanceolate, entire fls. calyx-tube obconical, lobes lilac, in a spike or raceme; glabrous or bristly, erect, awl-shaped, a half shorter than or nearly equal to the funnel-shaped corolla. Eu. Orient, N. Asia, N. Afr.—The roots and lvs. are eaten as a salad. The seeds, which are very small, are sown in the open ground in early May either broadcast or in drills. A little sand mixed with the seed gives an even sowing. Press firmly, and water carefully. Thin out the seedlings if necessary. Water freely in hot weather. A fresh sowing may be made in June, as early-sown plants may run to seed. Roots are gathered in Oct and may be stored in sand for winter use. "Rapunculus" means a little turnip.

763. Root of rapunculus—Campanula Rapunculus.

GROUP II. Tall or border campanulas, characteristically a foot or 15 in. or more high. Nos. 2-23.

a. Calyx with an appendage at the base of each sinus.

b. Caps. 5-celled and stigmas 5 (variable in No. 3).

c. Style excessively long, the stigma an inch or more long.

2. *macrostyla*, Boss. & Heldr. Annual, 1-2 ft., branched from the base, hispid with rigid spreading scattered bristles. branches stout. lvs scattered, small for the size of the plant, sessile, bristly on both surfaces; lower ones ovate-oblong, acute; upper ovate-lanceolate, recurved, cordate, eared at the base: calyx-tube hidden by the bladderly appendages, small, broader than long; fls. solitary; on stout peduncles, 2-2½ in.

broad; corolla very broad and open, pale purple without, dull purple within, marked with violet, and hairy toward the bottom; lobes very broad, short and acute Mt. Taurus in Anatolia. Gn 15: 356 and 12, p. 209 B M 6394.

—The very long exerted style is brown and spindle-shaped before spreading open. Self-sown seeds sometimes remain a year before sprouting.

cc Style not excessively long

3 *longistyla*, Fomine Perennial, 1½-2½ ft., more or less hairy: basal lvs lance-oval, lobed, the st-lvs oblong and sessile fls blue-purple, drooping; calyx-lobes lanceolate-pointed, the appendages reflexed on the peduncle; corolla

764. *Campanula Medium*, the Canterbury Bell. Modified forms are shown.

almost urn-shaped, dilated below the middle, style exerted with 3, 4 or 5 stigmas: caps 3-5-celled Caucasus. Gn W. 23 671 Var *parviflora*, Boiss Fls smaller. R H 1911: 548, p 549

4 *Medium*, Linn (*Medium grandiflorum*, Spach). CANTEBURY BELLS Fig 764 Biennial, 1-4 ft.; plant pilose st erect: lvs sessile, ovate-lanceolate or lanceolate, crenate-dentate: raceme lax, many-flid; fls. violet-blue, varying to several shades and to white, 2 in. long; calyx-lobes ovate-acuminate, the appendages half as long as the ample ovate obtuse lobes; corolla bell-shaped, inflated S Eu. Gn. M. 14:9. Two forms (aside from the single-flid) occur the double, Fig 764a, with 1-3 extra corollas, and the var *calycanthema*, Hort., Fig 764b, with an enlarged spreading and petal-like outer part sometimes deeply divided and sometimes little lobed or nearly entire (varying on the same plant). The var. *calycanthema* is the CUP-AND-SAUCE form (the

name hose-in-hose, sometimes applied in *Campanula*, would better be retained for *Primula elatior*), a fair percentage come true from seed; usually a stronger plant than the common *C. Medium*. G C III. 24:65. R H. 1896, p 301; 1897, p 238. Gng. 5 88. Gn. 48, p. 295. F S. 19, p. 152. G.W. 3, p. 29. G.Z. 17: 113. Var *Więsanda*, Hort. Fls golden yellow: fls. blue. Var *imperialis*, Hort., is a very floriferous form or possibly a hybrid — Canterbury bells are most commonly treated as hardy biennials, the seed being sown in the open border, but they do not flower the first year. They can also be treated as tender annuals, the seed being sown indoors in early spring and the plants set out May 1-15 They will then flower well the first season, but always better the second year. Sowings may also be made in April, May or later, in pots, boxes or beds, and plants then be transferred into some sheltered place where they can be slightly protected during the winter, and then transplanted in spring to their permanent places into good rich soil, where they will make a great show if they have had the right treatment. Let them stand 18-24 in apart. Seedlings potted up in autumn may be brought into bloom readily indoors in spring, and even blooming plants, if not spent, may be potted direct from the garden and used in the house in autumn

BB Caps 3-celled, stigmas 3.

5 *alliarifolia*, Willd (*C. lamifolia*, Bieb *C. macrophylla*, Sims) Perennial, 1½-2 ft. st erect, striate, woolly, branched only at the top root-lvs large, heart-shaped, crenate, tomentose, st-lvs on petioles which gradually shorten upward, the highest being sessile: fls white, nodding, on short stalks, borne singly in the axils of the floral lvs as in *C. sarmatica*, but the floral lvs larger and broader, calyx a third or a fourth shorter than the corolla, with margins rolled back, and appendages less minute than in *C. sarmatica*, corolla always white, 2 in. long, ciliated at the margin, and with characteristic tooth-like processes at the base of each sinus. Caucasus, Asia Minor B M 912 Gn M 14 9

6 *sarmatica*, Ker-Gawl Perennial, 1-2 ft. st simple, striate, pubescent lvs remarkable for their gray color, harsh, leathery, wrinkled, tomentose, oblong-cordate, crenate, the lower long-petioled, the upper sessile calyx with minute reflexed appendages, and a short, densely hairy tuft fls about 6 on a st, nodding, corolla about 1 in long, and 1½ in across, pale blue, marked with 5 hairy lines Caucasus, in subalpine places B M 2019 L B C 6 581.

7 *Grössekili*, Heuff Has the habit and infl of *C. Trachelium*, but the calyx is appendaged, perennial, 2½ ft., branching from the base, angled, pilose. lvs. hispid, the lower cordate, unequally petioled, doubly crenate-serrate, the uppermost ovate-acute, narrowed into a petiole calyx setose-ciliate, lobes spreading, reflexed at the apex, appendages lanceolate, a third shorter than the lobes, corolla hispid, 2 or 3 times longer than the calyx-lobes: fls large, bell-shaped, violet, in a long raceme Hungary Gt 35, p 477. G. 27.459.

8 *mirabilis*, Alboff Biennial or short-lived perennial, 1 ft. or more; whole plant forms a broad dense cone with such a profusion of bloom as almost to hide the foliage lower lvs 4-6 in long, obovate or spatulate, obtuse, coarsely toothed, petiole winged: fls pale lilac, erect, broadly campanulate, 2 in. across, the corolla hairy on margins and back Caucasus. B M. 7714. G C III 24:33, 42:144-5. Gt. 47, p 192. Gn. 54, p 454; 60, p 58. G.W. 12, p. 445.—A very beautiful and remarkable plant.

AA. Calyx without an appendage at the base of each sinus.

B. Fls. rotate or wheel-shaped.

9. *americana*, Linn. Annual and biennial, 3-6 ft.; st. erect, simple: lvs. thin, serrate, somewhat pilose;

root-lvs. ovate-acute, subcordate, petiolate; st-lvs. ovate-lanceolate, acuminate at both ends; calyx-tube long, obconical, the teeth linear-acuminate, almost entire, spreading, shorter than the 5-lobed, wheel-shaped corolla; fls. light blue, 1 in. broad, in long spikes, solitary or in 3's, corolla shallow, lobes pilose outside and at the apex; style long, strongly declined and upwardly curved; caps. cylindrical, grooved. Shaded low ground Canada to Iowa, south to Fla. and Ark.—Rarely cult. It is possible that *Phyteuma canescens* is still cult. as *C. americana*.

BB Fls. saucer-shaped or broadly bell-shaped, i. e., the tube shallower and the limbs more widely spreading than the bell-shaped.

c. St-lvs. linear-lanceolate, crenulate.

10 *persicifolia*, Linn Fig 765. Perennial, 2-3 ft: st. erect lvs glabrous, rigid, crenulate, root-lvs lanceolate-obovate, st-lvs linear-lanceolate or spatulate, often 3 in. long calyx-lobes acuminate, wide at the base, entire, half as long as the broadly bell-shaped corolla. fls blue or white, pedicelled, solitary, terminal and axillary, often $1\frac{1}{2}$ in long, 2 in broad caps ovoid, 3-grooved. Eu. B.M. 397. G.C III 43 384. Gn. 75, p 30 G 6'297. Gn M 14 9 G.W 3, p 292. C.L.A. 13.478, the white form in G. 13:71 and Gn. W 23 Suppl Jan 27. The double white in G.C III 27 409 and G 3 563. One of the best of all perennial campanulas. Var. *macrantha* is a large-flid form with fls. all along the st. Gt 41, p 148 Gn 48, p 306 A.F 6 383 S.H. 1:131. Var. *alba grandiflora* and var. *Bäckhousei* are among the popular white-flid forms. There are double and semi-double forms in blue and white. The double white is useful for cutting. For portraits of var. *grandiflora*, see G 27 158, 28 553, 673, G.W 12, p 133. Var. *coronata*, Hort., is a semi-double white form F.S. 7 699. The pictures in B.M. and F.S. show distinctly saucer-shaped fls. Var. *Moerheimi*, Hort. White-flid, double, 2-3 in diam; excellent G.C III 27 414 G.M. 49 535 G.W 6, p 545; 12, p 434 A.G 23 497. Var. *marginata*, Hort., has white fls. tinted blue on the borders. R.B. 32, p 252. This species occasionally runs wild, especially in England. The lvs. are very characteristic, and, once seen, are never forgotten.

cc St-lvs. under and coarsely toothed.

11 *labiloba*, DC (*C. grandis*, Fisch & Mey.) Perennial, 1-1 $\frac{1}{2}$ ft., glabrous. st. erect, simple, terete: st-lvs 3-5 in long, 4-6 lines wide, lanceolate, narrowed at both ends, crenate-serrate: calyx-lobes ovate-acute, broad, entire, erect, one-half shorter than the broadly bell-shaped corolla; fls. blue, often 2 in. wide, sessile, solitary or somewhat clustered, sometimes equaling the ovate-acute, dentate bracts. Mt. Olympus, P.M. 10.31. H.U 3, p 137. Gt 7 202—Fls. like *C. persicifolia*. Quickly forms a dense carpet. Variable in color. Var. *alba*, Hort. White fls. G. 19:440.

BBB. Fls. bell-shaped or tubular, not saucer-shaped.

c. Infl. a dense roundish head.

12. *glomerata*, Linn. One of the most variable: perennial, 1-2 ft., typically pubescent: st. erect, simple, terete. lvs. serrulate, lower ones rough with very short, stiff hairs, 1 $\frac{1}{2}$ -3 in. long, 1-2 in. wide, with a cordate, ovate-oblong blade shorter than the petiole; upper ones sessile, ovate, acute, fls. violet-blue to white, in dense heads or glomes, 15-20 in the terminal heads, fewer in axillary ones. Eu. Armenia, Persia, Siberia, sometimes escaped in this country. Gn M. 14 9. B.M. 2649 is var. *speciosa*, which has the largest fls. L.B.C. 6'505 is var. *sparsiflora*, with much smaller clusters.—This is one of the earliest flowering and easiest of cult. Fls. typically dark purple, running into lighter varieties. Var. *dahurica*, Hort., is probably the commonest form: terminal clusters 3 in. or more thick, a very characteristic infl. The fl. has a longer tube than

C. lactiflora and *C. thyrsoides*. G. 26.305. Var. *acabilis*, Hort., is an almost stemless form with very large fls.: sts. only 3-5 in. high. G.W. 9, p. 272. Var. *superba*, Hort., is a cross of the dwarf variety with var. *dahurica*: large heads of deep violet fls.

cc. Infl. a spike or raceme, dense or loose.

D. Color of fls. normally white or yellowish.

E. Corolla small, short-tubed.

13 *lactiflora*, Bieb. Perennial, 2 $\frac{1}{2}$ -6 ft.: st. erect, branching: lvs. sessile, ovate-lanceolate, acutely serrate calyx-lobes very broad, acute, serrulate, one-half shorter than the broadly bell-shaped corolla: fls. in a loose or dense panicle, which may be 3 $\frac{1}{2}$ in. long and thick; corolla white or pale blue, 1 in. long, nearly 1 $\frac{1}{2}$ in broad caps ovoid, erect Caucasus, Siberia. B.M. 1973 G.C III 50 438. Gn. 61, p. 29, 63, p. 90; 71, p. 418, 75, p. 89 G.M. 46: 168, 48 545. Gn. W. 23 623. The normally milk-white bluetinged fls. are characteristic. Var. *caerulea*, Hort., has light blue fls.—*C. celticifolia*, Boss., referred to the above, may be a strongly marked variety. *C. biserrata*, Koch, is also referred here.

14 *thyrsoides*, Linn. Biennial, 1-1 $\frac{1}{2}$ ft.; st. grooved lvs all covered with long hairs at the margin; root-lvs. sessile, spatulate or obtusely lanceolate, 2 $\frac{1}{2}$ in. long, $\frac{3}{4}$ in wide, in a dense rosette, lying on the ground; upper lvs more narrow and acute fls 40-50, sulfur or creamy yellow, in a dense thyrse-like spike, which may be 6 in long and 2 $\frac{1}{2}$ in broad; style exserted. Alps and Jura, 3,000-6,000 ft. B.M. 1290 L.B.C. 17 1614.—Intermingled with the fls in the spike are lvs. which are longer than the fls., which is not true of *C. lactiflora*. Should not be confounded with *C. thyrsoides*, Lapeyr., which = *C. speciosa*, (see supplementary list). Apparently no blue or purple forms are known. The picture in B.M. shows a characteristic red-tipped calyx. Garden hybrids are reported with *C. spicata* (see Kew Bull 1910, p.322).

EE Corolla large, long-tubed.

15 *Vidalii*, H.C. Wats. Perennial, 1-2 ft. st. branching from the base, some branches short, sterile, others tall, floriferous, all grooved, clammy, glossy. lvs 3-4 in long, oblong-spatulate, coarsely serrate, thick, fleshy, firm, viscid, the upper ones gradually becoming bracts fls 2 in long, nodding, about 9 in a loose terminal raceme; calyx-lobes triangular, thick, one-fourth shorter than the corolla; corolla tubular, swelled below, constricted above, white with a yellow base Azores. B.M. 4748. F.S. 7:729 A.F. 3:116. G.C III 18:95; 34:330-1 Gn. 54, p 299, 63, p. 297; 74, p. 402; 75, p. 410. J.F. 3, pl. 274.—Very distinct.

DD. Color of fls. normally blue or purple (with white varieties).

E. Size of fls. large.

F. Raceme pyramidal or long-conical, usually dense.

16. *pyramidalis*, Linn CHIMNEY CAMPANULA. Fig. 766. Glabrous perennial, 4-5 ft.: lvs. glandular-den-

765. A narrow-flowered form of *Campanula persicifolia*.

tate, lower petiolate, ovate-oblong, subcordate; st. lvs. sessile, ovate-lanceolate: calyx-lobes acuminate, spreading, half as long as the broadly bell-shaped corolla. fls. numerous, in pyramidal racemes, pale blue varying to white and darker at the base. G.C. III.

32:388. Gn. 45, p. 67; 48, p. 306; 51, p. 221 (a stalked pot plant); 47, p. 86 (with extensive cultural notes); 53, p. 535, 62, p. 254, 64, p. 96; 68, p. 137; 69, p. 4, 74, p. 548. R.H. 1897, p. 238. G.M. 46 612; 53. 811. G.W. 1, p. 39, 7, p. 7; 11, p. 137; 13, p. 571. Var *alba*, Hort., has white fls. Gn. 74, p. 645. J.H. III. 51:257. Var *compacta*, Hort. Dwarf: fls. larger and of better substance. The compact variety is very floriferous and convenient for conservatory, but lacks the characteristic erect, pyramidal habit. Gn. 73, p. 54. G. 18 64 S.H. 2:97. *C. Fergussonii*, Hort., is a hybrid of *C. pyramidalis* and *C. carpatia*, resembling a dwarf form of the former in growth, 18 in. petals more pointed than those of the latter: fls. bright lilac. Gn. 66, p. 276.

Hybrids between *C. pyramidalis* and *C. versicolor* are reported.

FF. Raceme not pyramidal, usually looser.

17 *latifolia*, Linn. Perennial, 3-4 ft. lvs. large, doubly serrate; root-lvs. sometimes 6 in. long, petiolate, cordate, covered with soft hairs; st. lvs. sessile, more acuminate. peduncle 1-flid.; calyx-lobes long-acuminate, one-third shorter than the corolla, fls. 6-15 in a loose spike or raceme about 8 in. long, erect, very large, 2½ in. long, purple or dark blue, hairy. Eu., Persia. G.W. 8, p. 445. Var *macrantha*, Sims (*C. macrantha*, Fisch.) is commoner in cult than the type, a little hairier, with a glabrous calyx and very large fls. B.M. 2553, 3347. R.H. 1897, p. 239. J.H. III. 60:263. Var. *ericaeformis*, DC., has the st. and lvs. pilose and more pallid, and a hispid calyx-tube. There is a white-flid. form. It is native to England, and is easily naturalized there in wild gardens. The st. lvs. are probably the largest of any of the garden kinds, often 3½ in. long and 2 in. wide.

EE. Size of fls. small, less than 1 in. long.

18 *bononiensis*, Linn. Perennial, 2-2½ ft.; scarious: st. simple. lvs. serrulate, ovate-acuminate, pallid beneath; root-lvs. cordate-petiolate; upper lvs. clasping: calyx-lobes acuminate, one-fourth shorter than the funnel-shaped corolla. fls. normally purplish, in a long, loose, pyramidal spike, which may be 2 ft. long, with 60-100 small fls.; corolla ¼ in. long and broad. E. Eu., W. Siberia, and Caucasus. Var. *ruthenica* (*C. ruthenica*, Bieb.), has lvs. wider and tomentose beneath. Caucasus and Tauria. B.M. 2653. There is a white-flid. form. The fls. are much smaller than in *C. latifolia*, and the raceme is much larger.

19 *rhomboidalis*, Linn. Perennial, 1 ft., sometimes 2 ft.: st. simple, erect: lvs. sessile, ovate-acute, serrate:

calyx-lobes awl-shaped, one-half shorter than the bell-shaped corolla; fls. 8-10 in an almost corymbose raceme, the lower pedicels of which may be 3 in. long, the uppermost 1 in. or less, corolla purplish blue, 1 in. long, and a little wider. Mts. of Eu. B.M. 551 (as *C. azurea*) J.H. III. 50:541. Var. *alba*, Hort., has white fls. G.W. 3, p. 14.—It flowers in July and August, after which the sts. and lvs. die down quickly.

20 *Trachelium*, Linn. THROATWORT. Fig. 767. Perennial, 2-3 ft.: st. angular, somewhat bristly (as also the fls.): lvs. rough, acuminate, coarsely crenate-dentate; root-lvs. cordate, ovate, short-stalked: calyx-lobes erect, triangular-acuminate, one-third shorter than the bell-shaped blue or white corolla. peduncle 1-3-flid, fls. erect at first, at length tending to droop in a loose raceme, which may be 12-18 in. long caps nodding. Eu., Caucasus, Siberia, Japan, and run wild in parts of N. Amer. R.H. 1897, p. 239. There is a double-flid. form and variations in color.—One of the commonest and hardest of the border plants, often running out the other campanulas, and passing under many names, especially as *C. verticillata*.

21 *rapunculoides*, Linn. Fig. 768. Perennial, 2-4 ft.: st. indistinctly pubescent or almost smooth: lvs. rough, ovate-acuminate, root-lvs. petiolate, cordate, crenulate; st. lvs. serrulate calyx a little rougher than in *C. Trachelium*, the lobes linear-lanceolate, at length reflexed, one-fourth length of the oblong-campanulate bright blue corolla, fls. soon declined or nodding, in long mostly 1-sided racemes or spikes, bright blue. Eu., Caucasus, Siberia, and common in patches on old roadsides and about yards. Summer. Gn. M. 14 9.

22 *versicolor*, Sibth & Smith. Perennial, 3-4 ft.; plant glabrous st. ascending lvs. serrate, root-lvs. long-petioled, ovate-acute, subcordate, st. lvs. short-petioled, ovate-lanceolate, acuminate calyx-teeth acuminate, spreading, at length reflexed, one-half as long as the corolla: fls. in long, spike racemes, style exserted caps spheroid. Greece.

ccc Infl. an open, compound panicle

23 *divaricata*, Michx. Glabrous perennial, 1-3 ft. st. erect, slender, paniculate above branches slender, divergent lvs. sparse, subsessile, ovate-lanceolate, acuminate at both ends, coarsely serrate: calyx-lobes awl-shaped, one-half shorter than the tubular, bell-shaped corolla, fls. small, nodding, pale blue, in a very open and compound panicle, style straight, exserted. Alleghenias, from Va. to Ga.—Rare in gardens.

GROUP III. Low-growing or rock-garden campanulas, mostly less than a foot or 15 in. high. Nos. 24-49.

A. Calyx with an appendage at the base of each sinus, often minute or disguised in form.

B. Throat of corolla spotted violet.

24 *punctata*, Lam. (*C. nobilis*, Lindl.). Named from the spotted whitish corolla, the purplish spots being inside and showing through faintly in the fresh fl. but

766. *Campanula pyramidalis*.

767. *Campanula Trachelium*. (×½)

more plainly in the dried specimen: like *C. albanica*. Perennial, 1 ft., with long and loose hairs; upper lvs. nearly sessile, and more sharply toothed than the lower; calyx-lobes one-third as long as the corolla, longer, looser and hairier than in *C. albanica*; and the margins much more recurved; peduncle 1-4-fld., fls. nodding, corolla cylindrical, $2\frac{1}{2}$ in. long, white, spotted within, strongly ribbed. Siberia, Japan. G.C. III 38, supp. Aug. 26, 42:96. Gn 73, p 423; 75, p 158. G.M. 51 781. G 29:595 — *C. nobilis* has been considered distinct. In P.S. 3 247 the corolla is dark violet without, the limb hairy, while in B.M. 1723 (*C. punctata*) the corolla is white outside and not bearded. In F.S. 6:563 (*C. nobilis* var. *alba*) the limb is not bearded and the st. is red, and not hairy. The three pictures show great differences in foliage, pubescence and appendages. This is one of the most interesting of all campanulas, and is, unfortunately, usually considered more quaint than beautiful. The spotted throat readily separates it from other campanulas.

BB Throat of corolla not spotted.
c Sts commonly 1-fld.

25 Van Houttei, Carr Perennial, 2 ft.: root-lvs. long-petioled, roundish cordate, more or less lobed; st-lvs. sessile, oval-lanceolate, irregularly bi-dentate, $2\frac{1}{2}$ -4 in. long, more or less villous, strongly nerved, fls. usually solitary, nodding at the end of a small branchlet, 2 in. long, half as broad, indigo-blue, or violet, calyx-lobes linear, spreading, 1 in. long — A garden hybrid resembling *C. punctata*. Intro. into France 1875 by Thibaut and Keteleer. Var. *pálida*, Hort., has pale lavender fls.

26 Allionii, Vill Perennial, 3-5 m. root-stock slender, creeping underground, sending up sts. at intervals of $\frac{1}{2}$ 1 1 1 lvs. few, about 7 on a st., 1-2 in. long, linear-lanceolate, sessile, slightly hairy, entire, midrib distinct, lower ones in a whorl of about 5, upper ones similar but more erect. calyx-lobes lanceolate, half as long as the corolla, the appendages ovate, reflexed, one-third the length of the calyx-lobes; fls. purple, with a rare white variety, only one on a st., inclined or nodding, $1\frac{1}{2}$ in. long, and as broad across the mouth, probably the largest for the size of the plant of any campanula. A very local species, found only in the western Alps. B.M. 6588 G.C. III 52 52 Gn 60, p 51

cc Sts usually several-fld.
n Margin of corolla bearded.

27. *barbata*, Linn Perennial, 6-9 m. st. pilose, lvs. villous, entire or nearly so, root-lvs. tufted, lanceolate; st-lvs. few, ligulate (?); raceme loose, 3-4-fld., fls. nodding, pale blue, calyx appendage ovate, obtuse, half as long as the lobes, corolla bell-shaped, shorter than in *C. Allionii*, and with a bearded mouth. Alps. I.B.C. 8:788 G.C. III 18 388 Gn 18, p 297. G.W. 12, p 417 — There is a white-fld. form, but apparently no purple. Readily distinguished from *C. Allionii* by the different colored, bearded and smaller fls., which are rarely borne singly, and by the dense, soft hairs of the st. Alps, 2,400-6,000 ft., widely distributed, mts. of Norway, and the Carpathians. Becomes coarse when grown in rich ground.

DD Margin of corolla not bearded.
c Fls erect.

28. *mollis*, Linn Perennial, velvety gray, 6-8 in. : sts. procumbent, about 2-fld. root-lvs. tufted, obovate or spatulate, st-lvs. ovate or rotund fls. loosely pinnated; calyx-lobes lanceolate, erect, half shorter than the glabrous, bell-shaped corolla, appendages minute, shorter than the calyx-tube; corolla erect, dark purplish blue or lavender, with a white throat, the tube long, segms. short, broad, spreading, acute Spain, Crete. B.M. 404 — Rock or border plant.

EE Fls nodding

29 *alpina*, Jacq Perennial, 3-8 in. : st. furrowed. lvs. smaller than in *C. barbata*, more narrowly lanceolate, entire, hairy fls. typically deep blue, bell-shaped, with broader and shorter segms. than in *C. barbata*; calyx-lobes proportionately very long, surpassing the fl-bud, and nearly as long as the flower, but widely spreading. Alps of Austria, Lombardy and Trans. Ivaria, 6,000-7,000 ft. altitude B.M. 957 J.H. III 29 5 — There is a white-fld. var. The plant has a characteristic shaggy appearance from the hairy lvs. Easy of cult.

768. *Campanula rapunculoides*. (× $\frac{1}{2}$)

30. *sibirica*, Linn. (*C. Höhenackeri*, Fisch.). Biennial or perennial, setaceous-pilose. st. erect, simple, pinnated above lvs. crenulate; root-lvs. petioled, obovate, obtuse; st-lvs. lanceolate-acuminatae calyx hairy, the lobes long-acuminate, a third shorter than the corolla, calyx appendages like the lobes but half shorter and reflexed; fls. 25 or more, violet, with a longer and narrower tube than in *C. alpina*, and longer divisions of the limb. N. Asia, Caucasus, W. Eu. B.M. 659. R.H. 1861:431 — The type is rare, but var. *eximia*, Hort., is somewhat commoner. It is dwarfier, much branched, with long, scabrous lvs. and pale bluish to violet fls. Var. *divergens*, Willd., has larger fls. and broader lvs. than the type. G.C. III 16:597. *C. sibirica* usually does best when treated as a biennial.

AA Calyx without appendages.

B. Fls. very wide-spreading, i.e., rotate, wheel-shaped, almost flat.

c Blossoms all erect.

31 *Waldsteiniana*, Roem & Schult. Perennial, 4-6 in. : sts. rigid, glabrous lvs. fleshy, sessile, gray-green,

lanceolate, slightly serrate-dentate, the lower obtuse, the upper long-acuminate: calyx-lobes awl-shaped, spreading or recurved, one-fourth shorter than the corolla: fls. 5-9 in a corymbose raceme $1\frac{1}{4}$ in. long, $\frac{3}{4}$ in. wide, pale purplish blue; corolla rotate, almost starlike, with a dark spot in the throat; pistil large, white, twice the length of the corolla, with a yellow stigma. S Austria. Gn. 8, p. 173. G. 18:81. G.W. 12, pp. 446, 710. *C. Tommasiniana*, Hort., is an allied plant, with very wiry growth and pendent pale blue fls. *C. Stansfeldii*, Hort., is a supposed hybrid, perhaps between *C. Waldsteiniana* and *C. carpatica*.

32. *ramosissima*, Sibth. & Smith (*C. Lörei*, Poll.) Annual, 1 ft or less, branching: lower lvs. obovate and crenate, upper lvs. narrow, entire: fls. violet with white base and blue intermediate parts, erect on long simple pedicels. Eu B M 2581. Var. *alba*, Hort. Fls. white.

cc. Blossoms not all erect.

d. Habit trailing or pendulous.

33. *fragilis*, Cyrill. Perennial, 4-6 in.: st. diffuse, trailing: root-lvs. long-petioled, roundish-cordate, obtusely dentate, or crenately lobed; st-lvs. smaller, scattered, the uppermost ovate-lanceolate: fls. pale purplish blue with a white center, $\frac{1}{2}$ in. wide, in loose corymbs; calyx-lobes linear-lanceolate, acuminate, erect, almost equaling the corolla; style exserted: caps. ovoid. Italy B.M. 6504. P.M. 11:25. G.C. III. 43:378. Gn. 8, p. 174; 47, p. 278; 63, p. 53. G. 18:120. G.W. 2, p. 381. Var. *hirsuta*, DC., is a hairier form.—This is the best species for hanging-baskets, window- and veranda-boxes, and for covering large stones in the rockery. Prop. by cuttings in spring, the roots being too fragile to divide well. Not so hardy as *C. garganica*.

769. *Campanula carpatica*. ($\times\frac{1}{2}$)

34. *garganica*, Tenore Perennial, 3-6 in.: st. diffuse, with pendent branches: lower lvs. reniform-cordate, crenate-dentate; upper lvs. ovate-acute, dentate: raceme lax; peduncles 1-2-fld; calyx-tube spheroid, the lobes spreading, a third or fourth shorter than the glabrous blue rotate corolla. Mt. Gargano in Italy, and elsewhere B.R. 1768. Gn. 48, p. 295; 43, p. 25. G.M. 54:664. G.W. 4, p. 255. Var. *hirsuta*, Hort., is a hairier form. Gn. 46, p. 253; 48, p. 297.—Half-shaded position. Prop. by cuttings or by division.

dd. Habit not trailing or pendulous.

35. *Elatines*, Linn. Perennial, more or less pubescent, 5-6 in.: lvs. cordate, coarsely and acutely dentate, lower rotund, others ovate-acute: raceme lax; calyx-tube spherical, the lobes spreading, linear-lanceolate, somewhat unequal, a half shorter than the rotate purplish corolla, style exserted. Piedmont. Gn. 60, p. 64.—Rare rock-plant for light, stony soil.

36. *Portenschlagiana*, Roem. & Schult. (*C. murdula*, Port.). Perennial, 6-9 in.: sts. somewhat erect: lvs. all

alike petiolate, cordate, roundish, acutely angular-dentate: calyx-tube spheroid, lobes erect, acuminate, a third shorter than the infundibuliform blue-purple corolla: fls. racemose. Dalmatia.—Allied to *C. garganica*, but the corolla not so deeply 5-cut. Gn. 61, p. 225, 72, p. 469. Var. *major*, Hort. Fls. nearly twice larger than in the type, $1\frac{1}{2}$ in. across, making a large mound of purple-blue. G.C. III. 48:58. Gn. 60, p. 111; 63, p. 110. G.W. 3, p. 13.

BB. Fls. broadly bell-shaped, less widely spreading than in B, under than in BBB (except perhaps in No. 40).

c. Height 2-3 in.

37. *Räinerii*, Perpent. Perennial, 2-3 in.: sts. suberect, branching: branches 1-3-fld; lvs. subsessile, ovate, distantly serrate, the lower smaller and obovate: calyx-tube obconical, the lobes long-acuminate, erect, half shorter than the broadly infundibuliform corolla: fls. large, solitary, erect, dark purplish blue; style short, not exserted: caps. obovate. Mts N Italy. F.S. 18:1908. Gn. 60, p. 163.—One of the choicest rock-plants, but somewhat rare. Several forms of the hybrid *C. Wilsonii* are often cult. under this name, but their lvs. are lighter green and less tomentose than *C. Räinerii*. Thrives in a well-drained, sunny position.

cc. Height more than 2-3 in.

d. Style not exserted.

38. *Tendrii*, Moretti Perennial, 8-12 in., glabrous: st. ascending or prostrate: lvs. leathery; root-lvs. long-petioled, ovate, subcordate, irregularly serrate, st-lvs. petiolate, ovate-acute, coarsely serrate: calyx-lobes linear-lanceolate, spreading, half as long as the broadly bell-shaped corolla: fls. racemose, blue; caps. spherical. Apennines, near Naples.—This is referred by botanists to the Grecian species *C. versicolor*, which is typically taller, but is kept distinct by Correvon and others. In the garden, *C. Tenorii* resembles *C. pyramidalis* in foliage and fl., but is shorter.

39. *carpatica*, Jacq. Fig. 769. Perennial, 9-18 in., glabrous, st. branching: lower lvs. thin, long-petioled, ovate-rotund, cordate, coarsely dentate, undulate; upper ones shorter petioled, ovate-acuminate: peduncles long, terminal and axillary, 1-fld; fls. large, often $1\frac{1}{2}$ in. wide, bright deep blue; calyx-tube obconical, the lobes acute, wide at the base, subdentate-erect, a third or half as long as the broadly bell-shaped corolla; style not exserted: caps. ovoid-cylindrical. Carpathian Mts. of Austria. B.M. 117. G.C. III. 48:412. G.W. 12, p. 436. Gn. 48, p. 297; 62, p. 326. Var. *caelestina*, Hort. Fls. sky-blue. Var. *alba*, Hort. Fls. white. G.M. 55:615. Var. *turbinata*, Hort. (*C. turbinata*, Schott), is dwarfier, more compact, with fls. more bell- or top-shaped, and often 2 in. across, purplish blue. It also has larger lvs. and more decumbent habit. Gn. 45, p. 171; 68, p. 179; 75, p. 201. G.W. 12, p. 446. F.E. 17:15. A form

770. *Campanula pulia*. (Detail $\times\frac{1}{2}$)

with pallid fls. is rarer. Var. *Wilsonii*, Hort. (*C. Wilsonii*, Hort.), is a hybrid of var. *turbinata* and *C. pulla*, with the large fls. of the former and the handsome dark foliage of the latter. It is compact, dwarf, and small, ovate, very hairy lvs., with crenate-serrate margin. Gn. 60, p. 219. Var. *haylodgensis*, Hort. (*C. haylodgensis*, Hort.), is a garden hybrid, probably between *C. carpatica* and *C. caespitosa*. Raised by Anderson Henry, Hay Lodge, Edinburgh. Height 6-9 in.: root-lvs. tufted, roundish cordate, slightly dentate, st-lvs. light green, ovate-cordate, conspicuously toothed, fls. light blue, bell-shaped, few, at the ends of sts. Var. *pelviformis*, Hort., from Crete, has very large, pale lilac, almost saucer-shaped fls. R. H. 1882, p. 509. G. C. III. 44:64. Var. *Hendersonii*, Hort., is often referred to var. *turbinata*, but is more robust; there is doubt as to its origin, *C. pyramidalis* or *C. albanica* possibly having played some part in it: lvs. ovate and ovate-cordate, $1\frac{1}{2}$ in. long, $\frac{3}{4}$ in. broad, slightly hairy on both sides, folded upwards, serrate; petioles 1-1 $\frac{1}{2}$ in. long: fls. dark blue, $1\frac{1}{2}$ -2 in. wide, in short, 6-9-fl. racemes. G. W. 8, p. 65; 14, p. 581. Var. *riverislae*, Hort. Fls. dark blue, 2-3 in. across: sts 12-15 in. long but spreading, parts of corolla often 6 or 7. G. M. 43:627. Var. *compacta*, Hort., is a condensed dwarf form. *C. Slansfieldii*, Hort. is supposed to be a hybrid between *C. carpatica* and *C. Waldsteiniana* (No. 31).—This species is very variable in height and in shape of fls.

DD. *Style exerted*

40. *isophylla*, Moretti (*C. floribunda*, Viv.). Perennial. st suberect. lvs. all of same form, petiolate, roundish cordate, crenate-dentate. calyx-lobes acuminate, half shorter than the broadly bell-shaped or saucer-shaped corolla; fls. pale blue, 1 in. or more wide, corymbose, style exerted caps. ovoid. Italy. B. M. 5745. Gn. 49, p. 483; 48, p. 297.—A desirable

basket or rock plant in sun or half shade. The white form, Var.

alba, is most excellent free-flowering.

C. Mayii, Hort., is supposed to be a derivative of this species. lvs. soft and woolly. Choice

BBH. Fls. bell-shaped.

c. *Style exerted*

41. *Scutleri*, Hook. Perennial, 3-12 in.: st. simple or branched: lvs. acutely serrate, somewhat hirsute; lower ones ovate-acute, petioled; middle ones ovate-lanceolate; upper linear-lanceolate, sessile, calyx-lobes awl-shaped, erect, one-third shorter than the corolla: fls. pale blue, racemose, or more or less panicle, style exerted: caps. ovoid. N. Calif. to Puget Sound.—The capsular valves are a little above the middle, while in *C. carpatica* and *C. persicifolia* they are near the apex.

cc. *Style not exerted.*

D. *Color dark purple.*

42. *palla*, Linn. Fig. 770. Perennial, 3-8 in., tufted or in clumps, showy: st. normally 1-flid.: lvs. glabrous,

crenulate-dentate, lower ones short-petioled, ovate-rotund; upper sessile, ovate-acute: calyx-lobes long-acuminate, erect, a half shorter than the bell-shaped, nodding corolla. Mts. of Austria, 4,000-6,000 ft. In B. M. 2492 the calyx-lobes are short-acuminate, a sixth as long as the corolla. L. B. C. 6:554. Gn. 63, p. 140. *C. pulloides*, Hort., is a supposed hybrid between *C. pulla* and *C. turbinata*, with habit of former: 5 in. fls. glistering purple-blue. Gn. 63, p. 203.

DD. *Color not dark purple, but violet or blue (varying to white.)*

43. *drabifolia*, Sibth & Smith (*C. alba*, Boiss.). Annual, hispid, 3-4 in. lower lvs. oblong or elliptic, dentate, tapering into a petiole fls. large, blue and lighter on the tube, bell-shaped, on forking sts. Greece.

44. *rotundifolia*, Linn. HAREBELL. HAIRBELL. BLUE BELLS of SCOTLAND. Fig. 771. Perennial, 6-12 in.: root-lvs. petiolate, orbicular or cordate, crenate-dentate. st-lvs. linear or lanceolate, usually entire. calyx-lobes awl-shaped, erect, a third shorter than the bell-shaped bright blue corolla; fl-buds erect. Eu., Siberia, N. Amer. Gn. 53:42; 62, p. 59. Gn. M. 14:10.—This is one of the most cosmopolitan of all campanulas, and the true harebell or bluebell of literature. In the wild it is usually slenderer and taller than in the garden. In shady woods it often grows 2 ft. high. The type has a white-fl. variety which is much less popular, but G. C. 1861:698 shows an excellent pot-plant of it. Var. *alaskana*, Gray. Dwarf, leafy to the top: radical lvs. cordate, lowest st-lvs. ovate and the upper ones becoming lanceolate. calyx-lobes attenuate, becoming deflexed; corolla $\frac{1}{2}$ -1 $\frac{1}{2}$ in. long. Alaska. Var. *arctica*, Lange. Rigid, 1- to few-fl. corolla 1 in. long, the calyx-lobes very slender and soon spreading or deflexing. Canada north. Var. *velutina*, DC. Herbage whitish pubescent. Var. *Höstii*, Hort. (*C. Höstii*, Baumg.), has larger fls. than the type and stouter sts. The lower st-lvs. are lanceolate, remotely dentate, the upper linear entire: calyx-lobes longer than in the type, a half shorter than the corolla. The white-fl. form is not so vigorous. J. G. 5:207. The most pronounced variant is var. *soldanellaeflora*, Hort. (*C. soldanella*, Hort.). Fig. 772. With semi-double blue fls. split to the base into about 25 divisions. F. S. 18:1880. Gn. 60, p. 162. This curious variation is unique in the genus. The alpine soldanellas are famous among travelers for melting their way through the ice. They have fringed blue fls.—The name *C. rotundifolia* seems singularly inappropriate until one finds the root-lvs. in early spring. *C. stenocodon*, Boiss. & Reut., by some referred to *C. rotundifolia*, is more slender and with narrower st-lvs.: fls. long and narrow, tubular, rich lilac-purple. Alps.

45. *Scheuchzeri*, Vill. (*C. lunifolia*, Willd.) Perennial, 4-12 in.: st. 1-4-flid., usually 1-flid.: root-lvs. roundish, ovate, or cordate; st-lvs. linear or narrowly lanceolate, sessile, denticulate, the lowest st-lvs. spatulate: calyx-lobes slender, linear-awl-shaped, nearly as long as the bell-shaped dark blue corolla. Alpine and subarctic regions of Newfoundland, Labrador, Alaska, and Rocky Mts to Colo., also in Eu. and Asia. F. S. 21:2205, not L. B. C. 5:485, which DeCandolle states is *C. rotundifolia*. Var. *alba*, Hort. Fls. white. Gn. 60, p. 164. The st-lvs. of *C. Scheuch-*

772 *Campanula rotundifolia* var. *soldanellaeflora*. (X $\frac{1}{2}$)

771. *Campanula rotundifolia*. (X1)

seri are distinctly serrate, while in *C. rotundifolia* they are entire; the fl.-buds nod in the former, but are erect in the latter. The calyx-lobes are relatively longer in *C. Scheuchzeri*, and perhaps the bell is deeper.

46. *cæspitosa*, Scop. (*C. pumila*, Curt *C. pusilla*, Henk.) Perennial, 4-6 in., root-lvs. tufted, short-petioled, ovate, glandular-dentate, shining; calyx-lvs linear, erect, a third shorter than the bell-shaped corolla; fls. nodding, blue; pollen violet-colored B.M. 512. Gn. 43.24; 48, p 297; 60, p 161 G 25 307. R.H 1908, p. 223.—Dwarfer than *C. rotundifolia*, with root-lvs never reniform, shorter-petioled, and lasting until after fls. have gone. Perennial, quickly forms a dense mat, and blooming from June till Oct The European trade catalogues usually offer *C. cæspitosa* and *C. pusilla* separately, and doubtless plants of distinct horticultural value are passing under these names, but there seem to be no sufficient botanical characters to distinguish them Corveon says that *C. pusilla* differs from *C. cæspitosa* only by its less stoloniferous character. Var. *alba*, Hort., has white fls G.C III, 48:96. Gn. 72, p. 143, 75, p 368 G M 51:466. Var. *pallida*, Hort., has pale blue fls. G M 53, 612

47. *excisa*, Schlecht. Perennial, glabrous, height 4-5 in.: sts slender, 1-fld: root-lvs spatulate, upper fls linear; calyx-lobes bristly, spreading, at length reflexed, a third shorter than the bell-shaped corolla. fls pale blue, divided to about half their depth, with a round hole at the base of each sinus, which easily distinguishes it from *C. pulia* and all other campanulas. Rare in Alps. B M 7358. L.B.C. 6.561. Gn. 60, p. 64.—A rare rock-plant. Likes cool, moist air, and not too full exposure to sun.

BBBB. Fls. tubular, often long and narrow.

48. *Zöysii*, Wulf. Perennial, 3-4 in.: plant tufted, glabrous, sts. few-fld.: root-lvs entire, crowded, petioled, ovate-obovate, obtuse, st.-lvs obovate-lanceolate and linear; peduncles 1-fld, terminal, rarely axillary; fls. azure-blue, large for the plant, terminated by a stellar process before expansion; calyx-lobes linear, awl-shaped, spreading, a fourth shorter than the corolla; corolla long-cylindrical, constricted at the apex, wider at the base, sharply angled, pale blue. Austrian Alps, 6,000-8,000 ft. Gn S, p 173 G.C III. 20:183, 38-228 —A rare and abnormal species.

49. *Erinus*, Linn. Annual. plant hispid height 3-9 in.: lvs small, glossy, $\frac{1}{2}$ - $\frac{3}{4}$ in broad, cordate, deeply cut, the pointed lobes conspicuous; fls. sessile, pale blue with a light center, tubular, $\frac{1}{2}$ in. broad, with acute narrow lobes; style long, conspicuous, colored like corolla racemes long, semi-prostrate, 10-12-fld. Medit.—Rare, short-lived rock-plant; also for edgings and pots

C. abietina, Griseb. Rare tufted rockery plant, with slender, wiry sts 9-15 in. high fls light blue, in loose branching spikes. July, Aug. E. Eu.—*C. acutidula*, Ler & Lev Dwarf, with trailing sts from a rosette of viny-like lvs at lvs small, rounded and toothed fls solitary on each st., rather large and star-like, purple-blue N Spain G.C III. 50:220 —*C. ambigua*, Leicht —*C. phytocaulis* —*C. Beccardiana*, Fomine Slender, to 2 ft., glabrous or finely hairy lower lvs oblong-ovate to broadly ovate, obtuse, serrate-serrate fls long solitary, slender-petioelled, blue, $\frac{1}{4}$ in. across B.M. 8299 Caucasus —*C. calandrinia*, Hort. —Medium var *calycanthema* —*C. cæntia*, Linn A rare rock-plant from Mt. Cenis and other mts of the Alps, with solitary deep blue fls on sts 2 in. high Root-lvs obovate, obtuse, at lvs ovate-oblong, all lvs sessile-entire calyx hirsute, the lobes linear-lanceolate, a half shorter than the deeply 5-cut, spreading corolla —*C. grandiflora*, Jacq = *Platycodon* —*C. hederacea*, Linn = *Wahlenbergia*. —*C. smerrina*, Rupp Dwarf, branching, resembling *C. alpinica* lvs small fls violet-blue Caucasus —*C. incana*, Aucher —*C. Leutweinii* —*C. kolanitina*, Mey Perennial, 9 in or less lvs mostly radical, about 1 in long fls in long-stalked raceme, bluish violet, 1 in long, include hairy Caucasus —*C. laciniata*, Linn. Robust much-branched biennial 2 ft. somewhat pubescent lower lvs 8 in long by $\frac{2}{3}$ in broad, deeply cut fls about 2 in across, upwards of 1 in long, pale blue Greece G.C III. 40:165. —*C. Leutweinii*, Heldr (*C. incurva*, Aucher) Perennial, simple, 1 ft. or more lvs cordate, white-downy, obovate, rounded at apex fls. pale blue, $\frac{1}{4}$ in long. Greece —*C. Marschii*, Hort. —*Platycodon* —*C. mitchauxoides*, Boiss. Tall-growing fls. bluish white,

the sages recurved Asia Minor.—*C. Landreckii*, D. Dietr. —*Adenophora* Lamareckii —*C. nitida*, Ait = *C. planiflora* —*C. petraea*, Linn Biennial, with ascending st., hairy, 6-12 in lower lvs. lanceolate-oblong, narrowed to the base, toothed, upper lvs. ovate and sessile fls small, pale yellow, in dense terminal and axillary heads N Italy.—*C. phytocaulis*, Boiss & Noë (*C. amabilis*, Leicht) Lake C Rapunculus in habit, 2-2½ ft. lvs. lanceolate or cordate fls 10-12 in raceme, dark blue with black styles, resembling those of *C. persicifolia* Armenia.—*C. planiflora*, Lam (*C. nitida*, Ait.) Glabrous height 3-9 in st simple; lvs sessile, leathery, shining, root-lvs crowded in a dense rosette, ovate or obovate-obovate, crenulate, $\frac{1}{4}$ in long, at lvs. linear-lanceolate and sessile, nearly entire fls blue or white, with double varieties, in spicate racemes, calyx-lobes ovate, acute, broad, erect, a third shorter than the broadly bell-shaped or saucer-shaped corolla. Not American, though commonly so stated. Habitat unknown. J.H III 33 283 —Rock-plant, for sunny position —*C. primulaefolia*, Brot Sts hairy, simple, 1-3 ft lowest lvs, lanceolate, at lvs oblong fls blue, downy at bottom, nearly rotate Portugal. B.M 4879 —*C. Raddiana*, Trautv Perennial, glabrous, 1 ft: lvs cordate, long-stalked fls large, dark purple Caucasus —*C. speciosa*, Pourr. is a rare species. Most of the plants passing under this name are likely to be *C. glomerata* B.M 2649 is *C. glomerata* var *speciosa* *C. thyrsoides*, Lapeyr. is referred here —*C. Spectabilem*, Linn = *Specularia* —*C. apida*, Linn Biennial, 1-2 ft lvs. very narrow, nearly or quite entire fls 1-3, sessile, in a long interrupted spike, blue Eu J.H III 47 267 —*C. sulphurea*, Boiss. Annual fls size of those of *C. rotundifolia*, pale straw-color outside and sulfur-yellow inside Palestine *C. urticaefolia* This name is now abandoned Plants are likely to be *C. Trachelium*

WILHELM MILLER.

L. H B †

CAMPANULÆA (variant of Campanula) *Campanulaceæ* Twining or loose-growing perennial herbs, with rhizomes or tubers, rarely grown in greenhouses. Lvs mostly opposite, simple and often cordate, petioled fls yellowish or greenish, broadly bell-shaped, 4-6-lobed fr a berry—Five species occur in the Himalayan and E Asian region and the Malay Archipelago *C. yamadae*, Blume, and *C. inflata*, Clarke, both with yellowish brown-veined fls. are mentioned in gardening literature the fls are about $\frac{1}{4}$ in, in the former the calyx is nearly free from the berry, which is hemispherical, in the latter the calyx is adnate to the berry, which is ellipsoidal, both are twiners. *C. gracilis*, Hort., is of the genus *Leptocodon*, and *C. lanceolata*, Sieb & Zucc., is a *Codonopsis*.

CAMPHORA: *Cinnamomum*.

CAMPIONA: *Siene*.

CAMPSIDIUM (alluding to its similarity to *Campsis*) *Bygoniaceæ* Ornamental vines grown for their bright orange flowers and also for their handsome evergreen finely pinnate foliage

Evergreen shrubs, high-climbing, without tendrils and without rootlets, with odd-pinnate, opposite lvs. and tubular, orange, slender-pedicelled fls. in terminal, loose and short racemes, calyx turbinate, 5-toothed, glandless; corolla tubular, slightly ventricose, straight, with 5 short equal lobes, stamens, 4, the 2 longer with the anthers exserted; anther-sacs parallel, disk cupular, flat fr a narrow caps with many winged seeds.—Two species in Chile and in the Fiji Isls

They are adapted only for subtropical regions and do not seem to bloom readily, but even without flowers they are worth planting for their foliage alone. In Old World gardens, they are sometimes cultivated as stove plants, but *C. validianum*, judging from its habitat, might do better in the cool greenhouse. Propagated by greenwood cuttings under glass For further culture, see *Campsis* *Campsidium filicifolium*, from the Fiji Islands, has never flowered in the writer's garden (in Florida) and is cut down by frost almost every winter, but it is a strong grower and worth planting for the foliage alone. *C. validianum* has proved to be a very poor grower and is very difficult to keep in health for any length of time. (H. Nehring)

validianum, Seem. (*C. chilense*, Reissek & Seem. *Tecoma validiana*, Phil.) Climbing, to 50 ft branches angular, glabrous lvs. glabrous, 4-6 in. long; lfts. usually 11-13, sessile, elliptic-oblong, $\frac{3}{4}$ - $\frac{1}{2}$ in. long, serrate near the apex or almost entire: racemes pendulous, 6-10-fld;

fls about $1\frac{1}{2}$ in. long, orange; caps. 3-4 in long, narrowly elliptic-oblong. Chile. G.C. 1870:1182. B.M. 6111 F.S. 20:2142.

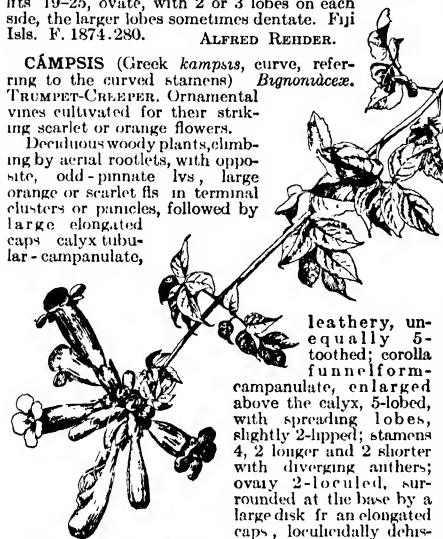

filicifolium, Van Geert (*Tecoma filicifolia*, Nichols.). Climbing evergreen shrub: lvs. odd-pinnate, 5 in. long; lfts 19-25, ovate, with 2 or 3 lobes on each side, the larger lobes sometimes dentate. Fiji Isls. F. 1874:280.

ALFRED REHDER.

CÁMPSIS (Greek *kampsis*, curve, referring to the curved stamens) *Bignoniaceae*.

TRUMPET-CREEPER. Ornamental vines cultivated for their striking scarlet or orange flowers.

Deciduous woody plants, climbing by aerial rootlets, with opposite, odd-pinnate lvs, large orange or scarlet fls in terminal clusters or panicles, followed by large elongated caps, calyx tubular - campanulate,

are attached, seeds numerous, compressed, with 2 large translucent wings—One species in N. Amer and one in China and Japan. By some botanists, Bignonia is considered the correct name for this genus, because the original description was chiefly based on *C. radicans*, while Tecoma is the proper name for the genus known as Stenolobium.

The hardest species is *C. radicans*, which may be grown as far north as Massachusetts, at least in sheltered positions, while *C. chinensis* is more tender; the hybrid is intermediate between the two in hardness. *C. chinensis* and *C. hybrida*, as well as *C. radicans* var. *speciosa*, can be grown as bushy specimens and will bloom freely on the young shoots, even if cut back almost to the ground by frost. Such plants can be easily protected during the winter by laying them down and covering them with earth. *C. radicans* is particularly adapted for covering walls and rocks, as it climbs with aerial rootlets and clings firmly to its support. The species of campsis prefer rich rather moist soil and sunny positions. Propagated by seeds, by greenwood cuttings under glass, or by hardwood and also by root-cuttings, and layers.

Trumpet-vines in the South—The trumpet-vines are very successfully cultivated in Florida, being well adapted to the soil and climate, but to do their best need to be planted from the start in rich soil; in addition they should be well fertilized at least once a year. They prefer a fertilizer rich in nitrogen, and a heavy mulch will also prove very beneficial. They should be grown on posts and tall stumps, or they may be trained over small oaks, persimmon trees or catalpas. Other bignoniads of similar culture are *Tecomaria capensis*, a half-climbing species with scarlet flowers effec-

tively used for decoration of the veranda, and *Tecoma stans*. That and *Campsis chinensis* are the two showiest bignoniads cultivated in Florida, the latter being a climber, flowering abundantly in May and June, while the first one is a large-growing bushy species opening its immense corymbs of vivid yellow flowers the latter part of November and early in December. The Chinese trumpet creeper, *C. chinensis*, is the most floriferous and gorgeous. In the writer's garden a large pine stump, about 16 feet high, in May and June is completely covered with masses of brilliant fiery orange-scarlet flowers which can be seen at a distance of half a mile. The flowers are much larger, more brilliant and much more abundantly produced than those of the native *C. radicans*. It is sometimes infested by a voracious caterpillar, which devours the leaves greedily. The lubber grasshoppers also attack the lower foliage. *C. chinensis* grows well in the poor sandy soil, perfecting luxuriant shoots 25 to 30 feet long in one season if well fertilized. The native trumpet creeper, *C. radicans*, is very common in the southern woodlands and fields. There is a great variety in the brilliancy of the blossoms. This is an excellent plant for covering the bare trunks of palmettos (H. Nehrling.)

radicans, Seem (*Tecoma radicans*, JUSS. *Bignonia radicans*, Linn.) **TRUMPET-CREEPER** **TRUMPET-VINE**.

TRUMPET-HONEY-SUCKLE.

Figs 773, 774. High-climbing shrub, clinging with rootlets; lvs. odd-pinnate, lfts 9-11, oval to ovate-oblong, acuminate, serrate, dark green above, pale and pubescent beneath, at least along the midrib, $1\frac{1}{2}$ -2 $\frac{1}{2}$ in long; fls in terminal racemes; corolla tubular-funnel-form, about 3 in long, with 5 spreading lobes, usually orange with scarlet limb, tube almost thrice as long as the short-toothed calyx fr cylindric-oblong, keeled along the sutures, stalked and with a beak at the apex, 3-5 in long July-Sept. Pa and Ill to Fla and Texas. B.M. 485 Gn 22, p 339 F. 1873, p 220 A.F. 12 34 Mn 2 9 Var. *atropurpurea*, Voss (var. *grandiflora atropurpurea*, Hort.) With large, deep scarlet fls. Var. *speciosa*, Voss. Scarcely climbing, usually forming a bush with long and slender branches lfts small, oval, abruptly narrowed into a slender point often $\frac{3}{4}$ in long fls. orange-red, with rather straight tube; limb about $1\frac{1}{2}$ in across. Var. *præcox*, Schneid. Large scarlet fls. in June. Var. *aurea*, Hort. Fls. yellow.

chinensis, Voss (*Tecoma grandiflora*, Delaun. *T. chinensis*, C. Koch. *Bignonia chinensis*, Lam. *C. adrepens*, Lour.) **CHINESE TRUMPET-CREEPER** Fig 775 (adapted from Gardening) Climbing shrub, with few or no aerial rootlets; lvs. odd-pinnate;

lfts. usually 7-9, ovate to ovate-lanceolate, serrate, glabrous beneath, $1\frac{1}{2}$ - $2\frac{1}{2}$ in. long; fls. in terminal racemes; corolla funnelform-campanulate, shorter and broader than that of the preceding species, scarlet, about 2 in. across; calyx 5-lobed to the middle, about

775. *Campsis chinensis* on a clothes-post.

as long as the tube of the corolla. fr. obtuse at the apex. Aug., Sept. China, Japan. B.M. 1398; 3011. F.S. 11:1124-5. Gn. 27, p. 94; 33, p. 348; 47, p. 373. G.F. 3.393. F.R. 2.27. Gng. 4:195. — Less high-growing and sometimes shrubby; blooms when quite small and can be grown as a pot-plant, also suited for forcing. Var. *Thunbergii*, Voss (*Tecoma Thunbergii*, Sieb.). Fls. bright scarlet, with very short tube and reflexed lobes. Often a var. of *C. radicans* is cult under the name *C. Thunbergii*. Var. *Princei*, Voss (*Tecoma grandiflora* var. *Princei*, Dipp.), probably belongs to the following hybrid.

hybrida, Schneid. (*Tecoma hybrida*, Joun. *T.*

intermedia, Schelle. *T. radicans grandiflora atropurpurea*, Hort. *T. Princei grandiflora*, Hort. *T. chinensis aurantiaca*, Hort.). Hybrid between the two preceding species somewhat climbing, often forming a bush with straggling branches. lfts. 7-11, ovate to elliptic-ovate, usually pubescent along the veins beneath. fls. in terminal loose panicles, calyx divided for about one-third into ovate long-acuminate lobes much shorter than the corolla-tube, corolla funnelform-campanulate with orange-yellow tube and scarlet limb, about 2 in. across and 3 in. long. July-Sept. Garden origin. S.T.S. 1:47. M.D.G. 1904:123. — The fls. are almost as large and showy as those of *C. chinensis* and the plant is harder.

ALFRED REHDER.

CAMPTOSORUS (Greek, *bent sor*, alluding to the irregular arrangement). *Polypodiaceae*. Two species of hardy ferns, with simple pointed lvs., which take root at the apex, and are hence known as "walking-leaf ferns." A single species is native mostly on lime-bearing rocks, and an allied species is known from Japan and N. Asia.

rhizophyllus, Link. Fig. 776. Lvs. evergreen, simple, tapering from a heart-shaped base, 4-12 in. long; veins forming meshes near the midrib; sori irregularly scattered, linear, straight or bent. Canada to Ala. — Sometimes grown in rockeries and wild gardens.

L. M. UNDERWOOD.

CAMPYLOBOTRYS: *Hoffmannia*.

CAMPYLONEURON: *Polypodium*.

CANADA: *British North America*.

CANAIGRE: *Rumex hymenosepalus*.

CANANGA: *Canarium*.

776. *Camptosorus rhizophyllus*. ($\times \frac{1}{2}$)

CANANGIUM (Makassar, *kananga*; Malay, *kenanga*) *Annonaceae*. Perfume-yielding tropical trees.

Closely allied to *Desmos* but differing in having the apex of the connectives of the stamens prolonged into a point, instead of being broadened into a hood-like covering for the pollen-sacs. sepals 3, petals 6 in 2 series, valvate, nearly equal, flat, linear; stamens many, closely crowded on the convex torus, the connective produced into a long tapering point; carpels indefinite,

777. *Canarium odoratum*. a, flowering branch, b, stamens, c, longitudinal section of fruit, d, fruit cluster.

clustered in the center of the mass of stamens, ovules in 2 columns or apparently in a single column, style linear or linear-oblong, terminating in an obtuse swelling, ripe carpels (fr.) several, pedicelled, ovoid or oblong and more or less constricted between the seeds. The name *Cananga*, usually applied to this genus, was used by Aublet in 1775 for an entirely different genus, and cannot therefore be valid for the present one. Baillon recognized this fact, and proposed the name *Canangium*, without, however, coupling it with specific names. It was taken up by Sir George King in his *Annonaceae of British India*, 1893, and was applied by him to the celebrated ylang-ylang tree, *Canarium odoratum*.

odoratum, King (*Urvra odorata*, Lam. *Udona odorata*, Dunal. *Cananga odorata*, Hook. f. & Thoms.) **YLANGYLANG** **LIANGILANG** **ALANGILANG** **MOSO'OI** **MOTO'OI** Fig. 777. A tree bearing a profusion of greenish yellow fragrant fls. with long narrow petals, from which the celebrated ylang-ylang is made. The tree is found in S. India, Java, the Philippines, the Malay Archipelago, and many islands of the tropical Pacific. It occurs spontaneously as well as in cult, and its seeds are widely scattered by fruit-pigeons and other birds. In the Samoan Is. it is much beloved by the natives, who make garlands of "moso'oi" with which to adorn themselves, and they celebrate its fragrance in their songs. The fls. yield a fragrant volatile oil known in commerce as the oil of liangilang, usually obtained by steam distillation. The natives use a much simpler process in securing oil for anointing their heads and bodies. Fls. are put into coconut oil and, after remaining a short time, are replaced by fresh ones,

the oil being subjected to a gentle heat. "Macassar oil" is prepared in this way, fls. of *Michelia Champaca* being often added to those of the ylang-ylang

Brandisianum, Safford (*Unõna Brandisiana*, Pierre. *Unõna latifolia*, Hook. f. & Thoms, not Dunal) A tree endemic in the forests of lower Cochín China and Cambodia, with very fragrant fls. resembling those of *C. odoratum* but with the petals relatively broader, constricted at the base, and thicker, and the lvs. usually cordate at the base and tomentose beneath, instead of rounded at the base and pubescent beneath. The fr. resembles that of the preceding species but with fewer seeds arranged almost in a single row, but on close inspection seen to be biserial. The fls. yield a perfume similar to that of the true ylang-ylang of commerce
W. E. SAFFORD

CANARINA (from the Canary Islands) *Campanulacæ*. Cool-house tuberous-rooted herb closely allied to Campanula, but with the tubes of the calyx and corolla grown together, and the floral parts in 6's.—Three species. *C. Campanula*, Linn., is a tender perennial from the Canaries, about 6-8 ft. tall, with drooping, inflated buds and solitary, bell-shaped fls. more than 1 in long and 1½ in wide, dull yellow, flushed and veined with dull purplish brown the lobes of the corolla strongly reflexed lvs. hastate, coarsely repand-dentate fr. a fleshy berry. B M. 444 —Intro. by Franceschi in 1895

CANARY-BIRD FLOWER *Tropæolum*

CANARY GRASS *Phalaris*

CANAVÁLIA (an aboriginal name). Including *Malacocha Leguminosæ*. Bean-like plants, some of them producing edible seeds and some more or less grown for ornament

Prostrate trailing or twining herbs, with pinnately 3-foliolate lvs. fls. in axillary racemes or fascicles, often large, violet, rose or white, with bell-shaped, 2-lipped calyx, papilionaceous corolla, 9 stamens united and 1 free for all or part of its length pods large and ribbed on edges—A dozen species, widely distributed in warm countries

ensiformis, DC (*C. glabráta* var. *ensiformis*, DC.). JACK BEAN. CHICKANAW LIMA Figs 485 (Vol I), 778. Glabrous or nearly so lvs. ovate-oblong or ovate, mucronate upper lip of calyx longer than the tube, recurved and notched, keel blunt, curved seeds white, with a dark raphe. Tropics of both hemispheres—B M 4027 A G 14. 84.—Grown in the southern states for stock, but the pods make passable snap beans when not more than 4-6 in long. In warm countries it is a bushy plant, with little tendency to climb. The pods

778 Seeds of *Canavalia ensiformis*. (X1)

reach a length of 10-14 in., the walls being very hard and dense when ripe; the halves of the pod, when split apart, roll up spirally often into an almost perfect cylinder. The large white turgid beans, bearing a very prominent brown seed-scar, are packed crosswise the pod, imbedded in a very thin white papery lining. The fls. are small and light purple, resembling those of the cowpea (but larger) and of various species of *Dolichos*. The lvs. are large and broad (5-8 in long and half or three-fifths as broad), strongly veined and dull, dark green, abruptly pointed and smooth. Beans should be used as a coffee substitute.

C. bonariensis, Lindl. Twining lvs. ovate, with the long apex obtuse, fls. purple in drooping racemes that exceed the lvs., the standard large broad and notched. Uruguay and S. Brazil. B R 1199 H U 4, p. 129.—*C. glauca*, DC. Prostrate or climbing lvs. nearly orbicular to oval or obovate, rounded or cuneate at base, fls. pink, in racemes exceeding the lvs. seed brown, oblong. Fla. and Texas south. Known as "mato de la playa" in Porto Rico.—*C. ruscopierma*, Urban. Large and tall, ascending highest forest trees seeds red. Known as "Mato colorado" W. Indies.
L. H. B.

CANDELILLO. *Euphorbia antisyphilitica*

CANDELBERRY, CANDENLUT. *Aleurites*.

CANDÓLLEA (A. P. DeCandolle, 1778-1841, famous botanist of Geneva, Switzerland). *Candolleæ*; formerly referred to *Dilleniæ*. Herbs or woody plants sometimes grown under glass or in the open far South for the mostly yellow flowers

Shrubs or undershrubs or herbs, mostly glabrous. lvs. simple, mostly narrow, sometimes with margins revolute. fls. few or solitary at the ends of the branches; sepals and petals 5, stamens many, united into 5 bundles or acts, each set bearing several anthers; carpels 2-3-5, with 1-3 ovules in each.—As now understood, probably 80-90 species, mostly W. Australian, but 1 in Trop. Asia and S. China and 1 in the E. Indies. Little known in cult., but the following Australian species are now offered

tetrándra, Lindl. Shrub, with branches angular, pubescent lvs. narrow-oblong to oblong-ovate, obtuse or short-acuminate, 2½ in or less long, clasping, margins not revolute. fls. much larger, paler yellow, the petals 1 in long and the acute sepals ¾ in long fr. with orange aril. B R 29 50.—Offered as a greenhouse plant.

cuneifórmis, Labill. Erect shrub, 6 ft and more, with short crowded branches that are somewhat hairy when young; lvs. oblong-cuneate to obovate, truncate or few-toothed at apex, 1 in long fls. bright sulfur-yellow, sessile in the crowded floral lvs.; sepals about ½ in, and the notched petals somewhat longer. B M. 2711.—Offered in S. Calif., where it blooms March-June
L. H. B.

CANDYTUFT. *Iberis*

CANE-BRAKE Species of *Arundinaria* (treated under Bamboo)

CANÍSTRUM (Greek, a basket) *Bromeliæ*. Epiphytic or terrestrial hothouse plants, requiring the treatment of billbergias

Leaves in a dense tuft, acute, spinulose on the margin inf. compound, in a cup of lvs. on a very short st. as in *Nidularium*, or on a longer exserted st., fls. usually green, rarely golden or blue—A genus of about 10 species, natives of Brazil. They are sometimes referred to *Nidularium*

Lindenii, Mez (*Æchmæa ebúrnea*, Baker. *Guzmánia fragrans*, Hort. *Nidularium Lindenii*, Regel) Lvs. about 20, in a dense rosette, tomentose, green-spotted, the bract-lvs. cream-white. fls. white or greenish

amazónico, Mez (*Karátas amazónica*, Baker. *Nidularium amazonicum*, Lind. & André. *Æchmæa amazónica*, Hort.) Lvs. 15-20, 10-20 in long, and rather wide at the middle, greenish brown above and light brown beneath, not spotted or scurfy, the bract-lvs. greenish brown; fls. white, with a green tube, in a dense head

C. aurantiacum, E. Morr (*Æchmæa aurantiaca*, Baker). Plant vigorous lvs. expanded in the middle fls. yellow, 2 in. long S. Amer. B H 1873 15
GEORGE V. NASH †

CÁNNA (name of oriental origin, of no application). *Cannæ*. Popular tall ornamental plants, prized for their stately habit, strong foliage and showy flowers: much used for bedding

Stout, unbranched: fls. mostly red or yellow, in a terminal raceme or panicle, very irregular: caps. 3-loculed and several-to many-seeded (Fig. 779, p.); sepals

(a) 3 and small and usually green; petals (ccc) 3, mostly narrow and pointed, green or colored, style (e) single and long, the stamens are commonly petal-like, oblanccolate bodies or stamnodia (aaab), 2 or 3 of which are usually

779. The parts of the Canna flower.

A generation or two ago, cannas were grown for their foliage or mass-effect. They were tall and long-jointed, with small and late flowers (Fig. 780). An old-time garden race of tall cannas was *C. Anna*, raised by M. Année, of France, from seeds of the true *C. uipalensis*, sown in 1818. The flowers from which the seeds were taken probably had been pollinated by some other species, most likely with *C. glauca*. In 1863, a new race appeared, as the result of the union of *C. vridiflora* with *C. Warszewiczii*. This hybrid was known as *C. Ehemanni* (and *C. vridiflora hybrida*). This was of intermediate stature, with showy foliage and better drooping flowers. Under this name plants are still sold, but they may not be identical with the original *C. Ehemanni*. This race has been variously crossed with other species and forms, and from innumerable seedlings there have been selected the dwarf and large-flowered cannas (Figs. 781, 782), which have now practically driven out

780. Old-time canna.

the old tall small-flowered forms. These dwarf cannas are often known as French cannas, from the country of their origin; also, as Crozy cannas, from a renowned breeder of them. Within recent years, another race of cannas has arisen from the amalgamation of our native *C. flaccida* with the garden forms and with *C. vridiflora*. These have come mostly from Italy and are known as Italian cannas; also as orchid-flowered cannas. The flowers are characterized by soft and flowing iris-like outlines, but they are short-lived. Of this class are the varieties *Italia* (Fig. 783), *Austria*, *Bavaria*, *Burgundia*, *America*, *Pandora*, *Burbank* and others. For a sketch of the evolution of the garden cannas, see J. G. Baker, Journ. Roy. Hort. Soc., Jan., 1894; also, for the history of the Italian race, *Revue Horticole*, 1895, 516, and *Gardeners' Chronicle*, Dec. 14, 1895; Kranzlin, cited above.

The culture of cannas is simple and easy. They demand a warm, friable, rich and moist soil. They are injured by frost, and therefore should not be planted out until the weather is thoroughly settled. For dense mass effects, set the plants not more than 1 foot apart each way, but if it is desired to show individual plants and their flowers at the best, give three times that amount of room to a single plant. Pick the flowers as soon as they wilt, to prevent the formation of seeds (which causes the plant to lessen flowering), and keep the plants in tidy condition. Give the soil and treatment that produce the best results with Indian corn.

New varieties are raised from seeds. The seeds usually germinate slowly, and sometimes not at all, unless the integument is cut or filed, or is softened by soaking in water, these precautions taken, they germinate quickly. Sow late in winter, in rather strong bottom heat, in flats or pots. Pick out, and give plenty of room. They should make blooming plants the first year.

Commonly, cannas are propagated by dividing the rootstock. This rootstock is a branching mass, with many large buds. If stock is not abundant, as many plants may be made from a rootstock as there are buds, although the weak buds produce weak plants. Leave as much tissue as possible with each bud. These one-bud parts usually give best results if started in pots, so that the plant is 6 to 12 inches high at planting time. The commercial canna plants are grown mostly in pots. If one has sufficient roots, however, it is better not to cut so close, but to leave several strong buds on each piece (as shown in Fig. 784). These pieces may be planted directly in the ground, although more certain results are to be secured by starting them in the house in boxes or pots.

If strong effects are desired, particularly in shrub borders, it is well to plant the entire stool. In the fall, when the plants are killed by frost and the tops have dried a few days, dig the roots, and let them dry, retaining some of the earth on them. Then store them on shelves in a cellar that will keep Irish or round potatoes well. Take care that the roots do not become too warm, particularly before cold weather sets in, nor too moist. Well-cured roots from matured plants usually keep without much difficulty. If they do not hold much earth, it is well to throw a thin covering of light soil over them, particularly if they are the highly improved kinds.

Cannas are commonly used only in formal beds, but most excellent effects may be secured by scattering them singly or in very small clumps in the hardy border or amongst shrubbery. Against a heavy background of green, the gaudy flowers show to their best, and the ragged effect of the dying flowers is not noticed. They also make excellent centerpiece for formal beds. The tall-growing cannas, with small and late flowers, have given way almost wholly to the modern race of Crozy or French dwarf cannas, which usually remain under 4 feet high, and give an abundance of large early flowers. The canna always must be used for bold planting effects, because the flowers

781. Modern flowering canna.

have not sufficient durability to be very useful as cut-flowers. As individual blooms, the flowers are not usually attractive, but they are showy and interesting in the mass and at a distance. The new race of Italian or Flaccida cannas has more attractive flowers, but even these are most useful when on the plant.

It is impossible for the gardener to determine species of canna in the common garden forms. In fact, the species are little known except in herbaria and as wild plants growing in their original habitats. The monographers do not agree as to the definitions of what have been described as original or wild species. The following account of species is included more for the purpose of showing the range within the genus and of making a catalogue of leading botanical names than to set specific limits or to indicate what species-forms are in cultivation. The Crozy experiments began with crossing *C. Warscewiczii* with a variety of *C. nepalensis* of gardens (*C. flaccida*) having large yellow flowers and very long creeping tubers, and some of the progeny was crossed with *C. aureopicta* (a garden form). The recent attractive orchid-flowered cannas spring largely from the *C. flaccida* forms.

A. Petal-like stammodia none.

1. *paniculata*, Ruiz & Pav (*C. excelsa*, Lodd.) St very tall, slender, glabrous lvs oblong or ovate and acute, green and glabrous above and pubescent beneath racemes lax, disposed in a squarrose panicle, the fls in 2's, sepals lanceolate, $\frac{1}{2}$ in long, obtuse; petals lanceolate, yellow-green, 2-3 in long, lip rather longer than the petals, crimson. Subequatorial Andes.

AA. Petal-like stammodia 2.

B. Plant woolly-pubescent on the sheaths and sometimes on the lf-blades

2. *compacta*, Roscoe. St tall, stout, and green; lvs many, oblong to ovate and acute raceme simple and densely many-fl'd, the rachis 3-angled; sepals ovate, acute, $\frac{1}{2}$ in long; petals unequal, narrowly lanceolate and long-acuminate, $1\frac{1}{2}$ in long, red-yellow; stammodia oblanceolate, slightly emarginate, $1\frac{1}{2}$ -2 in long, scarlet or deep orange-red; lip broad-linear, emarginate, red-yellow. S Amer

3. *lanuginosa*, Roscoe (*C. Achras*, Litt.) St green, woolly, 4-6 ft, densely lvd; lvs ovate-oblong, acute, green; raceme long and contracted, many-fl'd, simple,

the bracts obtuse, small and green, sepals ovate-lanceolate, greenish red, $\frac{1}{2}$ in or less long; petals long-lanceolate, $1\frac{1}{2}$ in long, tinged with red, stammodia entire, red or red-yellow, lip the same color, and revolute. Brazil, Peru B R 1358

4. *lagunensis*, Lindl Differs from *C. lanuginosa* in having long pale yellow fls, by some referred to *C. lutea* plant of medium size, lightly lanate on the sheaths lf-blades ovate-oblong, short-acute and apiculate, pale-margined petals linear-lanceolate and acuminate lip strongly revolute, red-spotted Mex, Cent. Amer. B R 1311, 1358 Aug-Nov

5. *pallida*, Roscoe (*C. Moritziana*, Bouché) Plant medium height lf-blade elongate-elliptic, acuminate and filamentous at end, sometimes white-margined; raceme simple and narrow, the bracts broadly oblong-cuneate; sepals ovate and obtuse, green, petals lanceolate and acuminate, greenish-sulfur-color, lip linear, 2-tipped, revolute, pale yellow, spotted W Indies and N. S. Amer

BB Plant glabrous on sheaths and lf-blades

C Lvs of 3 colors.

6. *discolor*, Lindl (*C. rotundifolia*, André) St stout, 6-10 ft, purple and glabrous lvs very broad-oblong, acute, the lower ones sometimes 3 ft long, dark green and purple-margined, red-purple beneath; fls in a deeply forked panicle of lax racemes, the bracts small and oblong, sepals lanceolate, obtuse, $\frac{1}{2}$ in long, green, tinted with purple, petals lanceolate, acuminate, $1\frac{1}{2}$ in long, pale green tinted with rose, stammodia entire, $2\frac{1}{2}$ in long, bright red, exterior yellow, lip lanceolate and emarginate, brick-red Cent and S Amer B R 1231 C. *concinna*, Bouché, is a related species with lanceolate lvs narrowed at both ends. S Amer.

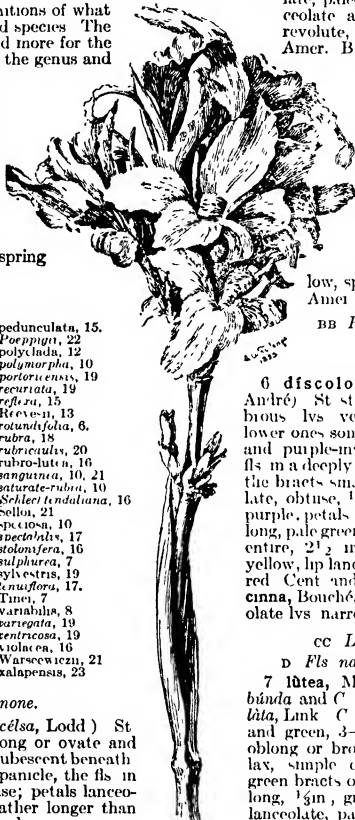

CC Lvs uncolored, green

D Fls narrow, the parts connivent

7. *lutea*, Miller (*C. commutata*, *C. floribunda* and *C. densifolia*, Bouché *C. maculata*, Link *C. sulphurea*, Hort.) St slender and green, 3-4 ft, distantly foliated lvs oblong or broad-lanceolate, acute raceme lax, simple or rarely forked, the small green bracts oblong and obtuse, sepals oblong, $\frac{1}{2}$ in, green, white-margined, petals lanceolate, pale yellowish white, 1-1 $\frac{1}{2}$ in long, stammodia pale yellow, often emarginate, $1\frac{1}{2}$ -2 in long, lip linear, pale yellow, emarginate Mex to Brazil B M 2085 L B C 7 G 46 C. *Tinei*, Tod, perhaps a hybrid, apparently is to be associated with this species

Var *aurantiaca*, Kranz Fls. orange; lip yellow

8. *variabilis*, Willd (*C. carnea*, Roscoe). St green, 3-6 ft lvs broad-lanceolate or elliptic, acute, bright green raceme simple and lax, the small bracts oblong and obtuse, sepals lanceolate, green, $\frac{1}{2}$ in long, petals lanceolate, acuminate, concave, $1\frac{1}{2}$ in long, pale flesh-color, stammodia 2, spatulate-linear, mostly entire, variable in color but mostly orange or rose; lip linear or ligulate and entire caps small, globose S Brazil, the particular place unknown.

Flowering or
French canna
—Prince
Hohenlohe.

DD. *Fls. rurgent or gaping, or open-spreading.*

E. *Infl. simple or only moderately branched.*

9. *humilis*, Bouché (*C. ectyua*, Bouché) Low, 3 ft. or less, slender. lvs. short-petioled, the blade oblong, acute or short-acuminate, glabrous above and below, 10-16 in long raceme sub-simple (rarely paniculate), bearing fls large for size of plant (about 3 in long); sepals very unequal, ovate-oblong, petals long-lanceolate, concave, connate at base into a tube, scarlet; staminodia spatulate, more or less 2-lobed at apex, lip rather narrow, about $2\frac{1}{4}$ in long Farther India, China, etc *C. cinnabarina*, Bouché (*C. fulgida*, Bouché), is a related species but larger and with yellow and scarlet rather smaller fls Mex., Cent Amer., W. Indies

10. *speciosa*, Roscoe (*C. leptochila* and *C. saturata-rubra*, Bouché *C. polymorpha*, Loud. *C. sanguinea*, Hort.) Large: st. green, 5-6 ft. lvs broad-oblong, acute: fls. in an elongated raceme or sometimes paniculate; sepals lanceolate, $\frac{1}{2}$ in. long, pale purple; petals linear-lanceolate, $1\frac{1}{2}$ in long, erect, pale purple; staminodia 3 in. long, emarginate, bright red; lip emarginate, yellow. Himalayas B.M. 2317. B.R. 1276. *C. chinensis*, Willd. (*C. nepalensis*, Wall.) differs in having reflexed petals

11. *orientalis*, Roscoe (*C. flavescens*, Link.) St. slender, glabrous, 3-4 ft. lvs ovate-oblong, a foot or more long, raceme lax, simple or forked, the bracts oblong; sepals oblong-lanceolate, obtuse, $\frac{1}{2}$ in. or less long, pale green and rose-tinted; petals lanceolate, acuminate, $1\frac{1}{2}$ in. long, pale rose, upper staminodia $2\frac{1}{2}$ in or less long, bright red, often emarginate, lip red-yellow caps globose and very small Malaysian tropics

EE. *Infl. much-branched; fls purple.*

12. *polyclada*, Wawra (*C. eximia*, Bouché. *C. cearensis*, Huber) St tall and very slender lvs. ovate or ovate-lanceolate, acute fls (often in pairs) in a long, much-branched panicle, the bracts nearly orbicular, sepals lanceolate, $\frac{1}{2}$ in long; petals long-lanceolate and unequal, acuminate, the longest about $2\frac{1}{2}$ in, purple; staminodia acute, scarcely longer than the petals; lip oblanceolate, scarlet-spotted. Brazil

AAA. *Petal-like staminodia 3 (exception in No. 18).*

B. *Lvs. lanceolate fls. mostly yellow or orange.*

c. *Petals deflexed.*

13. *flaccida*, Salisb (*C. glauca* and *C. angustifolia*, Walt.) St. green and glabrous, 4-6 ft., very leafy below lvs ovate-lanceolate to narrowly elliptic, acute, green. raceme simple, lax and few-fl'd., the bracts very small; sepals lanceolate or oblong, acuminate, 1 in. long, green; petals broadly linear-lanceolate to obovate and reflexed, to 3 in long (as is also the tube); staminodia obovate, sulfur-yellow, 2-3 in long by $1\frac{1}{2}$ in. broad, lip large, yellow. Swamps S. C. to Fla., near the coast. L.B.C. 6.562. G.W. 12, p. 253.—Useful for its good habit and irish-like fls *C. Reevesii*, Lindl., of India and the Philippines, has the outside staminodia acute rather than all obtuse or emarginate as in *C. flaccida*, and fls. less than 4 in. across rather than about 6 in. across. B.R. 2004.

14. *Fintelmannii*, Bouché. St. green and glaucous, 4-5 ft.: lvs. oblong or ovate-elliptic and acute, bright green. raceme few-fl'd and rather dense, the bracts green and oblong; sepals oblong, $\frac{1}{2}$ in., green; petals

lanceolate, acuminate, greenish yellow, $1\frac{1}{2}$ -2 in.; staminodia obtuse and entire (or 2-lobed at apex), 2-3 in. yellow; lip linear, strongly reflexed, yellow, mottled red: caps. large. Mex. and Cent. Amer.

15. *pedunculata*, Sims (*C. Buetti*, Weinm. *C. reflexa*, Nees). St. tall, slender, green and glaucous, 5-6 ft.: lvs. oblong-lanceolate, green and glaucous. 1-2 ft. long and 3-4 in. broad. fls. in a many-fl'd long raceme, with a hairy rachis and long-spreading pedicels, the bracts small, oblong and obtuse, sepals oblong, small and green; petals linear-lanceolate, greenish yellow, reflexed, 2 in long; staminodia emarginate, about 2 in. long, pale yellow; lip oblanceolate, yellow caps globose, small. W. Indies, S. Amer B.M. 2323. L.B.C. 7:622.

cc. *Petals erect.*

16. *glauca*, Linn. (*C. Schlechtendalana*, Bouché. *C. Annae*, André *C. mexicana*, and *C. stolonifera*, Bouché. *C. lanceolata*, Lodd.) St. green and glaucous, 5-6 ft., from a long and stoloniferous rhizome: lvs green and glaucous, oblong-lanceolate and very acute, tapering both ways (the middle of the blade 4-6 in wide), white-margined: raceme lax, simple or forked; sepals ovate-obtuse, green, $\frac{1}{2}$ in long, petals linear-lanceolate, yellow-green, $1\frac{1}{2}$ -2 in, staminodia entire, $2\frac{1}{2}$ -3 in, yellow, not spotted, lip linear or obovate-oblong, emarginate, pale yellow: caps oblong, $1\frac{1}{2}$ -2 in long W. Indies, S. Amer Var *rubro-lutea*, Hort., has fls. deep yellow tinted red, or in some portraits represented as deep purple B.M. 3437. *C. longifolia*, Bouché, from Mex and Cent. Amer., has the petals all free, whereas they are united in a tube in *C. glauca*, and with curved sulfur-yellow fls *C. leucocarpa*, Bouché, S. Amer, has petals united into a short tube, the fls small, pale orange with broad leafy style. *C. violacea*, Bouché, habitat unknown, has petals united in short tube, fls violet, strongly gaping, plant deciduous-woolly above.

BB. *Lvs. broadly oblong or elliptic: rhizome tuberosus.*

c. *Plant low or medium in height (mostly 5 ft. or less).*

d. *Staminodia entire at apex.*

17. *Indica*, Linn. (*C. patens*, Roscoe. *C. erodea*, Hort. *C. tenuiflora* and *C. speciosissima*, Bouché. *C. coccinea*, Link.) INDIAN SHOT St. slender, glabrous, green, 3-5 ft.: lvs oblong and acute, green, not glaucous, half as broad as long (1-1 $\frac{1}{2}$ ft. long) racemes simple or very nearly so and lax, some of the fls in pairs, the bracts green and nearly orbicular, fls small, sepals oblong and green, $\frac{1}{2}$ in. long; petals lanceolate, pale green, about 1 $\frac{1}{2}$ in. long; upper staminodia bright red, entire, 2 in. long but narrow; lip linear, red-yellow, minutely spotted with red: caps. globose, 1 in diam. W. Indies, Cent. and S. Amer. Naturalized in parts of southern states. B.M. 454. B.R. 776. L.B.C. 17:1693.

18. *coccinea*, Miller (*C. rubra*, Willd.). St. slender, green, 4-5 or sometimes 6 ft.: lvs. oblong, or oblong-lanceolate, and acute: raceme simple and lax, with small green, orbicular bracts; sepals lanceolate, $\frac{1}{2}$ in. or less

783.

Italia canna.

long, green tinged with red; petals lanceolate, acuminate, $1\frac{1}{2}$ in. long, pale scarlet; staminodia 2, long and narrow, mostly emarginate; lip yellow-spotted, caps. globose and small. W Indies, Cent. and S Amer. **C. formosa**, Bouché, Brazil, has 3 unlike staminodia.

DD. *Staminodia 2-lobed.*

19. **syvestris**, Roscoe (*C. portoricensis*, Bouché). Plant stout, 4-5 or 6 ft. lvs. long-oblong or oblong-lanceolate, acuminate, bright green, to $2\frac{1}{2}$ ft. long and one-third as wide. Raceme slender, usually squarrose, rarely simple, fls. narrow and elongated, red, sepals lanceolate and acute, $\frac{1}{2}$ in. long, petals much longer, lanceolate and very acuminate, staminodia sub-equal, narrow-spatulate; lip narrow, strongly revolute. W. Indies, Cent Amer. **C. limbata**, Roscoe (*C. patens*, Hook. *C. aureo-vittata*, Lodd. *C. floribunda*, *C. variegata*, *C. recurvata*, *C. lata* and *C. ventricosa*, Bouché), of S. Brazil, has unlike staminodia, the largest being 2-lobed, the medium one emarginate, the other entire, all red with yellow margins. B R. 771 L B C 419

cc Plant tall, often up to 19 ft. (No 21 perhaps excepted).

E. *The staminodia not united.*

20. **edulis**, Ker (*C. esculenta*, Lodd. *C. rubricaulis*, Link). Rootstock thick and edible. St. stout, 8-12 ft., purple; lvs. large, oblong, or ovate-oblong, green or bronze, 1-2 ft. long. Raceme lax, forked or simple, fls. red or brick-red, usually in pairs, the bracts orbicular or oblong, sepals oblong-lanceolate, $\frac{1}{2}$ in. long, tinged with red, petals oblong-lanceolate, $1\frac{1}{2}$ in., staminodia entire or emarginate, $2\frac{1}{2}$ in. long, bright red or orange, lip bright red or yellow-red caps. large. W Indies, S Amer. B M 2498 B R 775 Starch is procured from the roots, and for this purpose the plant is widely cult. in the tropics.

21. **Warszewiczii**, Dietl (*C. sanguinea*, Waise) St. claret-purple and glaucous, 3-4 ft. lvs. oblong and acute, more or less claret- or bronze-tinged, $\frac{1}{2}$ ft. long and nearly one-half as broad. Raceme simple and rather dense, with ovate, brown, glaucous bracts; sepals lanceolate, $\frac{1}{2}$ in., glaucous purple, petals lanceolate, acuminate, nearly 2 in. long, reddish and glaucous; staminodia oblanceolate, entire, $2\frac{1}{2}$ -3 in. long, bright scarlet, lip oblanceolate, emarginate, bright scarlet. Costa Rica, Brazil B M 4851 **C. Sellii**, Hort (*C. patens*, Baker), of S. Brazil, is tomentose, sepals ovate; petals oblong-lanceolate, united into a tube, staminodia strongly reflexed, one 2-parted.

EE *The staminodia united into a tube, or at least connate at base*

22. **Lambertii**, Lindl (*C. Pappigii*, Bouché) St. stout, very tall (to 10 or 11 ft.) green and glabrous, 12-14 ft. lvs. oblong-lanceolate to elliptic, green, acute; raceme simple or forked, lax and few-fl'd., the bracts large and oblong, green, sepals lanceolate, pale purple or lilac, $\frac{1}{2}$ in. long; petals lanceolate, acuminate, $1\frac{1}{2}$ in. long, purple, staminodia unlike, obovate, entire, scarcely longer than the petals, connate at base, bright crimson; lip bright crimson-purple; caps. oblong, large. W Indies, S. Amer. B R 470

23. **latifolia**, Miller (*C. gigantea*, Desf. *C. macrophylla*, Hort. *C. neglecta*, Wenm. *C. gemella*, Nees. *C. Allensteinii*, Bouché). St. stout, very tall (10-16 ft.) pubescent; lvs. ovate or ovate-oblong, acute, green, but purple-margined when young, the lower ones often 3-4 ft. long, fls. in several racemes forming a panicle, the bracts oblong or the lower ones becoming several inches long; sepals oblong and green, $\frac{1}{2}$ in. long, very unequal, petals lanceolate, acuminate, 2 in. long, scarlet; staminodia united into a tube, entire at apex or one of them 2-lobed, somewhat twisted, brick-red; lip brick-red; caps. large. S Amer. L B C. 7:634.

—**C. heliconifolia**, Bouché, Texas to Venezuela, has the staminodia more or less connivent, fls. orange-red, lvs. long-petioled, more or less woolly, oblong-acuminate plant 7-8 ft. Var **zalapensis**, Krnzl (*C. zalapensis*, Bouché), has narrower lvs. and smaller stature.

DD. *Staminodia large (5 in. or less long), united into a tube*

E. *Fls. pendulous, rose-colored*

21. **iridiflora**, Ruiz & Pav. St. green, 6-12 ft. lvs. broad-oblong, bright green, slightly pubescent beneath; racemes paniculate, drooping; fls. large, beautiful rose-color, tube of corolla and staminodia as long as the blade, sepals lanceolate, 1 in. long, corolla-lobes lanceolate, $2\frac{1}{2}$ in. long; 3 upper staminodia somewhat longer than the corolla-lobes, obovate, nearly or quite 1 in. broad, rose-crimson, lip narrow, deeply emarginate, rose-crimson. Andes of Peru B M 1968 B R 609 L B C 10 905 R H 1861 110

784. Stool of canna, showing how it may be divided.

EE. *Fls. erect-spreading, white and red.*

25. **liliflora**, Warse St. robust, green, 8-10 ft.: lvs. many, oblong, green, 3-4 ft. long, spreading from the st. at a right angle. fls. in a corymbose panicle; sepals linear, as long as the tube of the corolla, corolla-lobes lanceolate, 2-3 in. long, pale green, the tube of equal length, 3 upper staminodia white, united into a tube for half their length, the blade obovate and spreading, lip oblanceolate, as long as the staminodia. Colombia. R H 1884:132 F S 10 1055-6 —A fine species. The white fls. finally become tinged with brown; lonicera-scented.

L H B.

CANNABIS (the ancient Greek name) *Moræææ*. HEMP. A widely cultivated fiber plant, and also used occasionally as an ornamental subject, being grown from seeds and treated as a half-hardy annual.

Hemp is dioecious, staminate fls. in axillary panicles, with 5 sepals and 5 drooping stamens and no petals, pistillate fls. in short spikes, with 1 sepal folding about the ovary. lvs. digitate, with 5-7 nearly linear, coarse-toothed lfts., fr. a hard and brittle achene. **C. sativa**, Linn, probably native in Cent. Asia, is now escaped in many parts of the world tall, rough and strong-smelling, 8-12 ft. lfts. 5-11, linear-lanceolate, toothed, the upper lvs. alternate and the others more or less opposite. Only one species, but various forms have received specific names. In gardens, the form known as *C. gigantea* is commonest, this reaches a height of 10 ft. and more. The seeds are usually sown where the

plants are to stand; but if quick effects are wanted, they may be started indoors in pots or boxes. Hemp makes excellent screens in remote places. It thrives best in a rich rather moist soil. For field cult. for fiber (which is derived from the inner bark), see *Cyclo Amer Agric*, Vol II, p. 377.

L. H. B.

CANTELOUPE: *Muskmelon*.CANTERBURY BELL: *Campanula Medium*.

CÁNTUA (from Cantu, Peruvian name). *Polemoniaceae*. Showy flowering shrubs, with variable foliage, in greenhouses, and out-of-doors far South.

785. *Capparis spinosa*.
(X 1/2)

Flowers corymbose; calyx campanulate, of 5 (rarely 3) sepals, which are much shorter than the long tubular corolla; stamens inserted at the base of the corolla, but exceeding it in length.—Six species in S. Amer. One kind is recommended in Eu. as a coolhouse shrub. No tenderer than fuchsias. Prop. by cuttings in sand under a bell-jar.

buxifolia, Juss. (*C. dependens*, Pers.). Much-branched shrub, about 4 ft. high, branches more or less downy. lvs. very variable, generally oblong-obovate, acute, tapering at the base, entire or serrate, downy or glabrous. fls 5-8, drooping vertically, in a kind of leafy, terminal corymb, calyx pale, membranous, green-streaked, 5-toothed, a fourth shorter than the corolla-tube; corolla long-funnel-shaped, the tube 2 1/2 in. long, red, usually streaked; limb of fringed, obcordate, crimson lobes which are much shorter than the tube; stamens included. Peru Apr, May BM 4582. F.S. 7:650 R.H 1858, p. 294 R B 27 181—One of the choicest of European greenhouse plants. Very liable to red spider.

C. bicolor, Lam. Distinguished from the above by the entire lvs. which are shorter, about 1 in. long, and the solitary fls. with a short, yellow tube, the limb not fringed. The fls. droop, but not vertically. Peru B.M. 4729 F.S. 4 343. Probably less desirable than the above—*C. pyrrolifolia*, Juss. Lvs. generally broader and more toothed than in *C. bicolor* fls. as many as 17, in an erect, terminal, compound corymb, calyx red-tipped, nearly half as long as the yellow corolla-tube, corolla about 1 1/2 in. long, with a white limb, stamens long, exserted. Peru B.M. 4386. F.S. 4 383.

CAOUTCHOUC TREE: *Hura*, *Manihot*, *Ficus elastica*, *Castilloa*, *Hevea*, *Landolphia*, and others, not treated here.

CAPE BULBS. A name applied to bulbous and bulb-like plants native to South Africa. They are dry-region plants, and often bloom with us in summer and autumn. Some of the leading genera are *Amaryllis*, *Brunsvigia*, *Nerine*, *Ixia*, *Tritonia*, *Watsonia*. See *Bulbs*.

CAPE CHESTNUT: *Colodendrum capense*.

CAPSICUM

CAPE GOOSEBERRY: *Physalis*.CAPE JESSAMINE: *Gardenia*.CAPER: *Capparis*.CAPE-SPURGE: *Euphorbia Lathyris*.

CÁPPARIS (Greek, *caper*, said by some to have been derived from the Arabic name of the plant). *Capparidaceae*. CAPER-BUSH, or CAPER-TREE. Greenhouse plants North, and suited to the open in Florida and California.

Trees and shrubs, with simple lvs.: sepals 4, rarely 5; petals usually 4; stamens usually many, inserted on the receptacle, the filaments thread-like and free; ovary long-stalked, 1-4-celled, with many ovules.—More than 150 species distributed throughout the warm regions of the earth. Differing from *Cleome* and most other cult. genera of the family in having baccate, not capsular, fr.

Capers are pickles made by preserving the flower-buds of *C. spinosa*, a straggling shrub which grows out of old walls, rocks, and rubbish in Mediterranean regions and India. Also rarely cultivated as a greenhouse flowering shrub. Propagation is by cuttings of ripe wood, under a bell-jar, in greenhouses, and by seeds South.

spinosa, Linn. Fig 785. Spiny shrub, 3 ft. high, often straggling and vine-like. lvs. roundish or ovate, deciduous. fls. borne singly, attenuate, and fading before noon, sepals 4, petals 4, oblong, clawed, wavy, white, 1 1/2 in. long, stamens 40-50, filaments purple above, perhaps the chief beauty of the plant. B.M. 291.—What seems to be the long style with a short unopened stigma, is really the elongated peduncle or torus topped by the pistil, which has no style and a minute stigma. Var. *rupéstris* (*C. rupéstris*, Sibth. & Smith) is a spineless form.

Mitchellii, Lindl. A much-branched shrub, usually very spiny, and more or less densely tomentose. lvs. ovate-oblong, 1-1 1/2 in. long, narrowed into a short petiole. fls. few, axillary, white or yellowish, followed by a tomentose globular berry 2 in. diam. Sand plains of Austral.—Suitable for dry places outdoors in S. Calif.

C. acuminata, Lindl. St. shrubby, with flexuose, smooth branches. lvs. petiolate ovate-lanceolate, acuminate. fls. large, solitary, white, the conspicuous stamens 3-4 times as long as the petals. China B.R. 1320.

CAPRIFOLIUM: *Lonicera*.CAPRIOLA: *Cynodon*.

CÁPSICUM (name of uncertain origin, perhaps from *kapto*, to bite, on account of the pungency of the seed or pericarp, or from *capsa*, a chest, having reference to the form of fruit) *Solanaceae*. RED PEPPER. CAYENNE PEPPER. Herbs or shrubs, originally from tropical America, but escaped from cultivation in Old World tropics, where it was once supposed to be indigenous.

Stem branchy, 1-6 ft. high, glabrous or nearly so; lvs. ovate or subelliptical, entire, acuminate. fls. white or greenish white, rarely violaceous, solitary or sometimes in 2's or 3's, corolla rotate, usually 5-lobed, stamens 5, rarely 6 or 7, with bluish anthers dehiscing longitudinally, ovary originally 2-3-loculed fr. a juiceless berry or pod, extremely variable in form and size, many-seeded, and with more or less pungency about the seeds and pericarp. Fig 786. The fr. becomes many-

786 Normal 2-loculed fruit of *Capsicum*, in cross-section.

located and monstrous in cult.—About 90 species have been named, most of which are now considered forms of one or two species. Monogr. by Irish, 9th Ann. Rept. Mo. Bot. Gard. For cult., see *Pepper*.

A Plant annual or biennial

ánnuum, Linn Fig 787. Herbaceous or suffrutescent, grown as annuals in temperate climates, but in warmer latitudes often treated as biennials. All of the leading commercial varieties in the U. S. readily find classification within the types or botanical varieties. The species has never been found wild. It is the pimiento of Trop. Amer.

b Fr oblong-linear.

c Calyx usually embracing base of fr

Var conoides, Irish (*C conoides*, Mill.). Suffrutescent lvs numerous, rather small, 2-3 in long, $\frac{3}{4}$ -2 in. wide peduncles slender, straight, erect; fls. small, calyx obconical or cup-shaped, usually embracing base of fr, corolla greenish white, spreading, $\frac{1}{2}$ - $\frac{3}{4}$ in fr. erect, subconical or oblong-cylindrical, about $\frac{1}{4}$ in long or less, usually shorter than the peduncles and mostly borne above the lvs, very acid. Coral Gem, Tabasco Gn 66, p 381

Var fasciculátum, Irish (*C fasciculátum*, Sturt) RED CLUSTER PEPPER Fig 788 St herbaceous, round or nearly so branches few lvs clustered or crowded in bunches about the summit, elliptical-lanceolate, pointed at both ends fr also clustered, erect, slender, about 3 in long by $\frac{1}{4}$ in diam, very acid

Var acuminátum, Fingh (*C chilense*, Hort) LONG CAÑEVE Herbaceous, very branchy, about 2½ ft high, bearing a dense mass of foliage. fl medium size, spread $\frac{1}{2}$ - $\frac{3}{4}$ in fr larger than the preceding, either erect or pendent Chile

cc Calyx not usually embracing base of fr

Var lóngum, Sendt (*C ánnuum*, Linn *C lóngum*, DC.) Plant herbaceous, about 2½ ft high, with comparatively few branches lvs large, often 4 in long by 2½ in wide fl. large; corolla spreading, $\frac{3}{4}$ -1¼ in, dingy white, calyx usually patenteriform or funnelform, rarely embracing base of fr fr often a foot long by 2 in diam. at base, flesh thick and in some varieties very mild Garden varieties are: Black Nubian, County Fair, Elephant's Trunk, Ivory Tusk.

BB. Fr of various shapes, but not oblong-linear

Var gróssum, Sendt (*C gróssum*, Linn) Herbaceous, about 2 ft high, with few branches lvs very large, often 3 by 5 in., sometimes coriaceous, lower ones usually pendent; petioles deeply channeled; peduncles stout, about 1 in long; corolla large, spreading, $\frac{3}{4}$ -1¼ in. fr large, oblate, oblong, or truncated, 3-4 lobed, usually with basal depression, more or less sulcate and rugose, flesh thick, firm, and of a mild flavor. Emperor, Monstrous, Bell, Sweet Mountain, Golden Dawn, Ruby King, Golden King, Brazilian Upright, Golden Upright, Squash, and others, are garden varieties.

Var abbreviátum, Fingh (*C umbilicátum*, Vell. *C. luteum*, Lam.) Suffrutescent lvs broadly ovate, 2-4 in long peduncles slender, straight or curved, as long as or longer than the berry fr about 2 in. long or less, varying much in the different horticultural varieties, in general ovate, quite rugose, except in one variety, sometimes turbinate. While this variety is used to some extent for pickling, it is noted more as an ornamental plant. Some garden forms are: Celestial, Etna, Kaleidoscope, Red Wrinkled, Yellow Wrinkled.

Var cerasifórmis, Irish (*C. cerasifórmis*, Mill.) Suffrutescent lvs medium size, ovate or oblong-acuminate, about $\frac{1}{4}$ - $\frac{3}{4}$ in calyx seated on base of fr, corolla large, spreading, $\frac{3}{4}$ -1½ in fr. spherical, subcordate, oblate, or occasionally obscurely pointed or slightly elongated, smooth or rarely minutely rugose or sulcate, flesh firm, $\frac{1}{2}$ -½ in thick, extremely pungent Garden forms are: Cherry, Yellow Cherry, Oxheart.

AA Plant perennial

frutéscentis, Linn Fig 789 Shrubby perennial, 3-6 ft high, with prominently angled or somewhat channeled st and branches branches loosely spreading or trailing lvs broadly ovate-acuminate, 3-6 in long, 2-3½ in wide peduncles slender, 1-2 in long, often in pairs, usually longer than the fr, calyx cup-shaped, embracing base of fr, corolla often with ochreous markings in the throat fr red, obtuse or oblong-acuminate, $\frac{3}{4}$ -1¼ in. long, $\frac{1}{4}$ -½ in diam, very acid — Cult. only S., as the seasons in temperate latitudes are not long enough to mature fr.

788 Capsicum ánnuum var. fasciculátum.

Var baccátum, Irish (*C baccátum*, Linn) Plants not so tall, but more erect than the species branches slender, fastigiate, flexuose corolla small, spreading, about $\frac{1}{2}$ in fr ovate or sub-round, about ½ in diam

H C IRISH.

CARAGANA (*Caragan*, its Mongolian name) *Leguminosae* PEA TREE Ornamental shrubs chiefly grown for their bright yellow flowers; some species are also used for hedges

Leaves abruptly pinnate, often with persistent spiny-pointed rachis, lfts small, entire; stipules deciduous or persistent and spiny; fls papilionaceous; standard upright, like the wings with long claws, keel obtuse and straight, stamens 10, 9 connate, 1 free, ovary scarcely stipitate pod linear, terete, straight, 2-valved, with several seeds — More than 50 species from S Russia to China, most of them in Cent Asia. Monograph by Komarov in Act Hort Petrop 29:179-388 (1908), with 16 plates

The caraganas are deciduous unarmored or stony shrubs

787. A form of *Capsicum ánnuum*.

789. *Capsicum frutescens*.

with yellow, rarely whitish or pinkish flowers axillary and solitary or fascicled, followed by linear pods. The cultivated species are quite hardy, except a few Himalayan species. They grow in almost any soil, but best in a sandy soil and sunny position, and are well adapted for shrubberies. *C. arborescens* is the only one which grows into a small tree, and is of upright habit, like *C. frutex*, which is about half as high and more graceful; most of the other species are low shrubs, of usually spreading habit. *C. arborescens* is one of the best hedge shrubs for the prairies of the Northwest.

Propagation is by seeds sown in fall or in spring; if kept dry during the winter, soaking in tepid water for two or three days before sowing will be of advantage; also increased by root-cuttings and layers, or by grafting on seedling stock of *C. arborescens* in spring.

on seedling stock of *C. arborescens* in spring

791 *Caragana frutex*. ($\times \frac{1}{2}$)

CARAGUŬTA By the latest monographer referred to *Gusmania*, which sees

CARALLUMA (aboriginal name) *Asclepiadaceae*. Low succulents, sometimes seen in collections, about 40 species, from S Spain and Afr to Arabia and India. They resemble stapelias, and require similar treatment. The sts are leafless, somewhat branched, erect, 4-sided and the angles toothed: fls near the summit of the sts, more or less clustered, purple, brown and yellow, and other colors, corolla rotate and 5-parted: fr. long and slender follicles. The Carallumas are probably not in the American trade. Some of the names that may be expected in collections are *C. adscendens*, R. Br.; *C. affinis*, Wildem.; *C. campanulata*, N E Br. (Boucerosia campanulata, Wright); *C. commutata*, Berger (sometimes grown as C. Sprengeri); *C. fimbriata*, Wall; *C. inversa*, N E Br.; *C. Luntii*, N E Br.;

(*Sprengeri*, N. E. Br.; *C. Simonis*, Berger (Boucaerosia Simonis, Hort.); *C. tortia*, N. E. Br.

CARAMBOLA: *Averrhoa*.

CARAWAY (*Càrum Càrvn*, Linn). *Umbelliferae*. A biennial or annual herb grown for its seeds, which are used in flavoring bread, cakes and cheese, also occasionally for the young shoots and leaves, which are eaten. It grows a foot or two high, has finely-cut, pinately compound foliage, and small white flowers, in umbels. It is of the easiest culture. The seed is usually sown in spring and the crop of seed taken the following year. It thrives in any garden soil. The plant occasionally runs wild. See *Carum*.

CARBÈNIA: An incorrect or doubtful name for *Cnicus*, which see.

CARDAMINE (Greek name of a cross) *Cruciferae*. Small mostly leafy-stemmed perennials (the annual species apparently not cultivated), growing in low rich land, blooming in spring or early summer.

792. *Cardamine pratensis*. Root-leaves not showing.

Flowers sometimes large for size of plant, white or purple, petals obovate or spatulate, pods linear and straight, more or less flattened, the wingless seeds in 1 row, valves usually separating elastically from the base. Lvs simple or pinnate or lyrate, root often tuberous or rhizomatous. —About 50 species, largely in boreal or alpine regions. Of easy cult. Only *C. pratensis* is much known among growers.

pratensis, Linn. Cuckoo Flower. Fig. 792. Plant slender and usually glabrous, 12-20 in., somewhat branched. Lvs pinnately divided, lfts of root-lvs small and rounded ($\frac{1}{2}$ in or less across), those of the upper st. lvs oblong or even linear and entire or somewhat toothed. fls $\frac{1}{2}$ in long, in a corymb, white or rose-color, pretty. Eu and Amer, in the northern parts. —In the gardens it is chiefly known in the double-fl'd form, which probably has been derived from European rather than American sources. There are other forms

of it. It is an excellent little plant to grow in moist places, particularly along creeks and about springs. It is also useful in drier places, as in rockeries.

triflôia, Linn. Attractive spring bloomer, 6 in., creeping, lvs ternate, the toothed parts or sogs. irregularly roundish fls snow-white, on a naked scape. S. Eu B. M. 452.

angulata, Hook. Erect, 1-2 ft. high; lvs. 3-5-foliate, the lfts ovate or oblong, and the middle one usually coarsely toothed; fls. rather large, white, in short, few-fl'd racemes. Mts. of Ore and Wash. —Intro 1881 by Gillett.

L. H. B.

CARDAMON: *Amomum* and *Eleiaria*.

CARDIANDRA (Greek, *heart*, and *man* or *stamen*: alluding to the shape of the anthers) *Saxifragaceae*. Ornamental half-shrubby plants, rarely cultivated for their white, lilac or pink flowers.

Suffrutescent deciduous plants with alternate rather large lvs. and small pink, lilac or white fls. in terminal

793. Fruit of *Cardospermum*. ($\times \frac{1}{2}$)

loose corymbs surrounded by large sterile fls. calyx-tube cupulate, adnate to the ovary; petals 5, stamens numerous with filiform filaments, and suborbicular anthers; ovary inferior, incompletely 3-celled, styles 3, short; sterile fls with 3 large sepals caps locuhedral. — Three species in Japan and China. Tender plants, thriving in any good garden soil; best in a partly shaded and moist position. Prop. by greenwood cuttings under glass.

alternifolia, Sieb. & Zucc. One to 3 ft. lvs broadly elliptic to elliptic-lanceolate, tapering into a very short petiole, coarsely serrate, sparsely pilose, membranaceous, 3-7 in long; fls pink, lilac or white. Summer. S. Z. 66, 67. Ct. 14. 186.

ALFRED REHDER.

CARDINAL FLOWER: *Lobelia cardinalis*.

CARDIOSPERMUM

(Greek, *heart-seed*, from the white heart-shaped spot on the round black seed; hence the plant was thought a cure for heart diseases). *Sapindaceae*. Tendril-climbing tropical herbs.

Leaves alternate, bipinnate, lfts coarsely serrate; fls small, white, polygamous or dioecious, in axillary racemes or corymbs, sepals and petals 4, in pairs, stamens 8; ovary 3-celled, followed by a membranous caps.

—A dozen species widely distributed. The most popular is the interesting balloon-vine, which is a rapid-growing, woody perennial, behaving as an annual, curious for its inflated seed-vessels. Fig. 793. Prop. by seeds.

Halicacabum,

Linn. Fig. 794.

BALLOON-VINE.

HEART-SEED.

HEART-PEA.

Height 10 ft. st. and branches grooved. lvs glabrous, oblong-acuminate, deeply dentate. balloons an inch or more thick. Trop. India, Afr., and Amer. B. M. 1049.

—A general favorite, especially with children. Grown as a garden annual.

hirsutum, Willd. Creeping or ascending perennial

vine with densely hairy grooved st. and lvs as in the preceding, but usually hairy on the under surface fls. not showy. fr. pointed, hirsute, the globular chocolate-brown seed is borne on the detaching parachute-like dissepiment. Afr. —A useful perennial in S. Calif. for covering arbors; evergreen and blooming continuously.

N. TAYLOR †

CARDOON (*Cynara Cardunculus*, Linn.). A thistle-like plant of southern Europe, cultivated for the thick leaf-stalk and midrib.

It is thought to be of the same species as the artichoke, and to have been developed from it by long cultivation and selection. See *Cynara*. The plant has been

794. Balloon-Vine—*Cardospermum Halicacabum*. ($\times \frac{1}{2}$)

introduced into South America, and has run wild extensively on the pampas. Darwin writes that "no cultivated plant has run wild on so enormous a scale as the cardoon." From the artichoke it differs in taller and more prickly growth and smaller heads. The cardoon is perennial, but it is not hardy, and is treated as an annual. Seeds are sown in spring, either in pots under glass or in the open where the plants are to stand. The later sowing is usually preferred. The plants are given

795 Leaf of Canada thistle.—*Carduus arvensis* or *Cirsium arvense*. (×½)

rich soil and should have abundant moisture supply, for they must make continuous and strong growth. When the leaves are nearly full grown, they are tied together near the top, straw is piled around the head, and earth is banked against it. This is to blanch the plant, for it is inedible unless so treated. From two to four weeks is required for the blanching. The procedure is not very unlike that adopted for the blanching of celery or endive. If the plants are late, they may be dug just before frost and blanching in a storage pit. The plants are usually grown 2 to 3 feet apart, in rows which are 4 feet apart. They are sometimes grown in trenches, after the old way of growing celery. Cardoon is very little known as a vegetable in America except among foreigners.

L. H. B.

CÁRDUUS (the ancient Latin name of these plants). *Compositæ*. THISTLE. Spiny-leaved annual, biennial or perennial herbs, sometimes grown in borders and rock-gardens for the interesting habit and the heads of purple or white flowers.

Carduus is sometimes united with *Cirsium*, but is here kept distinct, being separated chiefly by non-plumose or only indistinctly serrate pappus-bristles (see *Cirsium*). The common weedy thistles are referred either to *Carduus* or *Cirsium*, depending on the definition of the genus. Fig. 795 shows the spiny leaf of one of these. Under the restricted use of the name, *Carduus* comprises about 80 species, from the Canary Is. to Japan. For *C. benedictus*, see *Cnicus*.

acanthoides, Linn. A much-branched perennial about 18-24 in. high: lvs. bright green, pinnately parted, the nerves very prominent beneath, spinose margined; the solitary heads long-peduncled, the fls. purple and showy. S. Eu.—Scarcely known in Amer.

C. Maritimus, Hort., is a Silphium, and *C. tabernum*, Hort., is a *Cirsium*. Both are advertised in England, but are unknown in Amer.

N. TAYLOR.†

CÁREX (name of obscure origin). *Cyperacæ*. SEDGE. Grass-like perennials of very many kinds, a few of which are grown in bogs or as border plants.

Flowers unisexual, in spikes, the staminate naked and subtended by a bract or scale, the pistillate comprising a single pistil inclosed in a thin sac or perigynium; monocious or rarely dioecious: sts or culms solid, not jointed, mostly 3-angled: lvs. grass-like but 3-ranked. One large group has 2 styles and a lenticular achene, and the spikes are commonly androgynous or contain both sexes (Fig. 796), another division has 3 styles and a triangular achene, and the spikes are commonly unisexual, the staminate being above (Figs. 797, 798).

Carexes are very abundant in cool temperate regions, both in species and in individual plants. There are more than 800 known species. Many of them grow

on dry land, but the largest species grow in low grounds and swales, and often form much of the bulk of bog hay. Carexes cover great areas of marsh land in the upper Mississippi region and are employed in the manufacture of "grass carpets" or Crex fabrics. The species are difficult to distinguish because they are very similar, and the study of them is usually left to specialists. Some of our broad-leaved native species make excellent borders and interesting clumps in corners about buildings and along walls.

Of such are *C. platyphylla*, *C. plantaginæa*, *C. albusina*. Many of the low-land species are excellent adjuncts to the pond of hardy aquatics. Others have very graceful forms, with drooping spikes and slender culms (Fig. 798). The following native species, and probably others, have been offered by collectors: *C. aiwa*, *C. thurua*, *C. flava*, *C. Grayi* (one of the best), *C. hystrixina*, *C. lupulina* and its var. *pedunculata*, *C. lurida*, *C. pauperula*, *C. pennsylvanica*, *C. plantaginæa*, *C. Pseudo-Cyperus*, *C. retrorsa*, *C. Richardsonii*, *C. riparia*, *C. Tucker-mani*, *C. utriculata*, *C. vulpinoides*. The species

present no difficulties in cultivation if the natural habitat is imitated. Propagated readily by seed sown in late fall (germinating in spring) or by division of the clumps.

Mörrowi, Boott (*C. japonica*, Hort., not Thunb. *C. tenuissima*, Hort. *C. acutifolia*, Hort.) Fig. 799. Lvs stiff and evergreen, long-pointed, in the common garden form with a white band near either margin. Culm 1 ft. with a terminal staminate spike and 2 or 3 slender pistillate spikes (1 in. long) from sheaths. Perigynium small and firm, somewhat excurved, 2-toothed, glabrous. Japan G.C. III. 13 173 RB 20, p. 9.—A very handsome plant, suited for pots or the border. The stiff clean white-edged foliage keeps in condition for months, making the plant useful for decorations in which pot-plants are used. It is perfectly hardy in Cent. N. Y., holding its foliage all winter. A useful florists' plant.

796. *Carex* (*C. scoparia*), with androgynous spikes and lenticular achenes. (×1). N. Amer.

797. *Carex* (*C. lurida*), with staminate terminal spikes and trigonous achenes. (×½). N. Amer.

intumescens, Rudge (*C. tenaria*, Hort. *C. ténera*, Hort.). Slender, but stiff, to 30 in.: lvs. narrow, rolling more or less when dry; staminate spikes long-stalked: pistillate spikes 1 or 2, short-stalked, short, with few large, turgid, tapering, shining perigynia and awl-like, rough-pointed scales. N. Amer.

c.m.n.s. Berger (*C. Valmortii*, Mott. *C. lilmoriana*, Hort.) Densely tufted, with many very narrow lvs., and filiform culms $1\frac{1}{2}$ ft. or less high; spikes 5-7, the terminal staminate, linear and short-stalked, the lateral pistillate (or perhaps staminate at base), oblong or cylindrical and dense-fld, about 1 in long, and with aristate scales: perigynium 3-angled (stigmas 3), lance-ovate, attenuate at base and with a 2-toothed scabrous beak. New Zealand—A good hardy edging plant when a tufted grassy effect is desired.

Buchananii, Berger (*C. lucida*, Boott, var. *Buchananii*, Kuek.) Allied to the preceding densely tufted: lvs leathery, semi-terete, very narrow, brown-red; spikes 5-8, the terminal staminate and linear-cylindrical, long-stalked, the lateral pistillate and cylindrical, $1\frac{1}{2}$ in long, densely-fld perigynium plano-convex (stigmas 2), produced into a long margined scabrous deeply bidentate beak. New Zealand—Grown for its reddish foliage.

Gaudichaudiana, Kunth (*C. vulgaris*, Fries, var. *Gaudichaudiana*, Boott.) Culms erect, 1-2 ft. lvs long and grass-like; staminate fls in terminal spikes pistillate fls in 2-3 cylindrical, sessile or subsessile spikes perigynium lenticular, small, very short-beaked, obscurely 2-toothed, finely nerved, longer than the narrow scale. Japan, Austral New Zealand—Useful for bog planting.

Fraseri, Andr (*Cymophyllus Fraseri*, Mack.) Lvs 1 in or more broad, stiff, but with no midnerve, flat and thick, evergreen culm 16 in or less high-bearing at its summit a single whitish spike which is staminate at top perigynium ovoid, thin and inflated. Rich mountain woods, Va B.M. 1391 (as *C. Fraseriana*)—Rare, and a very remarkable plant.

C. baccans, Nees. Robust, with curving lvs to 2 ft long and $\frac{1}{2}$ in broad fr berry-like (where the name), crimson or vermilion, in clustered spikes standing well above the lvs. India G 1461. Useful for pots or for planting in a conservatory, for its ornamental fr, but probably not now in cult commercially—*C. gallica variegata* is offered abroad as a "very elegant, showy and charming" carex—*C. riparia*, Curt., a rank-growing lowland species of wide distribution, is sometimes grown in a variegated-leaved form. The name has no botanical standing—With the extension of wild gardening, and particularly of bog- and water-gardening, many other species of Carex may be expected to appear in the trade lists.

L. H. B.

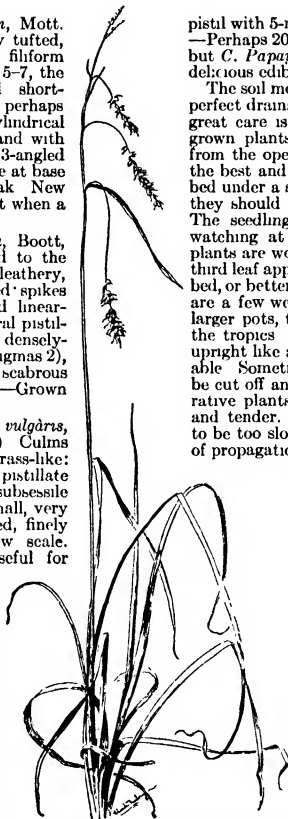

CÀRICA (a geographical name) *Papayaceae*. **PAPAYA**. Small, rapid-growing, unbranched trees, commonly grown in greenhouses as foliage plants and often bearing fruit under such conditions. Juice milky.

Leaves large, soft, long-stalked, in clusters at the top of the trunk usually dioecious, the male fls. on long axillary peduncles, funnel-shaped, with 10 anthers in the throat, the pistillate fls. larger and with 5 distinct petals and a single

pistil with 5-rayed stigma, sessile in the axils of the lvs.—Perhaps 20 species, all native to the American tropics, but *C. Papaya* is cult. throughout the tropics for its delicious edible fruits. See *Papaya*.

The soil most suited for caricas is a rich loam, having perfect drainage. As the stem is succulent and tender, great care is necessary to avoid bruising, hence potted plants are much to be preferred to seedlings from the open ground. Seeds should be selected from the best and largest fruits and sown in a well-worked bed under a slight shade. If seeds are quite dry or old, they should be soaked in warm water before sowing. The seedling plants are delicate, and require close watching at first to avoid damping-off. As soon as plants are well up remove the shading, and after the third leaf appears they may be pricked out into a larger bed, or better, potted off in fairly rich soil. After plants are a few weeks old, and have been shifted once into larger pots, they may be set permanently outdoors in the tropics. Caricas seldom branch, but usually grow upright like a palm, hence cuttings are not often available. Sometimes small branches form, and these may be cut off and as readily rooted as most tropical decorative plants, provided the cutting is not too young and tender. This method has been found in Florida to be too slow, and what is evidently a better method of propagation, by means of graftage, has been devised

by Edward Simmonds, of the Plant Introduction Field Station, Miami, Florida. Numerous shoots are formed by the buds at the leaf-scars when a papaya tree is topped, as many as fifty or more being produced. "One of these shoots is taken when a few inches long and about the diameter of a lead pencil, is sharpened to a wedge point, the leaf surface reduced, and inserted in a cleft in a young seedling which has been decapitated when 5 to 10 inches high, and split with an unusually sharp, thin grafting-knife. At this age the trunk of the young seedling has not yet formed the hollow space in the center. Seeds planted in the greenhouse in February produce young seedlings large enough to graft some time in March, these grafted trees, which can be grown in pots, when set out in the open ground in May or the latter part of April, make an astonishing growth and come into bearing in November or December, they continue bearing throughout the following spring and summer, and if it is advisable, can be left to bear fruit into the following autumn." Varieties of superior flavor and better size and shape for shipping, as well as hermaphrodite varieties, may now be successfully maintained. For complete description of this method see "The Grafted Papaya as an Annual Fruit Tree," by David Fairchild and Edward Simmonds, Circular No. 119, Bureau of Plant Industry, 1913. In temperate climates, caricas have been found to be good decorative plants for both conservatory and summer bedding, the deeply cut, palmate leaves forming a striking contrast to ordinary vegetation. In bedding out, select open, sunny exposure, with perfect drainage, and make the soil rich and friable. Constant cultivation with a light hoe will cause a

798. *Carex (C. longirostris)*, with terminal staminate spikes and drooping pistillate spikes ($\times \frac{1}{2}$). N Amer

799. *Carex Morrowii*.

luxuriant growth under these conditions, and the planter will be amply repaid for his trouble by beautiful showy specimens as tropical-appearing as palms.

Papaya, Linn. (*Papaya Cárica*, Gaertn.). **PAPAYA**. **PAPPAW**. The commonest species in cult., sometimes growing to a height of 20 ft., with large palmately 7-lobed lvs., sometime 2 ft. across, and fr shaped like a roughly angled melon up to 12 in long and half as thick, hanging, especially from the lower axils of the pistillate plant. B M 2898-9.—From the frs., which vary in size up to 15 lbs and in number to the tree from 20-50, is extracted the papaya juice, which furnishes the papain of commerce. This is obtained by slashing the fr., and collecting the milky juice in porcelain-lined receptacles, where it is allowed to evaporate. When evaporated to a granular condition, it is ready for the market and brings from \$4-\$6 a lb. in the crude state. The papaya has of recent years become one of the commonest table frs. of the tropics. The flesh, which is usually of a salmon-pink or yellow color, is excellent when one becomes accustomed to its peculiar flavor, and resembles somewhat a most luscious muskmelon. From its large content of papain, it may be eaten without injury in considerable quantities and assists in the digestion of other foods. As the tree grows with great rapidity in tropical climates, it may be treated as an annual, the seeds being sown early in protected beds, well cared for and transplanted to their permanent places when well established. They will then bear fr. late in the succeeding autumn. The method of graftage described on p. 663 is preferable, however. The frs. have a considerable cavity, which, in the smaller rounded frs., is well filled with the small brownish or blackish seeds. The firm skin, the firmness of which may be increased by selection, will permit of shipping to a distance. The plant is sometimes polygamous, and from such plants in Hawaii there have been bred types which appear to have great promise as a shipping fr. The green frs. are frequently used as vegetables, and the lvs., if cooked with tough meat, are said to make it tender, due to the digestive principle.

candamarcensis, Hook. f. (*C. cundinamarcensis*, Lindl.) This is a more hardy ornamental species with numerous lvs., dark green above and pale beneath, rounded-heart-shaped, 1½ ft. across, 5-lobed to the center with pinnatifid lobes. fls. green and pubescent; frs. small, pointed, 5-angled, golden yellow. B M 6198.—Hardy in S. Calif., but the frs. of no value as such.

quercifolia, Benth. & Hook. (*Vasconcellea quercifolia*, St. Hil.). Lvs. shaped like those of the English oak, palmately 3-lobed, and containing a greater percentage of papain than *C. Papaya*; frs. small.—Hardy in S. Calif.

gracilis, Solms (*Papaya gracilis*, Regel). Habit of *C. Papaya*, trunk simple, 4-6 ft. high, slender, very glabrous lvs. 5-digitate, the lobes sinuate-lobed, the middle one 3-lobed, the whole blade suborbicular in outline, petioled. Brazil. Gt. 1879. 986.

S. C. STUNTZ

CARÍSSA (aboriginal name). *Apocynaceae*. Very branchy spinose shrubs of the tropics of the eastern hemisphere, cultivated for ornament or hedges, but here mainly for the edible berry-like fruits.

Flowers white, solitary or in cymes; lobes of calyx and corolla 5, the 5 stamens free and included in the throat, the ovary 2-loculed: lvs. opposite and thick, simple.—About 30 species. Used abroad as greenhouse plants but grown in this country only in S. Fla., and Calif. Prop. by seeds and cuttings of ripe wood.

Caríndas, Linn. **CARAUNDA**. **CHRIST'S-THORN**. Evergreen shrub or small tree, with dark green ovate or elliptic mucronate entire lvs., strong axillary spines (which are often forked) and fragrant white fls. in clusters of 2-3, the corolla twisted to the left in the bud: fr. the size of

a cherry (1 in. diam.), reddish, pleasant-flavored. India. L B C. 7. 663.—Reaches 20 ft. Half-hardy in Cent. Fla. The frs. are eaten from the hand or made into a jelly much like currants when ripe, and pickled when green.

bispinosa, Desf. (*C. arduua*, Lam.). **AMATUNGULU**. **MARITZGULA**. Spines strong, often 2 in. long lvs. ovate and subcoriaceous, mucronate, glabrous and entire: fls. white, the corolla twisted to the right in the bud. S. Afr.—A choice evergreen shrub, rather hardy, with thick camellia-like very glossy lvs.: fls. large, fragrant, white, and borne profusely and continuously: fr. dark red, size of a cherry, good. L B C. 4. 387.—Closely resembles *C. grandiflora*, but fls. slightly smaller and frs. in clusters, seeds lanceolate.

grandiflora, DC. **NATAL PLUM**. Spiny shrub: lvs. ovate-acute, tapering to the base: fls. large, white, fragrant, solitary and terminal, twisted to the right, heterogonous: fr. red, 1-1½ in. long, resembling cranberries in flavor when cooked, and having a papery skin, milky juice and few small almost circular seeds. Sauce made from this fr. is almost indistinguishable in flavor from cranberry sauce, but the frs. ripen so irregularly, although almost continually, as to make the fr. suitable only for home-garden use unless handled on a large scale. Said to be the finest hedge plant in S. Afr. B M 6307.

acuminata, DC. Spines weak lvs. smaller, ovate-acute, subcoriaceous, mucronate; peduncles short, forked, axillary fls. with lance-acuminate calyx-lobes, the corolla twisted to the right in the bud. S. Afr.—Perhaps not different from *C. bispinosa*.

C. edulis, Vahl. A straggling shrub with small purple edible fr. from Trop. Afr. Intro from Abyssinia, but has not yet been thoroughly tested. The plant in the American trade under this name is described as much taller than *C. Carandae* and more vigorous lvs. persistent, ovate-acuminate. 10-25 in axillary clusters, white and pink, jasmine-scented berries oval, red but turning black at maturity. 1-seeded. *C. oreat*, R. Br. from Austral., a more open shrub than any of the preceding, the small frs. of which are edible and used for jam, has been intro. by the Office of Foreign Seed and Plant Introduction as a possible stock for the more tender species, in the hope of extending the range of these frs.—*C. spinarum*, DC., a small edible-tender evergreen shrub from India is said to be an important element in reforestation since it persists on the poorest and rockiest soils in spite of being greedily eaten by sheep and goats.

S. C. STUNTZ.†

CARLINA (said to have cured the army of Charlemagne [Carolus] of the plague). *Compositae*. Low rather coarse annuals, biennials or perennials, with thistle-like foliage, large white or purplish heads, a feathery pappus, and chaffy receptacle: outer involucre bracts coriaceous, usually spiny, the inner ones colored or shiny and petal-like: fr. a silky-hairy achene.—Some 15 or 20 species in the Medit. region.

An open sunny place and ordinary garden soil are all they require. They are capital for the sunny part of a rockery. Propagated by cuttings or seeds.

acaulis, Linn. A very dwarf hardy perennial: height 3-6 in. lvs. glossy, pinnatifid, divided, with spiny ends: fl. rising barely above the foliage, solitary, very interesting, the scales surrounding the fl.-head being long and narrow and ray- or petal-like, silky, shiny: head 6 in. across when expanded, white, June, July and late fall. G.C. II. 13:720-1. G.L. 19:178.

acanthifolia, Linn. A white-tomentose thick-lyd. biennial, the lvs. oblong, the upper pinnatifid and spiny: fl.-heads 4 in wide, yellowish purple. S. Eu. July and later. G.C. III. 47:68.—Little known in U. S.

N. TAYLOR.†

CARLUDOVICA (Charles IV, and his Queen Louisa, of Spain). *Cycanthaceae*. Palm-like, sometimes merely herbaceous plants, of tropical America.

The plants are stemless, or sometimes with a lax creeping st., and usually have stalked, sometimes sessile, flabellate lvs.: fls. monoecious, the two sexes being on the same spadix, which is inclosed in a 4-lyd. spathe; staminate fls. with many stamens and many-

lobed calyx, 4 of them surrounding a pistillate fl.—the latter have a 4-sided ovary, 4 barren stamens, and 4-lobed calyx: fr. a 4-sided, many-seeded berry. The carludovicæ are usually regarded and treated as stove palms by gardeners. They are useful for decoration. The family Cyclanthaceæ is exclusively tropical American, of about 45 species and 6 genera (*Stelestylis*, *Carludovicia*, *Sarcanthus*, *Ludovic*, *Evoidanthus*, *Cyclanthus*); it is often united with the Pandanaceæ or screw-pine family.

The genus is an important economic one, as *C. palmata*, and perhaps other species, are the source of Panama hats. In making these, the leaves are cut young, the stiff veins removed, after which the leaves are slit into shreds, but not separated at the stalk end. It is said that hats of superior quality are plaited from a single leaf, without any joinings. U. S. Dept. Agric., Fiber Investigations. Rept. 9:112 (1897).

800. *Carludovicia palmata*.

Carludovicia palmata is the species most frequently met with under cultivation. Under favorable conditions it grows to a height of about 8 feet. All of the kinds need stove treatment during the winter months; in summer they may be used for subtropical bedding with good results. They have a certain palm-like appearance, but the leaves are of a softer texture than any of the palms. They may be propagated by division, choosing the early spring for the operation. *C. palmata* seeds freely. The fruit, when ripe, has an ornamental appearance for a short time after bursting open. The seeds are very small, and should be carefully washed free from the pulp, and sown on the surface of a pan of finely chopped sphagnum moss. Germination takes place in two weeks from sowing if kept in a brisk, moist heat. The species are not particular as to soil but the drainage must be perfect, as the plants require an abundance of water when growing. (G. W. Oliver.)

A. Lvs 3-5-lobed.

palmata, Ruiz. & Pav. Fig 800. No trunk: petioles 3-6 ft long, glabrous, terete and unarmed, blades 4-lobed, the lobes again cut into narrow segms, dark green, gracefully spreading, and drooping at the margin. Peru. R H 1861, p 36.—The common species, and a very useful plant.

rotundifolia, Wendl. Much like the last, but more compact under cult, owing to the shorter petioles, but growing much larger. Petiole distinctly pubescent, lf-blade large and orbicular, 3- or 4-lobed. Costa Rica. B M 7083.

elegans, Williams. Blades with 4 or 5 lobes, which are very deeply cut into straight strap-like divisions. Probably of horticultural origin.

AA Lvs 2-lobed.

atrövirens, Wendl. Blades very deeply 2-lobed and very deep, rich green (whence the name, *dark green*), glabrous. Colombia.

humilis, Poepp. & Endl. Dwarf blades angular, 2-lobed at the summit, the segms more or less jagged but not divided, a foot or less broad. Colombia. R H. 1869, p 327.—One of the best.

Plümerii, Kunth (*C. palmatifolia*, Sweet). Caudex erect, blades with 2 lanceolate and plicate divisions, bright green above and pale beneath. Spadices pendulous. Martinique.

imperialis, Lind & André. Caudex short and prostrate, blades with 2 ovate-lanceolate entire segms, with very prominent veins, the lobes about 5 in. wide and shining green; petiole purplish, canaliculate, tumid at the base. Ecuador. I H 21 166 (by error 165).

The following species are in cult in this country but not as yet known to the trade: *C. funifera*, Kunth. Stemless or sometimes creeping and with a round, sparsely branched st. lvs alternate 1-2 ft. 8 Amer.—*C. incisa*, Wendl. A much cut, low plant from Cent. Amer.—*C. macrospora*, Klotzsch. St. scarcely 1 ft long. lvs faintly 3-nerved, deeply 2 parted, 1½-2 ft. Colombia.—*C. macrocephala*, Hook f. St. a few inches high. lvs numerous, 10-18 in long, split into 2-8-nerved segms, petiole slender, purplish at base. Costa Rica. B M 7263.—*C. plicata*, Klotzsch. St. short. lvs divided into 2 1-nerved segms, petioles channelled, squarish about 8 in. long, the thick woody caudex may not rise more than 1 ft. Colombia.—*C. sednensis*, Cowell. St. creeping, often 25 ft. long. lvs several at the summit about 18 in long. St. Ritz.

N. TAYLOR.†

CARMICHAELIA (Capt. Dugald Carmichael, Scotch botanist, who wrote on the flora of the Cape and certain islands) *Leguminosæ*. Shrubs, leafless or usually becoming so, either erect or depressed, with reddish or purplish small fls, rarely cult. There are about 20 species in New Zealand, very difficult of delimitation. Lvs 1- or 3-5-foliate, wanting or deciduous after the bloom has passed. fls in lateral racemes, calyx cup-shaped or bell-shaped, 5-toothed, corolla papilionaceous, the standard orbicular and usually reflexed, the wings oblong and obtuse and somewhat falcate, the keel oblong and incurved and obtuse, upper stamen free, pod small, leathery, oblong to orbicular. *C. grandiflora*, Hook f., is recently offered in S. Calif.: it is much-branched, to 6 ft high, with compressed and grooved glabrous erect branches. lvs pinnately 3-5-foliate, appearing in spring and early summer and then deciduous, the lfts glabrous and obcordate-cuneate, fls about ¼ in. long, in drooping racemes of 5-12, white or lilac. *C. odorata*, Colenso, has pubescent drooping branches, and much smaller fls in 10-20-fld. racemes, pod smaller (¼ in. or less long) and longer-beaked.

L. H. B.

CARNATION (*Dianthus Caryophyllus*, Linn.). *Caryophyllaceæ*. Choice and popular flower-garden and greenhouse plants of the pink tribe; in North America grown mostly under glass as florists' flowers. Pl. XXII. The carnation is a half-hardy perennial, herbaceous, suffrutescent at base, height 2 ft.; st. branching, with tumid joints. lvs. linear, glaucous, opposite. fls termi-

nal, mostly solitary; petals 5, flesh-colored, very broad, beardless, margins toothed; calyx cylindrical, with scaly bracts at base. June-Aug. S. Eu, occasionally met in the wild state in England, where it was intro. through cult. A single-fl'd and undeveloped carnation is shown in Fig. 801. A section of a single fl is depicted in Fig. 802, showing the 2 styles and the 5 stamens, also the bracts at the bottom, in 2 series, beneath the calyx. In Fig. 803 some of the beginnings of doubling are shown.

General development. (By Geo. C. Butz.)

Theophrastus, who lived about 300 years B C., gave the name *Dianthus* (Greek *dios*, divine; *anthos*, flower) to the group, probably suggested by the delightful fragrance. The specific name *Caryophyllus* (Greek, *caryon*, nut; and *phylon*, leaf) has been applied to the clove-tree (*Caryophyllus aromaticus*), and because of the clove-like fragrance of the carnation this name was applied to it. The

name carnation (Latin, *carnatio*, from *caro*, *carnis*, flesh) has reference to the flesh-color of the flowers of the original type. This plant has been in cultivation more than 2,000 years, for Theophrastus (Histor. of Plants, translation) says: "The Greeks cultivate roses, gillyflowers, violets, narcissi, and iris," gillyflower being the old English name for the carnation. It was not, however, until the beginning of the sixteenth century that the development of the carnation into numerous varieties made an impression upon its history. The original flesh-color of its flowers was already broken up into red and white. The gardeners of Italy, France, Germany, Holland and England, with their respective ideals of beauty in this flower, contributed so many varieties that in 1507 Gerard wrote that "to describe each new variety of carnation were to roll Sisyphus' stone or number the sands."

There have been many attempts at classification, but most of them, like the varieties they serve, have disappeared. Two of them are as follows: A French scheme arranges all varieties into three classes: *Grenadins* (Fig. 801), including those with strong perfumes, flowers of medium size, either single or double, petals fringed, and of but one color, *Flamands*, including those with large flowers, round and double, rising in the center to form a convex surface, petals entire, either unicolored or striped with two or more colors; *Fancies*, including those with colors arranged in bands on light grounds, the petals toothed or not. The English classification of these varieties makes four categories: *Sells*, or those possessing only one color in the petals, *Flakes*, or those having a pure ground of white or yellow and flaked or striped with one color, as scarlet, purple or rose; *Bizarres*, or those having a pure ground marked as in the *Flakes*, but with two or three colors, and *Picotees* (Fig. 804), or those having a pure ground of

white or yellow, and each petal bordered with a band of color at the margin. This last class has been regarded with the distinction of a race.

In the early part of the nineteenth century, English gardeners exercised very great care in the growing of carnations to mature only perfect flowers. Imperfect and superfluous petals were extracted with forceps, petals appearing out of place were arranged in a perfect imbrication, the calyx-tube was cut partly down between the teeth, to prevent excessive splitting at one side and to give more freedom to the expansion of the flower. These and many more tedious details seem to have wrought the depreciation of this flower about the middle of the nineteenth century.

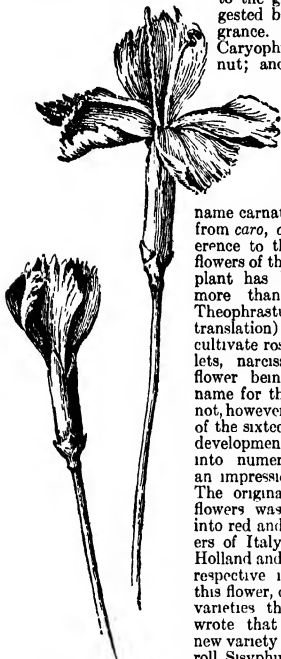

All the foregoing has reference to those types of carnations that are little known or grown in America at the present day, the varieties so common in Europe are usually kept in coldframes or coolhouses during the winter, and as spring approaches the plants are brought into their blooming quarters, for no flower is expected to appear until the month of July, when there is a great profusion of blossoms, but for a short season. Therefore, they can all be classed as a summer race. They are also grown permanently in the open.

Development of the perpetual-flowering carnation (*Remontant*, *Monthly*, *Forcing*, or *Tree*) Figs. 805-807.

The perpetual-flowering race of carnation, which has been brought to its highest state of perfection by American growers, and which is generally regarded as the "American carnation," really originated in France, and was grown in that country from its origin in 1840 until about the year 1856, before it was introduced to America. A French gardener, named M. Dalmais, obtained a constant-blooming carnation by crossing *Éillet de Mahon*, which bloomed in November, with pollen from *Éillet Biohon*, crossing again with the Flemish carnation, the first-named sort being disseminated under the name "Atin." By the year 1846 varieties in all colors had been secured and the type permanently fixed. These were taken up and improved upon in quality by other enthusiasts, among whom were M. Schmitt and M. Alphonse Algaetere, of Lyons, France. The latter succeeded in securing varieties with rigid stems which in 1866 were given the name "tree-carnation." M. Schmidt's most prominent varieties were *Arc-en-ciel* and *Etoile Polaire*, which were grown for several years. But the strong rigid-stemmed varieties obtained by Algaetere, which were termed tree-carnations in 1866, proved of greater value commercially, and became more generally cultivated. About the year 1852, a native of France who had settled near New York City, imported plants of this strain,

Section of normal carnation flower.

801. A single-flowered Grenadin carnation. ($\times \frac{3}{4}$)

803. The anthers are leafy, showing one process in doubling.

and cultivated several varieties for a number of years. About the year 1856 the firm of Dailledouze, Zeller & Gard imported plants of *La Purité*, a rose-colored variety, also *Mont Blanc* and *Edwards*, white, and *Manteaux Royal*, red-and-white variegated. These

804. Carnation, *Picotee*.

most famous variety was *Buttercup*, introduced in 1884. Jos Taubly, whose Grace Wilder became and remained the standard rose-pink variety until the introduction of *Wm. Scott* in 1893. John Thorpe and W. P. Simmons, who introduced *Portia*, *Tidal Wave*, *Silver Spray* and *Daybreak* in the eighties, Sewal Fisher, whose *Mrs. Fisher* appeared in 1890 and became one of the leading whites, E. G. Hill, whose most notable productions were *Flora Hill*, the leading white for several years, and *America*, a scarlet; R. Witterstaetter, who obtained *Estelle*, *Aristocrat*, *Afterglow* and *Pres. J. A. Valentine*, John Hartig, who raised the scarlet *Jubilee*, Peter Fisher, whose *Mrs. Thos. W. Lawson*, *Beacon*, and *Enchantress* with its several sports, became leaders in their respective colors; C. W. Ward, who disseminated *Governor Roosevelt*, *Harry Fenn* and *Mrs. C. W. Ward*.

The late Frederick Dörner conducted the most systematic work in developing the carnation, and succeeded in producing a strain which is recognized as the highest development of the American carnation. His records, which cover a period of 22 years, contain a complete list of the many thousands of crosses made during that time. This strain is distinguished for its easy-growing habit, its freedom and steadiness in producing blooms, the diversity of colors and its adaptability to commercial growing. His labors produced such varieties as *Wm. Scott*, *Mine*, *Diaz Albertini*, *White Cloud*, *Mrs. Geo. M. Bradt*, *G. H. Crane*, *Lady Bountiful*, *White Perfection*, *Pink Delight*, *White Wonder* and *Gloriosa*, all leaders in their respective colors.

Through the rapid strides in its development, after being introduced in this country, the carnation established itself as one of the leading flowers for commercial growing and now stands second only to the rose in commercial importance. Not only does it share equally with the rose the bench space in most large growing establishments, but many large ranges are devoted entirely to the carnation. Growing methods have been perfected by the carnation specialists until the practices employed during its early history have been entirely superseded. Since its first arrival in America, over 1,200 varieties have been introduced, and the quality has been improved until the highest developed varieties produce blooms measuring $4\frac{1}{2}$ inches in diameter and are carried on rigid stems 3 feet long.

In 1891 the American Carnation Society was organized to promote the interests of the carnation. By holding exhibitions annually it has assisted materially in popularizing the flower. A system of registering new varieties is in operation, which prevents confusion in nomenclature.

From this country, the improved strain of the perpetual-flowering carnation has returned to European countries, being grown in increased quantities each year and displacing all the older types of carnation for commercial growing.

Culture of outdoor or flower-garden carnations. Fig. 808.

Americans are not sufficiently aware of the excellence of some of the forms of the flower-garden or border carnation. While perennial, like the greenhouse carnation, many of them bloom profusely the first year from seed and are described as annuals. The *Marguerite* type is one of the most useful. These forms bloom by mid-summer from early-sown seeds, and with some protection the plants will pass the winter in the open and bloom again the following spring. The *Margaret* strain, distinct from the *Marguerite*, bears double flowers, sulfur-yellow, and also blooms the first season from early-sown seed. The *Chabaud* strains behave similarly. The *Grenadins* (Fig. 801) bloom the first year from seed. They pro-

805 The modern florists' carnation. High-centered dark-colored bloom.

806. Modern florists' or forcing carnation.

duce fine singles, of simple form and strong fragrance, although more than half of any sowing from unimproved seed may produce various degrees of double bloom. Riviera Market and others bloom in autumn from spring-sown seeds. The culture of the hardy or flower-

garden carnations is very simple. Their profusion of summer bloom makes them desirable.

The Picotee class (Fig. 804) is little known in this country. It is a hardy perennial in England, and the fine strains are often propagated by layers (Fig. 809). They also do well from seeds, blooming freely the second year.

The Malmaison strain, which was the leading carnation in England before the advent of the Perpetual-flowering strain, has been found of little value in this country. On account of its large size it was used to some extent for breeding purposes, but with unsatisfactory results.

The border carnation is a more condensed and bushy plant than the long-stemmed few-flowered plant seen in the American greenhouses, although there are different families or groups of them as there are of phlox or snapdragons. Some forms are dwarf and some tall-growing.

American methods of culture for indoor bloom.

The modern method of propagating the carnation for commercial growing is by means of cuttings which are taken from either the blooming stock or from plants that are grown for cuttings alone. The old method of layering (Fig. 809) would prove too slow in increasing stock for present-day needs. Millions of cuttings are rooted each season for planting the houses for blooming purposes. So much depends on the quality of the cuttings in keeping up the vitality in the stock that expert growers have learned to discriminate in their selection. The best cuttings, if taken from the blooming stock, are those from near the middle of the flower-stems (Fig. 810). These will not only show greater vitality than those taken higher up or lower, but they will prove more floriferous. The tip cuttings are likely to give a flower-bud immediately and, if this is pinched out, develop into a weak plant. Those taken from the base develop a large spreading growth known as "grassy." The cuttings are severed by an outward pull

and are afterward trimmed of all surplus foliage before being inserted in the propagating sand. Have a sharp knife with which to trim and a pail of fresh water into which to throw the cuttings as they are trimmed. Make a smooth cut at the base, near the joint, so that the lower pair of leaves will peel off readily, leaving a half-inch of clear stem to go into the sand. Shorten those leaves which turn outward, leaving those which stand fairly upright. The removal of part of the foliage is to avoid crowding in the bench and also to prevent flagging while the cutting is giving off more moisture through its leaves than it is taking up through the stem. The cuttings are inserted in the sand about $\frac{3}{4}$ inch deep in rows across the bench, placing the cuttings about $\frac{3}{4}$ inch apart in the row and the rows about $2\frac{1}{2}$ inches apart, according to the size of the cuttings. Use a putty knife for making the cut in the sand. The sand is kept constantly moist and the cuttings are protected from both the sun and drafts by means of muslin curtains. Frequent spraying should be avoided, though it must be resorted to at times to prevent flagging on warm windy days. The most favorable conditions for propagating are usually secured during the months of December, January, February and early March. During that period, ventilation is limited and a fairly even bottom-heat is easily maintained. Keep a bottom temperature of about 60° , while the overhead temperature should be about 52° . Any bench that can be protected from sun and drafts will prove satisfactory.

The bottom of the bench may be of wood or tile, the latter being preferred on account of more perfect drainage and a greater retention of warmth. The sand should be 3 inches deep after being packed down by means of a tool made from a 2-inch plank about 6 inches wide and

807. Carnation,
Little Gem.
A striped flower.

808. Flower-garden or outdoor carnation, showing the condensed bushy habit and short flower-stems

12 inches long with an inverted V-shaped handle. In about four weeks the cuttings should be ready for potting (Fig. 811). Those that come out of the sand February 15 or earlier should be potted first into 2-inch pots and later on shifted into larger pots as needed. Those potted later may be placed directly into $2\frac{1}{2}$ -inch

pots and left until planted out, the object being to keep the young plants growing steadily until they are planted in the field. Stunted, pot-bound plants will be slow in breaking and are likely to develop stem-rot in the field. Use a moderately light soil and only fairly rich.

When the young plants begin to run up to flower, they should be topped back to about four joints above the pot (Fig. 812). A low-branched plant will stand up better and will give less trouble in supporting later on. A second topping may be necessary before planting-out time, on early-propagated stock. A slight hardening-off of the young plants before planting out is beneficial, though not essential. This is usually done by placing the plants in coldframes about two weeks prior to planting them in the field. Late April or early May is the time for planting in the field, according to latitude and climate. A rich loam, inclined to sandiness, produces the finest plants in the shortest time. In a heavy soil the growth will be heavier, but slower and less branching. Set the plants about 8 inches apart in the rows, and if hand-power is to be employed in cultivating, space the rows about 16 inches apart. Space farther if horse-power is to be used.

When a large business is done in young plants or rooted cuttings, a part of the stock is grown especially for cuttings alone. These plants are benched the same as those for blooming, but are not allowed to

809 Layer of carnation. The parent stem was severed at *s*. This method is now employed only in special cases.

bloom. As the shoots begin to run up to flower, they are broken off a few joints higher up than is done when topping in the field. The young shoots which result from these breaks are taken off for cuttings, the very finest cuttings being secured in this way. These are trimmed and handled the same as those taken from the flower-stems.

When packing cuttings for shipping, moist sphagnum moss is used in which to pack the roots. Cut papers (newspapers are used mostly) into sheets about 10 by 18 inches. Lay a strip of moss about 3 inches wide across the middle of the paper lengthwise. Then lay the cuttings side by side with only the roots on the moss. When twenty-five have been laid on, begin to roll from one end until all the cuttings have been taken up. Then turn in the lower part of the paper and continue to roll until the end of the paper has been reached and tie around with any kind of cord. There is little difference in the returns from plants grown for cuttings and those grown for blooms, providing a fair market is found for each.

In shipping plants from the field, the soil is all shaken from the roots. The plants are then set upright in the shipping-cases with moist moss between the roots, a layer of damp moss having first been placed on the bottom.

Cultivate as soon as practicable after each rain, and in the absence of rain at least once each week. Shallow cultivating is recommended, just enough to maintain a loose mulch on the surface.

Do not water carnations in the field under any consideration. Cultivation will preserve moisture in the soil without causing soft growth. Keep topping back the young shoots as fast as they begin to run up, thus building up a shapely bushy plant.

If plants are to be placed inside during the summer, the benches should be refilled and made ready for planting as soon after May 1 as possible. It will be a great help to get the plants under way on the benches before hot weather sets in. Fill the benches the same as for field-grown plants and set the plants where they are to bloom. Indoor culture is practicable and profitable only when the benches can be spared by early May. If a good market can be found for the May and June cut, they will more than offset the slight advantage derived in the fall from indoor culture.

If the blooming plants have not made an exceedingly rank growth, they may be cut back sharp early in May, cleaned off, mulched with long manure and grown on for blooming the following year. This should not be attempted, however, unless the plants are free from disease or insects and in good condition to break freely from the lower part of the plant.

Carnations are grown successfully on both raised and solid benches. Perfect drainage is essential, and must be provided for, if solid beds are to be used. There will be no difference in the quality or the quantity if both are properly handled.

By the end of June the old blooming plants will become exhausted, and refilling the benches to receive the new plants from the field will be in order. Clean out the old soil, whitewash the inside of the benches with hot lime and allow to dry before refilling with the new earth. Four inches of soil is enough, and should be of equal depth all over the bench, especially along the edges. The soil should be fairly moist, but not wet when the plants are set, so that the roots may draw moisture from the soil rather than have the soil draw the moisture from the

810. *a* Desirable cuttings. *b* Weak cutting, too high up on stem. *c* Too low on stem.

811. Strong cutting, well rooted.

roots. On the other hand, soil for potting or planting should never be handled while in a wet condition. If too dry at the time of filling the beds, water, and let stand long enough to dry to the proper state before planting.

Apply a light shade of lime or whitening to the glass, to break the fierceness of the summer sun until the plants become established. This shade should not be too heavy, nor intended to darken the house, else a softening and weakening of the growth will result. Lift the plants carefully by means of a spade and leave a ball of soil about the size of the fist on the roots. This ball of soil will greatly assist the plant in re-establishing itself in its new quarters. However, no serious harm will be done should all the soil crumble from the roots without breaking the roots to any considerable extent. Set the plants just about as deep into the soil as they stood in the field and space them about 9 by 12 inches, if plants are of ordinary size. Larger plants may need more, smaller plants less space. It should be borne in mind that the highest quality may be expected only when the plants are not crowded.

After setting a few hundred plants, water each plant individually, saturating the soil thoroughly around each plant, but do not soak the whole bed until the roots become active and the surface of the soil has been worked over and leveled off, which will be about ten days after planting. Spray the plants overhead several times during each day to prevent wilting. Keeping the walks wet will also help to maintain a humid atmosphere until the roots are able to supply the plants with moisture. This transplanting is an ordeal during which the plants are unable to draw on the roots for support until they have taken a new hold on the soil, and wilting must be prevented by artificial means during this time. To allow severe wilting means loss of foliage and a loss of vitality, which results in inferior quality in at least the early part of the season.

As soon as the soil has been leveled off, and most of the weeds gotten rid of, the supports should be put in place. Large growers use one of two styles of supports, or a combination of the two. Wires run lengthwise between the rows, with cotton strings crosswise, placing two or three tiers one above the other to suit the height of the plants is extensively used. Another device is the carnation support, consisting of a wire stake with wire rings to surround each plant.

Yield of bloom.—Plants that were benched in the latter part of July, or early August, which is the time to plant for best results, should begin to yield blooms early in September. If flowers are not desired so early, the stems may be broken off about the time the bud appears, but no

general topping should be done after the plants are housed, if a steady cut through the season is desired. Cut the blooms during the early part of the day. They are then fresh and retain their natural color, much of which would be bleached out of the delicately colored sorts by the sun during a warm day. Place in water at once in a cool room as near 50° as possible. Sort the blooms in separate colors, making two or three grades of quality, tying them into bunches of twenty-five blooms. Cut the stems even at the bottom and replace in water. Avoid crowding the blooms while they are soaking up water, as they will increase 25 per cent in size during the first twenty-four hours in water.

During a season, running from September to the end of the following June, an average cut of twenty blooms per plant may be expected from most varieties. Varieties differ somewhat according to the size of the blooms, the smaller-flowered sorts usually being the freer bloomers.

The preparation of the soil for growing carnations is of the greatest importance. Choose a piece of land which has not been tilled for some years, if possible. If covered with a heavy sod, all the better. The soil should be a loam of good substance, with an inclination toward sandiness. Break this sod in the fall and leave in a rough state during the winter. In the spring plow again and sow to cowpeas or some other leguminous crop. After plowing this under in the fall, manure heavily and leave until the following spring when it should be plowed again. This soil should be in first-

class condition for use the following summer. In working or handling soil, always bear in mind that to handle it while it is wet is to ruin it for immediate use. Only freezing will restore it again. If it will crumble readily, it is safe to handle. Soil which has been prepared in this manner will be rich enough to carry the plants until after the first of the year, when light feeding may be given. Feeding should be done judiciously during the short days of winter, to avoid softening the growth and bloom.

Pulverized sheep-manure, dried blood and wood-ashes are used most-ly for this purpose. The manure and blood improve the size and quality of the bloom, and the ashes strengthen the stem.

Ventilation and temperature.—The carnation being a cool-temperature plant, abundant fire-hair and ventilation should be provided for. A steady temperature is essential to success in growing carnations. Splitting of

812. Showing where to top (a) or to head back.

813. Undeveloped five-petaled carnation.

814. Carnation flower showing the calyx which has split on account of poor shape.

the calyx may usually be traced to either irregular temperature or to overdoes of feeding. Any point between 48° and 52° will provide a satisfactory night temperature for most varieties, providing it is evenly maintained. The temperature should be 10° higher during the day. Care should also be exercised, when building, in placing the ventilators,

so that the atmosphere in the house may be changed without causing cold drafts to strike the plants. By placing the ventilators alternately on both sides of the ridge, this may be accomplished. The side ventilators are used only during mild weather.

The modern type of carnation house runs east and west, is of even span and is 30 feet or more in width, having ventilators on both sides of the ridge and in the side walls, if houses are detached. Many ranges are connected by gutters 6 feet or more from the ground. When economical

815 Carnation flower showing a well-shaped calyx that will seldom burst

in ground is necessary, this is a good plan, but such ranges always contain some benches inferior for growing stock on account of the shade cast by gutters. The single detached house is ideal. See *Greenhouse*

Varities

The leading varieties in cultivation in this country at this time are—White, White Perfection, White Enchantress, White Wonder, Slaxton, Matchless, Herb-Pink, Enchantress, Pink Delight, Mayday, Pres Valentine, Rose-Pink, Rose-Pink Enchantress, Dorothy Gordon, Gloriosa, Mrs C W Ward, Philadelphia Pink, Dark Pink, Roquette, Washington, Peerless Pink, Northport, Scarlet, Devon, Victory, St. Nicholas, Herald, Commodore, Crimson, Harry Fenn, Octoroon, Poncefontas, Yellow, Yellow Prince, Yellowstone, White Variegated, Benora, Mrs B P Cheney. Any other color. Gorgeous, Rainbow. New varieties are being registered with the American Carnation Society at the rate of about twenty-five each year. Few varieties remain in cultivation longer than ten years, so that the list changes continually.

Diseases

Stemrot (*Rhizoctonia*) is the common wet stemrot which does perhaps more damage than all the other diseases combined, and it is also more difficult to control than any of the others. Its presence does not manifest itself until its damage is wrought, and the plant is seen to wilt and die. The cause of the disease is a fungus which exists in the soil, and which will be dormant in the soil for several years if there are no plants to attack. Hence no carnations should be planted for several years in soil which is known to have this fungus present.

Spores of *Fusarium* cause a slow rot of the heart of the plant, the treatment is same as above.

Carnation-rust (*Uromyces carophylli-nus*) is more common than stemrot, but not nearly so destructive. A slight swelling of the outer tissue of the leaf is the first sign of its presence. Later on this bursts open, releasing a brown-colored powdery substance, comprising the spores by which the fungus is propagated. Keeping the foliage dry and the atmosphere buoyant and bracing will prevent the appearance of this disease. Spraying with bordeaux mixture has been found effective in combating this disease after it has gained a foothold.

Fairy-ring (*Heterosporium echinulatum*) is perhaps the most destructive of

the spot diseases. It is brought on by a humid or foul atmosphere, and must be fought with remedies which will produce the opposite in atmospheric condition. Bordeaux is the standard remedy for all spot diseases.

Bench rot may be caused by any one of a number of organisms attacking the ends of the cuttings in the propagating-bench. It is frequently a very serious disease. The fungi most frequently causing the trouble are in the sand and under the ideal conditions of temperature and moisture of the propagating-bench spread very rapidly. The use of clean sand, free from all organic matter, and the securing of new sand for each lot of cuttings and cleanliness in the propagating-house will help to control this trouble.

Insect pests.

A green plant-louse (*Myzus persicae*) is frequently troublesome on carnations. It also attacks a large number of greenhouse and garden plants as well as several fruit trees. Nicotine applied in one of the many forms will destroy it. Spraying and vaporizing are both employed successfully as preventives of the attacks of aphids.

Thrips (*Heliothrips haemorrhoidalis*) are equally destructive and more difficult to control. The same treatment as for aphids is suggested. Sueted Paris green used as a spray is also effective (three gallons of water, two pounds of brown sugar, two table-spoonsful Paris green).

The punctures made by thrips and plant-lice cause yellowish spots on the leaves, a diseased condition known as *stigmose*. Red-spider (*Tetranychus bimaculatus*) is found mostly where plants grow near steam-pipes, where ventilation is poor, or in houses kept too dry. First of all spraying with water will usually destroy them if the spray is applied to the under surface. Use much force and little water to avoid drenching the beds. Sulfur as a dust or in water will also destroy them.

The carnation mite (*Pedicalopus granum*) injures the buds by transmitting the spores of a fungus (*Sporotrichum poe*) which causes them to decay. The injured buds are easily recognized and should be promptly gathered and burned to prevent further spread of the trouble.

Raising new varieties

It is a long way from the undeveloped five-petaled carnation (Fig. 813) of early days to the perfectly formed full bloom of today. This filling out of the bloom has evolved gradually, and has been assisted by cross-fertilization and selection by the carnation-breeders through the many years in which the flower has been cultivated. This crossing, which has been the means of perfecting the American strain of the perpetual-flowering carnation, has been prosecuted continuously ever since the arrival of the first plants in this country. Many men have found both pleasure and profit in the work, and those with scientific inclination will find no subject more interesting. Not only have the blooms become larger, but the color has varied widely, the "substance" has been much improved, the calyx has been developed for non-bursting (Figs. 814, 815), the keeping qualities of the flowers have been improved, and the stems have been lengthened.

The operation of pollinating the bloom, or transferring the pollen from one flower to the stigma of another, is a simple matter, and is perhaps of less importance than other parts of the work of producing desirable new varieties.

817 Carnation flower Pink Delight, showing nearly entire-edged petals.

816. Cross-section of carnation flower showing reproductive organs.

The Fig 816 is a section of a flower showing the reproductive organs; a shows the pod which encases the ovules or forming seeds, b. From the top of the pod rises the style which has usually two, but frequently three curved ends, or stigmas, c. When the stigma is in the proper stage to be fertilized, which is indicated by the fuzzy appearance of the upper part, the pollen, which is the powdery substance released by the anthers, d, is applied to the fuzzy parts. To prevent self-fertilization, these anthers should be removed from flowers intended to be pollinated, before the pollen is released. Within one to three days, if fertilization has taken place, the bloom will wilt, the ovary will begin to swell and within a week the seed-pod can be seen to increase in size. As soon as the bloom has

818. Carnation flower Radiance, showing deeply serrated petals.

wilted, the petals should be removed and the calyx slit down the sides to prevent water from standing inside the calyx and causing the pod to decay. In six to eight weeks the seeds will be ripe and should be sown at once. Each seed may prove to be the beginning of a variety which will be one of the milestones of progress in the improvement of the carnation. Not one should be discarded until it has bloomed.

The seedlings should be potted as soon as the first pair of character-leaves appears. Later on they may be shifted into larger pots and bloomed, or they may be planted in the field and marked as they bloom and only the promising ones housed in the fall. The selecting of the plants for further trial is of the very greatest importance and requires a thorough knowledge of the subject. There are many points in the make-up of a first-class carnation, and a combination of as many of these as is possible to get in one plant is the object sought. No carnation has ever been found which was perfect in every way. The hybridist must be able to judge correctly as to the relative value or loss represented in certain characteristics shown by a seedling plant. This discrimination between the desirable and undesirable calls for the clearest judgment, and a valuable variety might be discarded through the failure of the grower to see its good points.

Among the seedlings will probably appear variety of colors, shapes and sizes of bloom, different types of growth, perfect in some respects and faulty in others. From these the hybridist is to select those which most nearly represent his ideal of the perfect carnation. This ideal should be of a pleasing shade of color, pure in tone, so as to hold when the bloom ages. The form should be symmetrical, resembling as nearly as possible a half-sphere with just enough petals to fill the bloom nicely without crowding. The petals may range from the smooth-edged, as seen in Fig 817, to the deeply-serrated, as seen in Fig. 818. The texture of the petals should be such as will resist bruising. The odor should be strong clove. The size should be as near 4 inches across as possible under ordinary culture. The calyx should be strong and large enough to hold the petals firmly at all stages of development. The stem should be 30 to 36 inches long, and strong enough to hold the bloom erect. The plant should have a free-growing habit, throwing blooming shoots freely after a shoot is topped or a bloom is cut. It should also be healthy and disease-

resistant. The American Carnation Society uses the following scale of points for new varieties:

Color	25
Size	20
Calyx	5
Stem	20
Substance	15
Form	6
Fragrance	100

The most uniform results have been secured by confining the breeding to separate colors; as, for example, crossing white with white, red with red or crimson, pink with pink, and so on. This method has been proved to produce the largest percentage of self-colors, which are considered the most valuable commercially in this country.

New varieties are frequently secured by sporting or mutation. A variety of a certain color may produce a bloom of another color, and by propagating the cuttings from the stem which carried the odd bloom a new variety is established. The securing of a new variety in this way is purely a matter of good fortune, as no method for causing the sporting is yet known.

Leading books on the carnation are, "The American Carnation," by C W Vard; "Carnations, Picotees and Pinks," by T W. Sanders; "Carnations and Pinks," by T H. Cook, Jas Douglas and J F McLeod; "Carnation Culture," by B C Ravenscroft. The last three are English.

A. F. J. BAUR.

CARNÉGIEA (named for Andrew Carnegie, philanthropist). *Cactaceæ*. The giant tree cactus of Arizona, California and Mexico.

Large columnar plants, usually single, strongly ribbed, with numerous spines, those from flowering and sterile areoles quite different. Its borne from the upper areoles, diurnal, funnelliform, petals white: fr. an oblong edible berry; seeds black and shining.

gigantæa, Brit & Rose (*Cereus gigantæus*, Engelm.). *Stawano*. (Plate III, Fig 819.) A tree 20-60 ft high, usually single, but sometimes with one or more branches: ribs in mature plants 18-21 fr 2-3 in long. B M 7222. A G. 11:451, 528—In rocky valleys and on mountainsides, S Ariz. and Sonora, with 2 stations in Calif. [reported, but probably not to be found, in Lower Calif]. This great cactus does not do well in cult, although large plants are often brought into greenhouses and grounds about railroad stations in the S W. It is not suited for small collections. The fr. is gathered in great quantities by the Indians of Ariz. J. N. Rose.

CAROB: *Ceratonna*.

CAROLÍNEA: *Pachira*.

CARPENTERIA (after Professor Carpenter, of Louisiana). *Saxifragaceæ*. Ornamental shrub cultivated for its large fragrant white flowers.

Evergreen. Lvs opposite, petioled, usually entire: calyx 5-parted; petals 5; stamens numerous; ovary almost superior, 5-7-celled; styles 5-7, connate at the base, with linear-oblong stigmas. Fr a many-seeded dehiscent caps. with numerous oblong seeds.—One species in Calif.

This is a highly ornamental evergreen plant, with rather large opposite leaves and showy white and fragrant flowers in loose and terminal corymbs. Hardy only in warmer temperate regions. It requires a well-drained, light and sandy soil, and sunny, somewhat sheltered position; it especially dislikes moisture during the winter, and its perishing is more often due to an excess of moisture than to the cold. Propagated by greenwood cuttings under glass in

819. Flower of *Carnegiea gigantea*. (X $\frac{1}{2}$)

summer, and by suckers, which it produces freely; also, by seeds sown in spring.

californica, Torr. Shrub, 6-10 ft.: lvs. elliptic-lanceolate, entire or remotely denticulate, bright green above, whitish-tomentose beneath, 2-4 in long; fls pure white, 2½-3 in. diam., fragrant; petals orbicular, concave. CARPET-BEDDING: *Bedding*.

CARPINUS (ancient Latin name). *Betulaceae*. HORNBEAM. Trees cultivated for their handsome foliage, assuming bright autumnal tints, also for the light green attractive fruit-clusters.

Deciduous trees or rarely shrubs' winter-buds conspicuous, acute with many imbricate scales lvs alternate, petioled, serrate, with deciduous stipules' fls. monocious; staminate catkins pendulous, each scale bearing 3-13 stamens, 2-forked at the apex; pistillate catkins terminal, slender, each scale bearing 2 ovaries, the bracts and bractlets of which develop into a large, leafy, more or less 3-lobed bract, embracing the small, nut-like fruit at their base.—About 20 species, most of them in Cent. and E. Asia, 5 in Eu. and W. Asia and 1 in N and Cent. Amer. Monogr by Winkler in Engler, Pflanzenreich, Betulaceae, hft 19, pp 24-43, quoted below as W. B.

The hornbeams are trees usually with dense round head, rarely shrubby, with medium-sized, bright green ovate to lanceolate leaves and rather insignificant flowers appearing with the leaves and followed by pendulous catkins consisting of large bracts bearing a small nutlet in their axils. The wood is very hard and close-grained, and much used in making tools and other small articles. The handsome foliage is rarely attacked by insects, and assumes a yellow or scarlet color in fall. The most beautiful are *C. cordata*, with large leaves, and *C. japonica*, of graceful habit and with elegant foliage. The European hornbeam bears severe pruning well, and is very valuable for high hedges, it was formerly much used in the old formal gardens for this purpose, it makes, also, an excellent game cover, as it retains its withered foliage almost throughout the winter.

The species are of comparatively slow growth and thrive in almost any soil, and even in dry, rocky situations, most of them are quite hardy North. Propagated by seeds, sown usually in fall, germinating very irregularly; if they do not appear the first spring, the seed-bed should be covered until the following spring with moss or leaf-mold, to keep the soil moist. If intended for hedges, the seedlings should be transplanted after the first year, and allowed sufficient space to prevent them from growing into slender tall plants, unfit for hedges. The varieties of rarer species are grafted in spring under glass, or in the open air on seedlings of one of the common species.

A. Lvs with 7-15 secondary veins; mature catkins with spreading narrow bracts.

caroliniana, Walt. (*C. americana*, Michx. *C. virginiana*, Michx. f.). AMERICAN HORNBEAM BLUE BEECH. Fig 820. Bushy tree, rarely 40 ft.. lvs ovate-oblong, usually rounded at the base, acuminate, sharply and doubly serrate, glabrous at length, except in the axils of the veins beneath, 2-4 in. long. fr.-clusters peduncled, 2-4 in. long. bracts ovate or ovate-lanceolate, ¾-1 in. long, with 2 broad and short unequal lateral lobes, and a much longer middle lobe, usually serrate only on one margin. E. N. Amer., west to Minn and Texas; also, in Mex. and Cent. Amer. S.S. 9:447. Em. 1:199. Gn. 24, p. 418.—Bushy tree, with dense, but slender and

often somewhat pendulous branches, and dark bluish green foliage, changing to scarlet or orange-yellow in fall.

Bétulus, Linn. EUROPEAN HORNBEAM Tree, to 60 or 70 ft. lvs similar to those of the former, cordate or rounded at the base, ovate or oblong-ovate, of somewhat thicker texture, and the veins more impressed above fr.-clusters 3-5 in long bracts over 1½ in long, with ovate, lateral lobes, and much longer oblong-lanceolate middle lobe, the margins almost entire or remotely denticulate. Eu to Persia H.W. 2:17, pp 31-33 W.B. 29 F.S.R. 3, p 153 Gn 24, pp 418, 419, 420.—The most remarkable of the garden forms are the following. Var *incisa*, Ait (var *asplenifolia*, Hort.) Lvs incised or lobed, smaller Gn 24, p 419 Var *pyramidalis*, Dipp (var *fastigiata*, Hort.) Of upright growth Var *purpurea*, Dipp. Lvs purplish when young, green at length.—It grows into a taller tree than the American species, although the former is of more vigorous growth when young, the foliage turns yellow in fall, and remains on the tree throughout the winter.

AA Lvs with 15-25 pairs of veins mature catkins with loosely appressed ovate and dentate bracts, of cone-like appearance.

japonica, Blume (*C. Carpinus*, Sarg *Disleocarpus Carpinus*, Sieb & Zucc.) Tree, to 50 ft. young branchlets pubescent: lvs reddish brown when unfolding, oblong-ovate or oblong-lanceolate, 2-4 in. long, acuminate, rounded or subcordate at the base, unequally serrate, with 20-24 pairs of veins deeply impressed above, bright green and glabrous above, beneath brownish pubescent on the veins at first, finally glabrous or nearly so mature catkins ovoid-oblong, 2 in. long, slender-peduncled, bracts inflexed at the base inclosing the nutlet Japan G.F. 6:365. R.H. 1895, p. 427 S.I.F. 1:21.—A very graceful species and quite hardy, sometimes cult under the name *C. lauriflora*, which is an entirely different species with the lvs having only 10-11 pairs of veins

cordata, Blume Tree, to 40 ft. young branchlets hairy at first, soon glabrous lvs ovate or oblong-ovate, acuminate, distinctly cordate at the base, 3-6 in. long, unequally serrate, with 15-20 pairs of veins deeply impressed above, pubescent on the veins beneath or glabrous mature catkins 2-3 in long, slender-peduncled; bracts not inflexed at the base, but with an opposite bractlet about as long as the nutlet. Japan, Manchuria, Korea G.F. 8:295 S.I.F. 1:24.—A very handsome species and quite hardy.

C. americana, Michx = *C. caroliniana* — *C. dumalis*, Scop = *C. orientalis* — *C. laurifolia*, Blume To 50 ft. lvs ovate or elliptic-ovate, long-acuminate, 2-3 in long, with 10-14 pairs of veins. Japan S.I.F. 1:25.—A very attractive in fall, with its long and slender catkins Var *macrodonia*, Winkl Lvs ovate-oblong fruiting catkins 2½-3½ in long W. China H.1 20 1989.—Recently intro.—*C. orientalis*, Mill Bushy tree, to 15 ft lvs ovate or oblong-ovate, 1½-2 in long, with about 10 pairs of veins. S.E. Eu. to Persia Gn 24, p 418.—*C. Parvi*, Winkl = *C. Turczaninowii* — *C. polynearia*, Franch (*C. Turczaninowii* var *polynearia*, Winkl.). Small tree young branchlets pubescent, soon glabrous lvs ovate-lanceolate, long-acuminate, usually rounded at the base, 1½-2½ in. long, with 15-20 pairs of veins, fruiting bractlets ovate to lanceolate, serrate W. China. W.B. 30.—*C. Turczaninowii*, Hance (*C. Parvi*,

820. *Carpinus caroliniana*. (X½)

Winkl.) Shrubby tree: lvs ovate, acute, 1-2 in. long, with 10-12 pairs of veins. N. China—*C. virginiana*, Michx f.—*C. caroliniana*—*C. yedoensis*, Maxim. Small tree branchlets and lvs beneath pubescent. lvs ovate-elliptic or ovate-lanceolate, with about 12 pairs of veins, 2-3 in. long. Japan. S.I.F. 2 11. ALFRED REHDER.

CARRIÈRE (after E. A. Carrière, prominent French horticulturist and botanist, died 1896). *Flacourtiaceae*. Ornamental tree chiefly cultivated for its handsome bright green foliage.

Deciduous: lvs alternate, long-petioled, serrate; fls dioecious; sepals 5, broadly ovate, pubescent outside; petals wanting; stamens numerous, shorter than the sepals, ovary 1-celled with numerous ovules, rudimentary in the staminate fls, styles 3-4, 3-lobed, short and spreading fr. a dehiscent caps., seeds winged—One species, or possibly two, in Cent. China.

This is a medium-sized tree very much resembling *Ilex* in appearance, the apetalous flowers with large white sepals in terminal corymbs or short racemes, the staminate usually many-flowered, the pistillate few-flowered, rarely solitary, and with large capsular long-pointed fruits. It has proved fairly hardy at the Arnold Arboretum. Propagated by seeds, can probably also be propagated like *Ilex* by greenwood and root-cuttings.

calycina, Franch. Tree, to 30 ft., with a wide-spreading flat head. lvs elliptic or ovate to oblong-obovate, 3-6 in. long, short-acuminate, rounded at the base,

821 Last year's umbel of wild carrot.

lustrous on both surfaces, glabrous, crenately-serrate; sepals broadly cordate-ovate about $\frac{3}{4}$ in. long and nearly as broad, white caps. 2-2 $\frac{1}{2}$ in. long, pubescent. Cent. China. R.H. 1896, p. 498. ALFRED REHDER.

CARROT (*Daucus Carota*, Linn.) *Umbelliferae*. Garden vegetable, grown for its elongated subterranean crown-tuber.

The carrot is native of Europe and Asia, and one of the bad introduced weeds of eastern North America (Fig. 821). The improved succulent-rooted garden varieties are thought to be descended from the same stock, though this has been denied. It seems probable that the horticultural improvement of the species was begun in Holland, and it is said that the cultivated forms were introduced thence into the gardens of England during the reign of Queen Elizabeth. The carrot is now very generally, though not extensively, cultivated everywhere, both for culinary purposes and for stock-feeding. It is sometimes forced under glass, but to no great extent. Carrots are most useful in culinary practice for soups, stews, and salads, and as this class of cookery has never been reasonably popular in America, this vegetable has not received the attention it deserves.

The carrot is hardy and may be planted as soon as the ground is in fit condition to be properly prepared for seeding. When grown as a market-garden or truck

crop, this early seeding is essential to maximum returns. The best soil for carrots is a medium to light loam, rich, friable and comparatively free from weeds. As the seed is slow to germinate, it is a good plan to sow some quick-germinating seed with the carrot seed so that the rows may be noticed in time to keep them ahead of weed growth. Lettuce serves well for this purpose. When the carrots are thinned, this lettuce is pulled out. The carrot seed is best sown in rows 12 to 15 inches apart, using enough seed to produce a plant every inch or two along the row. When the carrots are 3 to 5 inches high, they should be thinned to stand 3 inches apart in the row. The only further culture necessary is frequent tillage to conserve soil-moisture and to prevent weed growth. The early crop should be ready to pull and bunch for sale seventy-five days after sowing. Early carrots are an important crop on the market-garden and truck-farm. They are pulled as soon as they have attained sufficient size and tied into bunches of three, six or seven roots, according to the size of the roots and the market demands. The earlier the crop and the more active the demand, the smaller the roots which may be salable. A later sowing is made for the main or winter crop or for live-stock. This may be from four to six weeks after the first sowing. The crop is handled in the same manner as the early crop except that it is allowed to continue growth as long as the weather is suitable. It is then pulled, the tops cut from the roots and the roots placed in frost-proof storage for winter sale.

The expense of production of carrots is considerable, but the returns are usually satisfactory. The fall crop should yield 500 to 1,000 bushels to the acre. Truck-growers of the South ship many bunched carrots to the large northern markets in March, April and May, where they meet a ready demand at prices ranging from 35 cents to \$1 per dozen bunches.

There are several distinct market types of carrots, the variation being chiefly with respect to size and shape. The smaller varieties, as they mature more quickly, are used to some extent for the early bunching, while the larger kinds are always more popular in the general market.

The varieties of carrots differ chiefly in respect to size and grain, with differences in eatiness closely correlated. The following are now favorite varieties.

French Forcing (Earliest Short Horn)—One of the smallest and earliest; root small, almost globular, orange-red.

Oxheart or **Guerande**—Small to medium in size, root 2 to 4 inches long, growing to a blunt point, of good quality and popular in some sections for an early bunch carrot.

Chantenay—Large to medium in size, root 3 to 5 inches long, more tapering than Oxheart, of good quality and a better carrot for the bunched crop than the above.

Danvers Half-Long—Six to 8 inches long, 2 to 3 inches in diameter, at top tapering to a blunt point; the most popular garden carrot grown.

True Danvers—A long carrot, 8 to 12 inches; tapering to a slender point like a parsnip; grown more for live-stock or exhibition purposes. The Half-Long has largely displaced it as a market sort chiefly because of the greater ease with which the latter strain is harvested.

Half-Long Scarlet—Top small, roots medium size, cylindrical, pointed; much used for bunching.

Early Scarlet Horn—Top small, roots half-long, somewhat oval, smooth, fine grain and flavor, a favorite garden sort.

Large White Belgian—Of much larger size than the above-named varieties, of less delicate flavor and coarser texture; a popular variety for live-stock.

The variation in the different strains of carrot seed is marked and it is important to secure seed from carefully selected roots true to shape and color. Carrot seed may be produced in any location in which the crop of roots is grown successfully.

The carrot may be successfully forced under glass and is grown in this way to a limited extent. The small early varieties are used, such as French Forcing, Early Parisian, Early Scarlet Horn and Golden Ball. These will usually be grown as a catch-crop between tomatoes or cucumbers. When grown in this way, the carrot is one of the most delicious of all vegetables, and deserves much wider popularity. See *Forcing*.

The field cultivation of carrots for live-stock differs little from the garden or horticultural treatment except that earliness is not desired, and the longer-rooted later-maturing kinds are mostly used; and less intensive cultivation is employed. See Vol II, *Cyclo Amer Agric*, p. 540. F. A. WAUGH and H. F. TOMPSON.

CÁRTHAMUS (Arabic name, alluding to a color yielded by the flowers). *Compositæ*. Hardy annuals.

Plant 2-3 ft high, with spiny lvs. involucre with spreading and leafy outer scales and the inner ones more or less spiny; receptacle chaffy, corolla 5-fid, nearly

822. Garden carrots of the shorthorn type.

regular, smooth, expanded above the tube achenes glabrous, mostly 4-ribbed, the pappus none or scale-like. —A genus of 20 species, from the Canary Is. to Cent. Asia. Of easiest cult., from seed.

tinctorius, Linn (*Citrullus tinctorius*, Falk.). **SAFFLOWER**. FALSE SAFFRON. One to 3 ft high, glabrous, branched lvs ovate, spiny-toothed, almost as broad as long fl-heads with upward-tapering involucre, and a globular crown of orange florets. Asia.—Florets used like saffron, they have diaphoretic properties and have also been used for dyeing, especially silks, and in making rouge. N. TAYLOR.†

CARUELIA *Ornithogalum*.

CÁRUM (probably from Caria, in Asia Minor). *Umbelliferae*. Glabrous annual or perennial herbs, some of which yield aromatic and edible garden products.

Leaves pinnate fls white or pinkish, small, in compound umbels with involucre and involucels, the calyx-teeth small fr ovate or oblong, more or less ribbed, glabrous, or sometimes hispid; root usually tuberous or filiform.—Twenty or more species, widely distributed in temperate regions. The genus is variously defined and understood. *C. Petroselinum*, the parsley, is here kept under the genus *Petroselinum*.

Cáru, Linn. **CARAWAY** (which see). St. slender but erect, furrowed, 1-2 ft lvs. pinnately decomposed, with thread-like divisions. Old World.—Sometimes runs wild.

Gáirdneri, Gray. St solitary, 1-4 ft.: lvs. pinnate or the upper ones simple, with 3-7 linear lfts., the upper lfts. usually entire, but the lower ones often divided: fr. with long style. Dry hills, in Calif. and Nev. and to Brit. Col.—Intro. in 1881, by Gillett, as an ornamental plant. Roots tuberous and fusiform. L. H. B.

CARÚMBIUM: *Homalanthus*.

CÁRYA (*Karya*, Greek name for the walnut tree). Syn. *Hicória*, *Juglandácea*. **HICKORY**. Trees grown for their hard-ome foliage and strong habit, and some species for their edible nuts.

Deciduous branches with solid pith, lvs. alternate, without stipules, with 3-17 serrate lfts. fls. monoecious, apetalous, appearing with the lvs; staminate fls. in axillary, slender, pendulous catkins, each fl. with 3-10 stamens, borne in the axil of a 3-lobed bract, pistillate fls. in a terminal, 2-10-fl. cluster or spike, consisting of a 1-celled ovary enclosed by a 4-lobed involucre fr. globular to oblong, with a husk separating into 4 valves and a bony nut, incompletely 2-4-celled.—About 18 species of hickory, all in E. N. Amer. from Canada to Mex; the Chinese species recently described by Dode from nuts only is probably not a *Carya*. See Rep. Mo. Bot. Gard 7, pp. 28-42, pls. 1-23, and Rep. of U. S. Dept. Agric., Div. Pomol., Nut-Culture (1896), cited below as U. S. N. C. (the first number referring to the plate, the second and third to the figure). By some, *Hicoria* is considered to have priority, but *Carya* is retained as one of the "nomina

conservanda" of the Vienna code of nomenclature, because of its long-established usage.

The hickories are hardy ornamentals, usually tall trees with rather large, deciduous odd-pinnate leaves, small greenish flowers, the staminate ones in conspicuous pendulous racemes, and with rather large green dehiscent fruits inclosing a mostly edible nut. The hickories are among the most beautiful and most useful trees of the American forest, and are all very ornamental park trees, with a straight, sometimes high and slender trunk and a large, graceful, pyramidal or oblong head of usually light green foliage, turning from yellow to orange or orange-brown in fall. They are hardy North except *C. Pecan*, *C. aquatica* and *C. myristiciformis*, but *C. Pecan* thrives rarely in Massachusetts in sheltered positions. Most of the species have heavy hard strong and tough wood, much valued for many purposes, especially for handles of tools, manufacture of carriages and wagons, also for making baskets and for fuel. The nuts of some species, as *C. Pecan* and *C. ovata*, also *C. laevis* and some varieties of *C. glabra* and *C. alba*, are edible, and are sold in large quantities, mostly gathered from the woods, though in later years orchards of improved varieties have been planted. A large number of insects prey upon the hickory, attacking the wood, foliage and fruit, for which see the Fifth Ann. Rep. of the U. S. Entom. Com., pp. 285-329. There are also some fungi sometimes causing an early defoliation of the trees.

The hickories generally thrive best in rich moist soil, but some, especially *C. glabra*, *C. alba* and *C. ovata*, grow equally well in drier localities. They are of rather slow growth, and difficult to transplant if taken from the woods, therefore the seeds are often planted where

the trees are to stand, but if grown in the nursery and transplanted several times when young, trees 6-10 ft. high may be transplanted successfully.

Propagation is usually by seeds stratified and sown in spring in rows about 3 inches deep; named varieties may be grafted in spring in the greenhouse, on potted stock of *C. cordiformis*, which seems to be the best species for this purpose, veneer- or splice-grafting being usually employed, sometimes also increased by root-sprouts. For further horticultural advice, see *Hickory-nut* and *Pecan*.

B. Nut mostly elongated, almost terete, husk thin, splitting to the base, kernel sweet; cotyledons entire or only notched at the apex.

1. *Pecan*, Engler & Graebn. (*Juglans Pecan*, Marsh. *Hicoria Pecan*, Brit. *C. illinoensis*, Koch. *C. olivaeformis*,

Nutt.). *PECAN*. Fig. 823. To 170 ft., with branches pubescent when young; bark deeply furrowed, grayish brown; winter-buds yellow; lfts. 11-17, short-stalked, oblong-lanceolate, acuminate, serrate, or doubly serrate, tomentose and glandular when young, usually glabrous at length, 4-7 in. long; staminate catkins almost sessile; fr. 3-10 in. clusters or spikes, oblong, 1½-3½ in. long; nut ovoid or oblong, smooth, brown, irregularly marked with dark brown, 2-celled at the base; kernel sweet. From Iowa and Ind. south to Alabama and Texas; also in Mex. S.S. 7:338-9. A G 12:273-275. U.S.N.C. 1, 8, 9.—This species is the most important as a fr. tree, and many named varieties are cult. in the southern states, but it is tender N. The wood is less valuable than that of the other species. Hybrids are known of this species with *C. cordiformis*, *C. alba* and *C. laciniosa*, for which see Rep. Mo. Bot. Gard. 7, pls. 20-23 and Ging 2:226. See *Pecan*.

2. *myristiceiformis*, Nutt. (*Hicoria myristiceiformis*, Brit.). *NUTMEG HICKORY*. Tree, to 100 ft., with dark brown bark, broken into appressed scales; winter-buds brown. lfts 5-11, short-stalked or almost sessile, ovate-lanceolate, the uppermost much larger and obovate, serrate, scurfy-pubescent beneath when young and with brown scales above, at length dark green above, silvery and lustrous beneath, 3-5 in. long, staminate catkins peduncled; fr. generally solitary, short-ovoid or obovate, about 1½ in. long, nut ovoid, reddish brown marked with irregular spots and stripes, thick-shelled, 4-celled below, kernel sweet. From S C to Ark and Mex. S.S. 7:342-3.—A very decorative species on account of its handsome foliage, but not hardy N.

BB. Nut usually so broad as long, compressed, with irregularly angled or reticulate surface, thin-shelled, 4-celled below, kernel bitter, cotyledons deeply 2-lobed.

3. *aquatica*, Nutt. (*Hicoria aquatica*, Brit.). *WATER HICKORY*. *BITTER PECAN*. Usually small tree, rarely to 100 ft., with light brown bark separating into long, thin plates; winter-buds dark reddish brown. lfts 7-13, sessile or short-stalked, lanceolate, long-acuminate, finely serrate, yellowish tomentose when young, glabrous at length; fr. 3-4, ovoid to broadly obovate, 1-1½ in. long; husk thin, splitting to the base, nut obovate, much compressed, irregularly angled and ridged, dull reddish brown, kernel very bitter. From Va to Ill., south to Fla. and Texas. S.S. 7:344-5. U.S.N.C. 12, 7-8.

4. *cordiformis*, Koch (*Hicoria minima*, Brit. *C. amara*, Nutt.). *BITTERNUT*. *SWAMP HICKORY*. Tree, to 100 ft. bark grayish brown, broken into thin scales; young branches and petioles glabrous; winter-buds bright yellow. lfts 5-9, ovate-lanceolate to lanceolate, acuminate, densely serrate, pubescent when young and glandular, almost glabrous at length, 3-6 in. long; fr. 2-3, broadly obovate or subglobose, winged from the apex to the middle, ¾-1½ in. long; husk thin, splitting somewhat below the middle; nut slightly compressed, roundish, abruptly contracted into a short point, smooth, gray, kernel bitter. Que to Minn., south to Fla. and Texas. S.S. 7:340-1. Em. 226.—A valuable park tree, with handsome rather broad head, growing in cult. more rapidly than other hickories.

AA. Scales of buds imbricate, more than 6; fr. not or slightly winged at the sutures; nut usually thick-shelled, 4-celled below; lfts 3-9, not falcate, the uppermost larger and generally obovate.

B. Buds small, ¼-½ in. long; husk thin, nut slightly or not angled.

C. Lvs. glabrous or only slightly pubescent while young; nut not or only slightly angled, thin-shelled.

5. *glabra*, Sweet (*Hicoria glabra*, Brit. *C. porcina*, Nutt.). *PIGNET*. Figs 824, 825. Tree, occasionally to

cc Lvs hairy beneath; nut angled, thick-shelled.

7. *villósa*, Schneid (*Hicoria villosa*, Ashe *H. glabra* var. *villósa*, Sarg. *H. pallida*, Ashe) Tree, to 20 or sometimes to 50 ft.; branchlets slender, pubescent mixed with silvery scales, later glabrous. Ifs 5-9, usually 7, sessile or short-stalked, oblong to oblanceolate, 3-5 in long, acuminate, narrowed at the base, coarsely serrate, when unfolding glandular above, hairy below and with silvery scales, petioles pubescent and with tufts of brownish hairs, finally often glabrous; fr subglobose to pear-shaped, $\frac{3}{4}$ -1 $\frac{1}{2}$ in long, winged, husk thin, splitting to below the middle or nearly to the base, nut slightly angled, somewhat compressed, thick-shelled, pale or light brown, kernel small and sweet. N J to Fla., Miss and E Texas. S S 7 355 G F 10 305

826. Fruit of *C. ovalis*, the false shagbark. (Natural size).

BB Buds large, $\frac{1}{2}$ -1 in long; nut angled, kernel sweet. c. Bark not shaggy; branches and petioles tomentose, outer bud-scales falling in autumn; husk not separating quite to the base.

8. *álba*, Koch (*Hicoria alba*, Brit. *C. tomentosa*, Nutt.) Not to be confounded with *C. alba*, Nutt., which is *C. ovata*. MOCKERNUT BIG-BUD HICKORY Tree, rarely attaining to 100 ft. Ifs 7-9, almost sessile, oblong-lanceolate, long-acuminate, usually finely serrate, glandular and tomentose beneath, very fragrant when crushed, 4-8 m. long; fr globose to pear-shaped,

827. *Carya ovalis*, the false shagbark.

1½-2 in long; nut light brown, globular to oblong, slightly compressed, angled, narrowed toward the apex, thick-shelled, kernel small, sweet. Mass to Ont and Neb., south to Fla and Texas. S.S. 7:350-1. U.S.N. C. 12, 1-3. Em. 222.

828. Twig of *C. ovata*.

cc. Bark shaggy, light gray branches and petioles glabrous or pubescent husk very thick, separating to the base: outer bud-scales persisting through the winter.

9 *laciniosa*, Engler & Graebn. (*Hicoria laciniosa*, Sarg. *H. acuminata*, Dipp *C. sulcata*, Nutt.) Big or BOTTOM SHELL-BARK HICKORY KING-NUT Tall tree, occasionally to 120 ft. branchlets orange-red lfts 7-9, oblong-lanceolate, acuminate, serrate, pubescent when young, usually glabrous at length, 4-8 in. long fr. generally oblong, 1½-2½ in long, nut yellowish white, oblong, but sometimes as broad as long, slightly compressed and obscurely 4-angled, pointed at both ends; kernel sweet N Y to Iowa, south to Tenn and Okla S.S. 7:348-9 U.S. N C 11

10 *ovata*, Koch (*Hicoria ovata*, Brit *C. alba*, Nutt.) SHAGBARK HICKORY Also LITTLE SHELLBARK HICKORY, although the latter name by some is applied to the preceding. Figs 830, 831 Tree, occasionally to 120 ft lfts generally 5, sessile, oblong or oblong-lanceolate, acuminate, serrate, densely fimbriate, pubescent and glandular when young, glabrous at length, 4-6 in long fr. subglobose, about 1½-2½ in long, nut white, oblong to broadly obovate, 4-angled, kernel sweet From Que to Minn., south to Fla and Texas. S.S. 7:346-7. Em 217 U.S.N.C. 10 AG 11.386, 6, 9; 387, 3, 388, 11. Gng. 7-51. AF 14.339.—Next to Pecan the best as a fruit tree, especially for northern states, where the pecan is not quite hardy Several named varieties are in trade, of which probably var. *Halesii*, Hort., with large, thin-shelled nut, is the best known. An ornamental, often very picturesque tree; the stout branches forming a rather broad, usually somewhat open, head Var Nut-tallii, Sarg. (*C. microcarpa*, Nutt. in part). Fr. smaller; nut rounded, usually obovate, much compressed and prominently angled, about ½ in across. Mass to Pa. and Mo Nut-tall, Silv N. Am 1.13 Var. *f. axinifolia*, Sarg. Lfts. lanceolate or

829. Habit of the small-fruited hickory, *Carya ovata*.

nearly oblanceolate, the terminal one 5-6 in. long and 1¾-2 in wide. fr. generally smaller, ovoid, pointed 1½ in long, nut long-pointed. W. N. Y.

C. arkansana, Sarg. Allied to *C. glabra*. Tree, to 70 ft bark dark gray, scaly branchlets pubescent lfts 5-7, lanceolate, densely pubescent when unfolding, glabrous at maturity, 4-7 in long fr. ovoid or obovoid, husk usually splitting to the middle, nut slightly obovoid, shell very thick and hard; kernel sweet, small. Ark and Okla S.S. 2 181.—*C. Buckleyi*, Durand (*C. texana*, Buckl, not DC.) Allied to *C. alba* Tree, to 50 ft, with dark, furrowed bark lfts 7, lanceolate or oblanceolate, pubescent on the vein below, 3-6 in long fr. subglobose or ovoid, 1½ in across, husk thin, splitting to the base, nut reddish brown, veined, shell hard, kernel sweet

Texas to Okla and Ark S.S. 2 182 *C. caroliniana*, Engler & Graebn. (*Hicoria caroliniana*, Sarg. *C. septentrionalis*, Ashe) Allied to *C. ovata* Branchlets under lfts 4-5, lanceolate, glabrous fr. smaller, nut thin-shelled N C to Ga S.S. 14 720.—*C. floridana*, Sarg. Allied to *C. cordiformis* Buds valvate, brownish yellow. lfts usually 5, elliptic-oblong to lanceolate, densely silky beneath, 2-1½ in long fr. obovoid, about 1 in long, husk tardily splitting to the base, nut obovoid or subglobose Fla S.S. 2 177 *C. megacarpa*, Sarg. Closely related to *C. glabra* Bark close buds larger

830. Twig of *Carya ovata*.

831. Fruit of *Carya ovata*, the shagbark hickory. The cross-section is to show structure, not to show a good horticultural fruit. (Natural size)

lfts to 8 in long fr. broadly obovoid, to 1½ in long, husk thick, tardily dehiscant to the middle, nut obovoid, kernel small, sweet N Y to Mo and Fla S.S. 2 180.—*C. mexicana*, Engelm. Tree, with shaggy bark and tomentose-pubescent lvs fr. depressed, with rather thick husk and broad, sharply 4-angled, white nut. Mex. The only species not native to the U.S.—*C. texana*, DC. (*Hicoria texana*, Le Conte) Similar to *C. Pecan*, but lfts broader, less lacinate, almost sessile, nut smaller, much darker, with somewhat rough surface, kernel bitter Texas S.S. 14 719.—*C. texana*, Buckl.—*C. Buckleyi*.

ALFRED REHDER.

CARYOCAR (from the Greek word for nut) *Caryocaraceae*, formerly included in *Ternstroemiaceae*, and by some referred to *Rhizophoraceae*. Trees, or rarely shrubs, of about 10 species in Trop. Amer., one of which is well known for its large edible nuts. Lvs opposite, digitately 3-5-foliolate, leathery, often serrate; fls bractless, in terminal racemes; calyx deeply 5-6-parted, the lobes orbiculate and strongly imbricate; petals 5-6, imbricate; stamens many, somewhat joined at the base, ovary 4-6-celled, fr. drupaceous, with a hard stone or stones and very large seeds. *C. nuciferum*, Linn., produces the souari-nut or butternut of the American tropics. Although native of Guiana, it is cult in some of the W. Indies isls. tree, attaining 100 ft or more, producing durable timber used chiefly in ship-building. lvs trifoliolate, the lfts elliptic-lanceolate, glabrous fls large, purple, the stamens white and very numerous fr. several inches in diam., nearly globular or becoming misshapen by abortion of the contents, containing 2-4 hard-shelled nuts the size of a hen's egg, and which are flat-kidney-shaped, warty and reddish brown; kernel or meat white, with a nutty or almond-like flavor, and yielding oil when subjected to pressure B.M. 2727, 2728 The nuts now and then appear in northern markets. The closely allied *C. villosum*, Pers., of Guiana and Brazil, is reported as a notable timber tree; and the oily pulp surrounding the seed is eaten boiled and the kernel of the seed is eaten raw.

L. H. B.

CARYOPHYLLUS, the clove tree, is now referred to *Eucalyptus*.

CARYOPTERIS (Greek for *nut and wing*). *Verbenaceae*. Ornamental woody plants grown for their lavender-blue flowers profusely produced in autumn.

Deciduous small shrubs. lvs opposite, short-petioled, serrate. fls in axillary cymes; calyx campanulate, deeply 5-lobed with lanceolate teeth, spreading and somewhat enlarged in fr; corolla 5-lobed, with short cylindric tube and spreading limb, 1 segm. larger and fringed, stamens 4, exserted, 2 of them longer, style slender, 2-parted at the apex fr separating into 4 somewhat winged nutlets.—About 6 species in E Asia.

These are glabrous, pubescent or tomentose shrubs with small blue or violet late flowers. Free-flowering and very valuable for their late blooming season, not hardy North; even if well protected they will be killed almost to the ground, but the young shoots, springing up freely, will flower profusely the same season. They require well-drained and sandy soil and sunny position; if grown in pots, a sandy compost of peat and leaf soil or loam will suit them, and they will flower in the greenhouse until midwinter. Propagated readily by cuttings of half-ripened wood in summer or fall under glass, and by seeds sown in spring.

incana, Miq (*C. Mastacanthus*, Schauer *C. sinensis*, Dipp.) Fig. 832 Suffrutescent, 1-5 ft. lvs petioled, ovate or oblong, coarsely serrate, pubescent above, grayish tomentose beneath, 2-3 in. long cymes peduncled, dense-fl'd, fls. small, violet-blue or lavender-blue, Aug.-Nov. (China, Japan B.R. 32 2 B.M. 6799. R.H. 1892 324 R.R. 19 273 G.C. II. 21 119, III. 42 409 Mu. 5 5 S.H. 2, p. 89 G.W. 6, p. 197 Gn. 24, p. 523, 76, p. 24 G.M. 43 7.—Known in the nursery trade as "blue spirea" Var. *candida*, Schneid. has white fls.

C. mongolica, Bunge. Lvs. lineolate, almost entire (cymes with fewer but larger fls. R.H. 1872 150. ALFRED REHDER.

CARYŌTA (old Greek name) *Palmaceae*, tribe *Atticeae*. FISH-TAIL PALM. Spineless monocarpic palms, with tall stout ringed trunks, at length bearing suckers.

Leaves disposed in an elongated terminal fringe, ample, twice pinnately divided, segms dimidiate-flabelliform, or cuneate, entire, or split, irregularly dentate, plicate, folded back in the bud, indurves and primary nerves flabellate, petiole terete below, sheath keeled on the back, fibrous along the margins. Inguale short, spadices usually alternately male and female peduncle short, thick branches long, pendent spathes 3-5, not entire, tubular, bractlets broad, fls. rather large, green or purple, fr. the size of a cherry, globular, purple.—Species, 9. Malaya, New Guinea, Austral G.C. II. 22, 748.

These palms are remarkable for the delta-shaped or fish-tail-shaped leaflets, which make the graceful, spreading fronds very attractive. They are excellent warmhouse palms, very useful for decoration, particularly when young. They are frequently planted out in protected places for the summer. *C. urens*, the wine-palm of India, yields, when full grown, about twenty-four pints of wine in twenty-four hours. The beverage is very wholesome and a valuable article of commerce. There being so many different genera to choose from in selecting plants for moderate-sized conservatories, the members of this genus are not very popular for providing small specimens. In a high, roomy structure, however, they are among the most ornamental of the tribe. They are quick-growing, with large broad leaves, finely cut up, the small divisions resembling the tail of a fish, hence the name "fish-tail palm." After reaching maturity the plant begins flowering at the top, and continues downward until the vitality of the stem is exhausted. Suckers are freely produced by some species, but these, as a rule, do not become so robust as the parent stem, owing probably to the soil becoming

exhausted. Seeds are offered by most dealers. The young plants should be grown in a warm, moist atmosphere, the soil consisting of loam with about one-third of its bulk leaf-mold and sand in equal parts. They sometimes lose their roots if kept too cool and wet in winter. Prop. is by seeds and suckers. (G. W. Oliver.)

mitis, Lour (*C. sobolifera*, Wall. *C. furfuracea*, Blume) Caudex 15-25 ft. high, 4-5 in. diam, soboliferous petioles, lf-sheaths and spathes scurfy-villous; lvs 4-9 ft., pinnæ very obliquely cuneiform, irregularly dentate, upper margins acute, pinnules 4-7 in. long. Burma to Malaya.

urens, Linn. WINE-PALM. TODDY-PALM. Caudex stout, even in cult. specimens 60-80 ft. high and 18 in. thick, much higher in the wild, not soboliferous. lvs. 18-20 by 10-12 ft., pinnæ 5-6 ft., curved and drooping, very obliquely truncate, acutely serrate, the upper

margin produced and caudate, pinnules 4-8 in; petiole very stout India, Malaya. A.F. 12 295 Gng. 5.131. A.G. 21-533

Rumphiana, Mart. Lvs. 2-pinnate, several feet long, the pinnules thick, sessile, 6 in. long or nearly so, oblong Malaya Var. *Alberti*, Hort (*C. Alberti*, Muell.), is in the trade. It is large and free-growing, the lvs being 16-18 ft. long and two-thirds as long; lf-segms fan-shaped and oblique, toothed.

C. Blancoi, Hort., from the Philippines, has been listed in the American trade. It is probably a form of *C. urens*.

JARED G. SMITH.

CASAREEP: *Blighia*

CASCARILLA: *Croton*.

CASHEW: *Anacardium occidentale*.

CASIMIROA (named in honor of Cardinal Casimiro Gomez de Ortega, Spanish botanist of the eighteenth century) *Rutaceae*. Evergreen trees, one of which is grown for the edible fruits.

Leaves alternate, long-petioled, digitate, 3-7-foliate, lfts petiolulate, lanceolate, entire or slightly serrate, smooth or pubescent beneath fls regular poly-

gamo-dioecious; calyx 5-parted, small; petals 5, oblong, valvate, apex incurved, disk inconspicuous, circular; stamens 5, free; filaments subulate; anthers cordate; ovary sessile, on disk, globose, 5- or occasionally 6-8-lobed, 5-celled; stigma sessile, 5-lobed; ovules solitary in the cells, axillary: fr. a drupe, large, depressed-globose; pulp agreeable to taste, edible, seeds oblong, compressed, exalbuminose.—Four species in Mex and S.

edulis, Llav. & Lex. **WHITE SAPOTE COCHIL SAPOTA.** Large tree: trunk ashen gray, with warty excrescences: lvs. dark green, glossy: fls. greenish yellow, small: fr. greenish yellow when ripe, with strong, thick epicarp, $\frac{1}{2}$ in. thick, about the size of an orange; seeds nearly 1 in long and half as wide. Mex.—The fr. of this species has a delicious flavor, similar to that of a peach. It is used in Mex as an aid in inducing sleep, and the lvs. as a remedy for diarrhea. It grows on the coast of Mex. to an altitude of about 7,000 ft. See *Sapote*, *White*.

H. J. WEBBER.

CASSABANANA: *Sicana*.

CASSANDRA: *Chamedaphne*.

CASSAVA: *Manihot*.

CASSEBEËRA (from a German botanist). *Polypodiaceæ*. Small Brazilian ferns allied to the maiden-hair, but rarely seen in cult. There are 3 species: sori terminal on the veins, oblong or nearly globular; indusium within the margin and distinct from it. They require hothouse conditions. *C. pinnata*, Kaulf., has fronds 6 in. long, pinnate, the pinna linear-oblong and crenate. *C. triphylla*, Kaulf., has 3-5-parted fronds, the parts linear-oblong and crenate. *C. gleichenioides*, Gardn., has twice-pinnate fronds, the pinnules 4-cornered.

CASSIA (ancient Greek name) *Leguminosæ* SENNA. Herbs, shrubs or trees, a few of which are in cultivation in America, as border plants and under glass.

Leaves even-pinnate: fls. nearly regular (not papilionaceous), with the nearly equal calyx-teeth mostly longer than the tube; corolla of 5 spreading, nearly equal clawed spreading petals, stamens 5-10, frequently unequal and some of the anthers abortive, the good anthers opening at the top: fr. a stalked pod which is either flat or terete, containing numerous seeds and often partitioned crosswise.—Species nearly or quite 400 in the warmer parts of the globe, some of them in cool temperate regions. See page 3566.

The cassias delight in a sunny exposure. Most of those cultivated in the United States are herbs or herb-like shrubs, attractive for the finely cut foliage and the showy flowers. Some of them are cultivated only in the extreme South. *C. corymbosa* is probably the best garden subject. Cassias are summer bloomers, for the most part. Propagation is mostly by divisions and seeds, the annual species always by seeds.

Senna leaves, used in medicine as a cathartic, are derived from various species, chiefly from *C. acutifolia* of Egypt, and *C. angustifolia* of India and other Old World tropics. The "Cassia lignea" of pharmacopœias is the product of a Cinnamomum. Cassia pods of commerce, used in medicine, are the fruits of *C. Fistula*. Many of the species contribute to therapeutics. Some of them provide tanning materials.

A. Hardy border plants lfts 5 or more pairs

marylândica, Linn **WILD SENNA.** Perennial, glabrous or nearly so, sts nearly simple: lfts. 5-10 pairs, oblong or lance-oblong and entire, short-acuminate or nearly obtuse: fls. in axillary racemes near the tops of the sts. and often appearing as if panicled, bright yellow, wide open: pods linear, flat. New England, west and south, mostly in wet soil.—Grows 3-4 ft. high, and has attractive light green foliage.

Chameærista, Linn (*Chameærista nictitans*, Moench). **PARTRIDGE PEA** Annual, erect or spreading, 2 ft. or

less high: lfts. 10-15 pairs, small, narrow-oblong, mucronate, sensitive to the touch: fls. large, 2-5 together in the axils, canary-yellow and 2 of the petals purple-spotted.—Dry soil, Maine, south and west. Sometimes known as Magothay Bay bean and sensitive pea, and formerly recommended as a green-manuring plant. See *Cyclo. Amer. Agric.*, Vol. II, p. 309, for account and picture.

AA. Tender plants, grown far south, or under glass: lfts. few or many.

B. Tree, with woody indurated pods.

Fistula, Linn. **PUDDING-PIPE TREE.** **GOLDEN SHOWER** Lvs. large, the lfts. 4-8 pairs, and ovate-acuminate: fls. in long lax racemes, yellow, the pedicels without bracts: pods cylindrical, black, 3-furrowed, 1-2 ft. long, containing 1-seeded compartments. India, but intro. in W. Indies and other tropical countries. Sparingly cult. S.—Furnishes the cassia pods of commerce.

grândis, Linn **PINK SHOWER.** Lfts. 10-20, oblong, abrupt at either end, more or less pubescent beneath and above: fls. in long drooping axillary racemes, rose-colored, without bracts subtending the pedicels: pod 3 in. or less long, compressed-cylindrical, glabrous, transversely rugose. Trop. Amer.; offered in S. Calif. and grown in many tropical countries.

BB. Shrubs or herbs, with more or less dehiscent pods.

Sophora, Linn. (*C. schimifolia*, DC *C. Sophora*, Auth.). Shrub, 6-10 ft.: lfts. 6-10 pairs, lanceolate-acute. fls. yellow on many-fld axillary and terminal peduncles, which are shorter than the lvs.: pod thin, tardily dehiscent. Oriental tropics. Intro. in S. Calif.

corymbosa, Lam. (*C. floribunda*, Hort.) Shrub, half-hardy in middle states, 4-10 ft.: lfts. 3 pairs, oblong-lanceolate and somewhat falcate, obtuse or nearly so. fls. yellow, in long-stalked, small axillary and terminal corymbs. Argentina. B. M. 633. G. C. III. 31:252. Gn. 50, p. 139. J. H. III 61:139. G. G. 25:553. H. F. II. 3:252. G. W. 3, p. 421, p. 391 — The best-known garden species, being an excellent conservatory plant for spring, summer and autumn bloom. It is an old favorite, now coming again into prominence (as *C. floribunda* and var. *A. Boehm*, corrupted apparently into *C. Boema*) as a pot-plant, as a tub specimen for lawns, or for plunging in the border; winters readily in a dormant state in a cellar, very free-flowering.

tomentosa, Linn. Shrub, 10-12 ft.: lfts. 6-8 pairs, oval-oblong and obtuse, white-tomentose beneath: fls. deep yellow. Mex.—Said to be a good winter bloomer in S. Calif. and naturalized in some parts.

artemisioides, Gaud. Bushy shrub, soft-canescens and gray all over: lfts. 3-4 pairs, very narrow-linear: racemes axillary, 5-8-fld., the fls. sulfur-yellow: pods flat, shining brown. Austral.—Intro. in S. Calif. Withstands drought.

biflora, Linn. Shrub, 4-8 ft.: lfts. 6-10 pairs, broad-oblong or obovate-oblong, very obtuse but mucronulate. fls. large, yellow, on 2-4-fld. peduncles, which are shorter than the lvs: pod 3 in. or less long, oblong-linear or narrower, membranaceous. S. Amer. and W. Indies. B. M. 810.—Sparingly cult. in greenhouses.

C. longata, Willd. Shrub, glabrous: lfts. 3-4 pairs, ovate-oblong or ovate-lanceolate, acuminate: fls. yellow in terminal and axillary racemes, pod leathery, 2-3 in long, nearly cylindrical. Tropics — *C. occidentalis*, Linn. **FRONDOZA.** Annual or subshrubby, widely distributed in the tropics as a weed, the seeds used as a substitute for coffee, it is the "fedegosa" and "negro coffee" of Afr.: lfts. 4-12 pairs, ovate-lanceolate or lanceolate, acuminate, and a gland near the base of the petiole. racemes short and few-fld.: pod glabrous, oblong-linear compressed or nearly cylindrical, the small seeds produced abundantly — *C. tpiandida*, Vogel. Shrub, 6-10 ft., much branched: fls. bright yellow, very large. S. Amer. Recently catalogued in S. Calif. — Others of the numerous species of Cassia are likely to appear in cult., particularly some of the new kinds; but as a whole, the genus is not rich in horticultural subjects.

L. H. B.

CASSINE (a name said to have been used by the Indians in Fla.; see *Ilex Cassine*). *Celastraceae*. Some 20 or less erect or climbing glabrous shrubs of the Cape region in Afr., apparently not known in cult. in this country. Lvs opposite, thick, entire or serrate. fls. small, white, in axillary clusters; calyx 4-5-parted, minute; petals 4-5; stamens 4-5, on the disk, which encircles the ovary. fr. a 1-2-seeded drupe, with a hard pit or stone. *C. Colpoon*, Thunb (or *C. capensis* var. *Colpoon*) is the ladlewood of the Cape, the wood being used in the making of small articles. *C. Maurocenia*, Linn (now placed in a separate genus, *Maurocenia capensis*, Sond.) is the Hottentot cherry. H. I. 6:55 2.

CASSIOPE (Greek mythological name). *Ericaceae*. Ornamental small shrubs sometimes cultivated for their handsome delicate flowers.

Evergreen lvs very small, usually scale-like and opposite, rarely alternate and linear fls solitary, axillary, or terminal, calyx small, 5-parted; corolla campanulate, 5-lobed or 5-cleft; stamens 10, the anthers with recurved appendages; style included; fr. a 5-valved caps with numerous minute seeds.—Ten species in arctic regions and high mountains of N. Amer., N. Eu., N. Asia and Himalayas. Formerly included under *Andromeda*.

Cassiopeas are graceful, delicate plants, adapted for rockeries, flowering in summer. They are of somewhat difficult culture, and require peaty and sandy moist but well-drained soil and partly shaded situation, though *C. hypnoides* grows best in full sun, creeping amongst growing moss. Drought, as well as dry and hot air, is fatal to them. Propagated readily by cuttings from mature wood in August under glass; also by layers and by seeds treated like those of *Erica*.

C. fastigiata, Don (*Andromeda fastigiata*, Wall) Ascending: lvs imbricate, in 4 rows, with white-fringed margin fls. axillary, white. Himalayas. B. M. 4796 G. C. III 47 379 (habit) G. n. 43, p. 189. G. 15 709.—*C. hypnoides*, Don (*Harrimanella hypnoides*, Coville). Creeping: lvs linear, alternate, crowded fls. terminal, deeply 5-cleft. Arctic regions. B. M. 2436 L. B. C. 20 1946 G. C. III 39 226 (habit).—*C. Verzeiana*, Don. Erect or ascending to 1 ft. high lvs imbricate in 4 rows, carinate on the back fls. axillary, white or slightly tinged rose. Sikta to Calif.—*C. tetragona*, Don (*Andromeda tetragona*, Linn.) Similar to the former, but lower, and the lvs. with a deep furrow on the back. Arctic regions. B. M. 3181 M. D. G. 1910 125, 137 (habit).

ALFRED REHDER.

CASSIPOURÉA (a native name in Guiana). *Rhizophoraceae*. Perhaps a dozen or less species (if the African *Dactylopetalum* is included in the American *Cassipourea*) in Trop. Amer. and in Afr., one of which is now offered. Glabrous trees or shrubs. lvs opposite or whorled, stalked, somewhat leathery, oblong or lanceolate, entire or somewhat crenate fls. small or medium in size, white, solitary or fascicled in the axils; calyx 4-5-lobed, petals 4-7, fimbriate, linear or spatulate, inserted in the cup-like disk; stamens 10-30; ovary 2-4-celled caps ovoid, somewhat fleshy, tardily dehiscent, the cells 1-seeded. *C. verticillata*, N. E. Br., Natal, a handsome tree, with very shiny foliage: lvs. about 4 in long and half as broad, in 3's or 4's, lightly crenate-serrate or almost entire; petals 5-7, exserted, very narrow; stamens 10-14.—A rare mangrove-like tree, found at considerable elevations away from the coast. Offered in S. Calif.

L. H. B.

CASTÁLIA: *Nymphaea*.

CASTÀNEA (ancient Latin name). *Fagaceae*. CHESTNUT. Fruit and ornamental trees, grown for their edible nuts and also for their handsome foliage and attractive flowers.

Deciduous trees, rarely shrubs: lvs alternate, serrate, elliptic-oblong to lanceolate fls. monocious, the staminate ones with 6-parted calyx and 10-20 stamens, in long, erect, cylindrical catkins; the pistillate ones on the lower part of the upper catkins, usually 3 together in a prickly involucre; ovary 6-celled: fr. a large

brown nut, 1-7 together in a prickly involucre or bur winter-buds with 3-4 scales; branchlets without terminal bud.—About ten species in the temperate regions of N. E. Amer., Eu., N. Afr. and Asia.

The chestnuts are very attractive when in bloom. The handsome foliage is generally not injured by insects or fungi, but the whole tree is attacked by a serious disease known as the chestnut bark disease which has spread rapidly during the last years, chiefly in New York, Pennsylvania and the adjacent states. It was first discovered in 1904. It is caused by a fungus,

Endothia parasitica, which penetrates the bark, develops its mycelium in bark and sapwood, finally girdles the branch or trunk and causes the death of the portion above the infected place. The presence of reddish pustules on the infected area is a sure sign of the presence of this fungus. The cutting and destroying of the infected parts seems so far the only way of checking the spreading of the disease. This disease was without doubt imported with plants from eastern Asia, as the disease has been discovered recently in China on *C. mollissima*. The latter species and *C. crenata* seem much more resistant than the American and European varieties and there is much hope for a successful selection and breeding of resistant varieties and for keeping this disease under control, as it is done successfully in China.

C. dentata and *C. sativa* are large-sized trees, while *C. pumila* and *C. crenata* usually remain shrubby. The coarse-grained wood is much used for furniture, railway ties and fence-posts, as it is very durable in the soil. The chestnut is extensively cultivated in Europe and eastern Asia and also in this country for its edible fruit. It grows best in well-drained soil on sunny slopes, and even in rather dry and rocky situations, but dislikes limestone soil. The American species is perfectly hardy North, while the European species is somewhat tenderer.

Propagated by seeds, sown in fall where there is no danger of them being eaten by mice or squirrels; otherwise they should be stratified in boxes and

533. *Castanea dentata*.
($\times \frac{1}{2}$)

buried 1 or 2 feet deep in a warm soil until early spring, when they are sown in rows about 3 inches deep. If growing well, they can be transplanted the following fall or spring 2 or 3 feet apart from each other, and planted after three or four years where they are to stand. They are also increased by layers in moist soil. Varieties are usually worked on seedling stock or on sprouts by whipgrafting above the ground when the stock is just beginning to push into leaf. Crown-grafting, root-grafting and budding are also sometimes practised, but no method gives wholly satisfactory results, and usually only one-half take well. See *Chestnut*.

A. Nuts 2 or more in one involucre and more or less compressed, usually broader than high.

B. Branchlets glabrous or at first with close white tomentum: lvs. usually glabrous at maturity, often with close white tomentum while young.

C. Lvs. glabrous or nearly glabrous even while young.

dentata, Borkh. (*C. americana*, Raf.). Fig. 833 Tree, occasionally 100 ft.: lvs. cuneate at the base, oblong-lanceolate, acuminate, coarsely serrate, nearly glabrous when young, 6-10 in long and somewhat pendulous: fls. of heavy fragrance, in June or July: nuts about $\frac{1}{2}$ in. wide. S. Maine to Mich., south to Ala. and Miss. S.S. 9:440-1. Em 187. G.F. 10 373 F.E. 14, p. 30; 29, p. 895—The tallest, most vigorous-growing and hardiest species. The nuts, though smaller, have a better flavor than the European varieties. Lvs. said to have sedative properties; used in whooping-cough; bark astringent, tonic, febrifuge.

cc. Lvs. stellate-tomentose beneath while young.

sativa, Mill. (*C. vesca*, Gaertn. *C. Castanea*, Karst. *C. vulgaris*, Lam.). Fig. 834. Tree, 50-80 ft.: lvs. oblong-lanceolate, often truncate or rounded at the base, coarsely serrate, slightly pubescent or tomentose beneath when young, nearly glabrous at length, 5-9 in. long, erect nut over 1 in. wide. June From S. Eu. and N. Afr. to China. Gn 27, p. 292, 50, p. 389. Gng. 3:209. G.W. 8, p. 350, 385—There are some garden forms with variegated lvs., and others, of which var. *asplenifolia*, Lodd., with lacinate-cut and divided lvs. is the most remarkable. Of several varieties cult. for their fr., Paragon, a precocious kind, and Numbo, a variety with very large fr., are the most extensively planted in this country. See *Chestnut*.

crenata, Sieb. & Zucc. (*C. japonica*, Blume. *C. sativa* var. *pubinervis*, Makino). Fig. 835 Shrub or tree, to 30 ft.: lvs. elliptic or oblong-lanceolate, usually rounded at the base, acuminate, crenately serrate, or the teeth reduced to a long, bristle-like point, slightly pubescent when young, glabrous at length or only pubescent on the veins beneath, 3-7 in. long, erect. nut over 1 in. wide. Japan, China. S. I. F. 1:34—Shrubby and very precocious; it usually begins to fruit when about six years old. Hardy as far north as Mass.

834 *Castanea sativa*.
($\times \frac{1}{2}$)

burs among the dark foliage. The closely allied *C. alnifolia*, Nutt., in the southern states, grows only a few feet high, and has larger lvs. and fr.

Vilmoriniana, Dode. Tree, to 80 ft.: branchlets glabrous: lvs. oblong-lanceolate to lanceolate, long-acuminate, usually rounded at the base, the teeth mostly reduced to slender bristles, quite glabrous even while young, 4-7 in. long: fr. globose-ovate, about $\frac{1}{2}$ in. thick and slightly longer. Cent. China—A valuable timber tree. Recently intro. by the Arnold Arboretum.

ALFRED REHDER

CASTANEA of commerce: The nuts of *Bertholletia*.

CASTANOPSIS (*Castanea* and *opsis*, chestnut-like) *Fagaceae*. Ornamental trees or shrubs sometimes cultivated for their handsome evergreen foliage.

Closely allied to *Castanea*, but pistillate fls. usually on separate catkins, sometimes solitary, ovary 3-celled fr. ripening the second year. involucre sometimes tuberculate; winter-buds with many scales, terminal bud present: lvs. evergreen, entire or dentate—About 25 species, chiefly in the tropical and subtropical mountains of Asia, and 1 in W. N. Amer., which is the hardest, and is sometimes cult., also several Chinese species have been recently intro. into cult., but their names have not yet been determined. For prop. see *Castanea*.

chrysophylla, DC. (*Castanea chrysophylla*, Hook.). Fig. 836 (adapted from Pacific R. R. Rep.). Tree, to 150 ft., shrubby at high elevations: lvs. ovate-oblong or oblong-lanceolate, narrowed at both ends, entire, dark green above, coated with minute golden yellow scales beneath, 2-6 in. long: nut about $\frac{1}{2}$ in. wide, usually solitary in the spiny involucre. Summer. Ore. to Calif. S.S. 9:439. B.M. 4953. G.C. III. 22:411; 36:145. Ga. 76, p. 634. F.S. 12:1184 R.B. 7:240.—A highly

BB. Branchlets pubescent, with spreading hairs: lvs. soft-pubescent beneath, at least those toward the end of the shoots.

mollissima, Blume. Tree, to 40 ft.: lvs. oval-oblong to oblong-lanceolate, acuminate or short-acuminate, rounded or truncate at the base, $3\frac{1}{2}$ -6 in. long, coarsely serrate, glabrous above, white-tomentose or nearly green, but soft-pubescent beneath, at least on the veins, petioles pubescent, with spreading hairs nu. about 1 in. wide; spines of the husk pubescent. N. and W. China—Has proved perfectly hardy at the Arnold Arboretum and is to be recommended for its hardness and large nuts.

AA. Nuts solitary, round, higher than thick.

pumila, Mill. CHINQUAPIN. Shrub or small tree, rarely 50 ft.: lvs. cuneate, elliptic-oblong or oblong-obovate, acute, serrate, teeth often reduced to bristle-like points, white-tomentose beneath, 3-5 in long fr. ovate, small, about $\frac{1}{2}$ in wide and $\frac{3}{4}$ -1 in. long. May, June From Pa. to N. Fla. and Texas S.S. 9 442-3—Useful for planting on dry and rocky slopes, attractive when in fl., and again in fall with its abundant light green

ornamental tree with beautiful foliage, hardy only in the warmer temperate regions, but the shrubby form is much hardier.

ALFRED REHDER.

CASTANOSPÉRMUM (*chestnut seed*, because of the taste of the seeds). *Leguminosae*. A genus of 2 species, one of which is a tall Australian tree, with odd-pinnate lvs, the lfts broad, thick, entire; fls. large, yellow-orange, in lateral or axillary loose racemes which are usually about 5 in long; petals 4; stamens free; ovary long-stipitate, many-ovuled; pod 8-9 in. long with 4-5 seeds larger than Italian chestnuts, globular. *C. australe*, Cunn., is the species known locally

836. *Castanopsis chrysophylla*. (X $\frac{1}{2}$)

as "Moreton Bay chestnut." The seeds are roasted and eaten. Intro. in S. Calif., but not common. The other species is New Caledonian, and apparently not in cult.

CASTILLEJA (a Spanish botanist, D. Castillejo). *Scrophulariaceae*. PAINTED-CUR. Herbs with showy bracts in a terminal head or spike, sometimes cultivated.

Flowers small, solitary, in terminal gaudy-bracted spikes; corolla tubular, sometimes flattened laterally, 2-lipped, lower lip smaller, more or less 3-toothed, stamens 4. lvs alternate, entire or cut.—Upwards of 30 species in U. S. and Mex., and 1 in N. Asia. *Castilleja* are little known in gardens. They are more or less root-parasitic.

coccinea, Spreng. Biennial or annual, 1-2 ft., hairy; radical lvs clustered, ovate or oblong, mostly entire; st-lvs lacinate or cleft, and the middle lobe of the bright scarlet bracts dilated, corolla pale yellow, about the length of the calyx. Low grounds and grassy places, Canada, south.

indivisa, Engelm. Annual, 1-2 ft.; lvs lance-linear and entire (or sometimes 2-3-lobed); bracts not lacinate, bright red and showy. Texas.—Blossoms early in spring.

affinis, Hook & Arn. Perennial, 1-2 ft.; lvs narrow-lanceolate, entire or the upper ones toothed at apex; fl-bracts becoming short and broad, red; spike lax below. Calif., in moist soils.—Intro. 1891 by Orcutt.

foliolosa, Hook. & Arn. White-woolly perennial, 1-2 ft., the base woody. lvs small (1 in. or less long), narrow-linear, crowded or fascicled. bracts 3-parted; spike dense. Calif., in dry soils.—Intro. 1891 by Orcutt.

integra, Gray. Perennial, 1 ft. or less, tomentose. lvs grayish, linear, 3 in. or less long, entire; bracts of the short spike linear-oblong or obovate-oblong, entire or sometimes incised, red or rose. Texas to Ariz. and Colo.—Has been offered in Germany. L. H. B.

CASTILLÔA (for Castillejo, the Spanish botanist). *Moraceae*. Laticiferous trees, of which *C. elastica* Cerv., is one of the important rubber-producing plants. There are 2 or 3 species, in Cuba and Cent. Amer. lvs. alternate, short-petioled, often large, entire or toothed; plant monoecious, the sexes borne in the same cluster; sterile fl. with no perianth, stamens numerous and crowded, with scales intermixed, fertile fls. with 4-lobed perianth, including the short-styled ovary, fr. a crustaceous pericarp containing a pendulous seed. The cult. of *C. elastica* for rubber is described in *Cyclo. Amer. Agric.*, Vol. II, p. 557.

CASTOR BEAN, CASTOR-OIL PLANT: *Ricinus*.

CASUARINA (said to be derived from *Casuarus*, the Cassowary, from resemblance of the branches to the feathers). *Casuarinaceae*. BELFWOOD SHU-OAK. Odd slender-branched leafless trees and shrubs grown in warm regions and rarely seen under glass. They are thimptopped trees of striking appearance.

Casuarinas are usually classified near the walnut and hickory tribes, although very unlike them—or other known plants—in botanical characters. They are jointed and leafless plants, somewhat suggesting equisetums in gross appearance. Flowers are unisexual; staminate in cylindrical terminal spikes, each fl. consisting of a stamen enclosed in 4 scales, 2 of the scales being attached to the filament, pistillate fls. in dense heads borne in the axils, and ripening into globular or oblong cones, composed of 1-ovuled ovaries subtended by bracts. fr. a winged nutlet.—About 25 species in Austral., New Caledonia and E. Indies. The species fall into 2 groups, those having cylindrical and verticillate branches, and those having 4-angled and only imperfectly verticillate branches. The species bear small toothed sheaths at the joints.

Beefwood is planted in the extreme South for its very odd habit and also to hold sands of the seacoast. The wood burns quickly, and is very hard and durable. The redness of the wood has given the popular name, beefwood.—The species are remarkable for rapid growth. They grow well in brackish and alkaline soils. Propagated by seeds and by cuttings of partly ripened wood.

equisetifolia, Linn. Fig. 837. Tree, becoming 150 ft. high in favorable climates, and a most rapid grower branches drooping, pale green, simple, terete or nearly so, the internodes very short (less than $\frac{1}{4}$ in.); sheath-teeth 7 (6-8) lanceolate and appressed; staminate cone nearly terete, pistillate cone short-peduncled, ellipsoid, about $\frac{1}{2}$ -in diam. Widely distributed in the farther Old World tropics, and the best-known species in this country (in S. Fla. and Calif. and south). Gn. M. 7-21 L. B. C. 7:607.—The wood is valuable for many purposes. The casuarinas are known as "oak" in Austral.

837. *Casuarina equisetifolia*. (X $\frac{1}{2}$)

Cunninghamiana, Miq. Tree with slender branches, much like *C. equisetifolia*, but cones smaller, about ½ in. diam., globular and very irregular, with prominent valves. Austral.—Described as a rapid-growing tree in Calif., with strong and dense growth and numerous fine branches with very short internodes

stricta, Dry. (*C. quadrivalvis*, Labill.). Becoming 20–30 ft. high: branches erect, simple, 6–7-angled, scarcely green, internodes short, as in the latter sheath-teeth usually 7, ovate-lanceolate and appressed; staminate cone slender, pistillate cone nearly sessile, oblong (sometimes staminate above), about 14-sided, 1 in. diam. Austral. Gn M. 7 21.

torulosa, Dry. (*C. tenuissima*, Sieber) Reaches 70 or 80 ft. branches erect, capillary, mostly terete, internodes short: sheath-teeth 4, very short, triangular appressed: staminate cones filiform; pistillate cones ellipsoidal, 8–10-sided. Austral

sumatrana, Jungh. Shrub with dense very slender branches which are sharply angled, the internodes often very short, the sheath-teeth short, cone large, elliptical or globose, the valves thick and concave-truncate at apex. Sumatra.—Offered in England, and the branches said to be useful for bouquets, very much branched

L. H. B.

CATALPA (the Indian name of *C. bignonioides*) *Bignoniaceae*. Ornamental trees, often cultivated for their handsome flowers appearing in large and showy panicles in summer, and for their heavy foliage

Leaves usually deciduous, opposite, long-petioled, entire or coarsely lobed: fls. in terminal panicles; calyx splitting irregularly or 2-lipped, corolla campanulate, 2-lipped, with 2 smaller upper and 3 larger lower lobes; fertile stamens 2, curved, with diverging anther-sacs, not exceeding the tube of the corolla; style 2-lobed at the apex, slightly longer than the stamens: fr. a very long cylindrical caps., separating into 2 valves, with numerous small oblong compressed seeds bearing a tuft of white hairs on each end.—About 10 species in N. Amer., W. India and E. Asia, of which 6 are hardy in the northern temperate regions

Catalpas are deciduous or rarely evergreen trees with opposite or sometimes whorled, long-petioled, large

838. *Catalpa ovata* in fruit. (×½)

and simple leaves emitting in most species a disagreeable odor when bruised, and with white, pinkish or yellowish flowers in large and showy panicles followed by very long and narrow cylindric pods.

The coarse-grained and soft wood is very durable in the ground, and, therefore, much valued for fence-posts and railway ties. *Catalpa bignonioides* and particularly *C. speciosa* are sometimes planted as avenue trees. For formal gardens, if low round-headed trees are desired, *C. bignonioides* var. *nana* is to be recommended. They

grow in almost any somewhat moist soil, and are hardy as far north as New England. Propagated by seeds sown in spring, in the North, best with slight bottom heat, or by cuttings from ripe wood, the varieties often by softwood cuttings in early summer or by grafting on seedlings or on roots under glass in spring, also increased sometimes by layers and root cuttings.

A. Infl. paniculate. lvs. usually pubescent, with simple hairs.

B. Fls. yellow, striped inside orange and spotted dark violet, less than 1 in long.

speciosa, Warder Figs. 839, 840. (*C. cordifolia*, Jaume, partly) **WESTERN CATALPA**. Tree, to 100 ft: lvs. cordate-ovate, long-acuminate, pubescent beneath, 8–12 in long; panicles comparatively few-fl'd; fls about 2½ in diam, inconspicuously spotted inside: pod ½–¾ in. thick. June. From S Ill and Ind to La and Miss. S S 6:290–1 R H. 1895:136 M D G. 1903 229–30 (habit)—A very desirable ornamental tree, closely allied to the former, but taller and hardier. Properties similar to *C. bignonioides*. Var *pulverulenta*, Paul & Son. Lvs. freely dotted with white or cream color. G M 53:30. G. 30.289 F E 31.319

hybrida, Spath (*C. Tedsu*, Penhall. *C. Teasiana*, Dode). **HYBRID CATALPA**. Hybrid between *C. bignonioides* and *C. ovata*. Large tree, intermediate between the parents: the lvs. resemble more those of *C. ovata*, and are purplish when unfolding, but much larger and slightly pubescent beneath, while the fls. are more like *C. bignonioides*, but smaller and with the infl. often twice as long. Originated at J. C. Teas' nursery at Bayville, Ind. G F. 2:305. Gt. 47:1454. G.W. 3, p. 569.—A very valuable tree, flow-

ering profusely; of rapid growth and hardy. Seedlings usually resemble *C. oata*. Var *japonica*, Rehd. (*C. japonica*, Dode). Lvs broader and more abruptly acuminate, nearly glabrous beneath. Var *purpurea*, Rehd. (*C. hybrida* var. *atropurpurea*, Spach. *C. big-nonioides* var. *purpurea*, Hort.). Lvs dark purple when young, green at length.

AA. Infl. racemose, pedicels very slender, 1-1½ in. long, occasionally the lower ones with 2 or 3 fls.

B Lvs pubescent or tomentose beneath, with branched hairs.

Fargesii, Bur. Tree, to 60 ft: lvs ovate, acuminate, rounded at the base, entire, slightly pubescent above, densely beneath, 3-6 in long, racemes pubescent, 7-10-fld; fls. about 1½ in long, rosy pink with purplish brown dots in throat; pod to 2 ft long, ¼-½ in. thick. W China. Nouv. Arch. Mus. Paris III 6:3.

nn Lvs quite glabrous.

Ducloxi, Dode (*C. sutchuenensis*, Dode). Tree, to 80 ft: lvs ovate, acuminate, usually rounded or subcordate at the base, with purple spots in the axils of the veins beneath, 5-8 in long and often 4 or 5 in broad; racemes 5-15-fld, the lower branches sometimes with 2 or 3 fls; fls. rosy pink with orange markings in throat, 1½-1¾ in long; pod about 2 ft long and ¼-½ in. thick. Cent China.

Bungei, C A Mey. Small tree: lvs narrowly triangular-ovate, entire or with 1 or few pointed teeth near the base, long-acuminate, truncate or sometimes broadly cuneate at the base, with purple spots in the axils beneath, 3-6 in long and not over 3 in wide; racemes 3-12-fld, fls. white with purple spot, 1-1½ in. long; pod 12-15 in long. N China. Nouv. Arch. Mus. Paris III 6:4.—Has proved perfectly hardy at the Arnold Arboretum. Var *heterophylla*, C A Mey. (*C. heterophylla*, Dode). Lvs. with several pointed teeth near the base. racemes 3-5-fld.

C. longissima, Sims. Tree to 50 ft. lvs oblong-ovate, coriaceous fls. small, white. W Indies, often planted as shade tree in Cuba.

ALFRED REHDER.

CATANÁNCHÉ (Greek name, referring to ancient custom of using the plant in making love-philters). *Compósita*. Annual or perennial garden herbs, grown for the bloom.

Leaves crowded at the base of the st. and linear or lanceolate; head long-peduncled, blue or yellow. achene oblong, ribbed and usually villose or setose. pappus of 5-7 lanceolate long-acuminate scales.—A half dozen species in the Medit. region. Of easiest cult. in any garden soil, particularly if light. Prop by seeds and division. Useful for cutting.

carulea, Linn. Perennial, 2 ft.: lvs tomentose, lanceolate and few-toothed, 3-nerved, fls. heads 2 in. across, with wide flat-toothed blue rays, on long slender sts. Blooms in June, July and Aug. S. Eu. B. M. 293. R. H. 1890, p. 523. G. 28:541. Gn. 42, p. 25; 55:368. Var. *alba*, Hort., has white fls. Gn. 55:368. Var. *bicolor*, Hort., has white margin and blue center. Often used as everlasting. L. H. B.

CATASETUM (Greek for downward or backward, and bristle). *Orchidaceae*. Epiphytic or terrestrial orchids, requiring hothouse conditions.

Stems short fusiform. lvs plaited, membranaceous. scapes basal; fls. in racemes, globose or expanded; labellum fleshy, column erect, provided with sensitive appendages which, when touched, cause the pollen-masses to fly out; pollinia 2. The genus includes *Monachanthus* and *Myanthus*.—There are about 50 or 60 species in the American tropics.

The flowers are in racemes or spikes, firm in texture, and white or in shades of green, yellow, brown or purple. Catasetums are not much cultivated, since most of the species are not showy, but they are interesting to

the botanist and amateur because of the striking ejection of the pollen-masses. Gardeners often have trouble with catasetums, but they are not difficult to grow if given good care. They need a high temperature, long period of rest, and free supply of water during the growing season. They are grown in both pots and baskets. Readily propagated by dividing the plants at the base, also from very ripe pseudobulbs cut in pieces and put in sand. For culture, see *Orchids*.

A Fls. white.

Bungerthii, N. E. Br. Sts 8-9 in tall; sepals larger than the petals, nearly 2 in long, labellum tending toward concave, roundish, appendages thickish. Ecuador. B. M. 6998. G. C. III 1:142. I. H. 37:117, 34:10. Gu. 33:383. A. F. 6:633.—A striking plant.

840. *Catalpa speciosa* in fruit. (X ¼).

AA Fls. yellowish, more or less marked with brown or red.

macrocarpum, Rich. (*C. Claveringi*, Lindl. *C. tridentatum*, Hook.). Fls. large, nearly 3½ in across; petals and sepals yellow, verging on green, spotted with reddish brown, labellum yellow. Guiana. B. M. 2559, 3329. I. H. 33:619. Var *rubrum*, Hort. A red-fld. form.

umbriatum, Lindl. & Paxt. Pseudobulbs 2-3 in long, raceme pendulous, 8- or more-fld; fls. 2½ in across, sepals whitish or pale yellow, closely barred with red. Brazil. B. M. 7158. A. F. 6:609. Var *atrum*, Hort. Fls. pale green, slightly marked with rose, center of lip deep golden yellow.

longifolium, Lindl. Pseudobulbs deflexed; lvs. narrow and glaucous, reaching 3 ft. fls. on drooping, compact spikes; sepals and petals greenish yellow, tipped with dull red; lip helmet-like, orange-yellow. Guiana.—Epiphyte.

AAA Fls. essentially red or brownish.

decipiens, Reichb. f. Fls. 1½ in across; sepals and petals lanceolate, red-brown and spotted; lip saccate, yellowish outside and red-brown inside. Venezuela. A. F. 6:609.

AAAA Fls. many-colored, grotesque

Gnômus, André. Pseudobulb oblong-ovate and alternate, articulated fls. in a long loose raceme on slender pedicels; sepals greenish and purple-barred; 2 lateral petals spreading, concave, purple; lip bluntly conical, olive-green spotted outside, ivory-white within, fringed above. S. Amer. I. H. 24:270. A. F. 12:293.

C. barbatum, Lindl. Fls. green, blotched with purple. Guiana.—*C. caldum*, Lindl. Odd: fls. with chocolate-brown, narrow-lanceolate sepals and petals, lip greenish, speckled with red. Venezuela. B. M. 4219, 3648.—*C. Christyanum*, Reichb. f. Sepals and petals usually chocolate, lip greenish yellow, purple fringed. S. Amer. (2). G. C. III 18:617. B. M. 8007.—*C. Claveringi*, Lindl. & Cogn. Fls. greenish yellow, lip fringed along sides. Brazil. G. C. III 44:211.—*C. Cliftoni*, Hort. Probably a form of *C. Bungerothii*. G. M. 34:593 (desc).—*C. Colmanii*, Hort. Fine yellow fls. with 3-lobed lip stained with deep crimson.—*C. discolor*, Lindl. Fls. purple. An old sort, now rarely seen. Brazil.—*C. edurnum*, Rolfe.

XXIII. *Cattleya Lawrenceana*.

time of blooming of a cattleya, that is to say force it as other plants may be forced, without injury to the plants and a poor quality of bloom, but they are often retarded by systematic cooler treatment.

The best potting material is the soft brown osmundine, used alone with no sphagnum moss unless it is possible to make this moss live, and even then it is of no value to the plants except as an index to the presence of moisture. Moss that is dead and inert is a detriment in the potting material of all orchids. The one imperative thing in the potting of cattleyas is that they be made perfectly firm in their receptacles; if loose potting is practised, the young roots are injured each time the plant is handled, and the material is like a sponge, holding too much moisture in suspension for the plants to do well, and, given a time when the roots do not dry out quickly, all will soon die.

Newly imported cattleyas, as they arrive from South America, are usually much dried up, due to the treatment given before shipment to avoid loss by decay or fermentation on the way. If the plants are washed well with soap and water, placed in an airy shaded house for a few weeks and allowed to plump up again, roots will soon be seen starting. At this time, pot each piece in a receptacle suitable to the size of the plant (never let it be too large, but always err on the minimum when in doubt), fill the pots half full of drainage if common flower-pots are used, and fill up with osmundine to the top, pressing this material in with a blunt-pointed stick so that the plant will be firm. Moisture from this time on for weeks may be applied by spraying overhead during bright days. If the pieces are large, baskets are preferable to pots, as there is more aeration through the material and the plants may be suspended and space economized. Newly established plants often bloom the first year, and one may get an idea of the infinite variety found among the plants, as no two are alike. Some districts known to collectors produce better forms than others, in fact, in certain localities, the plants found produce flowers of very inferior quality. It is becoming more difficult to collect orchids, especially cattleyas from their native habitats, transportation not having improved and the distance to travel being greater each time. In consequence of this, hybridizers are now turning their attention to the reproduction of fine forms true to themselves, with considerable success, and should the supply of wild plants fail, there cannot now, in view of the well-understood and successful methods of raising cattleyas, be a time when the plants will be unobtainable. Considering the variation found among the wild plants, it is to be expected that home-raised seedlings will vary; but if the best-known forms are used, and these only are worth the trial, one may expect a large measure of success.

In our climate there is no period when the cattleyas should be kept dry at the roots. The plants are either getting ready to bloom, in crop, or recuperating therefrom, and these three periods cover the year. One does not have to resort to drying to attain ripening as do the European cultivators, and failure here is often traceable to foreign training or text-books.

Established plants should be repotted at least every second year. This is as long as the osmundine will remain suitable for the roots to ramify in, and if the plants are grown in pots, immerse the same a day before if the roots are dry, or most of them will remain attached to the pots. Remove all decayed portions of material and roots, wash with clean water, and repot as with newly imported plants, remembering always that a size too large often proves fatal to success. Plants that have been newly potted must not be placed among others that have not received attention, but all should be put in a situation in which they can be treated to little water at the roots for several weeks until the weather is such that there is no danger of their becoming overwatered. Cattleyas should be attended to in

this respect in the winter months, taking first *C. labrata*, as it is the first to start growing, then *C. Trianae*; the later kinds may be potted before flowering with less injury than afterwards, if done with care.

In hot weather, cattleyas should always be watered in the evening or latter part of the day. A generous spraying overhead will supply the moisture at a time when the roots get most of it, as may be seen by an examination in early morning. There is no danger of injury if an abundance of air is supplied. One has only to be careful during such times as the atmosphere outside is surcharged with moisture, then it is wise not to use any moisture inside even for a week at a time. This is when the dreaded "black spot" disease is often seen. It usually begins at the union of leaf and bulb, and when first seen, amputation must be practised to a point below infection, and dry sulfur and powdered charcoal applied at once as an absorbent. A small can of this ought always to be ready to hand, for if the disease gets down to the rhizome, several bulbs will be affected at once, and it is often difficult to save the plant. The disease is also highly infectious and may easily be transmitted to a healthy plant by means of a knife used to cut off diseased parts of another.

841. *Cattleya Mendeli*

Apart from seeds, the propagation of cattleyas is a slow process to be accomplished only by the cutting of the rhizome between the bulbs, leaving at least three of the leading ones and separating the older ones according to their strength or the dormant buds at the base that are visible. A clean cut or notch that almost severs the rhizome is the best, leaving the parts where they are until new growth and roots are made, then potting in small receptacles, wiring or staking the little pieces firmly. Apart from the three last-made bulbs on the rhizome, the older ones are a source of weakness to the plants and are better removed, and in the case of valuable forms utilized as above. This is the way all duplicates of the many albino varieties have been obtained. There are many white cattleyas bearing the same name, as *C. Trianae alba* or *C. Mossæ Wagneri*, for many have appeared among importations, but these differ in each individual and unless a plant is increased by division one cannot be sure of the same thing.

Opinions are divided as to the "feeding" of orchids. It is certain that when rain-water is saved in cisterns for the plants, and these happen to be in the vicinity of cities where soot collects on the roofs of the houses, the

plants show unusual vigor and in consequence of this, many have practised the use of fertilizers in exceedingly dilute proportions in all the water used on the plants, and some have had surprising results. The temptation, however, is always present to feel that if a little is good, more would be better, and herein lies the danger. When plant-foods are used in solution, they should be considered only as sufficient to make the difference between rain-water and that which comes out of a pipe.

The best twelve varieties of cattleyas for commercial purposes, and, indeed, for amateurs also, are the following: *C. Trianae*, fls. Jan.-March; *C. Schroederæ*, fls. March, Apr; *C. Mossæ*, fls. April, May; *C. Mendeli*, fls. Apr., May; *C. Warneri*, fls. May, June; *C. gigas*, fls. June, July; *C. aurea*, fls. June, July; *C. Gaskelliana*, fls. Aug., Sept.; *C. Harrisoniana*, fls. Sept., Oct.; *C. labiata*, fls. Oct., Nov.; *C. Bourrageana*, fls. Oct., Nov.; *C. Percivaliana*, fls. Dec.

With a number of plants of each of the above kinds, it will be seen that it is possible to have a succession of flowers from one end of the year to the other.

E. O. ORPET and JOHN E. LAGER.

The following American trade names belong to Lælia: *C. crispæ*, *C. labiata*, *C. marginata*, *C. pumila*. See, also, the list of hybrids at the close of *Cattleya*. For *C. aurantiaca*, see *Epidendrum*.

The cattleyas enter into various generic hybrids: consult, for example, *Brassocattleya*, *Brassocattleya*, *Brasso-Lælia-Cattleya*, *Epicattleya*, *Læliocattleya*.

Of several of the following species, there are named varieties in the American trade, varying in stature, habit and particularly in the color of the flowers.

KEY TO THE SPECIES.

- A. Infl. terminal.**
B. Lateral lobes of lip small or wanting, the column exposed.
C. Peduncles 1-8-fld., from a very short spathe or naked pseudobulb fusiform, short. 1. *Aclandia*
CC. Peduncles many-fld., from a large spathe pseudobulbs long. 2. *bicolor*
BB. Lateral lobes of lip large.
C. Corners recurved, exposing column. 3. *dolosa*
CC. Corners not recurved, concealing column.
D. Pseudobulbs 1-10d.
E. Plants large, pseudobulbs fusiform or clavate fls. large.
F. Sepals and petals yellow, lip ample, rich purple, beautifully veined and reticulated with gold. 4. *Dowiana*
FF. Sepals and petals not yellow.
G. Petals about twice as broad as the sepals which are markedly undulate.
H. Tube narrowly cylindric, the limb not striped. 5. *Lawrenceana*
HH. Tube cylindric-funnelform, the limb bordered with white and streaked with darker color, with a median yellow line. 6. *maxima*
GG. Petals 3 times or more as broad as the sepals which are not undulate or but slightly so.
H. Lip with a large orange blotch in the center, surrounded by circles of white and purple in order. 7. *Eldorado*
HH. Lip with other color arrangement.
I. The lip about as wide as or wider than the petals.
J. Tube of lip yellow; sepals and petals white. 8. *Rex*
JJ. Tube white or colored other than yellow.
K. Border of limb white, the center bright purple variegated with violet. 9. *Mossæ*
KK. Limb without white border.
L. Throat with a yellow or white eye on each side. 10. *Luddemanniana*
LL. Throat without eye.
M. Color of tube white, or the same as petals, limb purple-erimson. 11. *Mendeli*
MM. Color of tube and limb bright purple, throat with 2 yellow spots. 12. *Warszewiczii*
N. The lip narrower than petals.
J. Limb much shorter than the tube, the margin relatively but little creased. 13. *Trianae*
JJ. Limb about as long as the tube, the margin much creased.
K. Throat with a golden eye on each side. 14. *labiata*
KK. Throat without eye.
L. Margin of limb different in color from the center.
M. Petals longer than the sepals and lip; fls. 4½-5 in across. 15. *Percivaliana*

KEY TO THE SPECIES, continued

- MM. Petals about as long as sepals and lip; fls. 6-7 in. across. 16. *Gaskelliana*
- LL. Limb not margined. 17. *Warneri*
- BB. Plants small; pseudobulbs ovate or oblong fls small, yellow. 18. *luteola*
- DD. Pseudobulbs 2-3-lvd.
- B. Peduncles pendent, bearing usually a single yellow fl.; lip entire. 19. *citrina*
- BB. Peduncle erect, bearing 2-10 fls or more; lip usually 8-lobed.
- F. Ground-color of sepals and petals not green nor brown.
- G. With large purple spots. 20. *amethystoglossa* (glossa)
- H. Fls 5-10; sepals and petals not fleshy
- I. Lip emarginate; blooms in fall. 21. *Bowringiana*
- II. Lip acute, blooms in spring. 22. *Skinneri*
- HH. Fls 2-5; sepals and petals fleshy.
- I. Middle lobe of lip much broader than tube. 23. *Victoria-regina*
- II. Middle lobe of lip not broader than tube.
- J. Color of sepals and petals pale or white; petals the same width as dorsal sepal. 24. *intermedia*
- JJ. Color of sepals and petals marked, petals broader than dorsal sepal
- K. Lateral lobes of lip and petals acute. 25. *violacea*
- KK. Lateral lobes of lip and petals obtuse
- L. Lip distinctly 3-lobed, the nerves of the disk smooth. 26. *Loddigesii*
- LL. Lip indistinctly 3-lobed, the nerves of the disk rugose-thickened. 27. *Harrisoniana*
- FF. Ground-color of sepals and petals brown. 28. *Leopoldii*
- FFF. Ground-color of sepals and petals green.
- G. Lip warty or papillate.
- H. Claw long. 29. *granulosa*
- HH. Claw short or wanting. 30. *guttata*
- GG. Lip not warty nor papillate.
- H. Middle lobe much broader than the tube, sepals and petals spotted. 31. *Schilleriana*
- HH. Middle lobe not broader than the tube, sepals and petals not spotted. 32. *Forbesii*
- AA. Infl. from the base of the pseudobulb
- B. Pseudobulbs 1-lvd lateral lobes of lip separated, exposing column. 33. *Walkeriana*
- BB. Pseudobulbs 2-lvd.; lateral lobes of lip forming a tube, concealing column. 34. *nobilior*

1. *Aclándiz*, Lindl. Sts. 4-5 in. tall, bearing 2 or 3 lvs 2-3 in. long; peduncle with 1 or 2 fls. 3-4 in. across; sepals and petals similar, obtuse, greenish-yellow, marked with spots of black-brown; lip fleshy in the middle, somewhat fiddle-shaped, the lateral lobes small, curved over the column, the middle lobe large, broadly reniform, undulate, rose-purple with darker veins. Brazil. B.M. 5039. C.O. 23. There is a var. *nigréscens*.

2. *bicolor*, Lindl. Pseudobulbs cylindric, deeply striate, 1-3 ft tall, 2-lvd lvs. 4-6 in. long, oblong-lanceolate; peduncle with 2-6 fragrant fls. 3-4 in. across; sepals oblong, acute, usually olive or bronze-green, the lateral falcate; petals like the sepals but undulate;

lip crimson-purple, sometimes white-margined, the lateral lobes wanting, the middle lobe recurved, oblong-cuneate, bilobed, channeled in the center. Brazil. B.M. 4909. C.O. 10. O.R. 10:305.

3 *dolosa*, Reichb. (*C. Walkeriana* var. *dolosa*, Veitch). Pseudobulbs 4-6 in long, usually 2-lvd., the lvs oblong; peduncle 1- or 2-flid.; sepals and petals acute, rose-purple to lilac, the sepals oblong-lanceolate, the petals cuneate-ovate, lip 3-lobed, the lateral lobes erect, the middle lobe reniform, emarginate, amethyst-purple. Brazil. G C II 5 430-1. V.O. 2:49. A.G. 11:159.

4. *Dowiàna*, Batem (*C. labiata* var. *Dowiàna*, Veitch). Pseudobulbs up to 1 ft tall, furrowed, 1-lvd.: lvs. up to 1 ft. long; peduncle 2-6-flid.; fls. 6-7 in. across; sepals and petals nankeen-yellow, the sepals lanceolate, acute, less than half as wide as the undulate petals; lip ample, about as long as the petals, the tube yellow, striped with purple, the limb crisped, velvety, dark purple, finely and beautifully veined with golden lines which radiate from the median lines. R H 1869:30 A.F. 25:593; 21. 838, 30 1078. C.I.A. 11:45, 19 343. Costa Rica, where it was discovered by Warszewicz — It was rediscovered in 1864 by Mr Arce, who sent plants to Eu. in whose establishment they flowered for the first time. Var *aurea*, Williams & Moore (var. *chrysolæa*, Hort.), has the sepals and petals of a deeper yellow and the golden veins on the lip more copious and anastomosing. Colombia A.F. 6 563, 12: 10 F R 1 76 C.O. 2a O R 17 Var *jenseniana*, Hort. A large and handsome form. Var *rosita*, Hort. Sepals creamy white, tinged with purple, petals rose-purple, tinged with yellow.

5 *Lawrenceana*, Reichb. Pseudobulbs 12-15 in. tall, fusiform-clavate, compressed, furrowed, 1-lvd.: lvs oblong, 6-9 in long peduncle 5-8-flid, fls. 4-5 in. across, sepals and petals pale rosy purple to almost white, the sepals linear-oblong, the petals elliptic-oblong, undulate, about twice as wide as the sepals; lip with a narrowly cylindric tube, colored externally like the sepals and petals, the limb purple with a maroon blotch. Brit Guiana B M 7133 R 1 12.

6 *máxima*, Lindl. Pseudobulbs about 1 ft tall, claviform, furrowed, compressed, 1-lvd. lvs oblong, 5-10 in. long; peduncle 3-6-flid; fls. 4-5 in. across; sepals and petals lilac or pale rose, acute, the sepals lanceolate-ligulate, the petals about twice as broad as the sepals, undulate or cr-pled; lip as long as petals, the limb crisped, pale rose or crimson-purple with a median yellow stripe, from which radiate darker lines, the border white. Ecuador and Peru. B.M. 4902. F.S. 20. 2136. F.R. 1:298 C.O. 13.

7. *Eldorado*, Lind (*C. labiata* var. *Eldorado*, Veitch). Pseudobulbs 6-8 in tall, stout, 1-lvd. lvs oblong, 8-12 in long; peduncle with 1-3 fragrant fls. 5-6 in. across, sepals and petals pale rosy lilac passing to white, the sepals lanceolate, acute, the petals oval-rhomboid, obtuse, undulate; lip longer than lateral sepals, externally the same color as petals, the limb crisped, emarginate, a large central orange blotch surrounded by zones of white and purple. Brazil. F.S. 18.1826. C.O. 26. Var. *crocata*, Hort. Sepals and petals white or pale rose, the orange spot of lip extended in a broad line to the base. Var. *Wallisii*, Rand. (*C. Wallisii*, Lind.). Fls. pure white except golden spot on lip C.O. 26a.

8. *Réz*, O'Brien. Pseudobulbs 8-14 in. tall, claviform or fusiform, furrowed, 1-lvd.: lvs. up to 1 ft long, oblong; peduncle with 3-6 fls 6-7 in. across; sepals and petals cream-white, the sepals acutish, linear-oblong, the petals obtuse, as long as sepals but 3 times their width, oval-rhomboid, undulate; lip about as long as lateral sepals, the tube yellow, veined with purple, the limb crisped, the front part margined white surround-

ing a crimson center veined with a lighter shade. Peruvian Andes. B.M. 3377. R.H. 1894:228. C.O. 22.

9. *Mössiae*, Hook. (*C. Carreri*, Houll. *C. labiata* var. *Mössiae*, Lindl. *C. Peetersii*, André). Pseudobulbs fusiform, compressed, furrowed, 12-15 in. tall, 1-lvd.: lvs. 6-8 in. long, oblong; peduncle with 3-5 fls. 6-7 in. across; sepals and petals rose, of equal length, the sepals lanceolate, the petals oval-elliptic, crisped, especially on upper margin; lip with the tube colored like petals, the limb ample, emarginate, strongly undulate-crisped, the center purple, variegated with violet, the margin white, the throat yellow lined with purple-crimson. La Guayra. B.M. 3669. R.H. 1857, p. 322. S.H. 1:149. O.R. 18.241. C.O. 9. A.G. 14:70. A.F. 6:563. Var. *caerulea*, Cogn., has the sepals and petals and spot on the limb a pale blue-violet. C.O. 9c. Var. *Reineckiana*, O'Brien (*C. Reineckiana*, Reichb.), has the sepals, petals and external of tube white, the limb a mauve-lilac, bordered white, the throat yellow, veined purple-violet. C.O. 9b. Var. *Wägeneri*, Veitch (*C. Wägeneri*, Reichb.), has fls. white except the small yellow spot on lip. O.R. p. 24. Var. *rouselleana*, Hort., has rosy fls. Var. *coudoniensis*, Hort. Fls. large and richly colored. Var. *duclis*, Hort. Fls. rose-tinged; lip orange in center, rich rose-crimson in front, finely crimped. Var. *boelensis*, Hort. Dark-colored form. Var. *caelestis*, Hort. Fls. lavender-tinged. Var. *fulgens*, Hort. Fine fls. in shape and color. Var. *Alexandrea*, Hort. Fls. pure white with tinge of rose-pink on lip. Var. *alba*, Hort. Fls. white. Var. *Goossensiana*, Hort. Lip deep reddish violet, with white crimped margin; sepals and petals white. Var. *aureola*, Hort. Fls. large, white. Var. *Flörjæ*, Hort. Fls. pure white.—A variable group

10. *Luddemanniana*, Reichb. f. (*C. labiata* var. *Luddemanniana*, Reichb. f. *C. Dawsoni*, Warner *C. speciosissima*, Hort. *C. Roehlii*, Reichb. f. *C. Malouina*, Lindl. *C. Bissetti*, Hort.) Pseudobulbs clavate, 8-12 in. tall, 1-lvd.: lvs. oblong, 6-10 in. long; peduncle 2-5 fld.; fls. 5-6 in. across; sepals and petals rose-purple, suffused with white, the sepals oblong, acute, the petals elliptic, undulate; lip with the tube of same color as petals, the front lobe crisped, emarginate, amethyst-purple, the throat with 2 yellow or white blotches, separated by lines of amethyst-purple. Venezuela. C.O. 21. Var.

alba, Hort. Fls. white. O.R. 16:201. Var. *Stänleyi*, Hort. Fls. white, disk of lip yellow, front lobe lined with purple.

11. *Méndeli*, Backh. (*C. labiata* var. *Méndeli*, Reichb. f. *C. Morganæ*, Williams). Fig. 841. Pseudobulbs 12-16 in. tall, compressed, furrowed, 1-lvd.: lvs. oblong, 6-10 in. long; peduncle with 2 or 3 fls. 7-8 in. across; sepals and petals white, or often tinted pale rosy mauve, the sepals oblong-lanceolate, the petals obliquely oval, obtuse, crisped; lip with the tube white or colored like petals, the front lobe much crisped, rich crimson-purple abruptly passing into the yellow throat which is reddish streaked. Colombia. O.R. 1.273; 10:233. S.H. 2:413. C.O. 19. Var. *Blántii*, Hort., has the fls. white, except a small yellow spot on lip. Var. *Maudæ*, Hort. White with rose markings on the lip. Var. *gigantea*, Hort., has a very large lip. Var. *hackbridgensis*, Hort. Petals blotched with crimson. Var. *Bértii*, Hort. Fls. white tinted with rose. Var. *leucoglôssa*, Hort. Sepals bluish tinted. Var. *Löwie*, Hort. Lip white, pale purple at apex. Var. *wisetonensis*, Hort. Lip rich rose-purple, delicately veined, throat yellow veined with reddish purple. Var. *macrostigma*, Hort. Fls. very large. R.H. 1903, p. 253 (desc.) Var. *Lächneri*, Hort. Lip curiously colored, front lobe having a broad marginal band of dark purple sparingly blotched with white and an inner band of lighter purple. Var. *Pietiae*, Hort. Fls. nearly white, lip marked with pink. Var. *majestica*, Hort. Fls. large, white. Var. *Dixonæ*, Hort. Attractive bluish-pink form. Var. *Lambeanana*, Hort. Fls. white.

12. *Warszewiczii*, Reichb. f. (*C. labiata* var. *Warszewiczii*, Reichb. f. *C. gloriosa*, Carr. *C. imperialis*, Wallis). Pseudobulbs 1 ft. or more tall, stout, compressed, furrowed, 1-lvd.: lvs. oblong, 8-10 in. long; peduncle with 2 or 3 fls. 7-9 in. across; sepals and petals rosy mauve, the sepals lanceolate, acute, the petals oval, obtuse, undulate; lip entirely bright purple except 2 yellow spots and lines of the same color in the throat, crisped, the front lobe ample. Colombia. O.R. 12:241. G.C. III. 22:163; 42:312. Gn. 33, p. 18. C.O. 1. Var. *gigas*, Hort. (var. *Sanderiana*, Hort. *C. gigas*, Lindl. & André. *C. Sanderiana*, Hort. *C. labiata* var. *Sanderiana*, Hort.) Fig. 842. A noble form, the sepals and petals dark rose, with a deep purple-magenta lip, the fls. larger than those of any other form of the *labiata* group. Colombia. I.H. 21:178. Gn. 45, p. 445. G.F. 1:437. A.G. 19. July 23, suppl. F.R. 1:77, 674. F.E. 10:892. C.L.A. 11.42, 44. The following forms of this variety occur: *alba*, fls. pure white, the rarest of all cattleyas (O.R. 18:232); var. *albescens*, sepals and petals white, with faint blush, the lip rose-purple, fringed; var. *atropurpurea*, of deeper color, var. *rochellensis*, sepals and petals white, the lip with the faintest trace of color. Var. *saturata*, Hort. Fls. bright rose, with ruby-crimson lip.

13. *Trianae*, Lindl. & Reichb. f. (*C. labiata* var. *Trianae*, Duch. *C. Leedna*, Sander. *C. Rollissoniana*, Moore. *C. quadricolor*, Batem. *C. Massangeana*, Reichb. f. *C. bogotensis*, Lindl.). Fig. 843. Pseudobulbs about 1 ft. tall, clavate, 1-lvd.: lvs. oblong, 6-8 in. long; peduncle bearing 2 or 3 fls. about 6 in. across; sepals and petals a delicate rose to white, the sepals oblong-lanceolate, the petals much broader than sepals, obtuse, oval-rhomboid, crisped; lip narrower than in the other related forms, the tube rose, the front lobe purple, less crisped than in most of the related species, emarginate, the throat yellow, often streaked with deeper color. Colombia. O.R. 6:145. B.M. 5504. R.H. 1860, pp. 406-7. A.G. 17:177. Gng. 3:151. A.F. 6:607; 13:715. F.E. 9:325. F.R. 1:672-3. C.O. 5.

842. *Cattleya Warszewiczii*
var. *gigas* (x10).

S.H. 1:11, 27; 2:403, 405. Var. *álba*, Hort. Fls. white, except yellow blotch in throat. C.O. 5a. Var. *atropurpurea*, Hort. Fls. crimson-purple. Var. *Backhousiana*, Hort. Sepals and petals rose-purple, the petals strongly marked with amethyst-purple at the apex, the tube of lip rose-purple, the front lobe purple-magenta. C.O. 5e. Var. *chocóensis*, Hort. Fls. very fragrant,

not fully expanding, the sepals and petals white, sometimes flushed pale lilac. I.H. 20-120 A.F. 6; 563 Var. *delicatá*, Hort. Sepals and petals white, faintly flushed pale amethyst-purple, the deeper lip with a pale yellow spot. F.M. 1-8 Var. *Schröderæ*, Hort. (C. *Schröderæ*, Reiche f.) Fls. fragrant, the sepals and petals a delicate blush, faintly suffused with white, the petals and broader lip much more crisped than in other forms of this species. G.C. III. 20 73 A.G. 15 211 O.R. 11:177. C.L.A. 11.45 F.E. 9-331 The following forms of this variety occur: *álba*, the fls. pure white, *albescens*, the fls. nearly white; *carúlena*, the lip a bluish color, *Méla*, sepals and petals pink, the throat bright yellow, *lilacina*, lilac, *refulgens* Var. *grataxiána*, Hort. A large and richly colored form. Var. *cándida*, Hort. Fls. snow-white, lip with faint violet spot. Var. *cundoniensis*, Hort. Purple-rose-sepals and petals. Var. *Máñæ*, Hort. Silvery white sepals and petals veined with pink, front of lip deep magenta-crimson, with 2 yellow blotches on throat. Var. *triumphans*, Hort. Sepals and petals rose-colored, lip rich purple with an orange-yellow tube. Var. *enfieldensis*, Hort. Fls. white, tip of lip bluish-pink. Var. *boetzelæriensis*, Hort. Rose-colored form. Var. *tesselláta*, Hort. Large rose-colored form curiously marked. Var. *Brandneriána*, Hort. Anterior part of lip dark purple-violet. Var. *Höltzen*, Hort. Lip dark. Var. *Wélesleyæ*, Hort. A pretty white form. Var. *Mooreána*, Hort. Sepals and petals light rosy lilac, lip ruby-claret color, orange at base. Var. *Hölmesii*, Hort. Broad petals and rich rose-purple lip. Var. *brunoyensis*, Hort. Sepals and petals mauve. Var. *Goodsonii*, Hort. Richly colored, petals flushed with deep rose.

14. *labiáta*, Lindl. (C. *Lemoinei*, Lindl. C. *Naldereána*, Reiche f. C. *Pérrini*, Endl. C. *labiáta vera*, Veitch C. *labiáta autumnalis*, L. Lindl. C. *labiáta* var. *Waroqueána*, Rolfe C. *Waroqueána*, L. Lindl.) Pseudobulbs claviform, compressed, furrowed, 4-8 in. tall, 1-lvd. lvs. 5-7 in. long, ovate or oblong peduncle, from a double spathe, bearing 3-5 fls. about 6 in. across; sepals and petals usually rose-lilac, the sepals lanceolate, the petals undulate, lip with the tube colored usually like the petals, the front lobe deeply emarginate, undulate-crisped, commonly a violet-purple with deeper veins, the color running in streaks to the yellow throat which has an orange spot each side. The color-variations of this species are numerous. Brazil B.R. 32-35, 1859 O.R. 16-281. B.M. 3998. G. 5:146. F.S. 1893-4. P.M. 4:121. A.G. 17 65; 19:811. G.C. III. 19-13. A.F. 6:607. GEORGE V. NASH.

Cauliflower is the most fastidious and exacting member of the cabbage family. It is less tolerant of adverse soil and climatic conditions than any of its near relatives. This accounts, in a great measure, for its limited cultivation and the fact that it is grown only in certain localities. When well grown, however, it is one of the most profitable market-garden crops. Because of its

intolerance to heat, it is grown in the open so as to take advantage of the cool seasons of early spring and autumn. It is one of those crops, therefore, which is less adaptable than those having a greater range of heat-endurance. If the season happens to be favorable the amateur may have good luck, but if the season proves severe the most expert grower may fail.

A rich loamy soil, thoroughly charged with available plant-food is suited to this plant. Light thin sandy soils or those extremely heavy and retentive are, as a rule, not well suited for this crop. The soil should be one which does not dry out quickly but which will furnish the plants a constant supply of moisture. High-grade cauliflower is quite as dependent upon careful handling of the plants and a constantly available supply of moisture as high-grade celery. Among the fertilizers, none is better than well-decomposed manure from the horse-stable, thoroughly incorporated with the soil at the time of preparing it for the crop.

If commercial fertilizers are necessary, quick-acting ones are most desirable, except it is thought that sulfate of potash is preferable to muriate. The nitrogen-content of the fertilizer, however, should be in the form of nitrate of soda or sulfate of ammonia rather than in a slow-acting form. If a fertilizer is to be used, a portion of it should be scattered over the field before the plants are set. An application of 500 pounds to the acre at this time, applied broadcast, and a side dressing about the time "buttons" begin to form, will prove an advantage. The side dressing may be at the rate of 500 pounds, making a total application of 1,000 pounds to the acre. A good fertilizer is one carrying 3 to 4 per cent of nitrogen, 6 to 8 per cent of phosphoric acid and about 10 per cent of potash.

Cauliflower plants in northern latitudes are handled so as to prepare them either for an early or a late crop. The early crop should be started at the same time as early cabbage, or a few days later. Cauliflower plants cannot, however, be started in the autumn and successfully wintered in coldframes, as can early cabbage plants. Plants so handled are less likely to give a desirable product. The best early-crop plants are produced from hotbed or greenhouse propagated stock started in a mild temperature and grown so as to produce a sturdy broad-leaved plant to be set in the field a few

The early crop is usually grown on a smaller scale than the autumn crop. Plants grown in the hotbed are usually transplanted and the transplanted plants carried and set in the field by hand. The distance between the rows should be sufficient to permit of cultivation with horse-power implements, but the plants need not be set more than 18 inches apart in the row.

The late crop, however, is frequently transplanted during the drier parts of the season and, largely on this account, growers prefer to use a transplanting machine so as to water the plants at the same time they are set. A convenient distance between the rows is 3 feet, with the plants 20 to 24 inches apart in the row, depending upon the variety grown.

The old adage that "cabbage should be hoed every day" applies with equal force to cauliflower. Cultivation should be of such character as to prevent the formation of a crust and to discourage the development of weeds. The maintenance of a soil-mulch by shallow cultivation which shall not disturb or severely prune the roots of the plants is desirable.

Cauliflower is subject to the same enemies and diseases as cabbage. Clubroot and mildew are two of the most annoying diseases. The aphid, root-maggot and both the green cabbage-worm and the cabbage-looper are annoying pests. The delicacy of the curd requires that the plants be kept perfectly free from insects which devour any portion of the plant.

Cauliflower requires more careful field attention than that required by any other garden crop except those that are blanched either by tying or banking. The young curd of the cauliflower, as soon as it has reached the size of a hen's egg, should be carefully protected from the elements by adjusting the leaves in such a manner as to prevent discoloration by the action of sun or rain. The expert growers accomplish this and at the same time indicate the stage of maturity of the plants by different methods of folding the leaves together over the curd or by tying them with different tying materials, a different method being used each time the field is gone over. To illustrate the earliest developed curds may be protected by tying the leaves together with rye straw, the next later size may be indicated by folding the leaves together over the plant, while the third may be indicated by tying the leaves with raffia. Usually three operations will be sufficient to care for the entire season's crop. As soon as the curds have reached the desired market size, which varies greatly with different producers and somewhat also with different varieties and is to a degree dependent upon the season and fertility of the land, the plants are harvested by cutting the heads with at least two or three whorls of leaves attached.

After the heads have been cut and a sufficient number assembled in one place to justify packing, they are trimmed by using a large knife to sever the leaves just above the edge of the curd so as to form a border or "ruche" of leafstalks with a part of the blade attached about the curd. This border of stiff green leafstalks about the white curd gives it a very attractive appearance.

After the curds have been properly trimmed, which varies somewhat with different operators, they are protected by the use of tea paper, either white or brown, placed over the head in such a manner as to protect it from dirt and contact with its neighbors. The curds are then packed in crates or barrels, the California and Florida product being largely packed in crates holding one dozen heads in a single layer. If the heads are to be packed in barrels, a layer of excelsior is first placed in the barrel and the wrapped heads, curd down, are carefully placed so as to form a layer resting upon the excelsior over the bottom of the barrel. The next row of curds is placed stem end down and curds up; on top is placed another cushion of excelsior and the operation repeated until the barrel is filled in such a manner as to

845. Types of cauliflower heads: a, ricy; b, leafy; c, perfect

days later than the early crop of cabbage. Young cauliflower plants are less hardy than young cabbage plants and, for this reason, planting in the open must be somewhat delayed.

For the late cauliflower crop in the North, seed-beds are prepared on the shady side of a building or in a partially shaded situation and handled in same manner as seed-beds for late cabbage, the late crop in the Long Island region being placed in the open the last days of June or early in July.

leave the last row with the stem end upward, over which a cushion of excelsior and a burlap cover are placed. Ventilated barrels are ordinarily used for this purpose, but for long-distance shipment the smaller crates holding a single layer of heads have proved most advantageous.

During late years, the marketing of this crop has been very greatly facilitated and the returns to the growers considerably enhanced by a cooperative method of sale which has taken into consideration a more extended distribution of the crop than formerly. In this the Long Island Cauliflower-Growers' Association and the California Vegetable-Growers' Union have both been very helpful.

One of the handicaps in the cultivation of cauliflower has been the entire dependence of the American growers on foreign seed, little or no cauliflower seed having been produced in this country and that in the open only in the Puget Sound region. The seed has been expensive and not always to be depended upon. The greatest care should be given to securing a perfectly reliable stock of seed.

Broccoli

Broccoli, which is a long-season cauliflower, is in all respects like cauliflower except that its vegetative parts are somewhat coarser, the heads somewhat smaller, and it does not form an edible curl early in its life as does cauliflower.

Broccoli is cultivated only in climates having a mild winter, when it can be planted the summer before and carried through the winter to form heads early the following spring. It is a popular plant in all parts of France and particularly in England. It is undoubtedly the parent type of the cauliflower, the cultivated varieties of cauliflower being short-season forms.

For best results, the seed should be sown at the same time as that of autumn cabbage and the plants transplanted to the field about the same time, so that they will make their vegetative growth during the late summer and autumn. Where winters are mild, the plants can be left in the open, but in more rigorous climates at the approach of cold weather, a small number of plants can be lifted with earth adhering to the roots, stored in a suitable root-cellar, and the following spring transferred to the open to form heads.

L. C. CORBETT.

CAULOPHYLLUM (Greek, *stem-leaf*) *Berberidaceæ*. BLUE COHOSH. Two species of perennial herbs (sometimes combined with *Leontice*), one in E. Amer. and the other in Asia, the former sometimes removed from the woods to cult. grounds. *Rhizomatous* stems erect, very smooth; fls. 1, large, trilocular compound and sessile; fls. small, yellow-green, panicle; sepals 6, subtended by 3 or 4 bracts; petals 6, much smaller than the sepals and appearing like glands or scales; stamens 6; ovary soon bursting, freeing the 2 ovules which develop into depressed-globular berry-like seeds (without pericarp). *C. thalictroides*, Michx., Fig. 846, is the American species, a smooth or glaucous plant of rich woods from Canada south, 2-2½ ft. high. The plant is always attractive because of its trim growth and interesting habit; in Sept. and later, when the foliage is dead, the drupe-like seeds stand erect on the dry stalks and afford one of the richest and best of deep blues.

L. H. B.

CAUTLEA (Sir P. Cautley, 1802-1871, British naturalist). *Zingiberaceæ*. About a half-dozen Himalayan species closely allied to *Roscoea*, differing in the phorbol rather than narrow fr. and the spicate infl. Probably not in cult. in this country. *C. lutea*, Royle (*Roscoea lutea*, Royle. *R. gracilis*, Smith). Erect or leafy perennial herb, 1½ ft. or less. lvs. narrow-lanceolate, slender-tipped, reddish underneath; fls. 2 in. or less long; corolla yellow; calyx reddish purple, the linear

segs. prominent, the lateral ones spreading or reflexed and the dorsal one erect and with an incurved erect staminate under it.—Treatment of *Alpinia* and *Roscoe*.

CAVAN: *Acacia Cavenia*.

CAYENNE PEPPER: *Capiscum*.

CATRÁTIA JAPÓNICA: *Cissus japonica*.

CEANOTHUS (ancient Greek name) *Rhamnaceæ*. Ornamental woody plants grown for their profusely produced white, blue or pink flower-clusters.

Deciduous or evergreen shrubs or trees. lvs. alternate or sometimes opposite, short-petioled, serrate or entire, usually 3-nerved, with small stipules, fls. perfect, small, 5-merous, in small umbels forming panicles or racemes; sepals often incurved, colored; petals clawed, spreading or recurved, filaments slender; disk annular; ovary partly adnate to the calyx-tube, 3-celled; style 3-cleft fr a 3-celled drupe, dry at length and separating into 3 one-seeded dehiscent nutlets.—Nearly 50 species in N. Amer. chiefly in the Pacific coast region.

These are free-flowering shrubs, some especially valuable for their late flowering period. Many of them are hardy only in the warmer temperate regions, but *C. americanus*, *C. ovatus*, and *C. Fendleri* are hardy North, while the numerous hybrids of *C. americanus* are only half hardy, and even if protected they are killed to the ground in the North, but the young shoots will usually flower the same season. The safest way, however, to have good free-flowering plants of these beautiful hybrids will be, in the North, to dig them up in fall, store them away in a frost-proof pit or cellar, and plant them out again in spring. Pruning of the late-flowering species will be of advantage; about one-half of last year's growth may be taken away. They grow in almost any soil, but best in a light and well-drained one, and most of the Californian species prefer a sunny position. Propagated by seeds sown in spring and by cuttings of mature wood in autumn, inserted in a cold-frame or greenhouse; softwood cuttings also grow readily if taken in early spring from forced plants. Sometimes increased by layers, and the varieties and hybrids by grafting on roots of *C. americanus* under glass in early spring; the cones must be fresh and with leaves, taken from plants kept in the greenhouse during the winter.

846. Seed-berry of blue cohosh, *Caulophyllum thalictroides*. (×½)

A. *Los. alternate.* (Nos. 1-13.)

B. Margin of lvs. serrate or crenate.

C. Foliage glabrous beneath or slightly pubescent.

D. Fls. white; lvs. thin, deciduous.

E. Peduncles slender, at the end of the new growth.

1. *americanus*, Linn. Fig. 847. Low, erect shrub, to 3 ft.: lvs. ovate, usually acute, finely and irregularly serrate, bright green and dull above, paler and pubescent or nearly glabrous beneath, $1\frac{1}{2}$ -3 in. long; fls. in terminal and axillary panicles on slender peduncles, forming large, corymbose panicles. July-Sept. From Canada to S. C. and Texas. B.M. 1479. Gt. 61, p. 92 Gn. 56, p. 137.—Common in dry woods and making a profusion of bloom, which, however, is short-lived. Many hybrids have been raised from this species in Eu. (see *C. hybridus*). Var. *intermedius*, Trel. (*C. intermedius*, Pursh), has smaller, ovate or ovate-lanceolate lvs. and the fls. in small, very slender-peduncled, short racemes or panicles Tenn. to S. C.

847. *Ceanothus americanus*. ($\times \frac{1}{2}$)

tuse or acute, crenulate-serrate, nearly glabrous, glossy above, 1-2 in. long, inf. like the former, but usually smaller. New England to Colo. and Ala.

EE. Peduncles usually stout, from lateral buds of the old wood.

3. *sanguineus*, Pursh (*C. oregonus*, Nutt.). Tall shrub, with purple or reddish glabrous branches: lvs. orbicular to ovate or obovate, obtuse, serrate, nearly glabrous, 1-3 in. long; fls. in rather long, narrow panicles, on stout, leafless peduncles, axillary, from branches of the previous year. May, June. Brit. Col. to Calif. B.M. 5177.

DD. Fls. blue or pink, rarely white; lvs. usually half-evergreen.

4. *hybridus*, Hort. Hybrids of garden origin, chiefly between *C. americanus* and *C. thyrsiflorus*, between *C. ovatus* and *C. thyrsiflorus* and between *C. americanus* and *C. azureus*; the hybrids of the first group may be classed under *C. roseus*, Koehne, of the second under *C. pallidus*, Lindl., and those of the third group under *C. Arnoldii*, Hort. Some of the most distinct are: *dibolopisus*, with double white fls.; *atroceruleus purpureus*, fl. blue, foliage purple when young; *Arnoldii*, fls. sky-blue, in large panicles; *Gloire de Versailles*, with bright blue, large panicles (M.D.G. 1903:485); *Gloire de Plantières*, fls. dark blue, in large panicles; *Victor Joun*, fls. deep blue, darker than in the preceding, one of the hardest hybrids; *Crê de Provence*, fls. deep blue, profusely produced (R.H. 1903:332); *Marie Simon*, fls. flesh-colored; *roseus*, fls. pink (R.H. 1875:30); *pallidus*, fls. pale blue, lvs. green and pubescent below (B.R. 26:20).

5. *thyrsiflorus*, Esch. Shrub or small tree: lvs. oblong, obtuse, crenate-serrate, nearly glabrous, 1-1½

in. long; fls. blue, rarely white, in narrow panicles, about 3 in. long. May-July. Ore. to Calif. B.R. 30:38. S.S. 2.64. G.C. III. 20:363; 37.179. 41:221. Gn. 74, p. 303. G.M. 50:430.—A very fine, free-flowering species of beautiful blue color. Probably natural hybrids of this species are *C. Veitchianus*, Hook. (*C. thyrsiflorus* \times *C. rigidus*), with deep blue fls. in dense paniced clusters (B.M. 5127; F.S. 13:1383), and *C. Lobbianus*, Hook. (*C. thyrsiflorus* \times *C. dentatus*), with deep blue fls. in oval, peduncled, solitary clusters. B.M. 4810 (4811 by error). F.S. 10:1016.

CC. Foliage tomentose or densely pubescent beneath: half-evergreen or evergreen (see also *C. hybridus*).

D. Branchlets and the veins beneath nearly glabrous: lvs. very obtuse, fls. white.

6. *velutinus*, Douglas Tall shrub: lvs. persistent, broadly elliptic, mostly subcordate, obtuse, serrate, dark green and glabrous above, canescent beneath, but the veins glabrescent, 2-3 in. long fls. in large, compound panicles at the ends of the branches. June, July. Brit. Col. to Colo. and Calif. B.M. 5165

DD Branchlets and the veins tomentose or pubescent lvs. mostly acute fls. usually blue

E. The lvs. glabrous or puberulous above, whitish or tawny tomentose beneath.

7. *arborescens*, Greene (*C. velutinus* var. *arborescens*, Sarg.). Small tree, with whitish bark branchlets at first angled and pubescent, later glabrescent and glossy: lvs. elliptic-ovate, obtusish or acutish, rounded or subcordate at the base, closely serrate, with close white tomentum beneath, $1\frac{1}{2}$ -3 in. long fls. pale blue to white in panicles 2-3 in. long. Spring. Isl. off the Calif. coast. S.S. 2.65.

8. *azureus*, Desf. (*C. bicolor*, HBK. *C. caruleus*, Lag.). Tall shrub: branchlets terete, densely tomentose: lvs. oblong-ovate or oblong, acute or obtuse, rounded at base, serrate, with villous tawny tomentum beneath, 1-3 in. long fls. deep blue, in slender panicles 2-4 in. long Sprng Mex L.B.C. 2.110 B.R. 4.291. P.M. 2-74. Gn. 61, p. 223—Under this name, a hybrid species with *C. americanus* is often cult.

EE. The lvs. villous or hirsute on both sides, usually green beneath

9. *hirsutus*, Nutt Shrub or small tree, with villous branches: lvs. broadly elliptic or ovate, rounded or cordate at the base, obtuse or acute, with glandular teeth, $\frac{1}{2}$ -2 in. long; fls. deep blue to purplish, in narrow panicles 1-2 in. long. April, May Calif.—Called "wild hiae" in Calif var *Orcuttii*, Trel (*C. Orcuttii*, Torr.). Fls. blue, paler. fr. loosely villous.

BB. Margin of lvs. entire or nearly so (sometimes serrate on vigorous shoots).

C. Shrub prostrate fls. white.

10. *Fendleri*, Gray. Low, prostrate and spiny shrub: lvs. oval, rounded or nearly acute at both ends, entire, rarely finely serrulate, grayish green, minutely tomentose beneath, $\frac{1}{4}$ -1 in. long; fls. white, in short racemes, terminal, on short, lateral branchlets. June, July. From S. D. to New Mex. and Ariz. R.H. 1901, p. 423. M.D.G. 1908 208; 1912:499.—A very graceful and free-flowering shrub of almost creeping habit, well adapted for covering dry, sandy banks; half evergreen and hardy N.

CC. Shrubs tall, upright.

D. Branchlets terete or slightly angled, rarely spiny.

11. *integerrimus*, Hook. & Arn. Tall, erect shrub, with glabrescent branches: lvs. broadly elliptic or ovate, obtuse, sparingly hairy or glabrous, bright green beneath, 1-3 in. long; fls. blue, sometimes white, fragrant, in 3-6 in. long, narrow panicles. April-June. Wash. to Calif. and S. E. Ariz. B.M. 7640.

12. *divaricatus*, Nutt. Tall, erect shrub, with usually glaucous branches and often spiny: lvs. ovate, obtuse or nearly acute, glaucous and glabrous or grayish tomentose below, $\frac{1}{2}$ –1 in. long; fls. pale blue, sometimes whitish, in 2–3 in. long, narrow panicles. April–June. Calif. Gn. 74, p. 425 (habit).

DD. *Branchlets angled, spiny.*

13. *spinosus*, Nutt. Tall shrub, sometimes arborescent: branchlets glabrous: lvs. elliptic to oblong, thinly coriaceous, rounded or broadly cuneate at the base, very obtuse or emarginate, scarcely 3-nerved, glabrous, $\frac{1}{2}$ – $\frac{1}{2}$ in. long; fls. light blue to almost white in large terminal panicles 4–6 in. long. Spring. Cent. and S. Calif., Coast Range and down to sea-level. S.S. 13, 621.

AA. *Lvs. opposite, persistent.*

14. *cuneatus*, Nutt. Tall, much-branched shrub: lvs. spatulate or cuneate-obovate, mostly obtuse, entire, minutely tomentose beneath, $\frac{1}{4}$ –1 in. long; fls. white, in small clusters along the branches. March–May. Ore to Calif. B.H. 8, 170

15. *prostratus*, Benth. Procurrent shrub: lvs. cuneate, obovate or spatulate, coarsely and pungently toothed, sometimes only 3-pointed at the apex, often minutely silky when young, $\frac{1}{2}$ –1 in. long; fls. blue, in clusters, terminal on short branchlets. Spring. Wash. to Calif

C. africanus, Linn = *Noltea africana* — *C. dentatus*, Torr & Gray. Low shrub lvs. oblong, penninerved, dentate, glandular-papillate above, loosely hairy fls. blue, in peduncled clusters. Calif. F.S. 6 567, 2. B.H. 4 101 — *C. dentatus* var. *floribundus*, Treil (*C. floribundus*, Hook.) Fl. clusters numerous; nearly sessile lvs. smaller B.M. 4806 F.S. 10 977 I.H. 7 238 B.H. 5 120 — *C. foliosus*, Parry. Low shrub lvs. small, broadly elliptic, glandular-toothed, slightly hairy, pale or glaucous beneath fls. deep blue, in numerous small clusters. Calif. — *C. leucodonta*, Douglas. Tall shrub lvs. broadly elliptic, serrate, glabrous, glaucous beneath fls. yellowish white, in large panicles. Calif. — *C. microphyllus*, Mielch. Low shrub. lvs. very small, obovate or elliptic, nearly glabrous fls. white, in small, short-peduncled clusters. — *C. papillosus*, Torr & Gray. Low shrub, lvs. narrow-oblong, dentate, glandular-papillate above, villous beneath fls. deep blue, in peduncled, axillary oblong clusters. Calif. B.M. 4815 F.S. 6 567, 1. P.F.G. 1, p. 74. R.H. 1850 321 — *C. Parryi*, Treil. Large shrub lvs. elliptic or ovate, denticulate, cobbly beneath fls. deep blue, in peduncled, narrow panicles. Calif. — *C. rigidus*, Nutt. Rigid, much-branched shrub. lvs. opposite, cuneate-obovate, denticulate, usually glabrous, small; fls. blue, in small, nearly sessile, axillary clusters. Calif. B.M. 4660 (as *C. verrucosus*) and 4664. F.S. 3 316, 4 348 — *C. verrucosus*, Nutt. Low shrub, lvs. mostly alternate, roundish obovate, emarginate, denticulate, nearly glabrous, small fls. white, in small, axillary clusters along the branches. Calif. — *C. verrucosus*, Hook. = *C. rigidus*.

ALFRED REHDER.

CEARA RUBBER: *Manihot*.

CÉBATHA: *Cocculus*.

CECROPIA (from Greek word referring to use of the wood of some species in making wind instruments) *Moraceæ*. Milky-juiced trees, with peltate leaves, sometimes planted in grounds in tropics and warm countries.

Leaves large, alternate, long-petioled, the blade circular in outline; segms. or lfts. 7–11: dioecious; fls. very small, sessile in cylindrical heads or receptacles, which are arranged in umbels; calyx tubular and petals 0; sterile fls. with 2 stamens; fertile fls. with free ovary and divided stigma; frs. small 1-seeded nuts combined into short spikes.—Species about 40, from Mex. to Brazil. *C. peltata*, Linn., is the trumpet-tree of the W. Indies and S. It is a middle-sized tree with lvs. 1 ft. across; hollow branches used for the making of wind instruments. The juice of some species yields rubber. The hollow stems are often perforated by ants, which nest and rear their young in them.

palmata, Willd. Fig. 848 A characteristic tree of the farther W. Indies (and planted somewhat in S. Fla.), with a single long weak thin trunk and at the top a few horizontal or deflexed awkward branches bearing at their ends large palmate lvs. with divisions like thumbs, the trunk and branches partitioned at the

nodes: lvs. 7–11-lobed to the middle, white-tomentose beneath, the lobes oblong-obovate and blunt.—The tree attains a height of 50 ft.; wood soft, branches more or less hollow; grows rapidly, like an herb; often covering areas that have recently been burned over.

L. H. B.

CEDAR: *Cedrus, Juniperus*.

CEDAR, WHITE: *Thuja, Chamæcyparis*.

CEDAR, WEST INDIAN: *Cedrela*.

CÉDRELA (from *Cedrus*, the wood resembling that of *Cedrus*). *Melastacæ*. Including *Toona*. Ornamental trees, grown for their handsome foliage; some are valuable timber trees.

Trees with alternate, usually abruptly pinnate lvs., without stipules. lfts. petioled, entire or slightly serrate; fls. inconspicuous, whitish, usually perfect, 4–5-merous, in large, pendulous, terminal panicles; calyx short, 4–5-parted, the petals forming a tube with spreading limb, below partly adnate to the disk; stamens shorter than petals; ovary 5-celled, style simple, with capitate stigma, somewhat longer than the stamens fr. a caps., dehiscent, with 5 valves not splitting to the base, with many flat, winged seeds.—Nine species in Trop. Amer. and 8, forming the subgenus *Toona*, in E. India and Austral. *Toona* is often considered a distinct genus, distinguished from *Cedrela* by the disk being much longer than the ovary and by the seeds being winged above or at both ends, while in *Cedrela* the disk is as long or shorter than the ovary and the seeds are winged below. The first 3 species below belong to the subgenus *Toona*, the others are true *cedrelas*.

Cedrelas are tall ornamental trees with large pinnate foliage, well adapted for avenues. *C. sinensis* is hardy as far north as Massachusetts, the others are hardy only in southern California and in the Gulf states except *C. odorata*, which is tender even there. The wood of some species, particularly of *C. odorata*, is known as cedar wood, and much valued for making furniture and boxes. They thrive best in rich loam, and are propagated by seeds or by cuttings of mature wood, and, also, by root-cuttings, all with bottom heat

848. *Cecropia palmata*.

A. *Lfts. 10-25.*

B. *Lvs. quite glabrous.*

C. *Margin of lvs. more or less serrate; panicles very long, pendulous; seeds winged above.*

sinensis, Juss. (*Toona sinensis*, Roem *Ailanthus flavescens*, Carr.). Tree to 50 ft.; lvs long-petioled, 10-20 in. long; lfts. 10-22, oblong or oblong-lanceolate, acuminate, slightly and remotely serrate, light green beneath, 4-8 in. long; fls white, in very long, pendulous panicles, ovary glabrous; 5 subulate staminodes alternating with the stamens; fr. oblong or obovate, about 1 in. long. June. China. R H 1891, p. 574-5, 1875, p. 87. Gng. 4:1. M D G 1902:495 F. 1876, p. 175 F. E. 13, p. 1—Ornamental tree, with large feathery foliage, very valuable for avenues; similar to alanthus, and nearly of the same hardness, but of more regular and dense growth, and without the disagreeable odor when flowering. *Ailanthus* can be easily distinguished by the few coarse teeth near the base of the lfts., each bearing a large gland beneath (Fig. 849)

849 Leaflets of *Cedrela sinensis*. *Cedrela* on the right. (X 1/2)

serrata, Royle (*Toona serrata*, Roem.) Tree, to 70 ft.; lvs usually odd-pinnate, 15-20 in. long, lfts. 15-25, ovate-lanceolate or ovate-acuminate, irregularly serrate, glaucous beneath; panicles longer than the lvs., pendulous; fls fragrant, often 6-merous; ovary glabrous. Himalayas, to 8,000 ft. altitude. Royle, Ill 25 Collett, Flor. Siml 82—This is probably the hardest of the tropical species. Sometimes united with *C. Toona*

cc *Margin of lvs entire; panicles shorter than the lvs.*

Toona, Roxbg (*Toona ciliata*, Roem.) Tree, to 70 ft., nearly evergreen; lvs. abruptly pinnate; lfts. 10-20, usually opposite, lanceolate or ovate-lanceolate, sometimes undulate, 3-6 in. long, fls. white, honey-scented, 5-merous; ovary hairy; seeds winged at both ends. Himalayas. Wight, Icon 161. Brandis, Forest Fl. 14.

odorata, Linn. WEST INDIAN CEDAR Tree, to 100 ft.; lvs 10-20 in. long; lfts 12-20, ovate-lanceolate, acuminate, entire, bright green on both sides, 4-6 in. long, panicles shorter than the lvs; fr oblong, 1 1/2 in. long; seeds winged below. W. Indies.—The cedar wood comes mostly from this species. Wood brown, fragrant, the source of the cigar-box wood of commerce. It is a very durable wood,

and is much prized in the W. Indies in the manufacture of cabinets, furniture, canoes, and other articles. In the W. Indies known as "cedar"

bb *Lvs densely pubescent beneath.*

filialis, Vell. Tree. lvs 10-15 in. long, abruptly pinnate; lfts. 18-24, opposite, nearly sessile, oblong-lanceolate, acuminate, panicles pubescent, longer than the lvs., calyx pubescent outside, petals fulvous tomentose; ovary glabrous. Brazil, Paraguay St. Hilaire, Fl. Brazil 2 101—According to Franceschi it does better at Santa Barbara than any other species of this genus

aa *Lfts 6-10, finely ciliate*

Dugèsii, Wats. Tree. lvs 10-15 in. long, lfts cuncate, ovate-lanceolate, long and slender acuminate, nearly entire, shining above, pale green and glabrous or nearly so beneath, 4-6 in. long, panicles rather compact, much shorter than the lvs. Mex ALFRED REHDER

CEDRONELLA (*a little cedar*, from the odor of *C. triphylla*, a species from the Canary Islands sometimes called "Balm of Gilead") *Labiatæ* Herbs or shrubs, sometimes planted in borders in the middle and southern parts of the United States

Four species allied to *Dracocephalum*, to which the first 2 belong according to Benthom Engler and Prantl consider the genus monotypic, containing only the third species below The 2 native kinds described below are compact, free-flowering border perennials, with aromatic lvs and numerous showy purplish pink fls with blue stamens, and borne in dense whorls on long racemes or spikes; calyx a trifle oblique, 5-toothed, corolla-tube exerted, the limb 2-lipped, stamens 4, the anthers 2-celled—They are not quite hardy N., and should have a sheltered sunny position, or some winter protection The first 2 prop by division of the root, the last by cuttings

cana, Hook. Height 2 1/2-3 ft. sts hard, square, subshrubby; branches numerous, especially at the base, opposite, hoary with a minute pubescence; upper lvs. small, 1/2-1 1/2 in. long, entire, hoary, numerous near the fls.; ovate, lower lvs. larger, cordate-ovate, dentate-serrate; spikes numerous, whorls dense, 15- or more-fld; corolla 1 in. long, limb 5-cleft, the lowest lobe largest, crenate, revolute June-Oct Mex and New Mex B M. 4618

mexicana, Benth. (*Gardquia betonscoides*, Lindl.) Height 1-3 ft. root creeping; lvs 1 1/2-2 1/2 in. long, ovate-lanceolate (the lower ones cordate), crenate-dentate, becoming purplish below, petioled fls very like the above, bright pink. Mex. Mts S. Ariz B M. 3860—Rarer in cult than above; lvs larger, longer and fewer. Intro into cult. in 1839.

triphylla, Moench (*Dracocephalum canariense*, Linn.) BALM OF GILEAD Shrubby, 3 to 4 ft.; lfts. 3, oblong or lanceolate; fls. purple or

850. *Cedrus atlantica*.

white, in loose spicate whorls. Aromatic plant from Canary Isls.

C. paltia, Lindl. Similar to *C. mexicana*, but differing in having shorter, pale red fls. B R. 1846 29. It is sometimes confused with *C. mexicana*

N TAYLOR.†

CÉDRUS (*Kedros*, ancient Greek name). *Pinaceae*. CEDAR. Trees grown for their persisting foliage and striking habit, they are also valuable timber trees.

Large evergreen trees, with quadrangular, stiff, fasciculate lvs: fls monerous, the staminate forming cylindrical catkins. cones ovate or ovate-oblong, thick, 3-5 in long, with broad, closely imbricate, bracts, attaining maturity in 2 or 3 years, seeds winged.—Three closely allied species in N Afr. and Asia Minor and Himalayas.

The cedars are large ornamental conifers, with wide-spreading branches, very distinct in habit from most other conifers. They are usually considered tender, but a hardy race of *Cedrus Libani* has been recently introduced by the Arnold Arboretum from the highest elevation where the species occur in Asia Minor, the plants have stood all the winters since 1902 unprotected at the Arnold Arboretum and have proved perfectly hardy. It is very gratifying that one is now able to grow so far north the famous cedar of Lebanon which, aside from its beauty, is of peculiar interest for its historic and religious associations. The race of *Cedrus Libani* commonly cultivated is rather tender, more tender than *C. atlantica* which may be grown as far north as New York in sheltered positions, while *C. Deodara* can be grown safely only in California and southern states. The very durable and fragrant wood of all species is highly valued.

The cedars prefer well-drained, loamy soil, and will also grow in sandy clay, if there is no stagnant moisture. Propagated by seeds sown in spring; the varieties by veneer grafting, in late summer or in fall, on seedlings of *C. atlantica*; or, in warmer regions, on *C.*

Deodara; they grow also from cuttings, if the small shoots are selected which spring occasionally from the old wood. Plants of this genus are the true cedars; but trees of other genera are often called cedar. See *Chamaecyparis*, *Juniperus*, and *Thuja*; also *Cedrela*.

A. Branches stiff, not drooping; cones truncate, and often concave at the apex.

atlantica, Manetti. Fig. 850. Large, pyramidal

Young growth green, becoming later white at the tips. G.W. 11, p. 89. Var. *aurea*, Beissn. Foliage golden yellow. G.W. 11, p. 87.

ALFRED REHDER.

CÈIBA (aboriginal name). *Bombacaceae* SILK-COTTON. KAPOK. CEIBA. Trees, one of which is widely known in the tropics for its great size as a shade tree, and for the "cotton" of its seed-pods. *Eriodendron* is a more recent name.

Leaves digitate, with 5-7 entire lfts. fls medium to large, rose or white, on 1-fld. peduncles, solitary or fascicled; calyx cup-shaped, truncate or irregularly 3-5-lobed; petals oblong, pubescent or woolly, staminal tube divided at the apex into 5 or 10 parts, each part bearing a stamen, ovary 5-celled fr. a coriaceous caps, pubescent within and bearing obovoid seeds embedded in a wool-like or cotton-like fiber.—Allied to *Bombax* and *Adansonia*, from which it differs in having 5 parts in the staminal body or column, rather than a much more divided column bearing many stamens on each division. Ten or more species, mostly in Trop Amer, extending to Asia and Afr.

Casearia, Medic. (*C. pentandra*, Gaertn. *Bombax pentandrum*, Linn. *B. guineense*, Schum & Thoun. *Eriodendron anfractuosum*, DC. *E. occidentale*, Don. *E. orientale*, Kostel. *Xylon pentandrum*, O Kunze). SILK-COTTON TREE CEIBA POCHOTE Figs 852, 853. Great tree, reaching 100 ft and more, and having immense horizontal far-spreading branches and wide-lying thin buttresses or flanges; trunk spiny when young; branches verticillate. lfts. 7, arising from a nearly circular plate or disk at the top of the petiole, lanceolate-acuminate, undulate, smooth, each 4-6 in. long; fls. white or rose, the corolla 2-3 in. long, petals

oblong-obtuse, hairy outside; caps. 4-8 in. long, 5-valved, bearing many woolly seeds. Tropics of Asia, Afr., and Amer. B.M. 3360—One of the characteristic and well-known trees of tropical countries. The wings of some of the old trees run far in all directions, sometimes being prominent 30 ft. or more, note the

picture (Fig 852) of the well-known tree at Nassau on the island of New Providence. The wood is used to some extent in interior construction, but is soft, white and brittle. The cotton-like material in the pods is used in beds and pillows and for stuffing life-buoys, but it cannot be spun into threads, it is the "kapok" of commerce. Offered in S Calif and Fla., as a tree of rapid growth.

grandiflora, Rose Tree, 15-20 ft., 8-12 in. diam., the branches with short prickles; petioles 2-4 in. long, lfts 3-5, glabrous, oblong, cuneate at base, entire or slightly serrulate, 2-3½ in. long petals white, silky, 4-5 in. long, strap-shaped, stamens 5, the filaments 3½ in. long and each with 2 anthers. caps oblong, 4½ in. long. Trop W Mex.—The fls. are fleshy, they change to brown. Lashed in S Calif.

stigma: fr. a caps. dehiscent into 3 valves, each containing 1 or 2 seeds, inclosed in a fleshy crimson aril. —More than 30 species in S. and E. Asia, Austral. and Amer. The species with perfect fls. in axillary cymes and with evergreen lvs., being rigid and often spiny shrubs, are now included under *Gymnosporia*, which see.

These shrubs are hardy and ornamental, very effective with their bright-colored fruit remaining usually throughout the winter; *C. angulatus* is also worth growing for its large handsome foliage. They are very valuable for covering trelliswork, trees or rocks and walls; they grow in almost any soil and situation, and as well in shaded as in sunny positions. Propagated by seeds, sown in fall or stratified, and by root-cuttings or layers, suckers are freely produced, and become sometimes a nuisance in nurseries; they also can be increased by cuttings of mature and of soft wood.

ALFRED REHD.

CELERIAC (*Apium graveolens*, Linn., var. *rapaceum*, DC.). *Umbelliferae*. Fig 856 An offshoot of the celery species, producing an edible root-part instead of edible leaves.

Celeriac is very little grown in this country, and to Americans is almost unknown, but it is much prized in Europe Here it is cultivated chiefly where there is a foreign population Fifteen or twenty varieties are mentioned in the seed catalogues, but there is very little difference in the various sorts, some seedsmen even making no distinction between varieties, but cataloguing the plant simply as celeriac.

In general, the culture is the same as for celery, except that no blanching is required, since it is the enlarged root that constitutes the edible part. Sow the seed during the spring in a well-prepared seed-bed, preferably in a more or less shaded location. A coldframe or a spent hotbed is a good place. The seed is slow

to germinate, and must be kept well watered. When the plants are 2 or 3 inches tall, they ought to be transplanted, about 3 inches apart each way is a good distance to place them at this handling. Later, again transplant them to the open ground, in rows about 2 feet apart and 6 or 8 inches distant in the row. The soil should be a rich light loam well supplied with moisture. (The

seed may be sown where the plants are to remain, and thinned to the required distance, but stronger, more stocky plants are secured by transplanting as directed.) Plants thus treated will be ready for fall and winter use.

If they are desired

for earlier use, the seeds may be sown in a mild hotbed and transplanted to the open.

Aside from frequent tillage, celeriac requires but little attention during growth. It is a frequent practice with growers to remove a little of the earth from about the plants after the root has become well enlarged, and to cut off the lateral roots. This tends to make the main root grow larger, smoother and more symmetrical in shape. For winter use, the plants may be protected with earth and straw to keep out frost, or packed in moist sand and placed in a cool cellar.

The principal use of celeriac is for the flavoring of soups and stews, but it is also served in several other ways. It may be boiled and eaten with a white sauce, like cauliflower, as a salad, either first being cooked as beets or turnips, or else cut up into small pieces and used raw; when boiled, sliced and served with oil and vinegar, it forms the dish known as "celery salad." An extract may be obtained from it which is said to have medicinal properties.

Just how long celeriac, or turnip-rooted celery, has been in cultivation is unknown. Its history as a garden vegetable can be traced definitely as far back as the middle of the seventeenth century, although writers for a century or more previous to this time made references which would seem to relate to this vegetable, but the identity is obscure. Its origin was probably the same as that of the common garden celery, of which it is doubtless a state wherein the root has become enlarged and edible. This form is supposed to be the one most remotely removed from the wild state.

H. P. GOULD.

CELERY (*Apium graveolens*, Linn.). *Umbelliferae*. A major garden vegetable, grown for its blanching leaf-stalks which are eaten raw and also used in cookery.

Biennial, sometimes annual, plants. If-stalks 6-15

in. long, bearing 3 pairs and a terminal lft. coarsely serrated and ternately lobed or divided. The fl-stalks are 2-3 ft. high, branched and leafy; fls. white, inconspicuous and borne in compound umbels; seeds very small, flattened on the sides, broader than long. An acrid, pungent flavor characterizes the wild plants.

The genus *Apium* is variously understood. As mostly accepted, it comprises some 15 or 20 species of annual or perennial glabrous herbs with pinnate or pinnately compound lvs., and small greenish white fls. in compound umbels; calyx-teeth wanting, petals ovate or rounded. The species are distributed widely in temperate regions and in the mountains in the tropics. *A. graveolens* is the one important species to the horticulturist. Var. *rapaceum* is celeriac, a form or race in which the crown of the plant is thickened and turnip-like (see *Celeriac*). The wild celery plant is not stout, nor are the fl-stalks thickened, as they are in the domesticated races. It grows 1-2 ft. high when in bloom, in marshy places near the sea, on the coasts of Eu., Afr., and Asia, and it has run wild from cult. in some parts of N. Amer.

Celery probably was not cultivated until after the Middle Ages, and the varieties now grown so extensively have been developed within the past thirty-five years. It is not many years since this vegetable was regarded as a luxury and sold at prices that could be paid only by the wealthy, but today it is one of the standard vegetables and is produced in enormous quantities for the city markets. The industry is often highly profitable on muck areas, and thousands of acres of this land are used for celery-culture in Michigan, Ohio, New York, Florida and California. Intensive market-gardeners of the North regard it as one of their most profitable crops, and results are especially satisfactory if the land can be irrigated. When good markets are available, celery is an excellent crop to follow early garden crops, such as peas, beans, beets, bunch onions, radishes and other vegetables that mature in ample time to allow the after-planting of celery to mature. Soils that have been previously cropped the same season should be manured liberally before celery is planted.

Types and varieties

The methods of cultivation and handling of celery depend so much on the variety that this part of the subject should be discussed at the outset. Celery may be classified into two general groups—green varieties, and the so-called self-blanching varieties. Formerly, the green kinds were grown almost exclusively, but commercial growers soon discovered that the self-blanching varieties possess certain cultural advantages that make them highly desirable from a business point of view. They are more easily blanched, and this is probably the most important consideration when the crop is to be grown for commercial purposes. This is particularly advantageous in the summer crop, and equally appreciated by those who plant large areas for the late market. When boards are used for blanching, more than twice as many plants may be set on an acre as when green varieties are employed and the crop bleached with earth. It is

856. Celeriac trimmed for market (X 3/4); also an untrimmed root, on a smaller scale.

857. The Boston Ideal.

universally conceded, however, that the light-colored varieties are somewhat inferior in quality to the green sorts. For this reason it is a mistake to rely wholly on self-blanching varieties in the home garden. Many home gardeners plant the light-colored kinds for summer use only, and green varieties for fall and winter use.

In some regions, a plant with a much-branched base is desired as in Fig. 857; but in general a less spreading or a lighter plant is grown, as in Fig. 858. These differences are mostly matters of the way in which the plants are grown, as to room in seed-bed and field.

White Plume is one of the best known of the self-blanching varieties. It is vigorous in growth and attains a greater height than Golden Self-blanching and, for this reason, does not meet with as great favor among commercial growers. The quality is also inferior to Golden Self-blanching.

Golden Self-blanching is by far the most popular of American varieties. It is a favorite with amateurs and constitutes probably 90 per cent of all the celery grown in the United States. The plants attain a height of 14 to 20 inches, and are compact and stocky. The stems are short, thick, easily blanched to a creamy white, and the foliage is abundant.

Rose-colored Golden Self-blanching has a tinge of rose-color on the ribbing of the stems, which makes the variety attractive for the home garden. It is not grown largely for commercial purposes.

Giant Pascal is an old green-stem variety that is not surpassed in quality. In rich moist soils the plants attain a height of 30 inches or more. It is a favorite of home gardeners who take pride in producing tall, tender stalks of the highest quality.

Winter Queen is a more popular green variety among commercial growers than Giant Pascal. It does not attain such a great height and grows more compactly, so that less space is required between rows, and the crop is more convenient to store.

French Success is a very stocky compact winter variety that possesses excellent keeping qualities.

Boston Market is famous for its excellent quality. It is grown extensively about Boston in the home gardens and for commercial purposes. It is low, compact, crisp, tender and of the best flavor.

Many other varieties are planted to some extent, but the most important have been mentioned.

Soils

As previously stated, great commercial plantations are on muck soils, although the business is not confined to such lands. The mucks usually provide ideal conditions for the culture of celery. The plant thrives in soils abounding in vegetable matter, and as mucks contain 60 per cent or more of organic matter this requirement is fully met. A Kalamazoo (Michigan) muck soil, used extensively for celery, analyzed as follows:

	Per cent
Sand and silicates ..	19.16
Alumina	1.40
Oxide of iron	3.94
Lime	6.09
Magnesia	0.81
Potash	0.34
Soda	0.38
Sulphuric acid	1.31
Phosphoric acid	0.88
Carbonic acid	1.95
Organic matter (containing 2.53 per cent of nitrogen)	63.76
Water	6.51

Properly prepared mucks are loose and friable, and this is a great advantage in transplanting and in performing all tillage operations. The land is easily plowed, harrowed, leveled, marked and cultivated, and the work of ridging the plants is accomplished with the greatest ease. The depth of the water-table in muck lands varies greatly, but about 3 feet is considered most favorable; at this depth the plants never suffer from drought.

While it is universally conceded that muck soils provide the best conditions for the extensive cultiva-

tion of celery, the crop is grown with entire success on a great variety of soil types. In fact, the plants thrive in any friable soil which is adequately provided with moisture, plant-food and vegetable matter. Near all the northern cities of the United States may be found plantations of limited area that return excellent profits. This is particularly true in sections devoted to the most intensive types of market-gardening, when stable manure and commercial fertilizers are used almost lavishly. With this system of soil-management, the ground soon changes its physical properties and in some cases approaches the muck soils in mechanical composition. It is not uncommon to find small areas on various types of soil, cultivated intensely, which make a gross return of \$1,000 or more to the acre. These results indicate the great possibilities of the home garden for the production of celery. There is no reason why every gardener, whatever his type of soil, should not be fully successful in growing a bountiful supply of the choicest celery for the home table.

The reclaiming of new muck lands is often an expensive undertaking. The land must be cleared of brush and sometimes timber. Drainage must be provided

858 A good celery plant in the general market.

by means of tile or open ditches. The land is often acid, and lime should be employed to correct the acidity. For a year or two other crops than celery should be planted to get the land in the proper physical condition. The first plowing should be done in the fall so that the land will be exposed to frost during the winter. Corn is an excellent crop to plant the following spring. There should be repeated cultivation throughout the summer to destroy any other vegetation that may start.

Other types of soil should be prepared as in the usual way for the small garden crops. Fall plowing, after large quantities of manure have been added, is often desirable when an early crop is to be started the following spring. Smoothing harrows and plank drags should be used to make the soil fine and smooth preparatory to planting. All preparatory tillage operations should be conducted with a view to conserving soil-moisture, which is exceedingly important to celery throughout the period of growth.

Fertilizing.

As previously stated, it is important for land that is to be planted in celery to abound in vegetable matter. There must also be an abundance of available plant-food in order to secure a rapid and vigorous growth. When applying either manure or commercial fertilizer, the grower should bear in mind that this is a shallow-

rooted plant and the materials should not be placed at great depths.

All classes of growers, whether they are producing on a garden or field scale, and whatever their type of soil may be, recognize stable-manures as the best fertilizer that can be applied for this crop. Stable-manures are the most satisfactory because they furnish both organic matter and plant-food. It is often desirable to supplement stable-manures with commercial fertilizers, but the success of this crop will be far more certain if reliance is placed on barn-manures rather than chemical fertilizers.

An effort should be made to have the manures near the surface of the ground, and this can be accomplished by applying rotten or composted manure after plowing and working into the soil with a disc-harrow. If coarse fresh manure must be used and partially decayed manure is not available, it is preferable to apply it before plowing. Market-gardeners often apply thirty to forty tons to the acre, although smaller quantities give excellent results, especially if fertilizers are used in addition to the manure. Ten tons of manure on muck land is a decided advantage over no manure, even when fertilizers are used in large quantities.

Probably no commercial grower of celery should attempt to produce this crop without the use of at least some commercial fertilizer. When stable-manures are used lavishly, a little acid phosphate, nitrate of soda or potash will often give increased profits.

When stable-manure is not used at all, or perhaps in very small amounts, commercial fertilizers should be used with freedom. Two tons of a high-grade fertilizer to the acre is not an unusual application, and some of the most intensive growers use larger amounts. In the smaller areas, from which a gross return of \$800 to \$1,200 to the acre is expected, there should be no hesitancy in spending \$100 to \$125 an acre for manure and fertilizer. Celery requires much nitrogen and the mixed fertilizer applied before planting, or afterwards as a side-dressing, should contain not less than 4 per cent of this element. There should also be an abundance of potash and phosphoric acid. A fertilizer containing 4 per cent of nitrogen, 8 per cent phosphoric acid and 10 per cent potash should meet the requirements of this crop in all soils, when applied in sufficient quantity.

Some growers have found it highly desirable to apply nitrate of soda or complete fertilizer as side-dressings after the crop is well started. These applications may vary from 100 to 200 pounds to the acre and should be made at intervals of about three weeks.

Starting the plants.

The greatest care should be exercised in procuring seed, for inferior seed may result in pithy or hollow

859. Celery planted thick, and the patch edged with boards. The "new celery-culture."

stalks, a poor stand of plants in the seed-bed, seedlings of low vitality, or a large percentage of seed shoots. Only the most reliable dealers, those who have a reputation for furnishing first-class seed of the varieties desired, should be patronized. To make certain of securing good seed, some careful growers import their

seed directly from foreign producers, which, however, is unnecessary if the proper precautions are taken in the selection of a responsible seedman. Practically all of the seed of the self-blanching varieties is grown in France, while most of the seed of green varieties is produced in California. As there is never absolute

860. Blanching celery by wrapping it with paper.

certainty of securing entirely satisfactory seed, some growers follow the excellent practice of buying in large amounts, sufficient to last several years. Only a small quantity of the seed is planted the first year to determine its real merit, and if found satisfactory there is sufficient quantity on hand to last several years. If kept in sealed jars in a room where the temperature does not vary greatly, the germinating power will be retained at least six years.

Celery seed is very small. An ounce contains about 70,000 seeds, and with the very best conditions should produce at least half this number of plants. It is not safe, however, to count on a much greater number than 10,000 plants to the ounce, because many of the seeds usually fail to germinate and the plants at first are very small and easily perishable. The seeds are slow to germinate. They should be planted in fine soil which, if possible, should be kept constantly moist but never wet.

Seed for the early crop is seldom sown before the first of March. If checked in growth at any time, there is great danger of the plants producing seed shoots which renders them unsalable. Plants started the first of March will, with proper care, be ready for market in August. Earlier sowing is possible and sometimes desirable, but adequate facilities must be provided to avoid crowding the plants, which invariably results in checking the growth. Some gardeners have found it to be profitable to start the plants the latter part of February, finally transplanting into frames, where the crop is matured.

Seed for the early crop may be sown in the beds of the artificially heated frame or greenhouse. Many growers use flats or shallow plant-boxes, which are placed in the hotbed or greenhouse. While broadcasting of the seed is often practised, it is better to sow in drills 2 inches apart. The furrows should be very shallow, as the seeds should not be covered with more than $\frac{1}{4}$ inch of earth. Muck mixed with a small amount of sifted coal-ashes, sand and a little bone-meal, is most excellent for starting plants under glass. After sowing and lightly covering the seed, place a piece of burlap over the bed, and water it. Keep the bed covered with burlap or a piece of cloth until the plants begin to come up. Do not water more than necessary to keep the bed moist. When the plants appear they will need plenty of light, sunshine and fresh air. A temperature of 70° to 75° is most favorable for germination, but 10° lower should be maintained if possible after the plants are up. Higher temperatures, however, will do no harm if the proper attention is given to ventilation.

When the rough leaves appear, the seedlings should be transplanted into beds or preferably flats, spacing the plants $1\frac{1}{2}$ inches apart each way. Stronger plants will be developed if they are set 2 inches apart. The flats may be about 2 inches deep and half filled with

rotten manure, the remainder of the space being filled with good rich soil. The manure will furnish ideal conditions for the roots of the young seedlings and make it possible to transplant them to the open ground with blocks of earth and manure so that there will be practically no check in growth. If earliness is an important consideration, this method of treatment is highly important. Young celery plants require considerable nursing, and it will not do to take them from warm greenhouses or hotbeds to coldframes before the season is well advanced. They will suffer even more than tomato plants from low temperature. One of the most successful of our American growers invariably plants from the greenhouse to the open ground, beginning about May 10.

Spraying the seedlings several times with bordeaux mixture may be the means of avoiding loss from fungous diseases.

Seed for the late crop should be sown in the open ground or in protected beds as soon in the spring as the soil can be prepared. Delay in starting the plants is often responsible for a failure of the late crop. It is not so easy to control moisture in the outdoor seed-beds. If overhead irrigation lines are available, there will be no difficulty in this matter. The beds are often shaded with brush or lath screen. Small beds may be kept covered with moist burlap. When starting on a large scale, the rows may be a foot or more apart. Thinning is often necessary to secure stocky plants. The plants may be set where they are to mature any time after they have attained a height of about 3 inches. Ordinarily seedlings started out-of-doors are transplanted directly to the permanent bed or field without an intermediate shift, although this is an advantage in developing stronger plants with better roots. If the plants attain a height of 5 inches or more before they are set in the field, the tops should be cut back before transplanting.

Planting in the field.

As previously indicated, plants for the early crop should not be set in the open ground until about May 10 in the latitude of Philadelphia and New York. There is danger of injury from hard frosts if transplanted before this time, and such injury may result in a large percentage of the plants producing seed shoots, thus rendering them unsalable. Seedlings for the late crop may be transplanted in permanent quarters any time after June 20.

The time of planting in the field will depend largely on the varieties to be used. For example, Golden Self-blanching may be set out three or four weeks later than Giant Pascal and have time to mature fully before hard freezing weather is likely to occur. Many commercial growers do not transplant the late crop until nearly the first of August. In most parts of the North, it is better to transplant early in July. The date of transplanting, however, is not so important as to have the plants, as well as the ground, in proper condition before transplanting is started. Plants that are 3 to 5 inches high are much more likely to live and thrive than taller ones. The ground should be smooth, fine and moist. It is exceedingly important to have the rows perfectly straight and this can be accomplished by the use of a marker. A line may be used for this purpose, but transplanting may be accomplished much more rapidly by using a rope-and-peg marker.

There is the greatest variation in the planting distances for celery. Some of the most intensive growers plant 7 or 8 inches apart each way. Others prefer to space the rows about a foot apart and have the plants stand 4 inches apart in the row. When such close planting is followed, it is known as "the new celery-culture" (Fig. 859). The plants stand so close together

when this method is used that they blanch themselves and it is unnecessary to use boards or other devices. "The new celery-culture" is better adapted to greenhouse and coldframe use, where the plants can be watered by sub-irrigation. When plants stand so close together, there is little circulation of air and heart-rot or other diseases are likely to occur in hot moist weather. The possibilities of a small area by use of this method are very large and the system appeals to growers who have only small tracts of land to cultivate.

A more common practice is to space the rows 18 inches to 2 feet apart and to set the plants 4 or 5 inches apart in the row. This method is now almost universally employed for Golden Self-blanching when boards are to be used for blanching the crop. When transplanted 4 by 24 inches apart, about 60,000 plants are required to set an acre. If horse implements are to be used in planting, it is better to allow at least 28 inches between rows.

Some growers prefer to plant Golden Self-blanching in double rows 6 inches apart, placing the plants 4 or 5 inches apart in the row. This plan is not universally popular because it is not favorable to the full development of every plant. Boards are also used for blanching when this system of planting is followed.

When soil is to be used for blanching, more space

861 The last earthing-up or banking of celery

must be allowed between rows. Formerly the almost universal practice was to allow 5 feet between rows. With tall-growing varieties, such as Giant Pascal, this is not too much space to provide sufficient soil for blanching. When lower-growing varieties, such as Winter Queen, are used, the rows need not be more than 4 or 4½ feet apart to give sufficient space for blanching with earth. The larger varieties of the green type should not be planted quite so close together in the row as Golden Self-blanching; for the best development of the plants, it is better to space them 5 or 6 inches apart in the row.

Growers who plant both early and late varieties often alternate the rows. The early variety is removed first, of course, and then there is 4 feet or more of space between the rows of late varieties which are blanched with earth. Transplanting should proceed as rapidly as possible without undue exposure of the roots to the air. If the plant-beds are watered twenty-four hours in advance of transplanting, the plants may be removed with less injury.

Subsequent tillage practice in the North.

Celery is often inter-cropped with other vegetables. One of the most common plans is to plant five rows of onions about a foot apart as early in the spring as the ground can be prepared. The fifth rows are pulled for bunching, and celery is planted instead of the onions. This is a most excellent combination for muck soils where good markets can be found for both crops. Radishes are also excellent to precede celery. If desired, the small button-shaped varieties may be

used, every fifth row to be planted in celery and later-maturing varieties of radishes in the four rows between.

Frequent tillage is necessary for the best results with celery. As it is a shallow-rooted plant, tools that run at considerable depth should be avoided. For horse tillage there is nothing superior to the spike-tooth cultivator in general use. If the plants are small, great care should be exercised to avoid throwing dirt on top of the hearts. If the ground contains many

862. Water-holding celery crate.

weeds, more or less hand work will be required between the plants in the rows

The mulching of soils with horse-manure has been a very popular and profitable practice in recent years. It has been shown in the laboratory as well as in field practice that a fine mulch of 3 or 4 inches of horse-manure conserves moisture more perfectly than the most thorough tillage. The mulching of celery in the field not only conserves moisture but it reduces the labor of tillage and also furnishes nourishment to the plants. The rains carry liquid food to the roots and a more rapid growth invariably follows. Considerable hand labor is required, of course, to place the manure between the rows, but this is probably no greater than the labor needed to till the crop when a mulch is not used. It is customary to use fresh horse-manure, which has been aerated in thin layers for a few days before making application. The ground is completely covered, although the manure is not allowed to touch the plants. The mulch may be applied immediately after planting or, as some prefer, the plants may be tilled for ten days or two weeks and the mulch then applied. Very few weeds will appear if 3 or 4 inches of horse-manure is used.

Irrigation makes the crop more certain, and it is also a means of securing larger and more vigorous growth and consequently better quality. Most of the intensive growers of the East are prepared to irrigate. Various methods are employed. Some who cultivate very small areas use the hose or other sprinkling device. The method that is now in most common use is the overhead system of irrigation, providing for parallel pipe lines about 50 feet apart (see *Irrigation*). These are turned at will by means of levers at the ends and the water is thrown out at any desired angle through small nipples placed about 4 feet apart on the lines. It is important to do the watering if possible in the evening or at night so that the foliage may be as dry as possible during the day. It is also important to make thorough applications, as it is not advisable to water more frequently than absolutely necessary.

Blanching.

All American markets demand celery with creamy white stalks. This light color is secured by causing the plants to grow with the stalks in the dark, or nearly so, which prevents the development of chlorophyll. When boards, earth, paper, tile or other means are used, most of the leaves are not covered, and growth is not hindered in the least.

Green varieties are blanched almost exclusively by the use of earth. There should be no ridging until the weather is cool and, therefore, this operation is

not usually undertaken until early in September at the North. At first the ridging should be only a few inches high, but later should extend to the full height of the stems. Finally, the rows are ridged so that only the tops protrude above the ridges, as shown in Fig. 861. Special tools are available for this operation and the work may be done very rapidly.

The early crop is blanched mostly by means of boards, although paper (Fig. 860) and other devices are sometimes used. Hemlock, pine and cypress lumber are used for this purpose in various parts of the country. The boards need not be more than 10 inches wide, although 12-inch boards are commonly used. They may be of any convenient length, say 14 to 16 feet long. To prevent warping and splitting, cleats about 3 inches wide and 1/2 inch thick should be nailed at each end and in the middle of the boards. The boards are placed on edge, one on each side of the row and brought as close together as convenient at the upper edge and secured by means of wire hooks. Sometimes stakes are driven at the sides, although wire hooks are more convenient. The hooks should be 6 or 7 inches long and may be made of heavy fence wire. From ten days to two weeks is required for proper blanching with boards. As the crop is sold, the boards are shifted from place to place so that they may be used several times during the season. When not in use, the boards should be stored under cover or stacked in piles with strips between them. With good care, boards that are sound when purchased will last fifteen years.

Harvesting and marketing.

The harvesting of the celery crop when grown in coldframes usually occurs in the month of July. If the climate is not too severe, it is possible to have celery ready for market the latter part of June. The late crop, which is produced without the use of boards, is not usually ready for market until August. It is lifted with forks or perhaps cut with a sharp knife just beneath the surface and conveyed to the packing-house where it is prepared for market. In some sections the roots are not trimmed at all, the plants being tied in bunches of a dozen and packed in a standard crate such as is shown in Fig. 862. These crates are 24 by 24 inches at the base, and contain six to sixteen dozen plants, depending on the size of the celery. The height of the crate may be varied to suit the height of the celery. Another form of celery crate is shown in Fig. 861. In some regions, the roots are trimmed into tapering cubes as shown in Fig. 861. A very convenient method of bunching is to place three plants side by side, tapering the roots as indicated, tying the tapering roots tightly and then securing the tops. Formerly twine was used almost entirely for bunching, while in recent years many growers have found it desirable to use either blue or red tape, which gives the celery a more attractive appearance on the market. Michigan growers and other producers of celery in the Great

863. Celery crate

Lake district use small crates of very thin lumber. These vary in size and range about as follows: 6 by 12 by 24 inches; 6 by 16 by 24 inches; 2 by 20 by 24 inches; 6 by 26 by 24 inches and 6 by 30 by 24 inches. The number of bunches in the crates depends on the size of the celery and of the crate, but varies from four to twenty-four dozen. For local markets, the plants may be tied in bunches of the most popular size and packed in any crate of convenient form and size.

Storage.

A large percentage of the late celery crop is placed in city cold-storage houses. It is packed with the roots on, and there is very little trimming. Golden Self-blanching keeps fairly well in cold storage, or at least the hearts are presentable when they come out of storage. This is the product that now meets the general demand of the large cities until celery begins to arrive from Florida.

In the North, this crop is very commonly stored in trenches. The trenches are dug in well-drained ground and must be deep enough to accommodate the plants so that the tops will not extend more than about 2 or 3 inches above the trenches. The celery will keep better if the trenches are not too wide. Ordinarily they are dug 10 to 14 inches wide. The plants are lifted and stood as close together in the trench as possible. Some growers prefer to place a little earth over the roots, although this is not necessary. If the tops

of the plants are dry when stored, and if the plants are not permitted to wilt by being in the sunshine, they should keep in perfect condition in the trenches. Boards are nailed together in the form of a trough and placed over the trenches as rapidly as they are filled. Early in the season, and especially if the weather is quite warm, it is an advantage to provide additional ventilation by placing stones or blocks under the edges of the trough. As the season advances and the weather becomes colder, these should be

864. Celery plant trimmed for market

removed and when necessary, earth, or, better, manure, thrown over the boards to give additional protection. Four or 5 inches of manure will protect the crop thoroughly in most sections until Thanksgiving and perhaps Christmas, depending on the weather. Two kinds of trench storage are shown in Figs. 865, 866.

The late crop is often stored in coldframes of sufficient depth to receive the plants. The frames are usually covered with boards lapped in roof fashion, and straw or marsh hay is placed over the boards when necessary to give additional protection.

Ordinary house cellars, which are well ventilated and not too warm, may be used for storing a limited quantity of celery. Various types of houses have been built for keeping the crop. Cement or brick structures are perhaps the most serviceable. It is important to provide ample ventilation in structures of this kind. In some regions, as around Boston, pits are constructed. The sides of these should be about 2 feet high and the roof may be constructed in an even-span form or simply a shed roof against some other building. Boards are also used for the roofs and covered with straw or hay to give protection during cold weather.

Enemies.

Celery does not have any serious insect enemies. Diseases are much more destructive and difficult to control. The most important diseases are the blights (*Cercospora apii* and *Septoria petroselinii* var. *apii*), leaf-spot (*Phyllostelia apii*), and rust (*Puccinia bulbata*). The application of bordeaux mixture in the seed-bed will help to control some of these diseases. Many growers also find it necessary to make frequent applications of bordeaux mixture in the field in order to prevent serious losses. The complete control of diseases in the field may be the means of avoiding loss in storage. The earlier applications of bordeaux mixture are regarded as the most effective. Rotation is also desirable in preventing losses from disease.

R. L. WATTS.

Celery-growing in the South.

The method of raising celery seedlings is not the same in the South, and especially in Florida, as it is in the North. Sowing is done in July, August, and September, at a time of the year when there is continued warm weather, and frequent beating rain.

A place is chosen for the seed-bed near the celery field,—usually a plot at the edge. The size of the field to be planted will determine the extent of the seed-bed. The width of the seed-bed varies from 18 to 36 inches. Rows are sown across it, making it possible to weed and keep the earth worked from both sides. Immediately after sowing, pieces of heavy burlap (usually old fertilizer sacks) are placed over the beds to conserve the moisture, cool the soil, and to protect the seeds against the beating of heavy rains. The seed-beds are sprinkled as often as is necessary to keep the surface moist.

After the seeds have germinated and the seed-leaves have pushed their way through the ground, the sacking is removed and a screening of cheese-cloth is placed over the bed. Some beds may be covered with cheese-cloth parallel to the surface of the soil. In other cases, a wire is run lengthways over the middle of the bed, and the cheese-cloth is placed over the wire and secured at the sides like a roof. The covering is about 8 to 12 inches above the bed, which gives room for the circulation of air. The beds are kept moist by repeated watering, applied directly through the cheese-cloth.

As soon as the plants are 2 or 3 inches high and are well greened, they will be strong enough to stand direct sunlight and will shade the ground sufficiently to keep it from drying out rapidly.

The best variety

Formerly nearly all varieties of which seeds were offered by seedsmen were planted. In recent years, however, all have been nearly eliminated except the Golden Self-blanching. The seed of this variety is very high in price and, in years of scarcity, seed supplied under this name is often found to be more or less untrue to type. Seed of low-germinating quality is often found to contain many plants that will make unwelcome vegetables, probably because the undesirable green and red strains that may occur in the Golden Self-blanching variety are more resistant to deterioration than the true type.

Planting and blanching.

Blanching is secured entirely by the boarding-up method. For this purpose, second- or third-grade cypress boards are used; these low-grade boards usually have defective parts or are filled with worm-holes so as to be obtainable rather cheaply. The expense of the lumber, notwithstanding, is so great that it becomes necessary to plant the celery in double rows. Two rows are planted 8 or 10 inches apart, and the plants set 6 or 8 inches apart in the row. By alternating the settings in the two rows, additional space is secured for the plants.

A space of 30 to 40 inches is allowed between the sets of double rows. As soon as the celery has reached the proper stage of growth, or the market has arrived at a condition in which it is thought wise to ship the celery, the boards are placed alongside the plants and held in place by stakes driven into the ground. Further to exclude the air and light, a small quantity of soil is plowed against the bases of the boards, although this

865 An old method of growing celery in trenches. It is yet sometimes stored for winter in such trenches.

is unnecessary when the soil is sufficiently mellow. The tops of the boards are placed firmly together so that only a part of the foliage extends above them.

With the Golden Self-blanching variety, it is only a few days until the celery is sufficiently blanched and crisp to make a good vegetable.

Fertilizer.

In the preparation of the field, large quantities of fertilizer are used. Stable manure is not a favorite, unless it can be applied to the land early enough to become thoroughly rotted before the plants are set out. The quantity obtainable, however, is usually so small and the price so high in the

South that commercial fertilizers have largely replaced it. The quantity of fertilizer applied may range up to \$80 or even \$125 worth per acre (of the formula given on page 704.)

Irrigation.

In the most productive celery regions, sub-irrigation systems (as described under *Irrigation*) are established. The laterals are laid 15 to 25 feet apart, according to the contour of the land, and the notion of the grower. The irrigation system at the same time serves as a drainage system. This makes it especially convenient, since abundant artesian water is present in nearly all the celery-growing sections far south. The system has been found so convenient that a large amount of damage has been done by over-irrigation, not only in carrying off much soluble fertilizer, but also by water-logging the soil and thus driving the roots of the celery plants so near the surface as to be constantly liable to injury. In the hands of careful celery-growers, however, the system is the best that has been invented.

P. H. ROLFS.

Celery-growing in California.

There are two principal celery-growing districts in California,—Orange County, which is situated in the swamp lands south of Los Angeles; and the northern district, which includes the peat or swamp lands along the Sacramento and San Joaquin Rivers between Sacramento

and Stockton.

Several varieties of celery have been tested in this state, but the Golden Self-blanching is most popular and profitable.

Seeding.

In California the seed is sown in the extremely small size, it is difficult to get a good stand unless the ground is well pulverized. It is commonly estimated that enough plants may be grown on 1 acre of seed-bed to plant 20 acres in the field. To produce healthy, vigorous plants, heavy

watering is the rule at first, but as soon as the plants have begun to grow the quantity of water is reduced, and it should never be allowed to stand on the surface of the bed. In order to accomplish this the land must be well drained. The seed is usually sown in March, April or May.

Irrigation and drainage

Although not nearly so much water is required for the plants in the field as in the seed-bed, celery plants cannot stand drought at any stage of their growth; a well-controlled irrigation system is imperative, except where the water-table is close to the surface.

Good drainage is as important as irrigation, for, if water is allowed to stand in the field even for a short time, the plants will suffer seriously. As most of the California celery land is low and the ordinary drainage is poor, an extended system of tile drainage has been laid in nearly all celery fields, especially in Orange County, to prevent losses from standing water.

Subsequent tillage.

When the plants are large enough to be transplanted, they are pulled from the seed-beds, placed in tin pans and hauled to the field, where they are planted 6 inches apart in the furrows $3\frac{1}{2}$ feet apart. The depth of the furrows in which the plants are set is somewhat varied, depending on the soil-moisture, and the size of the plants. The average depth is from 3 to 5 inches.

After the plants have been set in the field for about three weeks or a month and have recovered from the transplanting, the field is "crowded." This operation consists in moving the earth away from the young plants so that they will have more air around them and to kill what weeds have grown so close to the plants that it is impossible to reach them with the cultivator.

As the earth between the rows of plants is left in a ridge after the plants have been "crowded," a large wooden roller, which extends across several rows, is now used to flatten down these ridges and to pack the soil more firmly. The roller is used only when the plants are small, otherwise they would be injured by being crushed. If the plants have grown so large that there is danger of injury by this rolling of the middles, the ridges are smoothed down by the cultivator.

When the plants are 12 to 15 inches tall, earth from between the rows is drawn up to them. This is termed "splitting." This should be done carefully, for, if the earth is put too close or too high up on the plants, they will become tender and weak, especially if the weather is hot. The object of "splitting" is gradually to encourage the plants to grow tall and straight instead of spreading out. This operation is repeated twice in the season, the first time when the plants are 14 to 16 inches tall and the second time just before banking. This last "splitting" also aids blanching.

Blanching.

Practically all the celery grown in California is banked with earth for blanching. Banking is done when the celery is reaching its maturity and is nearly ready for shipment. This is the last field operation before the crop is cut. When the celery is banked for the first time, the earth is not drawn very high on the plants, but each time the field is banked the soil is drawn higher so as firmly to hold the leaves together and in an upright position. If celery that has been banked for the last time is not harvested shortly, it will soon become "punky." The length of time that it can safely be left in the bank depends upon the character of the soil, the weather conditions, and upon the condition of the plants themselves. Celery on sandy soil will keep much longer in the bank than on heavy clay loam or peat soil. If the celery has not matured or if the weather is hot or moist, its keeping quality

866. A good form of trench storage.

will be injured. Holding too long in the bank will result in a wilted and "punky" product.

Harvesting and shipping.

When the celery is ready to harvest, a cutting machine is used which cuts off the plants just below the crown, leaving a few roots attached. The plants are then lifted and shaken from soil, trimmed and thrown in piles by laborers, who are usually Japanese. Another gang of men then place the plants in crates, marking on each crate the number of dozens it contains. More men follow, nail the crates securely, load them on wagons which transport them to the railroad siding, where they are ready for shipment and distribution to the various markets in the United States and Canada.

The celery is packed in the fields in crates 22-by-24-inch base and 18 to 24 inches in height, according to the quality. One of these crates holds from five to ten dozen celery plants. An ordinary car holds from 160 to 165 of these crates. The shipping of the crop starts in October and continues through March, but the bulk of the crop is harvested during November, December and January. The earlier shipments come into competition with celery from Michigan and other middle western states, and the later shipments come into competition with celery from Florida. A very efficient system of marketing has been developed by means of various associations of the growers which have representatives in the leading markets in the United States so that the celery is shipped to points of greatest demand.

Enemies.

The most important disease in California is the late blight (*Septoria petroselin* var. *api*), which has done an immense amount of damage in the past but is now handled successfully by most of the growers. Spray with bordeaux mixture. For early blight (*Cercospora api*) keep plants growing thriftily and spray with bordeaux. (For a detailed account of the diseases of celery in California see Bulletin No. 208, published by the University of California.) STANLEY S. ROGERS.

CELMÍSIA (a name in mythology) *Compositæ*. More than 40 New Zealand perennial herbs, and 1 in Austral and Tasmania, some of which may be expected in botanic gardens and collections. Lvs. radical and in rosettes, or densely imbricate if borne on the sts, usually tomentose. Heads large and solitary on a long or short scape, with imbricate pubescent or glandular bracts in several or many series; rays in a single row, always white. The celmisiæ are characteristic plants of New Zeal., covering the mountain slopes and valleys, especially in the South Isl., with the showy daisy-like fls. Probably none is regularly in cult.

L. H. B.

CELÓSIA (Greek, *kelos*, burned; referring to the burned look of the flowers in some species). *Amaranthaceæ*. Cockscomb. Popular garden annuals, grown for the showy agglomerated flower-heads and sometimes for colored foliage.

Alternate-leaved annual herbs, the lvs. entire or sometimes lobed, mostly narrow. fls. in dense terminal and axillary spikes, the spikes in cult. forms becoming densely fasciated and often the sts. much fasciated; perianth very small, 5-parted, dry, the segms. oblong or lanceolate, erect in fr., stamens 5, the filaments united at base; fr. a circumscissile utricle, with 2 to many seeds.—About 35 species, all tropical, in Asia, Afr. and Amer.

There are two main types of celosias, the crested form and the feathered or plummy ones. The crested cockscomb is very stiff, formal and curious, while the feathered sorts are less so, and are used to some extent in dried bouquets. The plummy sorts are grown abroad for winter decoration, especially under the name of *C.*

pyramidalis, but to a small extent in America. The crested cockscomb is less used as a summer bedding plant than formerly, but it is still commonly exhibited in pots at small fairs, the object being to produce the largest possible crest on the smallest plant.

For garden use, the seeds are sown indoors in early spring, and the plants set out May 1 to 15. If the roots dry out, the leaves are sure to drop off. The cockscomb is a moisture-loving plant, and may be syringed often, especially for the red-spider, which is its greatest enemy. A light, rich soil is needed.

A. Spikes crested, monstrous.

cristata, Linn. COCKSCOMB. Fig. 867. Height 9 in. or more: st. very glabrous; lvs. petiolate, ovate or somewhat cordate-ovate, acute, glabrous, 2-3 in long, 1 in. wide; spikes crested, subsessile, often as wide as the plant is high; seeds small, black, shining, lens-shaped. Tropics. Gn 13, p. 231. R H 1894, p. 58.—There are 8 or 9 well-marked colors in either tall or dwarf forms, the chief colors being red, purple, violet, crimson,

867 *Celosia cristata*.

amaranth and yellow. The forms with variegated lvs. often have less dense crests. *a japonica*, Mart., little known to botanists, is said to be a distinct garden plant with branching, pyramidal habit, each branch bearing a ruffled comb.

AA. Spikes plummy, feathery, or cylindrical.

argentea, Linn. Taller than the above. lvs. shorter-stalked, narrower, 2-2½ in long, 4-6 lines wide, linear-lanceolate, acute, spikes 1-4 in long, erect or drooping, long-peduncled, pyramidal, or cylindrical. India.—This species is considered by Voss (in Vilnorn's *Blumenkammer*) to be the original one from which the crested forms are derived. He makes 9 botanical forms, to one of which he refers *C. cristata*. The range of color is even greater in the feathered type than in the crested type. The spikes are very various in form and habit. Various forms are shown in Gn 6, p. 513, 9, p. 149; 17, p. 331 (all as *C. pyramidalis*). R H. 1857, p. 78, and 1890, p. 522 (as *C. pyramidalis*).

Huttoni, Mart. Height 1-2 ft.; habit bushy, pyramidal st. sulcate-striate. lvs. reddish or crimson, lower ones lanceolate, subsessile; spikes red, cylindrical, oblong, obtuse, 1½ in long; perianth-segms. oblong (not lanceolate, as in *C. argentea*). Java.—A foliage plant, and less common than the 2 species above.

C. spicata, Hort. = (?) Not the *C. spicata*, Spreng., perhaps some form of *C. cristata*.—*C. Thompsonii magnifica*, Hort., is a trade name and apparently without botanical standing.

WILHELM MILLER.

CELSIA (Olaus Celsius, 1670-1756, a Swedish orientalist). *Scrophulariaceæ*. Herbs, with yellow fls. in terminal racemes or spikes, closely allied to *Verbascum*, but has only 4 stamens, and they are of 2 sorts. About 40 Old World species, mostly from the Medit. region.

Only *C. crética*, Linn. f., is known in Amer., and that very sparingly. It is a hardy or half-hardy biennial, with alternate lvs., of which the lower are slightly pinnate and lanceolate, and the upper ovate-lanceolate, toothed and clasping; fls. large (nearly 2 in. across), and somewhat as in *Antirrhinum*, yellowish, with dark markings in the center and conspicuous deflexed stamens. Stout hairy plant, 3-6 ft. high, from Crete. B. M. 964.—A very showy plant well worth much wider cult. See page 3566

C. pónica, Hort. Has whitish lvs. and pure white fls.

N. TAYLOR.†

CELTIS (ancient Latin name). *Ulmaceæ*. NETTLE-TREE. Woody subjects grown chiefly as shade or lawn specimens.

Trees or rarely shrubs, sometimes spiny; lvs. alternate, petiolate, stipulate, deciduous or persistent, usually oblique at the base and 3-nerved; fls. polygamous-monoecious, inconspicuous, apetalous, 4-5-merous, axillary, the staminate in small clusters on the lower part of the branchlets, the fertile solitary in the axils of the

866. *Celtis occidentalis* ($\times \frac{1}{2}$) (Detail $\times \frac{1}{4}$)

lvs. on the upper part of the branchlets, with a 1-celled superior ovary crowned by a 2-parted style and with 4-5 short stamens; fr. a 1-seeded, small drupe, edible in some species; embryo with broad cotyledons.—Seventy species in the temperate and tropical regions of the northern hemisphere, of which a few hardy ornamental species are cult.

The nettle-trees are valuable as shade trees or as single specimens on the lawn, mostly with wide spreading head and light green foliage, which is rarely seriously injured by insects or fungi, they thrive in almost any soil and even in dry situations, they are of vigorous growth when young, and are easily transplanted. The straight-grained wood is light and elastic, easily divided, and much used for the manufacture of small articles and for furniture; that of *C. australis* is valued for carving. Propagated by seeds, sown after maturity; also by layers and cuttings of mature wood in fall; rarer kinds are sometimes grafted on *C. occidentalis*.

A. *Lvs. entire, or rarely with few teeth, thin, at length glabrous.*

mississippiensis, Bosc (*C. laevigata*, Willd. *C. integrifolia*, Nutt.). Tree, 60-80 ft.: lvs. unequally rounded or

cuneate at the base, oblong-lanceolate or ovate, acuminate, usually falcate, smooth above, 2-4 in. long; fr. orange-red, nearly globular, $\frac{1}{4}$ in. thick, on slender pedicel, longer than the petiole; stone pitted. From S. Ill. to Texas and Fla., west to Mo. S. S. 7:318. G. F. 3:41, figs. 9-11. Mn. 7:225, 227.

AA. *Lvs. serrate, sometimes entire and pubescent.*

B. *Ovary and fr. glabrous.*

C. *Branchlets usually and lvs. more or less pubescent, at least when young.*

D. *Fr.-stalks slender, longer than petioles: lvs. usually rough above, stone pitted*

E. *Under surface of lvs. glabrous at maturity.*

occidentalis, Linn. Fig. 868. Large tree, occasionally 120 ft.: branchlets glabrous or slightly pubescent; lvs. oblique and rounded at the base, ovate-acuminate, pubescent when young, usually rough above, sometimes smooth at maturity, usually entire toward the base, light green, 2-6 in. long; fr. orange-red, $\frac{1}{2}$ - $\frac{3}{4}$ in. long, on slender pedicel, longer than the petiole. S. S. 7:317. G. F. 3:40 (adapted in Fig. 868) and 43. Em. 304. Mn. 7:231, 233. A. G. 20 210, 531.—Very variable species. Var. *crassifolia*, Koch (*C. crassifolia*, Lam.), has firm, very rough and large lvs., to 5 in. long, usually cordate at base and more strongly serrate. Michx. Hist. Arb. 3:228

EE. *Under surface of lvs. pubescent.*

australis, Linn. Tree, to 60 ft. lvs. oblique, broadly cuneate or rounded at the base, ovate-oblong, long-acuminate, pubescent beneath, $2\frac{1}{2}$ -5 in. long; fr. over $\frac{1}{2}$ in. long, dark purple, sweet, pedicels 2-3 times longer than the petioles. Medit. region to Persia. H. W. 3:40, p. 11.—Not hardy N.

Helleri, Small. Tree, to 30 ft. branchlets pubescent. lvs. ovate or ovate-oblong, obtuse or acute, truncate to subcordate at the base, rough above, grayish and pubescent or tomentose, and reticulate below, 2-3 in. long; fr. $\frac{1}{2}$ in. thick, light brown, on pubescent pedicels about $\frac{1}{2}$ in. long and rather stout. Texas.—Sometimes planted as a street tree in Texas.

DD. *Fr.-stalks rather stout, as long or slightly longer than petioles: lvs. grayish green beneath, stone smooth*

sinensis, Pers. (*C. japonica*, Planch.) Tree, to 30 ft. lvs. usually rounded or cordate at the base, broadly ovate to oblong-ovate, acuminate, serrate-dentate, pubescent when young, pale or glaucescent and prominently reticulate beneath, 2-4 in. long; fr. dull orange-red, pedicels rather stout, not much longer than the petioles. China, Japan. S. I. F. 1:36.—Has proved hardy at the Arnold Arboretum.

CC. *Branchlets and lvs. quite glabrous, stone smooth.*

D. *Foliage bluish or grayish green.*

Tournefortii, Lam. (*C. orenalis*, Mill., not Linn.). Tree, to 20 ft., or shrub. lvs. ovate, acute, usually rounded or subcordate at the base, $1\frac{1}{2}$ -3 in. long, of firm texture, not reticulate, sometimes pubescent. fr. reddish yellow, about $\frac{1}{2}$ in. across, its stalk about as long as petiole, $\frac{1}{2}$ in. long or somewhat less. Greece, Sicily and Asia Minor.—Not quite hardy N.; attractive on account of its bluish green foliage.

DD. *Foliage bright green, lustrous*

Bungeana, Blume. Tree: lvs. usually rounded at the base, ovate, acuminate, crenate-serrate, nearly glabrous when young, green and shining on both sides, $1\frac{1}{2}$ -2 $\frac{1}{2}$ in.; fr. purplish black, small; pedicels longer than the petioles. N. China.—Hardy, and a very distinct species, with dark green and glossy foliage.

BB. *Ovary and fr. pubescent; subtropical, tender tree.*

Kraussiana, Bernh. Tree: lvs. oblong-ovate, usually rounded at the base, acuminate, crenate-serrate, pubes-

XXIV. *Cœlogyne cristata*, one of the popular and easily grown orchids.

cent on the veins beneath, semi-persistent: ovary tomentose: fr. mostly pubescent, slender pedicelled. S. Afr. to Abyssinia. Sim, Forest Fl. Cape Colony, 134. —Hardy only S.

C. Biondi, Pampanini. Lvs. broader than in *C. Bungeana*, grayish below (fr. dark blue), small. Cent. China. — *C. caucasicus*, Wild. Allied to *C. australis*. Lvs. broadly rhombic-ovate, somewhat smaller: fr. smaller, reddish brown. Caucasus, N. Persia. — *C. Davidiana*, Carr. Allied to *C. Bungeana*. Small tree lvs. ovate-oblong or elliptic-oblong, often sparsely hairy on the veins below, 2-5 in. long. N. China. Incompletely known. — *C. georgiana*, Small. Allied to *C. occidentalis*. Shrub or small tree branchlets pubescent: lvs. ovate, acute, entire or sharply serrate, 1-2 in. long. fr. $\frac{1}{4}$ in. across, short-stalked. Mt. to Fla., Ala. and Mo. — *C. orientalis*, Linn. = *Terna orientalis*. — *C. orientalis*, Mill. = *C. Tournefortii*. — *C. reticulata*, Torr. (*C. mitchamensis* var. *reticulata*, Sarg.) Small tree, to 60 ft. branchlets pubescent: lvs. ovate, usually cordate, entire or serrate, rough above, pubescent and reticulate below, $1\frac{1}{2}$ -3 in. long. fr. $\frac{1}{4}$ in. thick, orange-red. Colo. to Texas and Ariz. — *C. Smallsii*, Beadle. Allied to *C. mitchamensis*. Lvs. lanceolate or oblong-lanceolate, thin, sharply serrate, 2-4 in. long fr. $\frac{1}{4}$ in. thick, slender-stalked. N. C. and Tenn. to Ga. and Ala.

ALFRED REHDER.

CEMETERY GARDENING. Treated under Landscape Gardening

CÉNCHRUS (an ancient Greek name). *Gramineæ*. Mostly annual grasses with simple racemes of burs that become detached and adhere readily to clothing and animals. Spikelets as in Panicum, but 2-6 together in a spiny involucre or bur. *C. carolinianus*, Walt. (*C. tribuloides* of American authors), SAND-BUR, is a common weed in sandy soil. Dept. Agric. Div. Agrost 20:40.

A. S. HITCHCOCK.

CËNIA (Greek for empty, in allusion to the hollow receptacle) *Compositæ*. Low herbs from S. Afr., with the aspect of mayweed. Head small and rayed, the ray-fls. pistillate, the disk-fls. compressed and 4-toothed, the receptacle gradually enlarged from the top of the peduncle, and hollow. About 8 species, none of which are of much horticultural value. *C. turbinata*, Pers. (*C. prunoides*, DC.), is a common weed in Cape Colony, and it is occasionally seen in American gardens. It is annual, diffusely branched, and a foot or less high, with finely dissected, soft, almost moss-like foliage, and long-peduncled, small, yellow heads. Of easy cult. United with *Cotula* by Hoffmann in Engler & Prantl.

L. H. B.

CENTAURËA (a *Centaure*, famous for healing). *Compositæ*. CENTAURY. DUSTY MILLER. BACHELOR'S BUTTON. CORNFLOWER. KNAWEED. Annuals or hardy and half-hardy perennials with alternate leaves, useful for bedding, vases, baskets and pots, and for borders and edgings, species many and various.

Involucre ovoid or globose, stiff and hard, sometimes prickly. receptacle bristly marginal florets usually sterile and elongated, making the head look as if rayed. Differs from *Cnicus* in having the achenes obliquely attached by one side of the base or more laterally. —Species about 500, much confused, mostly in Eu, Asia and N. Afr., 1 in N. Amer., 3 or 4 in Chile. Several Old World species have become weeds in this country J. H. 43:76. The species are of simple cult., coming readily from seeds. Many of the perennial species make excellent border plants, and their blue and purple heads are welcome additions to the horde of yellow-flowering composites.

A. DUSTY MILLER — *White-tomentose low plants, used for bedding or for the sake of their foliage.*

1. *Cineraria*, Linn (*C. candidissima*, Lam.) Fig. 869. Perennial: sts erect, 3 ft., branched, the entire plant white-tomentose: lvs almost all bipinnate (except the earliest), the lower petioled, all the lobes linear-lanceolate, obtuse: scales of the ovate involucre appressed, with a membranous black margin, long-ciliate, the apical bristle thicker than the others: fls purple. S. Italy, Sicily, etc. — Much used as a bedding plant, not being allowed to bloom. The first lvs of seedlings are nearly entire (as shown in Fig. 869), but the subsequent ones become more and more cut. Grown both from seeds and cuttings. Seedlings are very apt to damp off unless care is taken in watering.

2. *depressa*, Bieb. A flat, almost prostrate perennial: st. floccose-tomentose and much branched lower lvs. scarcely denticulate, the upper oblong-linear, entire. bracts of the involucre white- or black-margined fls showy, the blue rays about $\frac{1}{2}$ in. long. Persia, Caucasus July.

3. *gymnocarpa*, Moris & DeNot (*C. argentea*, Hort. *C. plumosa*, Hort.). Fig. 870 Perennial: entire plant covered with velvety white pubescence: sts $1\frac{1}{2}$ -2 ft. high, erect: lvs. bipinnatisect; segms linear, entire, acute: fl-heads small, in a close panicle, mostly hidden by the lvs, fls. rose-violet or purple. Caprea. V. 4: 337. — Very ornamental on account of its velvety finely cut lvs. Much used, like No. 1, for low foliage bedding: lvs. more compound, and usually not so white.

869. Lower leaf from a young plant of *Centaurea Cineraria*. (X $\frac{1}{2}$)

870. Radical leaf of *Centaurea gymnocarpa*. (X $\frac{1}{2}$)

4. *Cleménte*, Boiss. Perennial, the entire plant densely white-woolly sts erect, branching, with few lvs root-lvs petioled, pinnate, the lobes ovate-triangular, sharp-pointed, st-lvs. sessile: fl-heads terminal on the branches, globose; involucre scales with scarious, ciliate margins, scarcely spiny: fls yellow. Spain.

AA. CORNFLOWER, OR BACHELOR'S BUTTON — *Tall-growing annual, with very narrow lvs, grown for the showy fls.*

5. *Cyanus*, Linn. (*Cyanus arvensis*, Moench.) BLUE-BOTTLE BLUET BACHELOR'S BUTTON (see also *Gomphrena*) CORNFLOWER. RAGGED SAILOR FRENCH PINK. Fig 871 Annual, slender, branching, 1-2 ft. high, woolly-white when young: lvs. linear, entire or the lower toothed, sometimes pinnatifid: fls. blue, purple, pink or white, the heads on long, naked sts.: involucre bracts rather narrow, fringed with short, scarious teeth. S. E. Eu Gt. 38, p. 641; 39, p. 537. V. 5, p 44; 13:361 — One of the most popular of garden fls., variable. It is perfectly hardy, blooming until frost

and coming up in the spring from self-sown seed. The following are varieties of this: *Pure White*; *Victoria*, a dwarf, for pots and edgings (Gn. 40, p 147); *Emperor William*, fine dark blue; *flore pleno*, with the outer disk-fls. converted into ray-fls; *nana compacta*, dwarf (Gt. 44, p 150) *Centaurea Cyanus* is one of the "old-fashioned flowers," everywhere well known and popular. It often escapes from gardens.

AAA. SWEET SULTANS — Straight-growing smooth annuals or perennials, with dentate lvs., grown for the large fragrant heads.

6 *moschata*, Linn (*C. suaveolens*, Linn. *C. odorata*, Hort *C. Amberbân*, Mill *Amberbâ moschata*, Less.). SWEET SULTAN Fig 872.

Annual sts 2 ft high, branching below, erect whole plant smooth, bright green. lvs. pinatifid, the lobes dentate. fl-heads long-peduncled; involucre round or ovate, smooth, only the innermost of the involucreal scales with scarious margins; fls. white, yellow or purple, fragrant. Orient Mn. 4, p 149. Gn. 54 372. I H. 42, p 106 Gng 4:147. G 5: 289; 16:267; 25:71.

Var. *alba*, Hort. (*C. Margaritæ*, Hort.). Fls white. Gn. 19, p 337; 54:372 A G 13: 607. This form, known as *C. Margaritæ*, is pure white and very fragrant. It was intro. by an Italian firm in 1891.

Var. *rûbra*, Hort Fls red. Gn 54. 372 — A popular, old-time garden fl, with long-stalked heads; of easy cult. It does not bear transplanting well — *C. imperialis*, Hort, is said to be the offspring of *C. moschata* and *C. Margaritæ*, intro into the American trade in 1899 Gn M. 13:74. Plants are said to inherit the vigorous free growth of *C. moschata*, being of the same easy cult. and forming clumps 3-4 ft. high. The fls. resemble *C. Margaritæ*, but are twice as large and abundantly borne on long sts. from July until frost. They range through white, rose, lilac and purple, are fragrant, and if cut when first open will keep 10 days *C. Mârtæ*, Hort, intro. 1899, resembles *C. imperialis*, but the fls. open sulfur-yellow, become lighter, and are tipped with rose All sweet sultans do best if the bloom is secured before very hot weather.

7. *glastifolia*, Linn. A strong-growing border perennial with a rough much-branched and winged st., lvs. oblong, entire, decurrent, the basal lvs petioled, sometimes divided. fls. yellow, the heads solitary, without bracts, and quite smooth. Cent Eu. B.M. 62. June-Sept.

AAAA. OTHER CENTAUREAS of various kinds, occasionally grown in hardy borders, for their fls. or imposing stature. See page 3567.

b. *Foliage green on both sides.*

c. *Lvs pinnate or bipinnate.*

8. *splendens*, Linn. (*C. Margaritæa*, Ten.). Perennial: sts. erect, branched: lvs. smooth, the lowest bi-

pinnate, the upper pinnate, all with very narrow, linear, entire, acute lobes: fl-heads subglobose; scales of the involucre with a rounded almost entire rather lax tip; fls. purple Spain, Italy.

9. *ruthénica*, Lam. Hardy perennial about 3 ft.: st. erect, branching, smooth: lvs. pinnatisect, the lobes linear-toothed, sharply narrowed at both ends, the base often somewhat decurrent: fl-heads usually solitary, the pale-yellow rays about $\frac{3}{4}$ in. long; pappus double: achenes glabrous. Cent. Eu. July. G 26:630.

cc. *Lvs. entire or dentate, not pinnatisect.*

10. *americana*, Nutt. (*Plectocéphalus americanus*, Don). BASKET FLOWER Fig 873 Hardy annual,

nearly smooth: sts. stout, simple or sometimes a little branched, 2-5 ft., thickened under the naked head. lvs. mostly entire, oblong-lance-shaped, mucronate involucre $\frac{1}{2}$ - $1\frac{1}{2}$ in diam, its bracts all with fringed scarious appendages: fls. rose or flesh-colored, sometimes purplish; disk 1-3 in diam; narrow lobes of the ray-fls. often 1 in long Mo. and Ark. to La and Mex F.S. 4 327 S.H. 2 223 A F 16: 1644 (*alba*). Gng 9:341 (*alba*). — Very attractive.

11. *macrocéphala*, Puschk. Perennial: sts simple, erect, swollen below the fl-head, leafy, 2½-3 ft high: lvs ovate-lanceolate, slightly decurrent, scarious, acute, somewhat serrate, gradually diminishing upwards to the base of the single terminal head head subglobose, larger than a hen's egg, often 3-4 in. diam; involucre of 8-12 rows of appressed, scarious-margined, rusty, fringed scales, fls. yellow, the marginal and disk alike Armenia B.M. 1248 J.H. III 35 331, 52: 547; 63 319 — Often grown from seeds

12. *nigra*, Linn. KNAFWEED. HARDHEADS. Perennial, 1-2 ft. high: sts. branching, rough pubescent: lvs. lance-shaped and entire or lower sparingly toothed or lobed, but not pinatifid involucreal bracts with pectinate-ciliate-fringed black appendages fls all alike, the disk and marginal ones of the same size Eu Var *variegata*, Hort. Lvs. edged with creamy white, tufted A very striking

border plant; useful in dry or open places.

BB. *Foliage white or tomentose, at least beneath (often green above).*

c. *Sts. low, weak, not strict.*

13. *leucophylla*, Bieb (*C. declinata*, Bieb). Perennial: sts short, decumbent, with very few lvs root-lvs. petioled, tomentose-woolly on both sides, pinnate, the ovate lobes undulate, sparsely cut-lobed or sinuate-toothed. fl-head with few bracts, solitary, terminal; scales of the ovate involucre lanceolate, acuminate, brown, long-ciliate; fls. purple. Caucasus.

14. *montana*, Linn. MOUNTAIN BLUEET. Perennial: sts. low, stoloniferous, unbranched, 12-16 or rarely 20

871 *Centaurea Cyanus* (×½)

in high: lvs. decurrent, the young ones silvery white, oval-lance-shaped: involucre of 4 or 5 rows of scales, black-ciliate along the margins: fls. blue, the marginal ones 1 in. long; disk-fls. very short, becoming purple. Eu. B.M. 77. G.M. 47:243. Var. *alba*, Hort. Fls. white. G. 25:71; 29:109. G.M. 51:102. Var. *rosea*, Hort. Fls. rose-colored. Var. *citrina*, DC. (var. *sulphurea*, Hort.). Disk-fls. brown, rays yellow. Armenia. B.M. 1175 (as *C. ochroleuca*).

cc. *Sts. erect, simple or branched.*

15 *dealbata*, Willd. Perennial: sts. sub-erect, 8-24 in high: lvs white-villous beneath, glabrous above, the lower ones 1-1½ ft. long, petioled, pinnate, the obovate lobes coarsely cut-toothed or auricled at the base; st-lvs. sessile, pinnate, with oblong-lance lobes. fl.-head solitary, just above the uppermost lf.; fls. red, those of the disk rosy or white; outer scales of the involucre with lanceolate tips, the middle rounded, deeply fringed, ciliate. Asia Minor, Persia. J H III. 46:515.

16 *nervosa*, Willd. A stout perennial about 2-2½ ft. tall with a simple unbranched rough st.; lower lvs glandular, usually slightly toothed, the st-lvs clasping by the auriculate base; heads solitary, the rays deep purple. A branched and numerous-flid. form is known in the wild but not to the trade. Cent. Eu. July, Aug

17. *atropurpurea*, Waldst & Kit (*C. calcephala*, Willd.) Perennial sts. erect, branched, about 2-3 ft high, the branches white-woolly at the summit lvs bipinnate, lobes linear-lanceolate, acuminate, lowest lvs. petioled, uppermost pinnatifid. fl-heads without bracts; involucre scales with fringed ciliate white lanceolate tips, the innermost ones rounded, scarious-margined; fls. black-purple Hungary

18 *babylonica*, Linn Silvery white perennial: sts. simple, stout, erect, 6-10 or 12 ft high lvs. long, coriaceous, strongly decurrent on the st., the radical lyrate, the lower st-lvs oval or oblong-acute, entire or undulate, the upper lance-acute. fls. yellow, the globular heads almost sessile in the axils of narrow bract-like lvs., one-third to half of the st fl-bearing; involucre-scales with a short, recurved tip Asia Minor, Syria. Gn. 2, p. 73; 8, p. 263. R.H. 1859, pp 540-1—Tall, stout and striking plant.

C. alpina, Linn Lvs downy beneath, prickly fl-heads yellow; scales of involucre ovate, obtuse hardy herb, 3 ft. from Eu., sometimes seen in collections—*C. cretaphora*, Linn. A low plant with a spiny calyx and silvery lvs. is cult in England. Not known in Amor—*C. pulcherrima*, Willd. (*Ethiopappus pulcherrimus*, Hort.). A stout hardy perennial about 2½ ft. with brilliant rose fls. is known in the trade.—*C. rigidifolia*, Hort. Stout perennial, 2½ ft. with crimson heads is apparently *C. orientalis*, Linn—Not much known in U. S.

N. TAYLOR.†

CENTAURIDIUM: *Xanthema*.

CENTAURY: *Sabatia*.

CENTRADENIA (Greek for spurred gland, alluding to the anther glands). *Melastomaceae*. Tropical herbs or sub-shrubs grown in warmhouses for their showy-colored leaves and pretty flowers.

Branches angled or winged: lvs. petiolate, opposite,

lanceolate or ovate, entire, ribbed: fls. with 4-lobed calyx, 4 petals, 8 stamens, and a 4-loculed ovary, pink or white, in axillary or terminal clusters.—Species 4-6, in Mex. and Cent Amer They fall into 2 groups,—those with very unequal stamens, and *C. floribunda* with nearly equal stamens.

Centradenias are very showy and desirable plants. The stems are often colored. They like rich leaf-mold with sharp sand, and brisk heat Give a light but shady position. Strong plants are much benefited by liquid manure, and such applications give better colors in both flowers and fruit.

grandifolia, Endl Branches 4-winged: lvs. ovate-lanceolate, strongly 3-nerved, brilliant red beneath, long-pointed and curving at the end. cymes many-flid., shorter than the lvs., the fls. light rose, rotate, the petals very obtuse, the stamens unequal Mex. B M. 5228—The plant grows 2 ft. high, and blooms in winter Very showy, and the species usually cult. The cut branches hold their color a long time, making the plant useful for decorations

inequilateralis, Don (*C. rosea*, Landl.). Lvs. ovate-lanceolate, unequal-sided, entire, ciliate, reddish beneath fls. pink, in terminal corymbose racemes: dwarf. Mex. B.R. 29.20.

ovata, Klotzsch. Lvs. ovate-acute, smooth and shining, pale beneath, 3-nerved: fls. pink in large terminal clusters. Cent Amer.

floribunda, Planch Branches obscurely angled, pubescent, red lvs narrow-lanceolate, tapering below, 3-nerved, red-nerved below: fls. pink, in terminal panicles. Mex. P.S. 5.453. L. H. B.†

CENTRANTHUS (Greek, spurred flower). *Valerianaceae* CENTRANTH. Annual and perennial herbs, one of which is frequent in old gardens

Leaves opposite, entire, dentate, or pinnatisect: fls. in dense clusters, small, red or white, terminating the branches; calyx cut into 5-15 narrow divisions, enlarging after flowering, corolla slender-tubed, 5-parted, spurred at the base, stamen 1; fls. with a pappus-like crest.—About a dozen species in the Medit. region, some of them sometimes half shrubby *C. ruber*, the common garden species, sometimes escapes and becomes more or less spontaneous.

ruber, DC RED VALERIAN. JUPITER'S BEARD. Perennial, 1-3 ft., smooth and glaucous, forming a compact and floriferous bushy plant: lvs. ovate to lanceolate, some of them toothed at base but mostly entire: fls. numerous, deep crimson to pale red, fragrant Eu., E.—A very handsome old garden plant, too much neglected; blooms all summer; excellent for cutting. Increased by division; also by seeds. There is a white-flid. form (var. *albus*).

angustifolius, DC. Perennial, glaucous, to 2 ft., simple or somewhat branched: lvs. linear-lanceolate or linear, very entire, nearly perfoliate: fls. clear rose, fragrant. S. Eu.—There is a white-flid. form (var. *albus*).

macrosiphon, Boiss. Annual, of easy cult. in any good soil: 1-2 ft.: lvs. ovate, glaucous, toothed: fls. larger than in the last, deep

872. *Centaurea moschata*. (×½)

873. *Centaurea americana*. (×½)

rose. Spain.—There are white-fl. (var. *dlbus*) and dwarf (var. *nānus*) forms. Excellent for rockeries and borders; also for lawn vases.

L. H. B.

CENTROPŌGON (Greek *kentron*, spur, and *pogon*, beard, referring to the fringed stigma). *Campanulacēae*. Sub-shrubs or shrubs, often scandent, grown under glass.

Plants with alternate mostly dentate lvs., and axillary, long, tubular fls. which are violet, purple, red, or orange, and usually borne singly on long peduncles: corolla 2-lipped, the tube incurved; bracteoles very small or wanting.—More than 100 species in Trop. Amer. Warmhouse perennials useful for hanging-baskets, prop. by cuttings which it is better to put under a bell-jar

Lucyānus, Houll. Height 1-2 ft.: st. somewhat woody. lvs. short-petioled, finely toothed: fls. rose, hemispherical, with lanceolate segms recurved at the tips. R.H. 1868:290. Native country unknown—Described from a cult specimen and said to be a hybrid of *C. fastuosus* and *Siphocampylus bellatorformis*, but seems to show little influence of the latter, which has longer petioles and peduncles, more coarsely toothed lvs., longer calyx-segms., and a yellow-tipped corolla.

fastuosus, Scheidw. Lvs. peach-like, oblong, acute, bordered with glandular teeth, very glabrous, short-petioled: fls. rose-colored, winter; calyx hemispherical, with 5 lanceolate denticulate segms. Mex R.H. 1853:181.

WILHELM MILLER.

CENTROSEMA (Greek, *spurred-standard*) *Leguminosae*. BUTTERFLY-PEA. Twining or trailing herbs, one of which is sometimes cultivated

Leaves pinnate, 3-7-foliate fls. in the axils, showy, white or reddish, papilionaceous, the standard spurred on the back, the keel broad, and the style bearded at the apex: pod long and narrow, many-seeded, with 2 thick-edged valves—Species about 30 in Trop. Amer. and 2 in U. S. Centrosema is a more recent name than Bradburya of Rafinesque, but it is thoroughly established in usage and is retained in the "nomina conservanda" of the Vienna Congress.

virginianum, Benth (*Bradburya virginiana*, Kuntze). Roughish, climbing, 2-6 ft. lfs. ovate to linear, shining, stipitate. fls. 1-4 in the axil, 1 in long, violet and splashed, showy: pod straight and long-pointed, 4-5 in. long. N. J. and S., in sandy lands. A G 13:649.—Intro. to cult. many years ago, but again intro. in 1892 (as *C. grandiflorum*), and much advertised. It is a hardy and desirable perennial vine, blooming the first season from seed; easily grown. There is a white-fl. form.

L. H. B.

CENTURY PLANT: *Azore*.

CEPHAËLIS (Greek-made compound, referring to the fls. being borne in heads). *Rubiacēae*. Tropical shrubs, sub-shrubs or herbs, one of which yields ipecac, some of them sometimes rarely seen in growing collections. As the genus is commonly delimited, it comprises perhaps 75 species of both the eastern and western hemispheres. Engler & Prantl and others, however, unite it with the Linnaean *Urugoga*. Lvs. opposite, usually ovate, oblong or obovate: fls. mostly small, white, collected in an involucreate head; calyx 4-toothed and persistent; corolla trumpet-shaped or salver-shaped, the short limb 4-5-lobed; stamens 4 or 5, inserted in the throat of the corolla: fr. a dry or fleshy 2-seeded drupe. *C. ipecacuanha*, Willd (*Psychotria ipecacuanha*, Muell.-Arg. *Urugoga ipecacuanha*, Baill.) from the root of which the commercial ipecac is produced, is a low creeping herb (4-8 in. high) with oblong-ovate entire lvs. which are pubescent beneath: heads becoming pendulous: root slender, knotty; it is exported in large quantities from Brazil.

L. H. B.

CEPHALANDRA: *Coccinia*.

CEPHALANTHÈRA (Greek for head and anther). *Orchidacēae*. About 10 species of small temperate-region terrestrial orchids, allied to *Epipactis* and *Pogonia*. Some of them are western N. American, and others are European. Sepals 3; petals small, ovate; lip saccate: lvs. (sometimes wanting) lanceolate or oblong; fls. mostly small (sometimes showy), in an open spike. The species are scarcely known in cult., but 2 Japanese species have been offered by importers. These are *E. falcata* Blume, yellow, and *E. erecta*, Blume, white.

CEPHALANTHUS (Greek, head and flower; flowers in heads). *Rubiacēae*. BUTTON-BUSH. Bush grown for its attractive white flower-heads appearing in summer

Shrubs with opposite or whorled entire stipulate lvs. fls. small, tubular, white or yellowish, 4-merous, with included stamens and long exserted style, in globular heads; ovary 2-celled: fr. dry, separating into 2 nutlets.—Five species in Amer. and Asia, of which only the one N. American species is cult. hardy ornamental shrub, with handsome glossy foliage and very attractive

874. *Cephalanthus occidentalis*. (×½)

occidentalis, Linn. Fig 874. Shrub, 3-12 ft., sometimes tree-like: lvs. long-petioled, ovate or oval, acuminate, glossy above, glabrous or slightly pubescent below, 3-6 in. long heads about 1 in. diam. long-peduncled, 3 or more at the end of the branches July-Sept. From New Brunswick south, west to Ont. and Calif. Em. 394. R.H. 1889, p. 280. S.S. 14:711. Var. **angustifolia**, André Lvs. oblong-lanceolate, usually in 3's. R.H. 1889, p. 281.

C. natalensis, Oliv. Branchlets hairy lvs. ovate, acuminate, 1 in. long fls. green, in solitary heads: fr. edible S. Afr. B.M. 7400.

ALFRED REHDER.

CEPHALÀRIA (Greek for head, alluding to the capitate flower-clusters). *Dipsacēae*. Coarse annual or perennial herbs planted to some extent in herbaries.

Much like *Dipsacus*, but the heads less spiny and mostly smaller: heads terminal, ovoid or globular, bearing many 4-parted yellowish, whitish or bluish florets; stamens 4, perfect; style filiform: fr. a 4-8-ribbed achene, the calyx-border often remaining on its summit.—About 30 species in the Medit. region, N. and S. Afr. and W. Asia; also in Abyssinia. Lvs. entire, dentate, or lobed. They are not much planted in Amer., but they make striking subjects for summer bloom, and the long sts. make them useful for cut-fls. The bloom is something like that of scabiosa. Of simple cult.; grown readily from seeds.

alpina, Schrad. Perennial: tall and widely branched, 5 or 6 ft.: lvs. pubescent and pinnatifid, the segms. cut

and decurrent: fl.-heads sulfur-yellow; involucre with 8 aristate teeth. S. Eu.—A good coarse plant for summer bloom. Hardy N.

leucantha, Schrad. Perennial: lvs. pinnate-parted, the lobes linear or oblong; fls. in subglobose heads, creamy white, in autumn. S. Eu. Variable.

transylvanica, Schrad. Annual, slender, 2-3 ft.: lower lvs. lyrate; the segms. serrate and the terminal one large, upper lvs. pinnate-parted into linear-lanceolate divisions fls. in globular heads on long peduncles, the ray-corollas bluish and disk-corollas whitish (fls. said to be yellow, in trade lists, to bloom June-Aug. and plant perennial). Greece and eastward.

tatarica, Schrad. Perennial, 6 ft., rank, with strate sts., suited to the rear border, where strong effects are desired, with showy cream-white, flat heads in July and Aug.: lvs. pinnate, the lfts broad-lanceolate and serrate. Russia, Asia Minor and E.—Grows readily, and is increased by seed or dividing the clumps.

L. H. B.

CEPHALOCÈREUS (referring to the crown of long hair) Syn *Pilocereus Cactaceae*. Mostly large columnar plants, single or branched, usually characterized by an abundance of wool or long white hair developing at the top or on one side near the top fls. nocturnal, small, thick, fleshy, naked fr. small, globular berry, naked; seeds black.—Some 16 or more species are known.

The culture of the species is similar to that of the arborescent species of *Cereus*. The species of *Cephalocereus* are well suited only for large collections and are rarely seen elsewhere, except in the case of *C. sentis*, of which enormous quantities are shipped to Europe by commercial dealers. See *Succulents*.

senilis, Pfeiff (*Pilocereus senilis*, Lem.). OLD MAN CACTUS. Columnar, reaching a height of 35 ft. and a diam. of 1 ft., branching at the very base, the branches becoming parallel with the parent ribs 20-30, very little elevated, areoles bearing 20-30 white, wavy bristles 2-5 in. long, later appear also, at first 1, then 3-5 strong, yellowish spines fls. very numerous in the cephalum, nearly 4 in. long, red outside, reddish white within fr. violet, 2 in. long. Cent. Mex. R. H. 1889, p. 568, 1890, p. 128.

Sartorianus, Brit. & Rose (*Pilocereus Houlettii*, of authors, not of Lem.). Tree-like, attaining 40 ft. in height branches divaricate cult. plants usually 3-4 in diam. ribs 6-8, rounded, glaucous. radial spines 7-9, spreading, $\frac{1}{2}$ in. long, honey yellow, central twice as long and stronger areoles of the sterile st. with more or less hairs, which in the fruiting area are very numerous, making a shaggy tract sometimes 1 ft. long fls. 3 in. long, imbedded in the wool, turbinate, greenish-red outside, rose-red within fr. dark red, depressed-globose. Mex. R. H. 1862, pp. 427-30.

Röyeni, Brit. & Rose (*Pilocereus Röyeni*, Rumpf. *P. Pöcoccus*, Lem.). Columnar, branching, reaching 15 ft. height, 2-3 in. diam. ribs 9-10, obtuse, bluish, pruinose. spines 12-16, rigid, divaricate, bright amber-yellow, the inner ones larger, nearly an inch long on the sterile branches long hairs are found on areoles, on the fertile bract these are more numerous and aggregated: fls. and fr. as in the last species, but lighter in color. Isl. of St. Croix.

Hoppenstedtii, Schum. (*Pilocereus Hoppenstedtii*, Web.). Columnar, simple, slender, reaching a height of 30 ft.: ribs numerous, more than 16: radial spines 14-18, very short; centrals 5-8, the lower longest one reaching 3 in.; all the spines at first yellowish, then white cephalum of 1-2 in. long tufts of yellowish hairs, forming a narrow bract on the north side of the plant: fls. 3 in. long, bell-shaped, whitish, with rosy tips. Mex.

polydophus, Brit. & Rose (*Pilocereus polydophus*, Salm-Dyck. *Cereus Nickelii*, Hort.). Columnar,

attaining a height of 50 ft. and a diam. of $1\frac{1}{2}$ ft., rarely branching. ribs 10-22, sharp-angled, shallow, the old sts. perfectly cylindrical: spines small and bristle-like, less than $\frac{1}{2}$ in. long, radials 5-6, central usually 1; spines of the flowering area 2-3 in. long, crowded: fls. large, trumpet-shaped, dark red. fr. red, scaly. Mex.

scoparius, Brit. & Rose (*Pilocereus scoparius*, Poselg.). Tree-like, richly branched, 25 ft. high, 1 ft. diam. radial spines 12-15, very short; centrals 7-8, not much longer, in the flowering branches the spines change to longer stout bristles and the areoles are closer together, forming a bristly cephalum fls. small, bell-shaped, reddish. fr. size of a hazelnut. Near Vera Cruz, Mex.

exrens, Rose (*Pilocereus exrens*, Schum. *P. virens*, Lem.). Branching at base, 3-4 ft. high, 2-3 in. diam., tapering above: ribs 4-6, obtuse, the sterile shoots with short, sparse, woolly hairs at the top: spines commonly 7, radials, very short, 1-3 centrals 4 times as long, woolly hairs much more abundant on the blooming plant: fls. about 3 in. long, trumpet-bell-shaped, without wool or spines. Brazil.—Not common, if occurring at all, in cult. in U. S.

The following species have been reported or may be expected in cult., but none is as yet at all common: *C. chrysanthus*, Brit. & Rose, *C. comites*, Brit. & Rose, *C. brasiliensis*, Brit. & Rose, *C. Russellianus*, Rose (Cereus Russellianus, Rumpf.) *C. nobilis*, Brit. & Rose.

J. N. ROSE.

CEPHALOSTACHYUM (Greek, head and spike). *Gramineae*. A few species of grasses of the bamboo tribe in E. Indies and Madagascar, one of which (*C. pergracile*) has been offered in this country. Tall shrubs spikelets in dense solitary heads at the ends of the branches or in scattered glomerules, the heads bristly with the subtending lvs., stamens 6, empty glumes 1-2, style long, 2-3-cleft fr. elongated and beaked. *C. pergracile*, Munro. Forty ft., sts. 2-3 in. thick lvs. 14 in. or less long an elegant species, growing in clumps. Burma. It is offered in S. Calif. In Fla., it loses most of its lvs. in winter, but the new growth in spring and summer is very attractive, it is said not to do well there on high dry pine land, preferring moderately moist soil, it needs much water in summer, and responds readily to fertilizer.

L. H. B.

CEPHALOTAXUS (Greek, head, *Taxus*-like plant, with fls. in heads or clusters). *Taxaceae*. Yew-like plants, grown for their handsome evergreen foliage.

Trees or shrubs, with evergreen linear pointed lvs. with 2 broad, glaucous lines beneath, arranged in 2 rows fls. dioecious, staminate in 1-8-fld, short-stalked clusters, pistillate consisting of a small cone with several bracts, each bearing 2 naked ovules: seed enclosed in a fleshy envelope, drupe-like, about 1 in. long, reddish or greenish brown. From allied genera it may be easily distinguished by the resin-canal in the center of the pith, and by the glaucous lines beneath from *Taxus*, which has the lvs. yellowish green beneath; and from *Torreya* by the glaucous lines being broader than the 3 green lines, while in *Torreya* the glaucous lines are narrower than the green ones.—Six closely allied species from Himalayas to Japan.

These are ornamental evergreen shrubs, in appearance very like a yew, but of more graceful habit. Not hardy North, or only in very sheltered positions. They thrive best in a somewhat moist but well-drained sandy loam, and in partly shaded situations. Propagated by seeds, stratified and sown in spring, imported seeds usually do not germinate until the second year, increased also by cuttings in August, under glass, and by veneer-grafting in summer, on one of the species or on *Taxus baccata*. For cions and cuttings, terminal shoots should be chosen, which form regular plants with whorled branches like seedlings, while cuttings from lateral branches grow into irregular, low, spreading shrubs.

A. Lvs. 2-3 in.: branchlets yellowish green, pendulous.

Förtnaei, Hook. Lvs tapering gradually into a sharp point, usually falcate, dark green and shining above; fr greenish brown, obovate. N China, Japan. B.M. 4499. F.S. 6 555. R.H. 1878, p 117.—This is the most graceful species, with long and slender branches, attaining in its native country 50 ft in height, in cult. usually remaining a shrub.

AA. Lvs. 1-2 in. long.

B. Base of lvs. cuneate; lvs. loosely 2-ranked.

Harringtonia, Koch (*C. pedunculata*, Sieb. & Zucc. *C. drupacea* var. *Harringtonia*, Pilger). With spreading, often somewhat pendulous branches, dark green when young lvs to 2 in. long, narrowed into a sharp point, shining and dark green above; staminate fls distinctly peduncled: fr ovoid, rounded at both ends, rarely globular Japan, China. G.C. II 21 113; III 18.716, 33:228.—In Japan, tree to 25 ft, usually shrub in cult. A remarkable form is var. *fastigiata*, Silva Tarouca (*C. pedunculata* var. *fastigiata*, Carr. *Podocarpus koraiana*, Sieb. & Zucc.), of columnar habit, with upright branches and spirally arranged lvs G.C. II 21.112; III. 33 229 S.H. 2:450. Gng 2.341. Var. *sphaerialis*, Rehd., (*C. pedunculata* var. *sphaerialis*, Mast), has globose fr.: lvs. falcate, subacuminate, 1½-2 in. long G.C. II. 21:117.

drupacea, Sieb. & Zucc. Branches spreading, stiff, usually light green when young lvs about 1 in. long, abruptly pointed, narrow and straight, often upturned. staminate fls. very short-stalked: fr usually obovate, narrowed at the base Japan G.C. III 18 717, 33:227. B.M. 8285.—The dwarfest species Var. *sinensis*, Rehd. & Wilson Shrub, to 12 ft. lvs linear-lanceolate, tapering to sharp point. Cent. and W. China.

BB. Base of lvs. truncate; lvs. very closely set

Öliveri, Mast. Shrub or small tree lvs strictly 2-ranked, rigid, broadly linear, spiny-pointed, about 1 in. long, bright green with 2 brown white bands beneath, the midrib scarcely elevated fr ovoid or obovoid, shortly apiculate, about ¼ in long. Cent. China. II 1 1933 (as *C. Griffithii*) G.C. III 33 226.—Differs from the other species in the very closely set rigid lvs

ALFRED REHDER.

875 *Cephalotus foliolaris*.

CEPHALOTUS (Greek, *head-shaped*, in reference to the knob-like swelling behind each anther). *Cephalotaceae*, a monotypic family near *Saxifragaceae*. The one species *C. foliolaris*, Labill (Fig 875), is abundant at King George's Sound and Swan River in S. W. Austral. From there it has frequently been intro into cult., and is now met with in American collections. The short creeping rhizomes form 2 sets

of lvs. each season: a set of 4-6 flat spatulate lvs., and later as many dainty pitcher-like lvs. that are richly colored green, crimson or purple, and white. The pitchers are ½-1½ in. long, are covered externally with minute alluring glands, and these with the coloring attract insects. They slip from the smooth-ribbed rim into the cavity, and there are digested by ferment liquids poured out by special glands. The erect scape bears an interrupted spike of small white apetalous fls, each with a 6-parted calyx, 12 stamens, and 6 separate 1-seeded carpels. The plant grows best under a bell-jar, and in a pot amongst fine sandy loam that is covered by sphagnum moss. The lower part of the pot should stand in a vessel with about ½ in. of water, and the whole should be placed in a cool greenhouse near the light, when the pitchers assume richest colorings. Prop is easily effected by separation of small pieces of rhizome that bear 1 or 2 lvs, also by seeds that mature not unfrequently under cult. R B 23, p 233 I H 27.391 F S 3 290. G 23 340 G W. 8.390. J. H. III 35 260 J. M. MACFARLANE

876. *Cerastium arvense*

CERASTIUM (Greek for *horn*, alluding to the shape of the pod). (*Caryophyllaceae*) MOUSE-EAR CHICKWEED. Decumbent annuals or perennials, used in rockeries or for bedding and borders.

Pubescent or hirsute herbs, rarely glaucous. lvs. small, opposite, entire fls. white, borne in terminal, dichotomous cymes, sepals 5, rarely 4, petals as many, emarginate or 2-cleft, stamens 10, rarely fewer; styles 5, rarely 4 or 3, opposite the sepals caps cylindric, often curved, dehiscent at the top by 10, rarely 8, teeth.—About 100 species of world-wide distribution according to the largest delimitation of the genus, by some authorities reduced to 40 or 50 species.

Cerastiums are of easy culture in ordinary garden soil. They are propagated by divisions or by cuttings taken after flowering and planted in a shady place. They are more or less used for edgings and in rockeries.

A. Lvs. green, merely pubescent.

arvense, Linn (var. *oblongifolium*, Holl & Brit.). STARRY GRASSWORT. Fig 876. Perennial, low, much branched and matted sts 8-12 in long lvs oblong or lanceolate, pale green, pubescent, obtuse, ½-1½ in long, ¼ in wide fls very numerous, appearing in Apr and May, petals 5, deeply bifid caps twice as long as the calyx.—A species of very wide range, growing mostly in dry rocky places from Labrador to Alaska and south to Ga and Calif, also in Asia and Eu. Gm 71, p 504.—Recommended as a bedding plant, for its mat-like habit, covered with white bloom. Var. *compactum*, Hort., is hardy in S. E. Canada.

purpurascens, Adams. Perennial, hairy, pubescent, caespitose, about 4 in high lower lvs oblong, narrowed into the petiole; upper lvs linear-lanceolate: cymes dichotomous or often simply umbelliform, fls. white; petals twice as long as calyx, ovate-oblong: caps. cylindric, twice as long as calyx. Asia Minor.—Hardy.

AA. *Lvs. silvery or grayish.*

B. *Caps. equalling the calyx.*

grandiflorum, Walldst. & Kit. (*C. argenteum*, Bieb.). Creeping perennial. lvs linear, acute, the margins reflexed infl. dichotomous; fls. sts 6-8 in. high; petals oval, 2-parted, transparent white, twice as long as calyx. E. Eu.

BB *Caps. much longer than the calyx.*

Bièbersteinii, DC. Perennial: sts. 6 in. creeping, diffuse, branched; lvs ovate-lanceolate, tomentose-woolly; peduncles erect, dichotomous, fls. white; caps. ovate-cylindrical. *Tauria*. B. M. 2782. Gn. 59, p. 470. — Like *C. tomentosum*, but with larger lvs. Fine for edgings

Boissièrei, Gren. Perennial, low: lvs silvery, ovate-lanceolate, acute, entire, sessile; peduncles 4-12 in. high, infl. a dichotomous cyme, fls. large, white. Spain.

tomentosum, Linn. SNOW-IN-SUMMER. Perennial, low, creeping, branched lvs oblong, spatulate, grayish woolly, upper lvs lanceolate; peduncles 6 in. high, erect, dichotomous, fls. white; caps. cylindrical. Eu. G. 29 555. Gn. 69, p. 143 — Much used for edgings. E. Z. B. f

CÉRASUS (from *Cerasunt* or *Cerasonte*, a place in Asia Minor on the Black Sea, whence cherries are said to have been brought to Italy before Christ). **CHERRY.** *Rosaceae*. Tournefort in 1700 founded the genus *Cerasus*, but by general usage it is now combined with *Prunus* inasmuch as no single important character holds clearly between the two groups. The name is sometimes kept distinct in trade lists, representing the cherries as distinct from the plums. Botanically, the group is distinguished from *Prunus* proper (the plum group) in having conduplicate venation (young lvs. with the halves folded together) rather than involute venation, fls. more characteristically in umbels or racemes, fr. mostly lacking bloom and pubescence, and the stone not corrugated or pitted. See *Prunus*.

L. H. B.

CERATIOLA (Greek, *a little horn*, referring to the four-branched, serrate stigma) *Empetraceae*. A heath-like evergreen, from the sand barrens of South Carolina to Florida and Alabama; rarely cultivated North, but not hardy.

Branches often whorled as are the lvs, which are narrow, strongly revolute and thus almost tubular; fls. dioecious, 2-3-whorled in the axils, sessile; sepals, petals and stamens, each 2 — Only 1 species.

ericoides, Michx. Height 2-8 ft. branches subverticillate, marked with scars of numerous fallen lvs, the younger and upper ones only retaining foliage; fr. crowded, $\frac{1}{2}$ – $\frac{3}{4}$ in. long, linear, rigid, shining, pale; fls. inconspicuous reddish, whorled in the axils; drupe round, orange-yellow, berry-like. B. M. 2758.

N. TAYLOR †

CERATÓLOBUS (Greek for *horned pod*). *Palmaceae*, tribe *Caladiceae*. Low or creeping pinnate palms allied to *Calamus*, and not as yet common in the American trade.

Stems and lf-stalks spiny but not the lf-blades: sts. frequently 30 ft. or more long and armed with stout spines an inch long; lvs pinnate, often as much as 7 ft. long, with numerous alternate or opposite lflets, which are crenate-dentate towards the apex fls. polygamous-monœcious, in a paniculately branched spadix; fr. drupe-like, 1-seeded. — There are only 3 wild species and 2 species known in horticultural literature, the botanical status of which is doubtful. All the wild species come from Java or Sumatra. For cult., see *Calamus* to which *Ceratolobus* is closely related, differing in having rhomboid, not linear lflets. G. C. II. 23:338.

glaucescens, Blume. St. up to 30 ft. and about as thick as one's wrist lvs. 6-7 ft. long, of 14-18 sessile, erect or spreading lflets, which are 8-10 in. long, $2\frac{1}{2}$ – $3\frac{1}{2}$ in. wide, opposite above, alternate below spadix from the axils of the upper lvs.; spathe 2-horned, 4-6 in. long. Java.

C. cœcolor, Blume. Similar, with 10-14 lflets, relatively broader than in *C. glaucescens*. Sumatra — *C. Pindigalanus*, Hort. lvs 2-4 ft. long, clear pale shining green. Hab. (?) A. G. 15 169 — *C. Micholitziana*, Hort. Very elegant palm, the st. and lf-rachis with scattered spines; lvs. oblong, the lflets remote, linear-oblong, acute, pale on the under surface. — Horticulturally the most attractive of the group.

N. TAYLOR.

CERATONIA (Greek for *horn*, in reference to the large pod). *Leguminosæ*. **CAROB.** A handsome evergreen tree, bearing large pods that are used somewhat for human food but chiefly for forage.

One of the Cassia tribe: calyx-tube disk-bearing, somewhat top-shaped, the segments 5 and short; petals 0; stamens 5; pod long (4-12 in.), compressed, thick and coriaceous, indehiscent, filled with a pulpy substance, bearing obovate transverse seeds. *C. Siliqua*, Linn. (Figs. 877, 878), the only species, is now widely distributed in warm countries, being grown both for shade and for the edible pods. It reaches a height of 40-50 ft.; lvs. pinnate, shining, the 2-3 pairs of lflets oval and obtuse. fls. in small lateral red racemes, polygamodioecious, the trees said to be variable in sexuality at different ages. It thrives well in S. Calif. and S. Fla. The dry pods are occasionally seen in the fruit stands in northern markets. There are many varieties, differing in the size and shape of pod. The *Ceratonia* is

877. *Ceratonia Siliqua*.

known also as *Algaroba*, *Karoub*, *Caroubier*, and *St. John's Bread*. The last name records the notion that the seeds and sweet pulp are respectively the locusts and wild honey which St. John found in the wilderness. The dry valves or pods have been supposed to be the husks that provided the subsistence of the prodigal son. See G. F. 3 318, 323. The seeds are said to have been the original carat weight of goldsmiths.

L. H. B.

The carob is of much importance as a farm crop throughout the Mediterranean basin and other hot and semi-arid regions. According to Alphonse de Candolle, its original home was about the eastern end of the Mediterranean, including the southern coast of Asia Minor and Syria and perhaps Tripoli. Its cultivation began in historic times, and was diffused by the Greeks in Italy and Greece and was carried by the Arabs west as far as Spain and Morocco. In all these countries the large pods, rich in protein and sugar, are a very important forage crop, being eaten with avidity by all kinds of stock, besides furnishing considerable sustenance to the poor in times of scarcity, and are also used for the manufacture of syrups and different fermented drinks. Carob pods were the main sustenance of Wellington's cavalry in the Peninsular campaign and at the present time are the chief food of the British army horses on the island of Malta and the horses of the tramways in the cities of southern Italy. They form one of the principal exports of Palestine, Syria and especially of the island of Cyprus. Thousands of tons are annually imported into England where they are ground for stock-feed. A. Aaronsohn, Chief of the

Jewish Experiment Station in Palestine, says that an acre of carob trees on arid soil yields a much greater quantity of food matter than an equal area planted with the best alfalfa. He gives the sugar content at 40 per cent and in some varieties even higher, and the protein content as 7 to 8 per cent. The French and Portuguese writers give somewhat lower percentages, but this seems to be much a matter of climate and varieties. The analysis published by Rivière and Lecoq points to a high digestive coefficient, and nutritive value a little higher than oats, it is estimated that 147.5 kilos of carobs equals 100 kilos of wheat (a kilo is nearly 2½ pounds).

The first introduction of the tree into this country on a considerable scale was by the U. S. Patent Office from Alicante, Spain, in 1854 and from Palestine in 1859. About 8,000 plants, grown from seed in Washington, were distributed during the spring of 1860, mostly in the southern states. Some of these plants probably found their way to California, as a number of old trees are growing in various parts of that state from San Diego on the south to Napa and Butte counties on the north. The latest importation was in June, 1911, from Valencia, Spain, by the Office of Foreign Seed and Plant Introduction of the Department of Agriculture. This shipment consisted of cuttings of six of the leading varieties grown in that district which are now being propagated by budding at the Chico (California) Introduction Field Station, and will soon be available for distribution.

Centuries of cultivation have given rise to a large number of varieties, differing in quality of pods, vigor and productiveness and adaptability to various soils. The species is either dioecious or monoecious. All trees in California are of course seedlings and, as far as examined by the writer, monoecious, although Aaronsohn states that the best kinds in Palestine are dioecious, and a sufficient number of staminate trees, therefore, must be planted with those varieties to pollinate the female trees. In the province of Algarvia, Portugal, seventeen named varieties are cultivated and about as many in France and Spain. The best of these should be introduced into this country.

878 Pods of *Ceratonia Siliqua*.

The carob tree thrives only in a warm climate, the range being about the same as that of the orange, but with a little protection for two or three winters, the range can be considerably extended. At the Government Field Station at Chico, several varieties have survived temperatures of 18° to 22°, while others when young have been killed to the ground by the same degrees of frost. The old trees scattered about the Pacific Coast States show that a large area is adapted to it.

In France, Spain and Portugal, the carob grows in most kinds of soil, except in stiff clay or wet ground, and even in gravel if fertile and permeable to the roots. The crop is sufficiently valuable to make it worthy of the best soil and treatment.

The carob is usually grown from seed and afterwards budded to the best varieties. It can be raised from cut-

tings, but requires bottom heat and careful treatment. At the Chico Field Station, where thousands of seedlings are grown, the best success is had by planting under glass. Quicker germination is secured by soaking the seed in water for three or four days or until they begin to swell. The tree is difficult to transplant and usually fails unless moved with a ball of earth. The best results are had by growing the plants in pots or in "flats" in tenacious soil, as is the practice with eucalyptus, when the trees are cut apart and lifted with squares of earth attached. At Aleppo, in Syria, the growers make pots of a mixture of clay and cow-dung which, dried in the sun, are strong enough to hold the earth in which the seeds are planted. When ready to put into the orchard the pot is sunk where the tree is to stand. As soon as the pot becomes moist from contact with the earth, it is readily permeable by the roots.

While the carob is a rather slow grower, it lives to a great age and should be planted not less than 35 to 40 feet apart, with interplanting of peaches or other growths for income until the carobs begin to bear. In Algiers and Tunis, it is often planted as a border tree, for which its beauty and utility admirably fit it. When well established, the seedlings are budded with the best varieties. If buds are taken from bearing trees, fruit may be expected in three or four years. In California seedlings bear when six to eight years of age. While it is eminently a dry-climate tree, two or three summer irrigations will greatly aid the development, hasten fruiting and increase the yield. It will respond to the same good treatment that is given to a well-kept fruit orchard.

The crop matures in September and October and, as with most other fruit trees, it is most abundant every second year. When ripe, the pods turn brown and begin to fall. Those that fail to drop are easily knocked down with bamboo or other poles.

Aaronsohn gives the crop in Palestine in good years at an average of 450 pounds to the tree, and states that he has seen wild stocks fifteen to eighteen years after grafting give a yield of 900 to 1,000 pounds of pods. Du Breuil gives the yield in southern France at 220 pounds and mentions single trees at Valencia, Spain, that produce as high as 1,380 kilos, or 3,040 pounds. Rivière and Lecoq report the yield of trees in Algiers at 100 to 300 kilos, or 220 to 660 pounds. Francis de Mello Lotte gives the crops of mature trees on deep fertile soil in Algarvia, Portugal, at 300 to 750 kilos, or 660 to 1,650 pounds each. As the pods are equal in nutrients to barley and superior to oats for feeding and fattening cattle, sheep, hogs and horses, and the yield is from three to four times the weight per acre of grain, it is evident that few crops will give the farmer an equal value. In the mild climate of the Gulf States, especially the coastal regions of Texas, the southern parts of New Mexico and Arizona and the greater part of California, this beautiful and valuable evergreen tree, when once appreciated, is bound to become a staple addition to farm crops for the nourishment of both man and beast.

G. P. RIXFORD

CERATOPÉTALUM (Greek, *horned petal*). *Cunoniaceae*, by some, *Cunoniaceae* is included in *Saxifragaceae*. Greenhouse trees or shrubs.

Glabrous and resinous trees and shrubs. Lvs opposite, compound, with 1-3 digitate lfts: fls small, white, rose or yellow, in terminal branching cymes or panicles; calyx-tube short, 5-lobed; petals 0, or, if present, lacinate; stamens 10, with connectives: fr a small and hard achene-like body, with persistent calyx-lobes, 1-seeded.—Two or 3 species, in Austral.

gummiferum, Smith. Tree, 30-40 ft. lfts 3, lanceolate, serrulate, narrowed at base, shining and strongly nerved; petals deeply 3-5-lobed, not exceeding the calyx.—Said to thrive in a peaty soil, and to prop. by cuttings of half-ripened wood under glass. L. H. B.

CERATOPTERIS (Greek, *horned fern*). *Ceratopteris* Very succulent tropical ferns, forming also a distinct family. They are the only truly aquatic plants among true ferns and grow floating or rooted under water in the mud or sometimes only occasionally flooded. The lvs. are borne in rosettes, the sterile

879. *Ceratopteris pteridoides*. ($\times \frac{1}{2}$)

spreading, often floating, the fertile more erect, 2-4-pinnate, with very slender rolled-up pod-like segms.: sporangia very large, borne separately along the veins and covered by the revolute margins somewhat as in *Pteris*.—Species very few. Best grown by planting in pots, slightly submerged. Reproduced by buds which arise from all parts of the lvs. New plants must be developed each season. Useful in ponds and aquaria.

pteridoides, Hook. Fig 879 Sterile lvs broadly deltoid, short-stalked, the margins irregularly lobed, floating, the fertile lvs taller, completely divided into long whip-like segms. spoutangia with a very small annulus, and containing 32 spores. Fla to S Amer.

thalictroides, Brongn. Sterile lvs. narrowly deltoid, long-stalked, 1-2 pinnatifid into deltoid segms. not floating, fertile lvs. similar but with linear segms. annulus well developed. Old World tropics.

R. C. BENEDICT.

CERATOSTIGMA (Greek, *horned stigma*). *Plumbaginaceae*. Diffuse glabrous perennial herbs or subshrubs, one of which is in cultivation as a bedding and border plant.

Ceratostigma differs from *Plumbago* in having no glands on the calyx, stamens adnate to the corollatube, fls. in dense clusters rather than spicate, and other technical characters. lvs. alternate, lanceolate or obovate, more or less ciliate fls. mostly in terminal heads, blue or rose; calyx tubular, deeply 5-parted, the lobes narrow; corolla salver-shaped, the tube long and slender, the limb spreading and with 5 obovate obtuse or retuse lobes; stamens 5, attached on the corollatube fr. a 5-valved caps. inclosed in the calyx.—Species 4 or 5, in N. China, Himalayas, Abyssinia.

plumbaginoides, Bunge (*Plumbago Lärpente*, Lindl. *Valoradia plumbaginoides*, Boiss.). Herb, 6-12 in., the st. red and branchy; lvs. entire, strongly ciliate on the edges fls. with a deep blue limb, the 5 lobes minutely toothed, collected in dense heads or umbels. China. B M 4487 F S 4 307—A hardy bedding plant, producing profusely of its deep blue fls. late in fall, very valuable. Needs covering in winter in the N.

Under the name *C. Pöhlili*, a dwarf and creeping shrub, with delicate lavender fls., is mentioned in British journals as coming from high elevations in W. China and giving promise as an outdoor subject.

L. H. B.

CERATOTHÈCA (Greek for *horned capsule*). *Pediculariaceae*. Tropical African glasshouse herbs.

Leaves opposite, ovate. calyx 5-parted; corolla 2-lipped, the lower lip very long in proportion to the upper fls. in pairs in the axils caps. 2-horned—Five species. *C. triloba*, Mey., is occasionally grown in S.

Fla., and it may be adapted to glasshouses. It is a tall herb (5 ft.), with the habit of foxglove, probably biennial, hairy and rather fleshy lower lvs. stalked, broadly ovate or almost round, the upper sometimes broadly angular and even 3-lobed, both kinds crenate-dentate corolla 3 in. long, blue or violet-blue, pubescent, deflexed, the lower lobe prolonged. Handsome. B M 6974.—Could be grown in temperate house N. in sandy loam.

N. TAYLOR.

CERATOZAMIA (Greek, *horned Zamia*, referring to the horned scales of the cones, which distinguish this genus from *Zamia*) *Cycadaceae*. Handsome Mexican foliage plants, with cypas-like leaves, but less cultivated in American palm-houses than *Cycas*.

Trunk erect in age, crowned by a whorl of pinnate cypas-like lvs. which are petiolate and unarmed: fls. in cones borne from among the lvs. the cones often stalked seeds rare and little known.

Six species. Best raised from young imported plants, but rarely prop. by seeds, or by offsets from the slow-growing trunk. Burn out the center of the plant with a hot iron, and a number of offsets will spring from the trunk and the crown; these may be used for prop.

mexicana, Brongn. Fig 880 Trunk thick, short, covered with the remains of fallen lf-stalks lvs. rich, dark green, pinnate, on prickly petioles 5-6 in. long, which are shaggy when young, lflets very numerous, 6-12 in. long or more, lanceolate cones produced annually on separate plants, female cones 9-12 in. long, 4-6 in. thick, the scales 2-horned, male cones narrower, longer, on a hairy stalk, the scales with 2 small teeth. Mex. Gn 9, pp 308-9—An excellent decorative plant, best grown in sandy loam. Give freely of water and heat in spring and summer, but keep cooler and drier in winter. Somewhat tender although grown in Cent. Fla.

C. Miqueliana, Wendl. A plant with 20-30 pairs of lflets and a lf-stalk 15 in. long fr. not known certainly. Cult. in botanic gardens and worthy of wider use. Mex and W. Indies.

N. TAYLOR.

CERCIDIPHYLLUM (*Cercis* and *phylon*, leaf, the lvs. resemble those of *Cercis*) *Trochodendraceae*. Tree grown for its handsome foliage and habit.

Leaves deciduous, usually opposite, petioled and palmately nerved fls. dioecious, inconspicuous, apetalous, solitary, staminate nearly sessile, bearing numerous stamens with slender filaments, pistillate pedicelled,

880. *Ceratozamia mexicana*.—Young plant (fertile)

consisting of 3-5 carpels, ending in long, purplish styles and developing into about $\frac{3}{4}$ in. long, dehiscent pods, with many seeds.—One species in Japan and W. China. Hardy, ornamental, shrubby tree or pyramidal and, when young, almost fastigiate habit, with handsome,

881. *Cercidiphyllum japonicum* ($\times \frac{1}{2}$)

light green foliage, purplish when unfolding, turning bright yellow or partially scarlet in fall. It prefers rich and moist soil, and grows rapidly when young. Prop. by seeds, sown in spring, and by greenwood-cuttings, taken from forced plants in early spring, or by layers; cuttings from half-opened wood in summer, under glass, grow also, but not very well.

japonicum, Sieb. & Zucc. Fig. 881.

Bushy tree, commonly with several trunks, usually 20-30 ft., but sometimes rising to 100 ft., with slender, glabrous branches; lvs. opposite, occasionally alternate, slender-petioled, cordate, orbicular or broadly ovate, obtuse, crenate-serrate, glabrous, glaucous beneath, 2-3 in. long. Japan. G.F. 7:106, 107, and 6:53. Mn. 3:74. Gng. 5:135. F.E. 32:211 (habit). P.G. 2:105. S.I.F. 1:41. —A very desirable tree, one of the best introductions from Japan. Var. *sinense*, Rehd. & Wilson. Tree, to 120 ft., usually with a single trunk; petioles shorter, about $\frac{1}{4}$ in. long, somewhat hairy on the veins beneath; caps gradually narrowed at the apex, $\frac{1}{2}$ in. long. W. China.—This recently intro. variety is perhaps still more desirable than the type. It is the largest of all broad-leafed trees known from China; the trunk is sometimes free of branches for nearly 50 ft. above the ground and attains to 25 ft. or exceptionally to 55 ft. in girth.

ALFRED REHDER

CERCIS (*Kerkis*, ancient Greek name). *Leguminosæ*. JUDAS TREE. RED-BUD. Trees or shrubs grown for their pink flowers profusely produced early in spring before the leaves, very interesting, also, in mode of branching, as seen in mature trees.

Leaves deciduous, alternate, petioled, palmately nerved, entire; fls. papilionaceous, pedicelled, pink or red, appearing before or with the lvs. in clusters or racemes from the old wood; calyx 5-toothed, red; petals nearly equal, the uppermost somewhat smaller; pod compressed, narrow-oblong, narrow-winged on the ventral suture, many-seeded.—Seven species in N. Amer., and from S. Eu. to Japan.

These trees and shrubs are very ornamental, with handsome distinct foliage and abundant showy flowers in spring, very effective by their deep pink color. They are well adapted for shrubberies or as single specimens on the lawn, and attain rarely more than 20 or 30 feet in height, forming a broad, irregular head when older. Only *C. canadensis* is hardy North, while *C. chinensis* can still be grown in sheltered positions near Boston, but is occasionally injured in severe winters; the others can not be grown successfully farther north than New York. They grow best in rich sandy and somewhat moist loam, and should be transplanted when young, as older plants can hardly be moved with success. Young plants, four or five years old, produce flowers

freely and may be recommended for forcing, especially *C. chinensis* and *C. racemosa*, which are the most beautiful of all. Propagated by seeds, sown in spring, best with gentle bottom heat; sometimes increased by layers, or by greenwood cuttings from forced plants in early spring, *C. chinensis* grows also from greenwood cuttings in summer under glass.

A. Lvs. abruptly and short-acuminate.

n. Fls. in clusters: lvs. usually pubescent only beneath near the base.

canadensis, Lam. Fig. 882. Tree, to 40 ft.: lvs. roundish or broadly ovate, usually cordate, 3-5 in. long; fls. rosy pink, $\frac{1}{2}$ in. long, 4-8 in clusters; pod $2\frac{1}{2}$ -3 in. long. From N. J. south, west to Mo. and Texas. S.S. 3:133-4. A.F. 13:1370. Gng. 6:290. F.E. 9:593. Mn. 2, p. 139. M.D.G. 1899:434-5 (habit). Gn. 25, p. 347.—A very desirable ornamental tree for the northern states. Var. *alba*, Rehd. Fls. white. Var. *plena*, Schneid. Fls. double.—Recently *C. canadensis* has been split by Greene into several new species (see Fedde, Rep. Spec. Nov. Veget. 11:110).

chinensis, Bunge (*C. japonica*, Sieb.). Fig. 883. Tree, to 50 ft., shrub in cult. lvs. deeply cordate, roundish, with a white, transparent line at the margin, subcoriaceous, glabrous, shining above, 3-5 in. long fls. 5-8, purplish pink, $\frac{1}{2}$ in. long; pod 3-5 in. long, narrow. China, Japan. F.S. 8:849. Mn. 2:139. G.F. 6:476.—A very beautiful species, with the fls. nearly as large as those of *C. Siliquastrum* and more abundant.

bb. Fls. in pendulous racemes.

racemosa, Oliv. Tree, to 30 ft.: lvs. broadly ovate, truncate or subcordate at the base, pubescent beneath,

882. *Cercis canadensis*. ($\times \frac{1}{2}$)

$2\frac{1}{2}$ -4 in. long; fls. rosy pink, about $\frac{1}{2}$ in. long on slender pedicels of about equal length, in many-fl. racemes $1\frac{1}{2}$ -3 in. long; pod $2\frac{1}{2}$ -4 in. long. Cent. China. H.I. 1894.—The handsomest of all. Young plants have not proved hardy at the Arnold Arboretum, but it is perfectly hardy in S. England.

AA. Lvs. rounded or emarginate at the apex, usually broader than long.

occidentalis, Torr. (*C. californica*, Torr.). Shrub, to 15 ft.: lvs. cordate, roundish, glabrous, about 2 in. wide; fls. rose-colored, $1\frac{1}{2}$ in. long, pod 2-2 $\frac{1}{2}$ in. long. Calif Torrey in U S Explor. Exped. 1838-1842, 17, pl. 3.—A closely allied species is *C. reniformis*, Engelm. (*C. texensis*, Sarg.). Small tree: lvs. subcoriaceous, 3-5 in wide, sometimes pubescent beneath pod 2-4 in. long. Texas, New Mex. SS 3:135.

Siliquastrum, Linn. Tree, to 40 ft. lvs. roundish, deeply cordate, glabrous, 3-5 in. wide; fls. 3-6, purplish rose, $\frac{3}{4}$ in. long, pod 3-4 in. long. S. Eu, W Asia. B M 1138. Gn 25, pp. 346, 347, 350; 33, p. 416; 42, 342, p. 343; 44, p. 379, 52, p. 5. G C III. 52 6 (habit) G 25 209. R H. 1899 469 (abnormal form). Var. *alba*, Carr. (var. *albida*, Schneid.) with white fls.

883. *Cercis chinensis*.
(Natural size)

CERCOCÁRPU

(Greek, *tail* and *fruit*; the fruit with a long, hairy tail). *Rosaceae*. MOUNTAIN MAHOGANY. Small trees or shrubs but rarely grown for their attractive evergreen or half-evergreen foliage and the peculiar feathery tailed achenes.

Leaves alternate, persistent, rather small fls. inconspicuous, apetalous, whitish or reddish, in the axils of fasciated lvs; calyx-tube cylindric, elongated, abruptly expanded at the apex into a cup-shaped deciduous, 5-lobed limb bearing 15-30 stamens with short filaments, ovary 1-celled, inclosed in the calyx-tube, with a long exserted style fr a 1-seeded achene, surmounted by the persistent, long and hairy style—Small genus of about 10, mostly rather local species, in the Rocky Mts. from Mont south to Mex. and in Calif.

The cercocarpaceae are not particularly ornamental, yet they are attractive with their small evergreen dark foliage and their feathery tailed fruits; they are adapted for planting on dry rocky or gravelly slopes in arid temperate regions, as they thrive under very unfavorable conditions. The very heavy and close-grained wood is manufactured into small articles, and valued as fuel and for making charcoal. *C. ledifolius* and *C. parvifolius* are the hardest and stand frost to zero, while *C. Traskiae* can be grown only in southern California. They may be cultivated in any well-drained soil in sunny positions, and propagated by seeds or by cuttings of half-ripened wood under glass.

A. Margin of lvs toothed fls 2-5 in a cluster.

B. Lvs oval to suborbicular, usually rounded at the base.

Traskiae, Eastw Tree, to 25 ft. lvs. coarsely sinuate-dentate above the middle, lustrous above, tomentose below, 1-2 $\frac{1}{2}$ in long; achene with the style 2-2 $\frac{1}{2}$ in. long. Santa Catalina Isl, Calif SS 13:635.

BB. Lvs usually cuneate-obovate, smaller.

parvifolius, Nutt Bushy tree, to 25 ft. lvs. dull green and pubescent above, pubescent or tomentose beneath, $1\frac{1}{2}$ -1 $\frac{3}{4}$ in long, with 4-5 pairs of veins style 2-4 in. long. From Neb and Ore to Low Calif. and W. Texas. SS 4:166. H I 4:323.—D M Andrews, of Colo., who handles this shrub, writes of it as follows: "Mountain mahogany, 6 feet. A nearly evergreen roseaceous shrub of peculiar and attractive habit of growth. Fls. white, early, followed by the long, plumose achenes, which are 3-5 in long, strangely curled and twisted, arranged above and on each side of the slender branches, so that at a little distance they have an appearance suggestive of ostrich plumes. Easily transplanted, and thrives anywhere."

betulaefolius, Nutt (*C. parvifolius* var. *glaber*, Wats. *C. parvifolius* var. *betulaefolius*, Sarg.) Small tree, to 30 ft., lvs. thinner, bright green and glabrous above at maturity, pubescent or glabrescent beneath, $1\frac{1}{2}$ -2 in. long, with 5-6 pairs of veins style 2-4 in. long. Calif. W G Z 4, p 554-5. H I 4:322.

AA. Margin of lvs entire, revolute fls solitary or in pairs.

ledifolius, Nutt Tree, to 40 ft. lvs lanceolate, coriaceous, lustrous and glabrous above at maturity, pubescent below, resinous, $1\frac{1}{2}$ -1 in long, veins obscure; style 2-3 in long. From Yvo and Wash to S Calif. and New Mex. SS 4:165. H I 4:324.

ALFRED REHDER.

CEREALS (*Ceres*, goddess of agriculture) (The agricultural grains, properly those of the grass family: maize or Indian corn, kafir, wheat, emmer, spelt, rice, oats, barley, rye, sorghum (for grain); popularly held to include buckwheat, but not accurately so. Consult Vol II, Cyclo Amer Agric.

CEREUS (from the Latin, but of uncertain application) (*Cactaceae*). Usually arborescent, columnar cacti with the surface covered with spiny ribs.

Flowers large, borne singly along the sides of the st; fl-tube slender and, as it decays, cutting off from the ovary, petals numerous, stamens numerous, style single, thick fr a large, naked, fleshy berry; seeds small, black. The genus *Cereus*, as it has generally been treated, contained more than 100 species which differed greatly in habit, armament, fls and fr, and was one of the most complex and difficult of the family. As now understood, it contains species of uniform habit, with similar fls and frs, while a number of species of very different habit have been referred elsewhere. Even as here treated, more than half of the species are anomalous. Until the fls and frs have been studied, it seems best to leave them in *Cereus*. The species are all from S. Amer.

Only a few species of true *Cereus* are grown in this country, and most of these are grown under glass. The flowers do not compare in size and attractiveness with those of the so-called night-blooming *Cereus*, which is described elsewhere under the genus *Selenicereus*. Several of the species have cristate and other abnormal forms which make them desirable to certain growers. *C. lepadolus* is a rather common cultivated species in certain of the West India Islands, where it grows to considerable height, and several of the species are grown in Europe along the Riviera, where they reach great size. With us, however, they do not grow very rapidly. They are easily propagated from seed or by cuttings. See *Succulents*.

The species treated in the first edition of this work that are not here given may be looked for under the following genera: *Acanthocereus*, *Aporocactus*, *Bergocactus*, *Carnegiea*, *Cleistoactis*, *Eseontria*, *Harrisia*, *Helocereus*, *Hylocereus*, *Lemaireocereus*, *Lophocereus*, *Myrtillocactus*, *Oreocereus*, *Pachycereus*, *Rathbunia*, and *Selenicereus*.

A. *Sts. erect*, 2 in. or more diam.

B. *New growth green*, not pruinose or covered with a bloom.

C. *Ribs of st. 10 or more*.

1. *Pasacana*, Web. A gigantic species, reaching a height of 20-30 ft., and sometimes even 50 ft., and a diam of 12-16 in.; sparingly branching above; in new growth dark green, becoming gray or bluish; ribs 15-20, or in young plants only 9-10. areoles $\frac{3}{8}$ - $\frac{3}{4}$ in apart, large, brown, becoming yellowish and finally gray; radial spines 10-13, about 1 in long, the under one or lowest pair straight, subulate, the others curved, centrals mostly 4, the under and upper ones the longest, reaching 2 in length, straight or curved, the young spines are clear brown, often with alternating rings of light and dark tissue, later gray, bulbous at the base; fls. from the lateral areoles about 6 in long, white. Argentina.—This is the giant cereus of the Argentine desert, as *Carnegiea gigantea* is of the certain N. American deserts. It is not a true *Cereus*.

2. *candicans*, Gillies. *Sts* upright, low, cylindrical, bright green, $2\frac{1}{2}$ -3 ft. high by 6-8 in diam.; freely branching from the base ribs 10, obtuse-angled; areoles $\frac{3}{8}$ - $\frac{3}{4}$ in apart, large, depressed, white, becoming gray; radial spines 11-14, spreading, at first thin, needle-form, later stronger, stiff, straight, about $\frac{3}{4}$ in long, central solitary or later 3-4 additional ones appearing above, stronger, reaching a length of $1\frac{1}{4}$ in, sometimes somewhat curved, all the spines horn-colored, with tips and bases brown, later becoming gray; fls long, funnell-form, resembling those of *Echinopsis*, 10 in long by 6 in diam. fr spherical to ellipsoidal, about 3 in diam, red, somewhat spiny, flesh white. Argentina.—Not a true *Cereus*.

3. *lampochlorus*, Lem. Related to *C. candicans*, of a taller growth, cylindrical, 3-6 $\frac{1}{2}$ ft. high by about 3 in diam, at first simple, but later branching at the base; in new growth bright green, later duty green. ribs 10-11 or occasionally 15, conspicuously crenate, later blunt and but little crenate areoles medium size, about $\frac{1}{2}$ in apart, yellowish white, becoming gray, above each areole 2 radiating grooves form a letter V; radial spines 11-14, spreading, straight, sharp-pointed, about $\frac{3}{4}$ in. long, clear to dark amber-color; some are strong and rigid, while others are bristle-form; centrals mostly 4, somewhat longer, stronger and deeper colored, with brown bases, becoming dark gray, about $\frac{3}{4}$ in. long; fls. from the previous year's growth, about 8-10 in. long by 6 in. diam., white. Argentina.—Not a true *Cereus*.

4. *Spachianus*, Lem. *Sts* upright, at first simple, later profusely branching at the base, branches ascending parallel with the main st, 2-3 ft high by 2-2 $\frac{1}{2}$ in. diam, columnar: ribs 10-15, obtuse, rounded; areoles about $\frac{1}{2}$ in. apart, large, covered with curly yellow wool, becoming white; radial spines 8-10, $\frac{1}{4}$ - $\frac{3}{8}$ in long, spreading, stiff, sharp, amber-yellow to brown; central solitary, stronger and longer; all the spines later becoming gray; fls. about 8 in. long by about 6 in. diam., white. Argentina.—Not a true *Cereus*.

5. *chiloensis*, DC. (*Cactus chiloensis*, Colla). *Sts* strong, upright, simple (so far as known), about $2\frac{1}{2}$ ft. high by $3\frac{1}{2}$ -5 in. diam, cylindrical to somewhat clavate, bright, clear green; ribs 10-12 obtuse; areoles about an inch apart, large; radial spines straight, sharp, rigid, at first 9, but later 4 others appear above these; centrals mostly 4, seldom but a single one, bulbous at the base; the young spines are brown honey-yellow, becoming white, with dark tips, and finally gray. fls. from the upper lateral areoles about 6 in. long, white, resembling those of *Echinopsis*. Chile.—This is not a true *Cereus*.

cc. *Ribs of st. 7-9*.

6. *euphorbioides*, Haw. (*C. Oliveri*, Otto). Columnar, simple, 10-16 ft high by about $4\frac{1}{2}$ in. diam., in young growth pale green, changing with age to gray-green; ribs 8-10, separated by sharp grooves, sharp-angled, becoming flattened in older growth; areoles about $\frac{3}{8}$ in. apart, small, white to gray radial spines mostly 6, the under one the longest, reaching a length of over an inch, strong, yellowish brown to black, the upper ones shorter and bristle form, central solitary, in young plants twice as long as the radials, all the spines finally become gray fls from near the crown, $3\frac{1}{2}$ -4 in long, beautiful flesh-red, remaining open for 24 hours Brazil. R H 1885, p. 279.—This plant is insufficiently understood; it may be a form of some species of *Cephalocereus*.

7. *Sepium*, DC (*C. Roezlii*, Hage). Upright, columnar, about 3 in. diam. ribs 9, separated by sharp, somewhat serpentine grooves, obtuse, above the areoles, 2 radiating, slightly curved grooves form a letter V; areoles $\frac{1}{2}$ - $\frac{3}{4}$ in. apart, comparatively large, slightly sunken, yellowish, later gray radial spines 9-12, radiate, nearly $\frac{1}{2}$ in long, straight, subulate, tolerably sharp, slightly thickened at the base, clear brown, with darker stripes, central solitary, reaching $1\frac{1}{2}$ in long, straight, porrect, later somewhat deflexed, clear brown; later all the spines become gray. Andes of Ecuador.—Near Borziacetus; needs further critical study.

8. *tetracanthus*, Labour. Upright, arborescent or bushy, freely branching, young branches leaf-green, later gray-green. ribs 8-9, low, arched: areoles medium-sized, slightly sunken, about $\frac{1}{2}$ in. apart, white to gray. radials 5, later 7, radiate, about $\frac{3}{8}$ in. long, straight, subulate, stout, white, with brown tips and bases, later ashy gray; centrals 1-3, under one largest and porrect, when young yellow and translucent, later gray; fls resemble those of *C. tortuosus* Bolivia.—This species should doubtless be referred to *Eriocereus*.

884 *Cereus peruvianus*. A flower that is just closing, from a plant flowered in Washington, D C, in 1904. ($\times \frac{1}{2}$)

ccc. *Ribs of st. 3-6.*

9. *Hankeanus*, Web. Upright, robust, not branching (so far as known), young growth bright green, later dark green, about 2 in diam.: ribs 4-5, compressed, about $1\frac{1}{4}$ in high, conspicuously crenate, with an S-form line passing from each areole toward the center of the st. areoles, $\frac{3}{8}$ -1 in apart, horizontally elliptical to heart-shaped, brown, becoming gray below and yellow above; radial spines 3, needle-like, stout, sharp-pointed, about $\frac{3}{4}$ in long, amber-colored when young, turning to brown, central solitary, straight, porrect, $\frac{3}{8}$ in. long, stronger than the radials, horn-colored; later all the spines become gray: fls. 4-5 in. long, white. S. Amer.

bb. *New growth blue, white- or gray-pruinose.*

c. *Ribs of st. comparatively broad and low: st. more or less triangular in cross-section.*

10. *macrogonus*, Otto. Arborescent, sparsely branching, reaching a height of 20 ft. (in cult., 6 ft. high by 3-5 in diam.), branches columnar: ribs mostly 7, seldom 8-9, thick, slightly undulate, obtuse and with convex faces, about 1 in high bluish green, frequently having a depressed line near the areole: areoles about $\frac{1}{2}$ in apart, large, gray radial spines 6-9, radiate or spreading, strong, subulate, $\frac{3}{4}$ in long, horn-color, later black, central spines 1-3, somewhat stronger and longer than the radials, more or less conspicuously porrect: fls. from the lateral areoles near the end of the branches, $2\frac{1}{2}$ -3 in long, tolerably fleshy, white fr. depressed-globose, 2 in diam. by little more than 1 in. long. Brazil

cc. *Ribs of st. strongly compressed laterally.*

11. *peruvianus*, Haw. (*C. monoelonus*, DC.). Hedge Cactus. Fig 884. Tall, 30-50 ft., branching freely toward the base, columnar, 4-8 in diam., new growth dark green and glaucous, becoming a dull green with age, and, in old sts becoming corky: ribs 5-8, compressed: areoles $\frac{1}{2}$ -1 in apart, in new growth covered with conspicuous, curly brown wool, becoming gray: radial spines about 6-7, about $\frac{3}{8}$ - $\frac{1}{2}$ in long; central solitary, reaching a length of $2\frac{1}{2}$ in, the number of spines increases with age to as many as 20, all are rigid, brown: fls. abundant, from the lower part of the st., white, nocturnal, 6-7 in long by 5 in diam. S. Amer. G. C. III. 24 175 (var *monstrosus*).

Var *Alaciportanus*, K. Schum. (*C. Alaciportanus*, Mart.) Of somewhat weaker growth, low, and less conspicuously pruinose in the new growth, which is consequently nearly clear green. S. Brazil

12. *Jamacaru*, Salm-Dyck. (*C. viduus*, Haw.) Sts. upright, robust, rigid, 12-16 ft. high by as much as 6 in. diam., young growth azure-blue, turning dark green with age, glaucous: ribs 4-6, thin, compressed, crenate: radial spines 5-7, stiff, needle-like, clear yellow with brown points, or brown and finally black, about $\frac{1}{2}$ - $\frac{3}{4}$ in. long, centrals 2-4, somewhat stronger, porrect, $\frac{3}{4}$ -3 in long fls. large, 10 in long by 8 in. diam, white, nocturnal. Brazil, Venezuela.

13. *chalybaeus*, Otto. Sts. upright, branching above, arborescent, azure-blue and pruinose, later dark green, $1\frac{1}{2}$ -4 in diam ribs 6, in young growth very much compressed, later depressed till the st. is nearly cylindrical: areoles about $\frac{3}{4}$ in apart, dark gray-brown: radial spines mostly 7, about $\frac{1}{2}$ in. long, centrals 3-4, similar but somewhat stronger and a little longer; all the spines are pointed, stiff, when young are black, later brown to gray with black tips, bulbous at the base: fls. very similar to those of *C. carylescens*. Argentina.

aa. *Sts. erect, less than 2 in diam.*

b. *Ribs of st. 10 or more.*

14. *isogonus*, K. Schum. St. upright, columnar, about $1\frac{1}{4}$ in. diam., in young growth light green to yellow-green, later darker. ribs 15-16: areoles approximate,

white, turning gray: radial spines as many as 20, spreading, at first clear or dark yellow, becoming white, and finally gray, bristle form, flexible, about $\frac{3}{4}$ in. long; centrals 6-8; two of these are somewhat stronger and stiffer, about $\frac{3}{4}$ in long, one directed upward and one downward, yellowish brown to dark honey-color; later gray, as in the radials. S. Amer.

15. *splendens*, Salm-Dyck. Columnar, slender, short, rigid, more or less branching from the base, reaching a height of about 2 ft and about $1\frac{1}{2}$ in. diam., light to yellowish green: ribs about 10-12, rounded areoles prominent, about $\frac{1}{4}$ in apart, tawny, becoming white, tomentose: radial spines 8-12, radiating, yellow and light brown, becoming gray, centrals 1-3, scarcely larger than the radial, yellowish to white; all the spines slender, bristle form, about $\frac{1}{4}$ - $\frac{3}{4}$ in. long. —*C. Cavendishii* has been referred to this species, but with some question.

bb. *Ribs of st. 3-10.*

16. *platygonus*, Otto. At first upright, later somewhat reclining, branching, at the base about 1 in. diam., tapering in the new growth: ribs 8, low, arched: areoles about $\frac{1}{4}$ in apart, very small, yellow, becoming gray, subtended by a small 3-angled bract: radial spines 12-15, spreading, bristle form, little more than $\frac{1}{4}$ in long, central solitary, slightly longer and stronger; all the spines at first yellow-brown, changing to white or gray with age.

17. *carylescens*, Salm-Dyck. (*C. Lindbeckii*, Phil.). Arborescent or shrubby, 3-5 ft. high: sts. $1\frac{1}{2}$ in. diam.: ribs usually 8, obtuse: areoles approximate, white bud soon becoming black: spines rigid; radials 9-12, $\frac{1}{4}$ - $\frac{1}{2}$ in long, black; centrals 4, $\frac{3}{4}$ in long, stronger, black or white, fls. from the side of the st., slightly curved, 6-8 in long by 6 in diam., tube bronze-green, corolla white or occasionally rose-pink: frs. ellipsoidal, pointed at both ends, about 3 in long and half that in diam., bright red, with blue glaucous covering. Argentina. B. M. 3922

18. *Bridgesii*, Salm-Dyck. Upright, tall, columnar, simple or later branching at the base, bright green when young, becoming blue to gray-green, $1\frac{1}{2}$ -2 in diam.: ribs 5-7, very broad and low: areoles $\frac{1}{2}$ - $\frac{3}{4}$ in apart, yellowish to gray: spines 3-5, radiating, the under one, or seldom the upper one, the longest, $1\frac{1}{2}$ in long, stiff, sharp, straight, dark honey-yellow, with brown tips, becoming gray with age. Bolivia

Var *lageniformis*, K. Schum. (*C. lageniformis*, Forst.). Spines more numerous, somewhat longer.

19. *azureus*, Parm. (*C. Seidelii*, Lehm.) St. upright, tall, slender, columnar, branching from the base, in the young, fresh bluish green, later dark green with gray, glaucous covering, about 3-4 ft. high and about 1 in diam.: ribs 5-7, rounded, enlarged at the areole, areoles about $\frac{3}{4}$ -1 ft apart, elevated, large, abundantly woolly when young: spines 8-18, nearly alike, about $\frac{1}{4}$ - $\frac{3}{4}$ in long, stiff, slender, needle-form to bristle-like, black; the 2-4 central ones somewhat longer: fls. 8-12 in long, obliquely attached to the st., slightly curved, white. Brazil

20. *cassius*, Otto. Upright, columnar, branching at the base, somewhat tapering above, in new growth, beautiful light blue, pruinose, later, light green to slightly bluish, about $1\frac{1}{2}$ in diam.: ribs 5-6, separated by sharp grooves, about $\frac{1}{2}$ in high, compressed, faintly crenate, becoming depressed in older growth: areoles about $\frac{3}{4}$ in apart, small, yellow at first, later becoming white and finally gray: radial spines 8-10, sometimes more appear later; radiate, light amber-color, brown at the base, the lower pair the longest, mostly about $\frac{1}{2}$ in. long, centrals 4-7, like the radials but usually somewhat stronger, longer and darker; and all the spines thin, needle-form, flexible, sharp; later, light, horn-color, finally gray. S. Amer. (?)

AAA. *Sts. weak, clambersome over rocks & other plants, and without areoles.*

21. *Bónplandii*, Parm. *Sts.* at first upright, later clambering over rocks and bushes, about 1-1½ in diam., branching and spreading, in new growth commonly of a bluish or purplish green, later gray-green: ribs 4-6, sharp, compressed, crenate, separated by broad, concave faces; later the ribs become much depressed, so that the st. is sometimes nearly cylindrical; the ribs commonly run spirally around the axis of the st. areoles ½-1½ in apart, at first considerably depressed, later shallower, white, becoming gray radial spines 4-6 (later 1-4 more appear), straight, spreading, the largest about ½-1 in, stout, subulate, pointed, the under one needle-form and shorter, central solitary, straight, stronger, 1 in long, deflexed or perrect; the stronger spines are white, with tips and bases brown, when young beautiful ruby-red, later all are gray, with black tips and bulbous bases. fls. from the lateral areoles about 10 in long, white, nocturnal: fr. nearly spherical, about 2 in. diam, mammate, dark carmine-red. Paraguay, Brazil, and Argentina

22. *tortuosus*, Forbes (*C. atropurpureus*, Haage). *Sts.* slender, weak, at first upright, but later reflexed, reaching a length of 3-4 ft., and 1-1½ in. diam. ribs commonly 7, sometimes but 5, rounded, low, separated by regular serpentine grooves: areoles about 1 in apart, large. radial spines 5-8, about ¾-1 in long, centrals 1-4, about ¾-1½ in. long, all the spines slender, rigid, red-brown when young, becoming ashy with age fls. from the previous year's growth, about 6 in long, trumpet-shaped, tube olive-green and spiny, in the axis of the reddish green scales, outer petals pale green, tinted with brown, inner petals clear white: fr. spherical, brilliant red without and white within, mammate, bearing a few spines on the summits of the lower mammas Argentina.

23. *Mártini*, Labour (*C. monacanthus*, Hort.) At first upright, later requiring a support, freely branching from the base, branches long, reaching nearly 5 ft., ¾-1 in. diam, slightly tapering, dark green: ribs 5-6, separated by serpentine grooves, contracted between the areoles, sometimes the ribs are not evident, when the st. is cylindrical areoles about 1-1½ in apart, white: radial spines 5-7, reddish, short, bristle-form, with bulbous bases or short conical, usually about ½ in long, central solitary, mostly deflexed, ½-1 in long (in young growth, frequently not longer than the radial), subulate, robust, light brown or white, with bases and tips black. fls. from the older growth sts., 8-9 in. long, clear white, nocturnal fr. spherical (very

similar to *C. tortuosus*), pointed, dark carmine-red, about 2 in. diam., mammate, a few spines on the mammas, toward the base of the fr. Argentina. R.H. 1860, pp 658-9.—This species is commonly sold under the name of *C. platygonus*.

24. *Pitajaya*, DC (*C. pernaibucensis* [fernambucensis], Lem *C. formosus*, Salm-Dyck *C. variabilis*, Pfeiff.) By recent authorities referred to the genus *Acanthocereus* St at first simple, later branching, in young growth light green, turning grayish green with age, pointed, ¾-1½ in diam ribs 3-5, commonly 4: areoles about 1 in. apart, large, bearing a conspicuous amount of curly hair, about ½ in long, in new growth: radial spines 5-7 and a solitary central one, uniform, about ¾-½ in long, amber color to brown and finally gray fls. from the older growth, large, about 8 in long, slightly curved, white, nocturnal Uruguay, Brazil, Colombia B.M 4084—*C. grandis*, Haw, according to Weber, is but a larger form of this species.

AAAA. *Sts. more or less climbing by means of aerial roots*

25. *Martianus*, Zucc Of bushy growth, branching, reaching a height of 3 ft and more branches slender, provided here and there with aerial roots, cylindrical, about ¾ in diam: ribs commonly 8, straight, separated by sharp grooves, very low areoles ¼-¾ in. apart, small, white: radial spines 6-10, bristle-form, spreading, clear honey-yellow, at base brownish, later whitish and becoming gray, about ½ in long, centrals 3-4, similar, only somewhat stouter and darker: fls. usually abundant, straight or slightly S-shaped, 4-5 in. long, scarlet-red fr. spherical, reddish green, covered with bristles S Mex B.M 3768.

C. ventimiglia, Vaupe (Borncactus ventimiglia, Riccob.) St. slender, 8- or 9-ribbed spines in clusters of 8-10, spreading perianth-tube elongated, opening into a large throat, petals red-violet, fr. small, globose, bearing few bracts. This species apparently does not belong to the true Cereus, and is probably much nearer Cleistocactus, as suggested in the New Bulletin. It was described from plants flowering in the Botanical Garden at Palermo, Italy, and which are said to have come from Ecuador. Borncactus is a recently described genus, not yet taken into American collections *C. alamosinus*=*Rathbunia alamosensis*—*C. Baumannii*=*Cleistocactus Baumannii*—*C. J. N. ROSE.

CERINTHE (Greek, *keras*, wax; *anthos*, flower: the ancients thought that the bees visited the flowers for wax) *Boraginaceae*. Annual or perennial herbs from Europe and Asia Minor, with alternate glaucous leaves and showy purple bracts.

Calyx deeply divided, the tubular corolla with 5 very small reflexed lobes usually differently colored from

XXV. Celery.—The cultivation under field conditions, at the hilling-up or banking stage.

the tube.—About 6 species. The best species is *C. retorta*, which has a unique appearance in the garden, and is strongly recommended for more general cult. It is a hardy annual of easy cult.

retorta, Sibth. & Smith. HONEYWORT. Fig. 885. Height $1\frac{1}{2}$ –2 ft.: lvs. glaucous, often spotted white or red; lower lvs. obovate-spatulate, upper lvs. amplexicaul, with 2 round ears, on the flowering branches gradually becoming smaller and closer together until they pass into purple bracts, which form the chief attractive feature of the plant fls when full-blown protruded beyond the bracts; corolla tubular-club-shaped, yellow, tipped purple, with 5 small, spreading teeth: frs smooth but not shining. Greece B.M. 5264 Gn. 41.212. For a garden review of the other honeyworts, see Gn 41, p 212.

C. major, Linn. A showy annual 6–15 in high: lvs clasping the st., very rough and ciliate fls with showy bracts, the corolla yellow below, purplish at the top fr. smooth, shining and brown-spotted. Medit region B.M. 353.

WILHELM MILLER.

N. TAYLOR.†

CEROPEGIA (Greek, *wax* and *fountain*, the flowers having a waxy look). *Asclepiadaceæ*. Greenhouse vines of Africa and Asia.

Stems fleshy, erect and twining among the other plants in nature, or pendulous lvs. opposite, sometimes in the S. African species wanting fls medium-sized, the corolla more or less inflated at the base, straight or curved, corolla something as in our common milk-weeds, double.—A genus of 100 species, a dozen of which are known in Old World collections but only the following in Amer. Many of them have tuberous roots, and need a season of rest and dryness. May be grown in a compost of loam, leaf-mold or peat, and sand. Temperate house is the best for the two following. Prop by cuttings in spring over bottom heat. Odd and handsome.

Woodii, Schlecht. With many slender prostrate or trailing sts lvs fleshy, about $1\frac{1}{2}$ in. long, almost rotund fls in pairs, axillary on stalks, 3–7 in. long; corolla slightly curved, about $\frac{3}{4}$ in. long, pink or with dark lines below, the upper part sometimes purplish. Natal G.C. III 22 357, 37:244 (desc.) B.M. 7704.

Sandersoni, Decne. St. twining, fleshy and thick: lvs about $1\frac{1}{2}$ in. long, ovate-lanceolate. fls. cymose, 3–4 at a node, the greenish white corolla about $1\frac{1}{2}$ –2 in. long, curved and with an obvious inflation at the base. Natal B.M. 5792 G.C. III. 40.383. R.H. 1901, p. 111.

C. barbertoniensis, N.E. Br. Lvs somewhat variegated with pale green along the veins fls similar to *C. Woodii*. Transvaal.—*C. Brownii*, Ledger. Corolla-tube pale green with dark blotches, lobes greenish with a zone of white and dark purple in the middle. Uganda.—*C. discolora*, N.E. Br. Tuberous tube whitish, dark-veined, lobes rarely low at base, purple-green at apex. Madras.—*C. fuscata*, B. Hille. Many succulent sts. corolla dull reddish brown, corolla light yellow. Canary Is. B.M. 5066 G.C. *gemmifera*, C. Rehm. A tall climbing species fls solitary W. Trop Afr.—*C. Lupardii*, N.E. Br. Lvs thin, 1–2 in. long tube 1 in. long, abruptly curved immediately above inflated base, dilated at apex into funnel-shaped mouth. Bechuanaland G.C. III 30 302 (desc.)—*C. Rëndalii*, N.E. Br. A small species with fls having an umbrella-like canopy surmounting the corolla twining. Transvaal.—*C. similis*, N.E. Br. In cult as *C. Thwaitesii*. Corolla-tube white or pale green at base, ciliate. G.C. III 40 384 *C. Thörneri*, N. Br. Sts twining: cymes axillary, many-fld., corolla white, with purple blotches. Transvaal B.M. 5458.

N. TAYLOR.

CEROPTERIS (Greek, *wax fern*). *Polypodiaceæ*. Hot-house ferns of rather small size, interesting for the powder: covering on the leaves.

A rather small group somewhat related to *Pteris*, characterized most conspicuously by having the under surface of the lvs. covered with a colored powder, often silver, white or bright yellow (so-called silver and gold ferns). The sporangia are borne in indefinite lines and are unprotected by any indusium. The species of *Ceropteris* have in the past been classified under the generic name *Gymnogramma*, but fern students

are now generally agreed in separating it as a distinct genus.

INDEX.

<i>argentea</i> , 4.	<i>gigantea</i> , 2.	<i>sulphurea</i> , 3.
<i>argyrophylla</i> , 7.	<i>Laucheana</i> , 2.	<i>tartarea</i> , 8.
<i>calomelanos</i> , 6.	<i>magnifica</i> , 6.	<i>triangularis</i> , 1.
<i>chrysophylla</i> , 2, 6.	<i>peruviana</i> , 7.	<i>vivacea</i> , 1.
<i>decomposita</i> , 5.	<i>pulchella</i> , 9.	<i>Wettenhalliana</i> , 9.

A. Powder commonly yellow lvs. about as broad as long
1. *triangularis*, Underw (*Gymnogramma triangularis*, Kaulf.) Fig. 886 Lf-blades 2–5 in. wide and long, on stalks 6–12 in. long, dark green above, below deep golden yellow, or occasionally white; lower pinnae much larger than the others, deltoid, the upper lanceolate. Calif. to Brit. Col. Gn 48, p. 444—A white-powdered variety with a viscous upper surface and coarser cuttings (var. *viscosa*, D. C. Eaton) is found in S. Calif.

886. *Ceropteris triangularis*. (X $\frac{1}{2}$)

AA. Powder yellow: lvs. lanceolate, several times as long as broad.

B. Lvs. scarcely more than bipinnate.

2. *chrysophylla*, Link (*Gymnogramma chrysophylla*, Kaulf.) Lvs 12–18 in. long, with blackish stalks and rachises, the segms slightly pinnatifid at the base: powder golden yellow W. Indies to Brazil. R.H. 1856.201 G.C. III 23.373—Often considered a var. of *C. calomelanos*. Var. *Laucheana* (*Gymnogramma Laucheana*, Hort.), has triangular lvs. except in its sub-variety *gigantea* Gn 48, p. 437.

BB. Lvs tripinnatifid to quadripinnate.

3. *sulphurea*, Fée (*Gymnogramma sulphurea*, Desv.). Lf-blades 6–12 in. long on chestnut-brown stalks, the pinnae long, tapering, less than $1\frac{1}{2}$ in. wide at base, the pinnules compact, with 3–7 divisions. powder sulfur-yellow. W. Indies.

4. *argentea*, Kuhn (*Gymnogramma aurea*, Desv.). Lvs 6–12 in. long, 7–10 in. wide, deltoid, pinnae deltoid, 2–3 in. wide at base, the ultimate divisions cuneate. Madagascar.—By some this is referred to *Gymnogramma argentea*, Mett., a similar fern with white powder.

5. *decomposita*, Baker (known only under the name *Gymnogramma decomposita*, belongs in *Ceropteris*). Lvs. $1\frac{1}{2}$ ft. long, 1 ft. broad, deltoid, quadripinnate or even 5-pinnate; pinnae close, lanceolate, with the ultimate divisions linear and 1-nerved powder rather scanty. Andes. FR 2.25 G.C. III. 11:365. F. 1874, p. 148.

AAA. Powder white: lvs. lanceolate.

B. Segms acute

6. *calomelanos*, Underw (*Gymnogramma calomelanos*, Kaulf.). Fig. 887 Stalks and rachises nearly black: lvs. 1–3 ft. long, with lanceolate pinnae, segms. often with a large lobe-like auricle at the upper side of the base. W. Indies to Brazil. A.G. 14.303—The most variable species of the genus *C. magnifica*, Hort., is probably one of the many garden varieties. Var. *chrysophylla*, is here considered a distinct species. (See No. 2.)

BB. Segms obtuse, rounded.

7. *peruviana*, Link (*Gymnogramma peruviana*, Desv.). Lvs. 6–12 in. long, 3–5 in. wide, with dark

chestnut-brown stalks; pinnae somewhat regularly pinnatifid on both sides below. Mex. to Peru. By some considered a var of *G. calomelanos* Var. *argyrophylla* (*G. argyrophylla*, Hort.) is silvery on both sides.

887. *Ceropters calomelanos*. ($\times \frac{2}{3}$)

in long, 4 in wide, the lower pinnae much the largest; pinnules imbricated, texture rather thin. Venezuela. Var *Wettenhalliana*, Moore (*G. Wettenthaliana*, Hort.), is a garden variety, with pale sulfur-yellow powder.

L. M. UNDERWOOD.
R. C. BENEDICT.†

CERÓXYLON (Greek, *wax and wood*, i.e., wax-tree). *Palmaceae* WAX-PALM. Tall palms with ringed stems and pinnate leaves.

Spineless, the trunk covered with wax lvs clustered at the top, 15–20 ft. long when full grown, equally pinnate, pinnae long, rigid, sword-shaped, bases recurved and tips pointed, dark green above and glaucous beneath, the petiole very short and sheathed fls. mostly unisexual, on spikes nearly or quite covered by the simple spathe, fl-parts 3; stamens 9–15 seed as large as a hazel-nut, round, bony, inclosed in a soft or crumbling integument—Perhaps 4 or 5 species in the Andes of Colombia and Ecuador

andicolum, HBK. (*Idraria andicola*, Spreng *I. Klopstockia*, Hort *Klopstockia cerifera*, Karst *Beethovenia cerifera*, Engl.). The celebrated wax-palm of the Andes, and a good greenhouse subject said to reach nearly 200 ft.; trunk slender, swollen at the middle; lvs 6–8 m, the crown, the under sides silvery-scurfy.—The waxy covering of the trunk gives it a marble-like and columnar appearance. The wax, used as an ingredient in the making of candles, is an article of commerce. It is said that *Diplothemum caudescens* (*Cerozyllon ruveum*, Hort.) is sometimes sold for the wax-palm by plant dealers. *C. ferrugineum*, Regel, is probably referable to *Inarteia*. It appears not to be in the trade. *C. andicolum* is a free grower under cult., and is a very ornamental subject. It thrives in a warm moist house, and the seeds also germinate well under similar conditions.

L. H. B.

CESPEDÉSIA (named in honor of Juan Maria Cespedes, priest of Bogota). *Ochnaceae*. Tall handsome glabrous trees, sometimes grown in the juvenile state in hothouses

Leaves alternate, large, coriaceous, mostly obovate to lanceolate and narrowed at base, entire, or crenate; fls. yellow, showy, in large terminal bractless panicles; sepals 5, small and deciduous; petals 5; stamens 10 to

many; fr. a 5-valved caps; seeds very small.—Species probably 6–10, in S. Amer and Panama

discolor, Bull. Lvs large, lanceolate, drooping, handsomely colored on young growths in bright brown or tan tinted with rose and veined with yellow. Gn. W. 20.618.—A comparatively recent intro. to cult. in England.

L. H. B.

CÉSTRUM (old Greek name). Incl., *Habrothamnus*. *Solanaceae*. Greenhouse shrubs (or low trees) some of them with a climbing habit, and grown in the open in southern California and elsewhere South

Leaves alternate and entire, usually rather narrow; fls tubular, in axillary or terminal cymes, red, yellow, greenish or white, often very fragrant, corolla salver-shaped or somewhat trumpet-shaped, the long tube often enlarged at the throat, 5-lobed, exceeding the bell-shaped or tubular 5-toothed calyx, stamens mostly 5, all perfect, attached in the tube. fr a scarcely succulent mostly reddish or blackish berry, derived from a 2-celled stipitate ovary and seeds few or reduced to 1—Probably 150 species, in Trop and Subtrop Amer. They are much grown in warm countries, where they bloom continuously. For a monograph of the West Indian species (about 20) see O. E. Schulz, in Urban, Symbolor, Antillanae, vi, p 249–279 (1909–1910).

Cestrum are among the most useful of bright-flowering shrubby greenhouse plants, and they may be grown either as pot-plants, or planted against the back wall or supports of a greenhouse, where, if given a light position, they will produce an abundance of flowers from January to April. The Mexican species will do well in a winter temperature of 15° to 50°, but the species from Central America require stove temperature. They are propagated by cuttings taken in February or early in March and inserted in sand in a warm temperature, keeping them somewhat close until rooted, when they should be potted in a light soil, after which they may be grown in pots, shifting on as often as required, or planted out in the open ground toward the end of May in a sunny position, where, if kept pinched back to induce a bushy growth and attention is paid to watering, they will make fine plants by the first of September. They should then be lifted and potted in a light rich soil and kept close and shaded for a few days, and then transferred to their winter quarters. After flowering, the plants should be given a rest for a month or six weeks, gradually reducing the supply of water to induce the leaves and wood to ripen, after which they should be cut well back, the old soil shaken

888. *Cestrum elegans*. ($\times \frac{1}{2}$)

off, and the roots trimmed back, and then either potted again or planted out for the summer. While in the greenhouse, cestrum are very subject to the attacks of insects, especially the mealy-bug. (E. J. Canning.)

A. Fls red.

élegans, Schlecht. (*Habrothamnus elegans*, Brongn.). Fig 888. Tall and slender, half-climbing, the branches pubescent; lvs. ovate, lanceolate, long-acuminate, of medium size, pubescent beneath. fls. red-purple, swollen

near the top of the tube, in loose clusters which nod at the ends of the branches, the lobes ciliate. Mex. F.S. 2:82.—One of the old-fashioned greenhouse shrubs, blooming almost continuously. There is a form with variegated lvs. Var. *Smithii* (C. *Smithii*, Hort. Bull.) has beautiful blush-rose fls., profusely produced through summer and autumn. Gn 62, p 242, desc.

fasciculatum, Miers Spring bloomer, with larger fls. than those of *C. elegans*, and more compact, nearly globular fl.-clusters, the cluster subtended by small lvs. as if an involucre lvs ovate. Mex. B.M. 4183 (and probably the *C. elegans*, B.M. 5659.).

Newelli, Nichols (H. *Néwelli*, Vetch). Fls. bright crimson, larger and more brilliant than those of *C. elegans* and *C. fasciculatum*. Gn 34:106—A free-growing plant, originating from seed by Mr. Newell, Downham Market, England. Evidently an offshoot of one of the preceding species.

AA Fls. orange or yellow.

aurantiacum, Lindl. Of half-climbing habit: lvs. oval to ovate, more or less undulate, fls. sessile in a panicle, orange-yellow. Guatemala. R.H. 1858, p. 238.

Pseudo-Quina, Mart Glabrous lvs. membranaceous, ovate, obtusish or acute, narrowed at base: peduncles articulated at apex, axillary or in congested 4-8-fid terminal racemes, corolla slender with acute lobes, much longer than the toothed calyx. Brazil.—Said to have marked medicinal qualities. Differs from *C. Parqui* in having glabrous filaments and pedicellate fls.

AAA Fls. white, greenish, or cream-yellow.

Parqui, L'Her Shrub, half-hardy, nearly glabrous. lvs. lanceolate to oblong, petioled, short, acuminate: fls. sessile, long, tubular, with a wide-spreading limb, in an open panicle, greenish yellow, very fragrant at night Chile B.M. 1770 Adventure in Fls.

diurnum, Linn Quick-growing evergreen shrub, minutely pubescent or glabrous lvs. oblong and short-acute, thickish and glabrous, shining above fls. white, very sweet-scented by day, in axillary long-peduncled spikes; corolla-lobes roundish and reflexed, berry nearly globular; filaments erect and not denticulate W. Indies

nocturnum, Linn NIGHT-BLOOMING JESSAMINE Shrub, 4-12 ft.: branches brownish, very slender or flexuose, glabrous or nearly so lvs. thinner, ovate or elliptic, prominently acuminate: fls. creamy-yellow, very fragrant by night, corolla-lobes ovate and blunt: berry ovoid-oblong; filaments denticulate. W. Indies.

pubens, Griseb Sts and lvs. woolly-pubescent: fls. greenish, much like those of *C. nocturnum* and also fragrant at night. Argentina.

laurifolium, L'Her Glabrous shrub lvs. ovate to oblong, glossy, thick fls. greenish yellow and changing color (sometimes described under cult as pure white), in erect heads, slightly fragrant; corolla-tube club-shaped, tapering gradually; corolla-lobes ovate-roundish and blunt; filaments toothed. Berry ovoid W. Indies, S. Amer.—Much planted in S. Calif. L H B

CHÆNÁCTIS (Greek, *gaping ray*: the marginal corollas often ray-like) *Compositæ*. West American low herbs or undershrubs sometimes planted in the open for ornament.

Leaves alternate and mostly dissected: fls. yellow, white or flesh-colored on solitary peduncles or in loose cymes; florets of one kind, but the marginal ones with a more or less enlarged limb, involucre campanulate; receptacle flat and generally naked: pappus of toothed or entire scales (wanting in one species).—About 20 species, of which 3 have been intro as border plants; but they are little known to gardeners. Of easy cult. Prop. by seeds or division.

A. *Pappus of entire or nearly entire persistent scales.*

tenuifolia, Nutt Small, tufted annual, white-pubescent when young but becoming nearly or quite glabrous: 1 ft.: lvs. once or twice pinnately parted, the lobes linear or filiform. heads $\frac{1}{2}$ in. high, lemon-yellow. S. Calif.

Dodgiasii, Hook & Arn. Perennial, 3-15 in. high, usually white-woolly when young. lvs. broad, bipinnately parted into short and crowded, obtuse lobes: heads $\frac{1}{2}$ - $\frac{3}{4}$ in. high, white or whitish, usually in crowded, cymose clusters. Mont. south and west.—Variable Var. **achilleæfolia**, A. Nelson, is often sold for the type. It has more finely divided lvs.

AA. *Pappus of fimbriate and deciduous scales, or even wanting*

artemisæfolia, Gray Tufted annual, 1-2 ft., rusty pubescent and somewhat sticky on the under side of the lvs., glandular hairy above lvs. twice or thrice pinnately parted into short-linear or oblong lobes: heads $\frac{1}{2}$ in. high, the involucre viscid, the florets white or cream-color. S. Calif. N. TAYLOR †

CHÆNOMÈLES (Greek *chavenn*, to gape, to split, and *melea*, apple: the fruit was supposed by Thunberg to split into five valves) *Rosaceæ*, subfamily *Pônææ*. Woody plants, grown chiefly for their handsome brightly colored flowers appearing early in spring; formerly commonly included in *Cydona*.

Shrubs or small trees, sometimes spiny: lvs. subpersistent or deciduous, alternate, short-petioled, serrate fls. solitary or fasciated, before or after the lvs., sometimes partly staminate, calyx-lobes entire or serrate, petals 5, stamens numerous; styles 5, connate at the base fr 5-celled, each cell with many seeds.—Four species in China and Japan. See page 3507

These are ornamental plants, nearly hardy North except *C. sinensis*, which can be grown only South. *C. japonica* and *C. Maulei*, with handsome glossy foliage and abundant flowers in early spring, varying in all shades from pure white to deep scarlet, are highly decorative, and especially adapted for borders of shrubberies and for low ornamental hedges. The fruit of all species can be made into preserves. They thrive in almost any soil, but require sunny position to bloom abundantly. Propagated by seeds, usually stratified and sown in spring, also readily increased by root-cuttings made in fall or early spring, and rarer kinds or less vigorous-growing varieties are grafted in the greenhouse in early spring, on stock of the Japanese or common quince, they grow also from cuttings of half-ripened or nearly mature wood, under glass, and from layers.

A. *Fls. solitary, with reflexed serrate calyx-lobes, with or after the lvs. stipules small. (Pseudocydona)*

sinensis, Koehne (*Pyrus sinensis*, Poir *Cydōna sinensis*, Thoun *Pseudocydōna sinensis*, Schneid.). Shrub or small tree lvs. elliptic-ovate or elliptic-oblong, acute at both ends, sharply and finely serrate, villous beneath when young, 2-3 in. long fls. light pink, about $1\frac{1}{2}$ in. across: fr. dark yellow, oblong, 4-6 in. long. May China B.R. 11 905 R.H. 1889:228 A.G. 12:16. B.M. 7988.—The lvs. assume a scarlet fall coloring. Not hardy north of Philadelphia, except in favored localities. See also *Quince*.

AA *Fls. in leafless clusters, nearly sessile, before or with the lvs., calyx-lobes erect, entire, stipules large. (Chænomeles proper)*

B *Lvs. lanceolate or narrow-lanceolate, pubescent beneath while young.*

athayensis, Schneid (*Pyrus athayensis*, Hemsl. *Cydōna athayensis*, Hemsl.). Shrub, to 10 ft. lvs. lanceolate or oblong-lanceolate, acute, finely and sharply serrate, $2\frac{1}{2}$ - $4\frac{1}{2}$ in. long and $\frac{1}{2}$ - $1\frac{1}{2}$ in. broad;

petioles about $\frac{1}{2}$ in. long. fls. in clusters, red, $1\frac{1}{2}$ in. across; styles pubescent at the base; petals distinctly clawed. fr. oblong-ovoid, 6-7 in. long, with a cavity at each end. Cent. China. H.I. 27:2657, 2658. "Closely related to the following species, but lvs. much narrower, less hardy.

BB Lvs. elliptic-oblong to obovate, glabrous.

japonica, Lindl. (*Pyrus japonica*, Thunb. *Cydonia japonica*, Pers. *Chanomèles lagenaria*, Koidzumi). JAPAN QUINCE JAPONICA Fig 889 Shrub, 3-6 ft., with spreading, spiny branches; lvs ovate or oblong, acute, sharply serrate, glabrous, glossy above, $1\frac{1}{2}$ -3 in. long. fls. in 2-6-flt. clusters, scarlet-red in the type, $1\frac{1}{2}$ -2 in. across fr. globular or ovoid, $1\frac{1}{2}$ -2 in. high, yellowish green. March, April China, Japan. R.B. 1 280 L B C 16:1591. Gn 33, p. 491, 40:126; 50, p. 106 (frs.), 71, p. 262 (habit), G C III 34:434. B H. 1 260 (frs.). R.H. 1876:330 (fr.) G M. 35, suppl. Nov. 12 V. 4:38.—Many garden forms in all shades from white to deep scarlet, and also with double fls. Some of the best are the following Var **alba**, Lodd. Fls. white, blushed L B C 6 541. Mañlei, Schneid. (*Pyrus Mañlei*, Last. *Cydonia Mañlei*, Moore. *C. alpina*, Koehne). Low shrub, 1-3 ft.; branches spiny, with short, rough tomentum when young; lvs roundish oval to obovate, obtuse or acute, coarsely crenate-serrate, glabrous, 1-2 in. long. fls. bright orange-scarlet, 1-1 $\frac{1}{2}$ in. across, fr. yellow, nearly globular, about $1\frac{1}{2}$ in. across. March, April Japan. B.M. 6780 G C II 1:757 and 2:741; III 34:435. Gn. 13:390, 33, p. 490; 50, p. 106; 55, p. 354. F 1875:49. R.H. 1875 195 F.M. 1875 161. H.B. 26 241 — A very desirable hardy shrub, with abundant fls of a peculiar shade of red Var. **alpina**, Schneid (*C. japonica* var. *alpina*, Maxim *Cydonia Stargenti*, Lemoine). Dwarf spiny shrub, with procumbent sts. and ascending branches. lvs roundish oval, $\frac{1}{2}$ -1 in. long flowering and fruiting profusely R.H. 1911 204 Var. **supérba**, Hort Fls. deeper red Var. **tricolor** Hort. Dwarf shrub, with pink and white variegated lvs — By some botanists this species is considered to be the typical *C. japonica*, and the preceding species is called *C. lagenaria*

ALFRED REHDER.

CHÆNÓSTOMA (*gaping mouth*, in allusion to the shape of the corolla) *Scrophulariaceæ* African herbs or sub-shrubs sometimes planted in greenhouses, or in the open in mild climates

Leaves simple, mostly opposite; fls. axillary or terminal-racemose, showy, stamens attached to the throat of the corolla, more or less exerted, style filiform and club-shaped, and obtuse at the apex, corolla tubular, swollen in the throat, with a 5-lobed spreading limb; fr. a caps. with numerous seeds — Recent authorities combine this genus with *Sutera*, which, in the enlarged sense, comprises more than 190 species in Afr and the Canary Isls. *Chænostoma*, as separately limited, has 25-30 S. African plants with white, yellow or reddish fls. axillary or in terminal racemes, lvs. usually opposite, mostly dentate, 4 didynamous stamens which are exerted rather than included as in typical *Sutera* and the top of the style club-shaped and stigma obtuse rather than 2-lobed

hispidum, Benth (*Sutera brachiata*, Roth) Small perennial, sometimes an under-shrub, with opposite, oval or oblong, toothed lvs., and bluish-white or rosy white star-like fls. $\frac{1}{2}$ in. across, in dense clusters S. Afr J.H. III 33 636 — An old and deserving greenhouse or pot-plant, but rarely seen at present. It blooms almost continuously, the fls. sometimes hiding the foliage. Prop. by seeds or cuttings, either in fall or spring. Begins to bloom when 4-6 in. high. To be recommended for windows, and for summer vases. It has been listed as *Schænostoma hispidum*. In S. Calif. it is a half-hardy dwarf shrub (12 to 20 in. high and withstanding 4-6 degrees of frost), recommended for edgings

N TAYLOR †

CHEROPHYLLUM (Greek-made name, referring to the agreeably scented foliage). *Umbelliferae* Scented herbs, annual, biennial or perennial, glabrous or hirsute, often tuberous-rooted, of 30-40 species in the northern hemisphere, one of which is cult. Lvs. pinnately or ternately decomposed, the segms. also toothed or cut fls. small, white, in a compound many-rayed umbel, calyx-teeth 0. carpels with 5 more or less apparent ribs, the beak 0 or much shorter than the body. *C. bulbosum*, Linn., of Cent. Eu. and the Caucasus, biennial, is the turnip-rooted chervil (See *Chervil*) St. hairy, at least below, 3-5 ft. tall, branching, swollen below the joints, the root tuberous (and edible). lvs. much compound, the ultimate divisions very narrow.

L H B.

CHÆTOSPERMUM (from Greek, *hair* and *seed*). *Limonia* § *Chætosperrum*, Roemer. *Rutacæ*, tribu *Citræ*. A small spiny tree, proposed as a stock for citrus fruits.

Chætospermum bears hard-shelled frs : lvs. persistent, trifoliate; fls. pentamerous with 10 free stamens; ovary 8-10-celled, with numerous ovules in each cell, cells filled with spongy vesicular tissue; seeds hairy, the cotyledons aerial in germination—first foliage lvs. opposite.—Only one species is known.

glutinosa, Swingle (*Lundonia glutinosa*, Blanco. *Egle decidua*, Naves *Egle glutinosa*, Merrill) TABOG. Fig. 890. Petioles margined, lateral lfts small, sessile, scarcely one-third as long as the terminal one, spines slender, straight, sharp, axillary usually in pairs in the axils of the lvs.; fls. rather large, occurring singly, or in few-fl'd. clusters on long slender pedicels in the axils of the lvs : fr. oblong, 2-3 x $1\frac{1}{2}$ in with a thick leathery rind longitudinally ribbed, 8-10-celled; it contains numerous flattened hairy seeds, $\frac{3}{8}$ to $\frac{1}{2}$ in immersed in a watery tissue. Native to the Isl of Luzon, Philippine Archipelago. Ill Blanco, Fl Filip ed. III, pl. 124 Vidal y Soler, Sinop de fam Fil pl. 25. Bull. Soc Bot Fr 58, Mem 8d pl 5.—The tabog is a rapid-growing tree when young, and in a warm greenhouse shows a vigorous root-growth. This species is being tested as a stock for use in commercial citriculture. Experiments have shown that oranges, lemons, grapefruits and kumquats grow well when budded or grafted on young tabog plants

WALTER T. SWINGLE.

CHALCAS (from Greek for copper, as the wood has a copper-colored grain) *Murræa* of Koenig. *Rutaceæ*. Small spineless trees or shrubs, suggested as a stock for citrus fruits

Leaves pinnate, alternate fls large, 4-5-merous, solitary or in terminal or axillary cymes; ovary 1-5-celled, with 1 to several ovules seeds white, woolly or glabrous, cotyledons aerial in germination, first foliage lvs opposite

exótica, Millsp (*Murræa exótica*, Linn) ORANGE JESSAMINE. A small tree with pale bark, twigs and petioles usually puberulous lvs pinnate; lfts usually 5-9, ovate, obtuse or obtusely acuminate, often emarginate, dark green above, paler below fls fragrant, campanulate, 5-parted, petals white, stamens 10, free, ovary 2-celled, style deciduous fr subglobose, $\frac{3}{4}$ - $\frac{1}{2}$ in long, pointed, red. Ill Beddome, Outlines Bot., pl vii, Wight, Ic., pl Ind I, pl 96.—The orange jessamine is commonly grown in greenhouses on account of its abundant and very fragrant fls. These are often to be seen along with the mature red fr, which makes a striking contrast with the panicles of white fls and delicate foliage. The root-growth of this species is remarkably vigorous under greenhouse conditions. Lemons can be budded on it and make a rapid growth. It is being tested as a stock for the common citrus fruits in situations in which a vigorous root-system is desired

WALTER T. SWINGLE.

CHAMÆBÀTIA (Greek, dwarf, and bramble, alluding to its bramble-like flowers). *Rosaceæ*. A woody plant, grown for its handsome white flowers and for the finely divided aromatic foliage

Low shrub, clothed with glandular pubescence; lvs. alternate, stipulate, tripinnatifid, persistent; fls. in terminal corymbs, white; calyx-tube broadly campanulate; petals 5; stamens numerous; pistil solitary, with short style and decurrent stigma fr. a small achene inclosed by the persistent calyx.—One species in Calif. Ornamental shrub of agreeable aromatic odor, with graceful foliage and showy white fls. in June and July. It can be grown only in warmer temperate regions, and thrives best in sandy well-drained soil and sunny position Prop by seeds sown in spring and by greenwood cuttings under glass.

foliolosa, Benth. Two to 3 ft.: lvs. nearly sessile, oval or ovate-oblong, closely tripinnatifid dissected, $1\frac{1}{2}$ -2 $\frac{1}{2}$ in. long; fls. white, $\frac{3}{4}$ in. wide, in 4-8-fl'd.

corymbs. B.M. 5171. G. 29:29 B.H. 10, p. 295 H F. 1861:9. Gn. 3, p. 27.

ALFRED REHDER.

CHAMÆBATIÀRIA (in allusion to the similarity of this plant to *Chamaebatia*). *Rosaceæ*. Shrub grown for its handsome white flowers and the finely divided foliage, allied to the spiræas

Deciduous, with glandular aromatic pubescence; lvs alternate, bipinnate, with numerous minute segms.; stipules lanceolate, entire fls in terminal panicles; calyx turbinate, with 5 erect lobes, petals 5, suborbicular, stamens about 60 carpels 5, connate along the ventral suture, at maturity dehiscent into 2 valves; seeds few, terete, with a simple testa.—One species in W. N. Amer. Very similar in general appearance to *Chamaebatia*, but easily distinguished by the bipinnate lvs. and the large dense panicles, and very different in its floral structure. An upright aromatic shrub with finely cut foliage and white fls in large terminal

panicles, one of the first shrubs to burst into leaf. It is hardy as far north as Mass., but, like other plants from the same region, it dislikes an excess of moisture, particularly during the winter, and is likely to be killed by it. It prefers a sunny position and a well-drained soil, and likes limestone, but grows nearly as well without; it is not a plant for dense shrubberies. Propagated by cuttings of half-ripened wood taken with a heel in August with slight bottom heat, usually by seeds sown in spring, and treated like those of spiræa.

Millefolium, Maxim. (*Spiræa Millefolium*, Torr. *Sorbària Millefolium*, Focke) Shrub, to 3 ft. glandular-pubescent lvs. bipinnate, short-stalked, ovate-oblong to linear-oblong in outline, 2-3 in long, primary segms. linear, deeply pinnatifid, with closely set obtuse lobes about a line long, fls. white, $\frac{1}{4}$ - $\frac{3}{4}$ in. across, short-pedicelled, in terminal panicles 3-6 in. long; carpels hairy. Calif to Wyo. and Ariz. B.M. 7810 G.C. III. 22 237; 40-183 Gn 75, p. 459 G.F. 2 509 R.H. 1900, p 515 M.D. 1905-198 M.D.G. 1908 203

ALFRED REHDER.

CHAMÆCÉRASUS: *Lonicera*

CHAMÆCYPARIS (*chamai*, dwarf, and *kuparissos*, cypress; referring to its affinity). *Pinacæ*. Trees or shrubs grown for their handsome evergreen foliage; also valuable timber trees; *RETINOSPORA*, in part.

Evergreen, with opposite scale-like lvs in 4 rows, densely clothing the compressed branchlets fls monostrobilous, small; pistillate inconspicuous, globose; staminate yellow or red, oblong, often conspicuous by their abundance; cones small, globose, with 6-11 bracts, each bearing 2, or rarely 5, winged seeds, ripening the first season. Closely allied to *Cupressus*, which differs in its larger cones maturing the second year, the bracts containing 4 or more seeds, and in its quadrangular branches and minutely denticulate lvs—Six species in N. Amer and E Asia, all very valuable timber trees in their native countries. Highly ornamental evergreen trees of pyramidal habit, of which only *C. thyoides* is fully hardy N., while the Japanese species

801. *Chamæcyparis pisifera*.

are hardy in sheltered positions north to New England, and *C. Lawsoniana* only from Mass south; the horticultural varieties are often shrubby.

They grow best in somewhat moist but well-drained, sandy loam and in a partly shaded position, sheltered against dry winds. *C. Lawsoniana* and *C. obtusa* like more dry, the others more moist situations, and *C. thyoides* grows well even in swamps. Propagated by seeds sown in spring; increased also by cuttings from mature wood in fall, inserted in a sandy soil and kept in a coolframe or greenhouse during the winter; if in early spring gentle bottom heat can be given, it will hasten the development of roots considerably. All the so-called *retinosporas* and the dwarfier forms, and most of the varieties of *C. Lawsoniana*, are readily increased in this way, while the other forms of *C. nootkatensis*, *C. obtusa* and *C. thyoides* do not grow well from cuttings; therefore for most varieties veneer-grafting on seedling stock during the winter in green-

house is preferred, but dwarf forms always should be grown from cuttings, as they often lose their dwarf habit if grafted. The so-called *retinosporas* of the gardens, with linear, spreading leaves, are juvenile forms, which have retained the foliage of the seedling state. There are similar forms in *Thuja*. For their distinguishing characters, see *Retinospora*. For the numerous garden forms, see Beissner, *Handb. der Nadelholz.*, 2d ed., pp. 528-574, quoted below as Beissner.

A. Lvs. green on both sides or paler beneath.

thyoides, Brit. (*C. sphaeroides*, Spach *Cuprèssus thyoides*, Linn.). WHITE CEDAR. Tree, to 70 or 80 ft., with erect-spreading branches. branchlets irregularly arranged, spreading, not pendulous, very thin and slender, flattened: lvs. closely imbricate, glaucous or light green, with a conspicuous gland on the back, fragrant cones small, $\frac{1}{4}$ in diam., bluish purple, with glaucous bloom. From Maine to Fla., west to Miss S S 10 529. M D G 1896.301 (habit). Beissner 529 (habit) Var. *ericoides*, Sudworth (*C. ericoides*, Carr. *Retinospora ericoides*, Hort.) Compact shrub, of erect, dense habit lvs linear-lanceolate, spreading, with 2 glaucous lines beneath, colouring in winter usually reddish brown. Beissner 532, see also *Retinospora* Var. *andelyensis*, Silva-Tarouca (*C. sphaeroides andelyensis*, Carr. *C. leptoclada*, Hochst *Retinospora leptoclada*, Hort., not Zucc.) Intermediate form between the former and the type bluish green, and of erect growth, with loosely appressed, lanceolate lvs., often some branchlets with lvs of the type and some with lvs of the var. *ericoides*. R II 1869, p. 32, and 1880, p. 36. M D G 1890 329 R B. 2 155 Beissner 532, see also *Retinospora* Var. *glauca*, Sudworth (*C. sphaeroides glauca*, Endl Var *lewinsii*, Hort.) Of compact habit, very glaucous, with silvery hue Var *variegata*, Sudworth (*Cuprèssus thyoides variegata*, Loud.) Branchlets partially colored golden yellow

nootkatensis, Sudworth (*Cuprèssus nootkatensis*, Lambert *C. nutkaensis*, Spach *Thuyopsis borealis*, Hort.). YELLOW CEDAR. Tree, to 120 ft., with ascending branches, pendulous at the extremities. branchlets distichously arranged, slightly flattened or nearly quadrangular, pendulous lvs densely imbricate, usually dark green, acute, mostly without glands: cones subglobose, nearly $\frac{1}{2}$ in diam., dark red-brown, with glaucous bloom. From Sitka to Ore. S S 10 530. R II 1869, p. 18. G 19:345. F E 25 513 Gt 53, p. 542. G W 8, p. 484; 10, pp. 41, 227 Beissner 555. Gn. 5.395. G C. III 40.167. 36, suppl. April 25. M.D.G. 1900.589; 1903.201, R.H. 1903, p. 399. Beissner, 556. Var. *filicoides*, Beissn. Of slow growth with short and densely frond-like arranged branchlets. G.C. II. 5. 235. Var. *filiformis*, Beissn. (*C. pendula*, Maxim. *Thuja obtusata pendula*, Mast., not *C. obtusata pendula*, Beissn.) Branches elongated, thick and throat-like, pendulous, with few distant branchlets. Var. *gracilis aurea*, Beissn. Graceful form, foliage bright yellow when young, changing later to greenish yellow. Var. *lycopodioides*, Carr. Low form, of somewhat irregular habit, with spreading, rigid branches and thick, nearly quadrangular, dark green branchlets. Var. *nana*, Carr. Low form, of slow growth, with short, deep green branchlets. R.H. 1882.102. Var. *pygmaea*, Carr. (*C. obtusata breviramea*, Hort., not Beissn.) Very dwarf form, with horizontal, almost creeping branches, densely frond-like branched. Exceedingly interesting form for rockeries. R.H. 1889, p. 376. Var. *formosana*, Hayata. Differs in its smaller and finer foliage, and much smaller cones. Formosa. J.C.T. 25, 19, p. 209.

pisifera, Sieb. & Zucc. (*Cupressus pisifera*, Koch. *Retinospora pisifera*, Sieb. & Zucc.) SAWARA CYPRESS. Fig. 891. Tree, to 100 ft., with horizontal branches; branchlets flattened, distichously arranged and somewhat pendulous. Lvs. ovate-lanceolate, pointed, shining above, with whitish lines beneath. Cones globose, 1 1/2 in. diam., brown. S.Z. 122. G.C. II. 5. 237. C.L.A. 11. 311.—This is, next to *C. thyoides* the hardest species, and some varieties are much cult., while the type is less planted. Var. *aurea*, Carr. Yellow foliage. G.W. 1, p. 303. Var. *filifera*, Beissn. (*Retinospora filifera*, Standish. *C. obtusata filifera*, Hort.). Branches elongated and slender, threadlike, gracefully pendulous, with distant branchlets and lvs. Very decorative form. G.C. II. 5. 237. G.W. 1, p. 301;

893. Chamæcyparis pisifera var. squarrosa.

5, p. 17. Beissner 571, 572. Var. *plumosa*, Beissn. (*Retinospora plumosa*, Veitch) Fig. 892. Of dense, conical habit; branches almost erect, with slender branchlets of feathery appearance. Lvs. subulate, pointed and slightly spreading, bright green. Intermediate between the type and var. *squarrosa*. G.C. II. 5. 236. Gn. M. 2. 27. Beissner 569. Var. *plumosa*

argentea, Beissn. Tips of branchlets whitish. Var. **plumbea aërea**, Beissn. (*Retinospora plumbea aërea*, Standish). Young growth of golden yellow color. A very showy form. Var. **squarrosa**, Beissn. & Hochst. (*Retinospora squarrosa*, Sieb. & Zucc. R. leptoclada, Zucc.). Fig. 893. Densely branched, bushy tree or shrub, with spreading, feathery branchlets: lvs linear, spreading, glaucous above, silvery below. A very distinct and beautiful variety. S.Z. 123. R.H. 1869, p. 95, and 1880, p. 37. Beissner 567. M.D.G. 1909.44. R.B. 2. 189.

C. formosensis, Matsum. (*Cupressus formosensis*, Henry) Allied to *C. pauciflora*. Tree, to nearly 200 ft and 20 ft diam. branchlets dull green on both surfaces or slightly bloomy below. lvs acute, ovate cones ovoid, $\frac{1}{4}$ in across, with 10 or 11 scales. Formosa G.C. III. 51 132, 134.—Recently intro into England, but probably tender.

ALFRED REHDER

CHAMÆDAPHNE (*chama*, dwarf, and *daphne*, the laurel in ancient Greek, alluding to its dwarf habit and evergreen leaves) Syn., *Cassandra*, *Ericaceæ*. LEATHER-LEAF. Small plant, rarely cultivated for its early white flowers and evergreen foliage.

Low shrub, with evergreen alternate small lvs. fls. nodding in terminal leafy racemes; calyx small, 5-lobed; corolla urceolate-oblong, 5-lobed, with 5 included stamens; anthers 2-pointed. fr. a pressed-globose, 5-lobed caps with numerous seeds.—One species in the colder regions of the northern hemisphere. Low, hardy, ornamental shrub, valuable for the earliness of its pretty white fls. It thrives best in a peaty and sandy, moist soil. Prop by seeds sown in sandy peat, only slightly or not covered, and kept moist and shady; also by layers and suckers and by cuttings from mature wood in late summer under glass.

calyculata, Mench. (*Cassandra calyculata*, Don *Lyonia calyculata*, Reichb. *Andrōmeda calyculata*, Linn.) Fig. 894. Bush with spreading or horizontal branches, 1-3 ft. lvs short-petioled, oblong, obtuse, slightly serrulate and revolute at the margins, dull green above and rusty-lepidote beneath. fls short-peduncled, nodding, corolla white, oblong, about $\frac{1}{4}$ in long. B.M. 1286. L.B.C. 6:530, 15 1464, 16 1582. Mn N. 1 125. Em 423. Var. **angustifolia**, Rehd. (*Andrōmeda calyculata* var. *angustifolia*, Ait. *A. crispata*, Poir.) lvs linear-lanceolate, undulate and crisped at the margin.

Var. **nana**, Rehd. (*Andrōmeda calyculata* var. *nana*, Lodd. *A. vaccinioides*, Hort.). One foot or less high, with horizontal branches. L.B.C. 9:862.—Handsome little shrub, well suited for borders of evergreen shrubberies and for rockeries.

ALFRED REHDER.

894. *Chamædaphne calyculata*.
($\times \frac{1}{2}$)

CHAMÆDORÆA (Greek, *dwarf* and *gift*) *Palmarææ*. Spineless, erect, procumbent or rarely climbing usually pinnatisect or pinnate palms.

Trunks solitary or caespitose, slender or reed-like. lvs. simple, bifid at the apex or variously equally-pinnatisect; lobes broad or narrow, straight or oblique, acuminate, plicate-nerved, usually callous at the base, the basal margins folded back or recurved; petiole usually cylindrical; sheath tubular, oblique at the throat; spadices among or below the lvs., simple or paniculately branched; spathe 3 or many, often appearing much below the lvs., alternate, sheathing, elongated, split at the apex, membranous or coriaceous, usually per-

sistent, pistillate fls. very small, solitary, in small pits in the spadix: fr. small, of 1-3 globose or oblong-obtuse carpels, coriaceous or fleshy.—Species about 60. Mex to Panama. G.C. II. 23.410, and Dummer's articles in G.C. III. 38.42-44 (1905), and 36.202, 245 (1904).

Peat or leaf-mold, loam and sand in equal parts, with a little charcoal added, form the best soil. The species common in cultivation are quick-growing. They are well suited for planting out in greenhouse borders. The sexes are on different plants, therefore several should be planted in a group if the handsomely colored fruit is desired. All of the kinds require warm temperature in winter. Increased from seeds. Of the many species, only a few appear in the American trade. (G. W. Oliver.)

895. *Chamedorea glaucifolia*.

desmoncoides, 2.	glaucifolia, 3.	Sartorii, 4.
elator, 7.	Karwinskiana, 7.	leptoclada, 6.
elegans, 5.	latifolia, 8.	

A. Lvs simple.

1. **Ernesti-Augusti**, Wendl. St 3-4 ft., reedy, erect, radiant at base. blade obovate, cuneate at the base, deeply bifid, coarsely serrate along the margins; petiole shorter than blade, sheath amplexicaul. sterile spadix 8-9 in., the simple branches 6-8 in., attenuate, slender; fertile spadix simple, fls. red. Mex. B.M. 4837. F.S. 13' 1357.

AA. Lvs pinnate

B. Plant becoming of climbing habit.

2. **desmoncoides**, Wendl. Lvs. 2-3 ft long, with drooping, narrow lfts. a foot long, and glaucous petiole. plant tending to climb after it becomes a few feet high. Mex.

BB. Plant not climbing.

c. St or trunk evident

d. Lfts. 40-50, glaucous on both sides.

3. **glaucifolia**, Wendl. Fig. 895. St. 20 ft. lvs. long, pinnate, lfts 40-50, narrowed, long and slender, dark green, glaucous. fls. on a tall spadix which often exceeds the lvs and comes out from between them. Guatemala. G.F. 8' 507 (adapted in Fig. 895).—Horticulturally one of the best of all *chamedoreas*.

dd. Lfts. less than 40, bright green, at least above.

e. Spadix appearing among or with the lvs., not conspicuously cauline

4. **Sartorii**, Liebm. St. 8-14 ft., ringed, clothed above with lf-sheaths: lvs. 3-3½ ft. long; petiole terete, sulcate, dilated at the base, sheath, petiole and rachis white on the back, lfts. 12 in long, 1½-2 in. wide, alternate, falcate, acuminate, narrowed at the base, sometimes almost confluent spadix among or just below the lvs. Mex.

5. **elegans**, Mart. St. strict, 6 ft. high, scarcely more than 1-1½ in. thick, closely ringed, often sending out

roots from above the base. lvs. 6-8 in a cluster, broadly lanceolate; lfts. about 14, the upper pair sometimes confluent, acuminate, straight; fls. reddish orange; fr. globose. Mex. B.M. 4845.

EE. Spadix appearing much below the lvs., conspicuously cauline.

6. *Tepejilote*, Liebm. St. 10 ft high, closely ringed, about $1\frac{1}{2}$ in. thick; lvs. 4 ft; lfts. 20-30, 7-nerved, close alternate, falcate, acute, narrowly lanceolate, 13-15 in. long, $1\frac{1}{2}$ in. wide, rachis convex on the back, canaliculate above. fls. yellow Mex. B.M. 6030.

7. *elätior*, Mart (*C. Karwinskiana*, Wendl.). St. 20-30 ft, bamboo-like. lvs. 6 ft long, the sheath 18 in. long, lfts. 15 or 16, the lower very narrow, opposite or nearly so, the upper lanceolate, acuminate at each end, petioles $1\frac{1}{2}$ -3 ft long spadix simply branched, appearing at least 6 ft below the lvs; fls. reddish orange fr. globose, ovoid. Mex.—Intro. by Franceschi in 1898.

8. *Arenbergiana*, Wendl. (*C. latifolia*, Hort.). St. slender, 5-6 ft, green lvs. usually only 5 or 6, erect-spreading, lfts. 10-15 pairs, alternate and drooping, very long-pointed, plicate and many-ribbed. fls. yellowish white Guatemala B.M. 6838.

cc. St. or trunk none.

9. *Pringlei*, Wats. Acaulescent or nearly so; lvs. usually rather stiff, erect, pinnate, 3 ft; lfts. 12-15 on each side, linear-lanceolate, acuminate, 6-8 in. long, $\frac{1}{4}$ - $\frac{1}{3}$ in. wide, rachis triangular spadix simple, 8 in. long San Luis Potosi, Mex.

C. atrovirens, Mart. St. bamboo-like, stiff and simple, about 9 ft high lvs. bright green, spreading about $2\frac{1}{2}$ ft long. Mex. Not common in the trade but grown in fanciers' collections.—*C. bambusoides*, Hort. Sts. tufted, thin, reed-like, with feathery light green lvs. Honduras.—*C. formosa*, Hort. A showy pinnate-lyd palm of unknown botanical status. G.C. II 5724.—*C. gronomiformis*, Wendl. St. 4 ft lvs. simple, deeply cut, about 9 in. long spadix from among the lvs. long-pedicellate. Guatemala. G. 24, p. 244, 30, p. 593—here are said to be a number of unidentified species scattered about Calif.

JARED G. SMITH.

N. TAYLOR †

CHAMÆLIRIUM (*dwarf or ground lily*, a Greek combination) *Liliaceæ*. Sometimes spelled *Chamaelirion*. Rhizomatous whitish flowered hardy plant, sometimes planted in the herbary.

Erect, tall unbranched herb 2-4 ft high (or perhaps 2 species), inhabiting low grounds from Mass to Fla. and W. rootstock tuberous diaceous, the sterile plant less leafy than the other lvs. radical and cauline, the lowermost spatulate, the upper lanceolate, narrowed at the base fls. small ($\frac{1}{3}$ in. across), in a slender terminal raceme, segms. of perianth 6, white, narrow, 1-nerved, withering and persistent, sterile fls. with 6 stamens, and fertile fls. with rudiments of stamens, ovary 3-celled and 3-styled; fr. a 3-valved caps.

luteum Gray (*C. carolinianum*, Willd. *Chamaelirion caroliniana*, Hort.) BLAZING-STAR DEVIL'S-BIT. Variable as to height (6 in. to 3 ft or more), with most of the lvs. at the base raceme spike-like, 4-12 in. long, fls. yellowish white, in effect, fruiting pedicels $\frac{1}{2}$ in. or less long.—A good perennial, blooming May-July, thriving in moist shady places.—*C. oborile*, Small, by some considered not to be distinct, has larger fls. and fruiting pedicels $\frac{1}{2}$ in. or more long.

L. H. B.

CHAMÆMELUM (*small apple*, suggested by the odor of the fls.) *Compositæ*. Under this name one plant is offered. The genus is by many included in *Anthemis*, however, the sub-group being distinguished by very short or absent pappus, sometimes making a 1-sided border, ray-fls. fertile, and other minor characters. *C. caucasicum*, Boiss. (*Pyræthrum caucasicum*, Bieb.), is listed, with white daisy-like fls. about the size of a marguerite, of trailing habit, very free-flowering,

recommended for the rockery: perennial, 1- $1\frac{1}{2}$ ft, smooth, not strong-scented, st. ascending from a rhizome or procumbent or sub-erect; lvs. oblong, pinnatisect, the segms., cut into linear-subulate parts; fl-heads large, terminal; involucre-scales oblong-obtus, margined. High mts. in the Caucasus, variable.

CHAMÆPEUCE: *Carduus*.

L. H. B.

CHAMÆRANTHEMUM (*dwarf and flower*, from the Greek) *Acanthaceæ*. Three or 4 Brazilian small herbs, allied to *Eranthemum*, but readily distinguished by the 4 (instead of 2) stamens. Lvs. large and membranaceous, entire, variously marked. fls. showy, white or yellow, in bracteate clusters—Grown chiefly for the beautiful foliage, greenhouse subjects. *C. igneum*, Regel (*Eranthemum igneum*, Lind.) is in the American trade. It is a low spreading warmhouse plant (cult. of *Eranthemum* and *Justicia*), with dark green lvs., with the veins and sometimes the margins richly banded with orange or yellow; fls. small. F.S. 17:1722.

N. TAYLOR †

CHAMÆROPS (Greek for *dwarf bush*). *Palmaceæ*, tribe *Sabalæ*. Low fan-leaved palms.

Caudices caespitose, branched from the base and clothed with the bases of the lf-sheaths. lvs. terminal, rigid, semi-orbicular or cuneate-flabellate, deeply

896 *Chamerops humilis*.

laciniate, the lobes narrow, bifid, plicate; no rachis; ligule very short, petiole slender, bi-convex, the margins smooth or rough, sheath split, reticulate, fibrous; spadices short, erect compressed, branches short, densely fld. spathes 2-4, broad, thickly coriaceous, the lower ones split, the upper entire, bracts small, subulate, bractlets none primary spadix branches bracted; fls. small, yellow, fr. globose or ovoid, 3-sided toward the base, brown or yellow.—Species 1 or perhaps 2. Mediterranean. From *Rhapidophyllum*, an American relative, it may be distinguished by its bracted spadix. The common *C. humilis* is widely cult., and very variable. Many of specific-made names represent forms of this species. Of such cases are evidently the garden names *C. arborensens*, *C. argentea*, *C. canariensis*, *C. elata*, *C. elegans*, *C. farnosia*, *C. gracilis*, *C. littoralis*, *C. nvea*. G.C. II 23, 410.

The best soil for these palms is fibrous loam two parts, leaf-mold and sand one part, with good drainage. Propagated by suckers and by seeds. These are among the hardest of all palms, and are well suited to greenhouses where a high temperature is not kept up. (G. W. Oliver.)

humilis, Linn. Fig. 896 This is the only palm native to Eu. St. 1- $1\frac{1}{2}$ ft high lvs. ragged, fibrous; margins of the petioles armed with stout, straight or hooked spines, blade suborbicular, truncate or cuneate at the base, rigid, palmately multifold, segms. acuminate, bifid. Medit. B.M. 2152 R.H. 1892:84 (showing habit and a colored plate of the fr.)—Reaches 20 ft in a rather arborescent variety. Var. *dactylocarpa*,

Becc, is interesting for its elongated frs shaped like a date. Offered by Montarioso Nursery in 1912.

C. Biron, Sieb. = *Livistona rotundifolia* — *C. Bjerho*, Hort. = *Livistona rotundifolia* — *C. eschba*, Thunb. = *Trachycarpus excelsus* — *C. farinosa*, Hort. = *C. humilis*, Linn. = *C. Fortunei*, Hook. = *Trachycarpus* — *C. humilis schottii*, Hort. Said. to be a "choice garden hybrid of Florida origin" — *C. hystrix*, Fraser. = *Rhapido-phyl-lum hystrix* — *C. sinuacantha*, Hort. = *Azarthoriza aculeata*.

JARID G SMITH
N. TAYLOR.†

CHAMOMILE: *Anthemis*.

CHAPTALIA (J A C. Chaptal, 1756-1831, agricultural chemist) *Compositae*. Low perennial herbs, with white or purplish fls. on naked scapes, blooming in spring and summer. heads radiate, the ray-fls pistillate, and the disk-fls perfect, but some or all of them sterile, involucre campanulate or turbinate, of appressed and imbricated bracts; pappus of soft capillary bristles: achenes oblong or fusiform, narrowed above, 5-nerved. — Twenty-five American species. The only species in the American trade is *C. tomentosa*, Vent (*Thursan-thema semiflosculare*, Kuntze), of N C and south. Of this the scape is 1 ft. or less high, and the heads are

purple-rayed lvs oblong or oblanceolate, more or less remotely denticulate, rather thick, white-tomentose beneath. Intro. as a border plant. B M. 2257. N TAYLOR †

897. Chard, or sea-kale beet.

CHARD (*ch* pronounced as in *charge*) SWISS CHARD SEA-KALE BEET. A form of the plant (*Beta vulgaris*) which has produced the common beet, known as *Beta Cicla* (p 496). See *Beet* and *Beta*.

The beet plant has given rise to two general types of varieties: those varieties with thickened roots (the beet of America, the beet-root of European literature), and those with large and pulpy or thickened leaves (but whose roots are small and woody). The latter type is known under the general name

of leaf-beets. These leaf-beets may be arranged into two sub-groups (1) Common or normal leaf-beets, or spinach beets, in which the leaf-blade is large and pulpy, and is used as spinach, chard, in which the petiole and midrib are very broad and thick, is a form of this, although the name is sometimes used as synonymous with the general edible leaf-beet group. (Fig. 897), (2) ornamental beets, of which the foliage is variously colored.

Chard is of the easiest culture. Seed is sown in spring, as for common beets. The broad petioles, or chards, may be gathered from midsummer until frost. These broad white stalks or ribs are used as a pot-herb; and, if desired, the leaf-blades may be cooked with them. The dish is usually more attractive, however, if only the chards are cooked. If cutting of the leaves is carefully performed, a succession may be had till cold weather. Chard is an attractive vegetable when well grown, but is little used in this country.

L. H. B.

CHÁRIEIS (Greek, *elegant*, from the pleasing flowers). *Compositae*. Attractive hardy flower-garden annual.

A small, branchy plant, 6-12 in high, with blue or red aster-like fls. on long sts. plant pubescent or hispid: lvs oblong-spatulate or oblong-lanceolate, entire or remotely denticulate: heads many-ldd, radiate, the ray-fls pistillate, the disk-fls perfect achenes obovate and compressed, those of the disk with plumose pappus involucre scales in 2 rows — One species, in the W. Cape region. Known as *Kaulfussia* in gardens. The genus *Kaulfussia* was founded by Nees in 1820, in 1817, however, the plant was described by Cassini as *Charietis heterophylla*.

898. *Charietis heterophylla*. (X1)

heterophylla, Cass. (*C. Neesii*, Hort. *Kaulfussia amelloides*, Nees) Figs 898, 899. Rays blue, disk yellow or blue. An excellent subject of easy cult in any garden soil. Var. *atroviolacea*, Hort., has dark violet fls. Var. *kermesina*, Hort., has violet-red fls. Sow seeds where the plants are to grow, or they may be started indoors and the plants transplanted to the open. L. H. B.

CHARLOCK *Brassica* like *Raphanus*.

CHARLWOODIA. *Cordylina*

CHASTE TREE *Vitex*

CHAVICA, kept distinct in part by recent authors, is accounted for under *Piper*.

CHEAT, or CHESS. *Bromus*

CHECKERBERRY: *Gaultheria*

CHEESES. Vernacular for *Malva rotundifolia*

CHEILANTHES (Greek, *lip-flower*, alluding to the indusium). *Polypodiaceae*. Semi-hardy or hothouse ferns of small size.

Plants often hairy or woolly, with the sori terminal on the veins and covered with a roundish indusium. — Some 60 or 70 species are known, nearly a third of which are natives of the W and S W United States, one species as far east as Conn. They are of easy cult., enjoying a position near the glass, and disliking strong, close heat and syringing or watering overhead. Most of the

899. *Charietis heterophylla*.

species grow naturally in dry rocky situations. They are among the few ferns to be found in dry regions. Commercially valuable only from the fern collector's standpoint.

L M UNDERWOOD.

R C BENEDICT †

CHEIRANTHUS (derivation in dispute, but probably from Greek for *hand* and *flower*) *Cruciferae* Flower-garden perennials, with large purple, brown, orange or yellow fragrant bloom

Leaves alternate, entire, on a strict or upright st lateral sepals sac-like at the base valves of the pod with a strong mid-nerve Much confounded with Matthiola, and the genera are not sufficiently distinct In *Cheiranthus*, the lvs are acute, hairs 2-parted and appressed, stigma more spreading, pod more flattened and seeds not thinned, and the fls are prevailing orange or yellow—Probably a score of species, in the Canary and Madeira Isls, Medit region and E and in N Amer The garden species are confused, a critical study may find that some of them belong to *Erysimum* or other genera The genus hybridizes with *Erysimum*

Cheiri, Linn. **WALLFLOWER**

Fig 901 Perennial, slightly pubescent, 1-2½ ft lvs lanceolate and entire, acute fls large, mostly in shades of yellow, in long, terminal racemes, sweet-scented S Eu—An old garden favorite, blooming in spring Although a woody perennial, it is best to renew the plants from seed, for they begin to fail after having bloomed one or two years. Seedlings should bloom the second year, in England, Christmas bloom is secured from seeds sown in Feb. There are dwarf and double-fl. varieties,

901 *Cheiranthus Cheiri*.
($\times \frac{1}{2}$)

and innumerable forms in various shades of yellow, brownish, and even purple. Not prized so much in Amer. as in Eu. A common plant on walls in England.

alpinus, Linn. St. strict and simple, 1 ft. lvs. lanceolate, somewhat dentate, stellate-pubescent; pods spreading on short pedicels. fls. lemon-yellow, spring. Norway, Lapland.

mutabilis, L'Her. More or less woody, 2-3 ft.; lvs. linear-lanceolate and pointed, obscurely serrate; fls. white, cream-colored or yellowish, becoming darker and striped. Madeira B.M. 195.—It is doubtful whether the plant known in cult. as *C. mutabilis* is this species.

Marshallii, Hort. Perhaps a hybrid, 1-1½ ft. lvs. spatulate and crowded below, more scattered and narrower above; fls. orange.

Allionii, Hort. Said to be a hybrid. 12 in. or less; fls. brilliant orange, profusely produced in spring and summer and sometimes so freely that the plant exhausts itself and becomes practically biennial.

kevenensis, Hort., is valuable as a winter-blooming greenhouse plant, prized for its fragrance and its dark-colored fls. In 1897 at Kew a cross was made between *C. mutabilis* of the Canary Is. and a yellow wallflower, the cross being known as *C. hybridus*, and this in turn was crossed with a red wallflower, producing the plant known as *C. kevenensis*. It has the bushy character of *C. mutabilis*, racemes upright; fls. about 1 in. across, brown in bud, or expanding brownish orange inside and reddish brown outside, all turning pale purple with age. Prop. by cuttings. G.C. III. 35-123. Gn. 65, p. 89.

C. dinuxia, Hort.—Matthiola, but early-blooming forms of *C. Cheiri* seem to pass under this name.—*C. Mézierei* Benth & Hook.—Perrya.

L. H. B.

902 *Cheilone glabra*. (×¼)

CHELIDONIUM (Greek for the swallow, the fls. appear when the swallow comes) *Papaveraceae* **CHELANDINE** POPPY. One or two loose-growing herbs, sometimes seen in old gardens. Plant with fl-buds nodding, and small yellow fls. in small umbel-like clusters; sepals 2; petals 4; stamens 16-24; style very short, the

stigma 2-lobed. pod slender, 2-valved, opening first at the bottom. *C. majus*, Linn., is a European plant, now run wild in waste places, and often seen in old gardens. It is biennial or perennial, with brittle hairy sts. and pin itely-parted lvs., the lobes rounded and toothed (or, in var. *laciniatum* again dissected). The plant has bright orange juice which has been used for removing warts. Herb an old-time remedy, used for its cathartic and diuretic properties, for promoting perspiration, and as an expectorant. Lvs. light glaucous underneath.

L. H. B.

CHELONE (Greek for *tortoise* or *turtle*: the corolla fancied to resemble a reptile's head) *Scrophulariaceae*. **TURTLE-HEAD**. Several North American perennial herbs, with showy flowers in short spikes or in panicles, some of which are now sold by dealers in native plants. Allied to Pentstemon.

Upright smooth branching plants; corolla more or less 2-lipped or gaping, white or red, the upper lip arched and conspicuous and notched; anthers 4, woolly, and a rudiment of a fifth stamen. seeds winged. lvs. opposite, serrate.—Four species, in N. Amer.

Half-shaded places are preferable for these easily cultivated plants. Very dry grounds should be avoided, from the fact that they are best in swampy places. In the ordinary border they should have a very liberal mulch of old manure in their growing season. 4-5 in. thick is none too much: the surface roots will feed in this compost, and the plants are not so liable to suffer from drought when thus protected. (J. B. Keller.)

A. Fls. in terminal and axillary close spikes

B. Lvs. elliptic to broad-ovate, long-petioled

Lyonii, Pursh. Plant, 2-3 ft. high. lvs. broad to linear cordate at base, thin, evenly serrate; fl-bracts minutely ciliate. fls. rose-purple. Mts., Va. and S.

BB. Lvs. lanceolate or oblong, short-petioled

obliqua, Linn. Two ft. or less; lvs. 2-8 in. long, broad-lanceolate or oblong, very veiny, sharp- or deep-serrate or cut; fl-bracts ciliate. fls. deep rose. Damp grounds, Ill., Va., S.

glabra, Linn. (*C. obliqua* var. *alba*, Hort.) Fig. 902. One to 2 or more ft. high, more strict. lvs. mostly narrower, acuminate, appressed-serrate, nearly sessile, not very veiny. fl-bracts not ciliate. fls. white or rose-tinted. Wet grounds; common.

AA. Fls. in a loose thyrs or panicle

nemorosa, Douglas (*Pentstemon nemorosus*, Trautv.). Two ft. or less high, of unpleasant odor. lvs. ovate and acute, sharp-dentate, sessile or nearly so. fl-bracts none; corolla 1 in. long, violet-purple. Calif. and N. B.R. 1211.

C. barbata of gardens is *Pentstemon barbatus*.

L. H. B.

CHENILLE PLANT. A proposed name for *Acalypha hispida*, better known as *A. Sanderi*.

CHENOPODIUM (*goosefoot*, alluding to the shape of the leaves). *Chenopodiaceae*. **GOOSEFOOT**. Widely dispersed weedy herbs, with very inconspicuous greenish flowers, some of which occur in gardens as oddities or for ornament, and others are pot-herbs of very minor importance. Spinach, beet, and orach are allied plants.

Plants of various habit, mostly erect; fls. perfect, bractless, sessile in small masses and these clusters arranged in spikes or panicles; calyx 4-5-parted, petals wanting; stamens usually 5; styles 2 or 3; seed lenticular. lvs. alternate. The calyx sometimes enlarges and becomes succulent and colored, inclosing the fr., and the glomerules may then look like berries.—Perhaps 60 species in all parts of the globe, annuals and perennials, sometimes woody. Many of them are field and garden weeds. They are mostly mealy or

glandular herbs, often with strong odor. Some of them are used as pot-herbs or "greens."

A. Fls. in dense heads or glomerules which become berry-like and bright red in fr.

capitatum, Aschers. (*Bätum capitatum*, Linn.). STRAWBERRY BLITE Annual, erect and becoming diffuse or spreading, branching, glabrous or nearly so lvs soft, hastate-ovate, toothed, stalked fr-clusters large and becoming fleshy, in an interrupted spike, the upper part leafless Eu —A frequent but not pernicious weed, and sometimes offered as a pot-herb.

AA. Fls. not in dense separate heads, and the clusters not becoming prominently fleshy or colored.

n. Plant shrubby, spinescent.

nitrariaceum, F Muell. Rigid, much-branched, often prostrate shrub or undershrub, mealy-white. lvs linear-oblong or linear-spatulate, obtuse, entire, 1 in or less long, often clustered fls clustered in dense or more or less interrupted spikes and panicles, greenish Austral.—Offered in Eu

BB Plant herbaceous

c Species perennial a pot-herb.

Bönus-Henricus, Linn (*Blitum Bönus-Henricus*, Reichb.) GOOD KING HENRY MERCURY (by corruption, Markery) Stout and erect from a thick rootstock, to 2½ ft, glabrous lvs broad, triangular-hastate or ovate, with very long wide-spreading basal points, entire or undulate fls in paniculate spikes Eu. —Escaped now and then, and sometimes cult for "greens"

cc Species annual.

purpurascens, Jacq (*C. atriplicis*, Linn f) Vigorous, erect, 3 ft, the young parts and lvs covered attractively with a rose-violet or violet-purple crystalline pulverulence lvs spatulate or rhomboid or oval, obtuse, long-petioled, the lower ones serrate-dentate and the upper lanceolate and entire fls small and numerous, in dense pyramidal leafy reddish clusters China—An old garden plant, seldom seen in this country, grown for its colored character in summer There are different forms, one with variegated foliage

amarantifolius, Coste & Reyn Very large, 8 ft, much like the preceding and perhaps derived from it: st glabrous, striped white and red lvs triangular to rhomboid, 4 in or less long, red-pulverulent fls in a long red panicle S France—Differs from *C. purpurascens* in its greater size and its black shining somewhat sharp-edged seeds. The brilliant colors disappear as the plant matures.

Quinoa, Willd. QUINOA. Erect, stout, st furrowed, 4-5 ft lvs triangular-ovate, serrate, long-petioled, angulate-pinnatifid, glaucous fls small and green, in dense axillary and terminal farinose clusters arranged in panicles, seeds very large W slope of the Andes B M 3641—A very important plant in W S Amer, the seeds being used as food. There are white- and red-fruited forms Sometimes cult in this country as a curiosity. Allied to *C. album*, the common pigweed

Bötrys, Linn. FEATHER GERANIUM. JERUSALEM OAK. Erect, glandular-pubescent and viscid, aromatic, 1-3 ft. high, with pinnatifid long-petioled lvs and long, feather-like, enduring spikes, for which it is used in vases and baskets; pretty Eu, and widely naturalized although not usually becoming abundant

Many weedy chenopods invade cult grounds *C. album*, Linn the common pigweed or lamb's quarters is a favorite for "greens" This species runs into many forms *C. rivale*, of Eu and Asia, has seeds that are said to be edible *C. vulgare*, Linn, sparingly into from Eu, has the smell of stale fish *C. ambrosioides*, Linn, Mexican tea and var *anthelminticum*, Gray, wormseed, are frequent, they contain strong essential oils The weedy species are variable, and puzzling to the systematist

L. H. B.

CHERIMOYA, CHERIMOYER (Quichua language of Peru, *chirimuya*, signifying cold seeds) (*Annona Cherimola*, Mill) Figs 9003-9005. An important table fruit of warm countries See p 293, Vol I, for botanical description

The cherimoya is considered by many to be the finest of the subtropical fruits, and that not only by the natives of the countries in which it grows, but also by Europeans It is somewhat like the pomme-cannelle, or sweet-sop, but differs from it in having a peculiar acidulous flavor most agreeable and grateful to the taste. For centuries the cherimoya has been cultivated

903. Cherimoya—smooth form (X¼)

and several distinct varieties have resulted One of these has smooth fruit devoid of protuberances, which has been confused with the inferior fruits of both *Annona glabra* and *A. reticulata* The last two species, however, are easily distinguished by their leaves and flowers, *Annona glabra*, commonly known as the alligator apple or mangrove annona, having glossy laurel-like leaves and globose flowers with 6 ovate petals, and *A. reticulata* having long narrow glabrate leaves devoid of the velvety lining which characterizes those of the cherimoya. Both of these species, moreover, are essentially tropical, while the cherimoya is subtropical, growing in tropical countries only at considerable elevations, where the climate is cool and the soil well drained

The origin of the cherimoya has been much discussed. De Candolle, however, is in all probability correct in attributing it to the mountains of Ecuador and Peru. The common name which it bears, even in Mexico, is of Quichua origin, as explained above, and terracotta vases modeled from cherimoya fruits have been dug up repeatedly from prehistoric graves in Peru. It was introduced at a very early date into Central America and Mexico and into Jamaica in 1786 by Hinton East It is now of spontaneous growth in limited areas both in Central America and the mountains of Jamaica In Madeira, the cherimoya has taken the place of the grape-vine on many of the estates on the warm southern slopes of the island. Here the cultivation is systematic The two-year-old seedlings are budded or grafted. The trees are frequently trained on walls or on trellises, so that the fruit may hang in the shade while ripening, and manure is regularly supplied (see *Annona*) The result of careful selection is that there are varieties of fine flavor, comparatively few seeds, and great size, weighing from twelve to sixteen pounds According to W Fawcett, ordinary fruits weighing from three to eight pounds, have been sold in the London market at \$1 50; large ones at \$2 50 and even \$3 The cherimoya has been

successfully introduced into southern California where it finds the most favorable conditions in the foot-hills near the coast.

The cherimoya grows in the form of a small tree, usually about 15 or 20 feet high. The flowers are remarkably uniform, but vary somewhat in size. They are often solitary or in two's or three's, while those of the bullock's heart (*Annona reticulata*) and the sugar-apple (*A. squamosa*) are usually clustered. The leaves are always velvety on the lower surface. The following varieties, based upon the form of the fruit, are recognized:

(1) Finger-printed cherimoya (forma *impressa*), known in Costa Rica as "anona de dedos pintados." This form was the first to be figured (Feuillec, Pl. med. Journ. Obs. 3, append. 24, pl. 17, 1725). The fruit, conoid or subglobose in shape, has a smooth surface covered with concave U-shaped areoles resembling finger-prints in soft wax or putty. It is one of the best varieties, with sweet juicy pulp of good flavor, and with relatively few seeds.

(2) Smooth cherimoya (forma *lavis*), called in South America "cherimoya lisa" and in the market of Mexico City, "anon." Fig. 903. It is this form which is so often mistaken for *Annona glabra* and *A. reticulata* on account of the general appearance of the fruit and the common name "anon," which is also applied to the fruit of the last-named species. This is one of the finest of all the cherimoyas.

(3) Tuberculate cherimoya (forma *tuberculata*). Fig. 904. It is one of the commonest forms, in which the fruit is heart-shaped and bears small wart-like tubercles near the rounded apex of each areole. To this group belongs the "golden russet" cherimoya grown in the orchard of C. P. Taft at Orange, California. It is the form most frequently found in the Peruvian markets and is represented in prehistoric pottery from the graves of that country.

(4) Mammillate cherimoya (forma *mammillata*), called in South America, "cherimoya de tetillas."

This is the form successfully established on the ranch of Charles F. O'Brien, in the mountains of Santa Monica, southern California. It is also the common form of the Nilgiri Hills of India, and is one of the best forms grown on the island of Madeira.

(5) Umbonate cherimoya (forma *umbonata*), called "cherimoya de puas" and "anona picuda" in Latin America. In this form the skin of the fruit is comparatively thick, the pulp more acid than in other forms, and the seeds more numerous. It has the flavor of pineapple and is one of the best for producing cooling drinks and sher-

bets. The fruit is oblong-conical in shape, with the base more or less umbilicate and the surface studded with protuberances, each of which corresponds to a component carpel. To this form should be referred the "Horton" cherimoya, grown in the vicinity of Pasadena, California.

Very recently there has been received from Florida an interesting fruit borne by a hybrid, the result of pollinating the stigmas of a cherimoya with the pollen of *Annona squamosa*. The leaves of this plant are very broad, resembling those of *A. Cherimola* in shape, but glabrous like those of *A. squamosa*. The fruit resembles that of *A. Cherimola* in form, but with the protuberances very distinct and covered with a glaucous bloom like that of *A. squamosa*. The seeds are distinct from both species, larger than those of *A. squamosa*, and much darker colored than those of *A. Cherimola*, and the pulp is very juicy, with the fine slightly acidulous flavor of the cherimoya.

For the propagation and culture of cherimoyas, see *Annona*.

W. E. SAFFORD.

CHERLÈRIA: *Arenaria*.

CHERRY. Several kinds or types of small stone-fruits ripening in late spring and in summer, widespread and popular in domestic and commercial use. Figs. 906-910. Plate XXI.

Sweet and sour cherries have been domesticated from two Old World species: cultivated sweet cherries having come from *Prunus avium* and the sour cherries from *Prunus Cerasus*. Varieties of these two species, and hybrids between them, now encircle the globe in the north temperate zone and are being rapidly disseminated throughout the temperate parts of the southern hemisphere. For centuries, probably from the beginnings of agriculture, cherries have been valuable fruit-producing trees in Europe and Asia, inhabitants of nearly every orchard and garden as well as common roadside trees in temperate climates of both continents.

Coming from the Old World to the New, the cherry has played an important part in the orcharding in temperate regions of the western hemisphere. In North America, varieties of one or the other of the two cultivated species are grown from Newfoundland to Vancouver Island on the north, southward to the Gulf of California, Texas and Florida, probably yielding crops in a greater diversity of soils and climates on this continent than any other tree fruit.

Sour cherries are suited to many environments, thriving in various soils and withstanding rather better than most orchard fruits heat, cold and atmospheric dryness, and though they respond to good care, yet they thrive under neglect better than most other tree fruits. Sour cherries also have fewer insect and fungous troubles than other tree fruits, being practically immune to the dreaded San José scale. Sweet cherries, however, are much less easily grown. Sweet varieties are all somewhat fastidious as to soils, are lacking in hardiness to both heat and cold, are prey to more insects than sour cherries and subject to nearly all of the fungous ills to which stone-fruits are heir, suffering in America in particular from brown-rot and leaf-spot.

905. Flower of Cherimoya with two outer petals removed to show minute inner petals and essential parts, also an outer petal. (X1 1/2)

904. Cherimoya, tuberculate form. (X 1/4)

Sweet cherries can be grown with commercial success in but few and comparatively limited regions, although the localities adapted to sweet varieties are rather widely distributed.

The cherry is probably the most popular of temperate climate fruits for the home yard, being planted more commonly than any other tree-fruit, in the many regions in which it is grown, in the dooryard, garden and along the roadside. The characters, other than those already named, that commend it for home plantations, are, early bearing after planting, early ripening in the season, regularity in bearing, great fruitfulness and ease of culture. It is more than a home fruit, however, and is largely grown for the markets, for canning and for preserving.

In America, the consumption of cherries is being greatly increased by the fashion of adding them preserved to many ices and drinks. The demand for canned cherries has also increased enormously in this country during the last few years. In Europe, wine is made from cherries, "kirschwasser," a spirit, is distilled from the fermented fruit pulp, and in the Austrian province of Dalmatia a cordial called maraschino is made by a secret process of fermentation and distillation. This liquor is imported to America in considerable quantities to flavor preserved cherries which become the well-known "maraschino cherries" of confection and delicatessen shops.

Other species

Several species of cherries other than the two named have more or less horticultural value. *Prunus Padus* and *Prunus Mahaleb* of the Old World furnish fruits sometimes used for culinary purposes but much more cultivated, in their various forms, as ornamentals, the latter furnishes a stock upon which orchard varieties are now most commonly budded. *Prunus Besseyi*, *Prunus pumila* and *Prunus pennsylvanica* are species from North America, the first two having varieties cultivated for their fruits and all three being used as ornamentals and for stocks. *Prunus Pseudo-Cerasus* and *Prunus tomentosa* from Asia are much grown in China and Japan as ornamentals, for their fruits and as stocks, and should find favor in Europe and America for these purposes. In recent years many new species of cherries have been discovered in Asia. E. Koehne, one of the best authorities on the genus *Prunus*, places 120 species, nearly all from Asia, in the sub-genus *Cerasus* to which belong the orchard cherries (Mitt. Deut. Dendrol. Gesell., 1912 168-183). A few of these have already been introduced in America by the United States Department of Agriculture, and from them one is sure to find valuable horticultural species to be

used for their fruits, as ornamentals, as stocks, and for hybridization with species already domesticated.

Propagation.

Both orchard and ornamental cherries are commonly propagated in Europe and America by budding on Mazzard or Mahaleb stocks and in Japan, where cherries are much grown, on *Prunus Pseudo-Cerasus*. When exceptional hardness is required, seedlings of the Russian sour cherries may be used or those of *Prunus Besseyi* or *Prunus pennsylvanica*. Undoubtedly the Mazzard is the best stock for regions in which cherries can be grown commercially. Upon the Mazzard, varieties of either sweet or sour cherries make larger, thriftier, longer-lived and more productive trees.

The Mahaleb, on the other hand, is the best stock from the nurseryman's point of view. It is more easily budded, harder, freer from insects and fungi as it stands in the nursery before budding, and the buds more quickly develop into salable trees. But the advantages of the Mazzard are so much greater for the fruit-grower that he should accept only trees on this stock unless hardness be a prime requisite. Cherries are set in the orchard at two years from the bud.

The cultivation and handling

Sweet cherries are most profitably grown on high, comparatively light, sandy, gravelly or even stony loams, while sour cherries do best on somewhat heavier soils. The former are set 22 to 24 feet apart, the latter 16 to 20 feet. Both respond to care in cultivation which, in brief, is early spring plowing, frequent cultivation until the first of August with a cover-crop sown just before the last cultivation. Cover-crops are various—a favorite one in New York and Michigan is a half bushel of oats or barley, and twelve pounds of clover or twenty pounds of winter vetch. In Delaware and New Jersey the cowpea is much liked as a cover-crop.

Cherry trees are usually headed 2 or 3 feet from the ground with a tendency to head them lower—half the above distances, in the lower-headed orchards there seems to be no inconvenience in tilling with modern implements. Nearly all commercial growers form the head with five to seven main branches about a central trunk, but some prefer to remove the central stem, especially in sweet varieties, leaving a vase-formed head. After the head is formed, the subsequent pruning is exceedingly simple, consisting of cutting out an occasional injured or crossed branch and now and then heading-in a long whip-like growth. In soils well adapted to cherry-growing, commer-

906
Tall erect growth of
sweet cherry

907 Low-headed and spreading
growth of sour cherry.

908. Old sweet cherry tree, on the Chesapeake peninsula

cial fertilizers are little needed. Good cultivation, the yearly cover-crop and an occasional dressing of stable-manure furnish an abundance of food. If, with this treatment, the trees fail to make sufficient growth, and if the drainage be good, the grower should experiment with fertilizers containing potash, phosphoric acid or nitrogen to see which, if any, his trees may need.

Cherries are picked with stems on, the sweet a few days before fully ripe, the sour when practically

mature. Some growers guard against breaking the fruit-spurs for the next year by using picking scissors. Cherries are variously packed in boxes and baskets but the container is usually a small one and much art may be displayed in placing in layers, facing, and in making the package in all ways attractive. Fruit for canning must be carefully picked but is sent to the cannery in trays holding one or two pecks.

The chief commercial plantations in eastern America are found in New York, New Jersey, Delaware, northern Ohio and western Michigan. Sweet-cherry growing is precarious because of natural obstacles, and sour cherries are so easily grown that through very abundance their sale is often difficult. Yet with both success has been attained by many, the profits ranging as high as \$300 to the acre.

Special difficulties.

The cherry is attacked by a dozen or more fungi. Of these, three are serious pests. The brown-rot, *Sclerotinia fructigena*, attacks the flowers, leaves, twigs and most disastrously the fruits at ripening time. Leaf-blight, *Cylindrosporium Padi*, produces diseased spots on the leaves, which for the most part drop out, giving a shot-hole effect and eventually causing the foliage to drop prematurely. A common and striking disease of the cherry is black-knot, *Plowrightia morbosa*, characterized by wart-like excrescences on shoots and branches which at maturity are black; affected parts sooner or later die.

The text-books give no less than forty insect enemies of cherries, of which the plum-currulo, *Conotrachelus nenuphor*, the peach-borer, *Sanninoidea exilis*, and the San José scale, *Aspidiotus perniciosus*, on sweet

cherries, must be combated. All of the pests named, both fungi and insects, are more destructive to plums and peaches, and the reader is referred to those fruits for treatment which is much the same as for the cherry.

Sweet cherries suffer severely in the South and the Mississippi Valley, and somewhat in the North, from sun-scald, either directly from the sun's rays or from alternate freezing and thawing in winter or spring. The injury is manifested by the bursting of the bark and the exudation of gum on the south and west sides of the tree. Some immunity from such injuries may be obtained by protecting the trunks with boards or other screens. "Gummosis," or a flow of gum from the wood, often follows injuries of various kinds and the work of insects and fungi in both sweet and sour cherries.

Types and varieties.

There are now about 600 varieties of cherries grown in America and Europe, and the names of as many more that have passed from cultivation remain. These are variously grouped, but the following simple classification takes in the common orchard sorts.

A. *Prunus avium*

(1) *The Hearts*.—Large, heart-shaped, soft-fleshed, sweet cherries, light-colored as represented by Governor Wood and dark as in Black Tartarian.

(2) *The Bigarreus*.—Large, sweet, heart-shaped and colored as in the previous group but with firm, crisp and crackling flesh. Well represented by Napoleon (Fig. 909) and Yellow Spanish as light-colored members of the group, and by Schmidt and Bing as dark sorts.

(3) *The Dukes*.—Somewhat smaller cherries than the Hearts and Bigarreus, softer in flesh, light-colored and usually sour or nearly so. This group is placed under *Prunus avium*, but there can be no doubt but that the widely varying Dukes are hybrids between *Prunus avium* and *Prunus Cerasus*. May Duke and Reine Hortense serve as illustrations of the group.

AA. *Prunus Cerasus*

(1) *The Amarells*.—Rather small, light-colored, sour cherries with colorless or nearly colorless juice, produced on upright trees, represented by Early Richmond and Montmorency (Fig. 910).

(2) *The Morellos*.—Also comparatively small and very sour but dark in color and with dark-colored juice and trees with a drooping habit, represented by English Morello and Louis Philippe.

In spite of the great number of varieties, the cherry, of all stone-fruits, seems most fixed in its characters. Thus, the difference between tree and fruit in the cherries of the several groups is comparatively slight and many of the varieties come nearly true to seed. So, too, cherries, although probably domesticated as long ago as any other of the tree-fruits, are now most of all like their wild progenitors. Notwithstanding this stability, there are probably rich rewards to be secured in breeding cherries by those who will put in practice the discoveries of recent years in plant-breeding, and will hybridize especially the various groups of the two species now cultivated and introduce wholly new blood from wild species. So little effort has been directed toward improving cherries, and the material seems so promising, that it would seem that with proper endeavor the coming generation may have a new and greatly improved cultivated cherry flora.

U. P. HEDRICK.

The cherry in California.

In commercial importance, the cherry is least of the fruits of the temperate zone grown in California on a commercial scale—not considering the quince and

XXVI. Sweet cherry in flower and fruit.

nectarine, of which the product is almost insignificant. This is not because the finest cherries cannot be grown, but because the avenues for the disposition of the product are not so wide as for other leading fruits. Recently there are indications that these avenues will be widened, for, in the year 1912, 244 carloads were profitably shipped in a fresh state to eastern markets, and in 1911 a product equivalent to 243,010 cases (each containing two dozen 2½-pound cans) of canned cherries were disposed of to advantage. In 1910, there was large shipment of barreled cherries in sulfur water to eastern bottlers who put up maraschino cherries in competition with importations, but this business seems to have transgressed the pure food laws and declined. Until it is demonstrated that such distant demands will increase, present plantations will not be largely extended. Cherries are costly in picking and packing, and the chance of low price in a local market, over-supplied whenever the trees do their full duty, the grower does not enjoy. Cherry-drying has never seemed warranted on a large scale, because of the large amount of labor required to the pound of product; and the grower has had no recourse when the canner and local consumer would pay only the cost of picking and boxing. A good shipping demand seems, therefore, the measure of the extension of California's cherry interest, and the early ripening of the fruit, which permits its sale during the blooming season of eastern cherry trees, is the leading surety of such demand. On several occasions early varieties have been shipped from the Vacaville district overland, on March 31, but the usual opening date is about two weeks later, and thence onward later varieties, and from later regions, may be shipped until July, if found profitable.

But, although there is plenty of good land upon which to multiply the present total of three-quarters of a million trees, the cherry regions of California are restricted. It is one of the most exacting of all trees, and is profitable only when its requirements are respected. About one-half of the present acreage lies in valleys opening upon the bay of San Francisco, where deep and moist, but well-drained alluvial soil fosters strong and sound root-growth, and modified atmospheric aridity favors leaf and fruiting. On similar deep and moist soils, however, the sweet cherry enters the hot interior valleys to certain limits, chiefly along the river bottoms. It abhors dry plains. In dry air it usually refuses to fruit, although, if the soil be moist, it may make stalwart tree-growth. In foot-hill valleys it sometimes does admirably, both in growth and fruiting, and in mountain valleys, above an elevation of 2,000 feet, on good soil, and in the greater rainfall, and even with the snow flurries, which are experienced every year at proper elevations, the tree becomes very thrifty and profitable to the limits of local markets. The tree seems to have no geographical limitations in California, wherever suitable soil and weather conditions occur, it accepts the situation—the Dukes and Morellos succeeding under conditions too trying for the Hearts and Bigarreus, but the latter, only, are of commercial account

Cherry trees are grown by budding upon Mazzard and Mahaleb seedlings—both being largely imported. It is customary to plant out in orchards at the end of the first year's growth from the bud, though two-year-old cherry trees can be more successfully handled than other two-year-olds. The trees are headed at 1 or 2 feet from the ground, cut back to promote low branching for two years, and then allowed to make long branches, and not usually shortened-in, so long as thrifty and healthy. The tree, in a good environment, is, however, a very hardy tree, and will endure pruning to almost any degree. There are many trees which have made a very broad but not usually high growth, bearing 1,000 pounds of fruit to the tree, and a few others which have even doubled that figure, while others have been dwarfed and trained *en espalier*. The commercial orchards are, however, uniformly of low trees, approximately of vase form in exterior outline, and with branches curving outward without shortening.

The cherry is very readily grafted over by the usual top-grafting methods, and large orchards have been thus transformed into varieties more acceptable for canning or shipping. Comparatively few varieties are grown. Early Purple Guigne, Chapman and Knights Early Black are grown in early-ripening localities. Black Tartarian, Lewelling and Bing are the mainstay for black cherries. The Napoleon Bigarreau (locally known as Royal Ann) is the ideal for a white cherry, and almost excludes all others, although the Rockport Bigarreau has some standing. Of all the varieties grown, the Black Tartarian and Napoleon (Fig. 909) constitute 70 per cent of the crop, and probably 90 per cent of the amount marketed.

California-grown cherries attain large size, the canner's requirement for fancy fruit is a diameter not less than ½ of an inch, and for No. 1 not less than ¾ of an inch. Wholesale prices usually range from \$40 to \$60 a ton for black and \$80 to \$120 for white, but occasionally canners have paid as high as \$160 a ton for white cherries. The higher rates can be expected only in years of short crops.

EDWARD J. WICKSON

910. Montmorency cherry—Sour. (X½)

CHERVIL. A term applied to two umbelliferous plants that produce edible parts, neither of which is well known in America. The name is sometimes applied, also, to the sweet cicely.

Salad chervil or leaf chervil is *Anthriscus cerefolium*, Hoffm., a native of Caucasus, southern Russia and western Asia. It is annual, reaching 1½ to 2 feet high. The neat and aromatic leaves are used like parsley, which they much resemble. The leaves are decomposed, with oval cut leaflets; and there are varieties with much cut and curled foliage. The cultivation of salad chervil presents no difficulties. Leaves are ready to use in six to ten weeks

from seed-sowing, and any good garden soil is congenial. It thrives best in the cooler and moister part of the year. In hot weather, seeds would better be sown in a shaded place.

Tuberous or turnip-rooted chervil is *Cherophyllum bulbosum*, Linn., of southern Europe. (See *Cherophyllum*.) It is biennial or per-annual, like the radish and carrot. The roots are like small carrots in shape (1 to 5 inches long), but are gray or blackish, and the

flesh is yellowish white and of different flavor. The roots are eaten as carrots are, either boiled or in stews. The one difficulty in the growing of tuberous chervil is the fact that the seeds germinate very tardily, or even not at all, if kept dry over winter. It is customary, therefore, to sow them in the fall, although they do not germinate until spring. If they are to be reserved for spring-growing, they should be stratified (see *Seedage*) or kept in sand. In four or five months after germination, the roots are fit to use, although they improve in quality by being left in the ground. The roots keep well in winter.

L. H. B.

CHESS, or CHEAT: *Bromus*.

CHESTNUT. Three species of tree or true chestnuts are cultivated in this country for their nuts,—the European *Castanea sativa*, the American *Castanea dentata*, the Japanese *Castanea crenata*. See *Castanea*. The horticultural characters that distinguish these three types are as follows:

European chestnuts.—Tree large, with a spreading but compact head, stocky, smooth-barked twigs and large glossy buds of a yellowish brown color; leaves oblong-lanceolate, abruptly pointed, with coarse sometimes incurved serrations, thick and leathery, generally pubescent beneath when young, but green on both sides when mature. Burs very large, with long branching spines, and a thick velvety lining. Nut larger than American chestnut, sometimes very large, shell dark mahogany-brown, pubescent at tip, thick, tough and leathery; kernel inclosed in a thin tough and astringent skin: quality variable from insipid, astringent to moderately sweet. The leaves remain on the trees until late in autumn, but are more susceptible to the attacks of fungi than the American and Japanese species. At least one variegated and one cut-leaved variety are grown as ornamentals. This species is variously known as European, French, Spanish and Italian chestnut (*Castanea sativa*), and sweet chestnut of English writers. It is an inhabitant of mountain forests in the temperate regions of western Asia, Europe and north Africa, and is esteemed for its nuts in Spain, France and Italy, where they have constituted an important article of food since an early day. Introduced to the United States by Irénée Dupont, at Wilmington, Delaware, in 1803, although recorded by Jefferson, under the designation "French chestnut," as grafted by him on native chestnut near Charlottesville (Monticello), Virginia, in 1773.

American chestnut (Castanea dentata).—Fig. 911. A tall straight columnar tree, in forests reaching a height of 100 feet and a diameter of 3 to 4 feet; when grown in the open, forming a low round-topped head of slightly pendulous branches. Leaves thinner than in *C. sativa*, oblong-lanceolate, acute, long-pointed at the apex, coarsely serrate except toward the wedge-shaped

911. Native wild chestnuts. ($\times \frac{1}{4}$)

base, green and glabrous on both surfaces, changing to bright clear yellow later in autumn. The staminate flowers open in June or July after leaves have attained full size, and exhale a sweet, heavy odor, disagreeable to many persons, and sometimes causing symptoms of hay-fever. The

two- or three-flowered involucre of pistillate flowers are on short stout peduncles at the bases of androgynous aments which bear toward their tips scattered clusters of staminate flowers. Burs smaller and spines sharper than in *C. sativa*. The nuts, usually two or three, rarely five to seven, are usually broader than long, and much compressed by crowding, although sometimes nearly oblong and approaching cylindrical.

912. Japanese chestnuts. ($\times \frac{1}{4}$)

They are of a bright brown color, covered at the apex with thick pale tomentum, which sometimes extends nearly to the base of the nut. The nuts are sweet and agreeable in flavor, the best among chestnuts, and are marketed in large quantities from the forests of the Appalachian region. Occurs in eastern North America, Maine to Georgia, westward to Michigan, Mississippi and Louisiana. Gradually receding from its southern areas from causes not yet understood. A few selected forms have been propagated by grafting.

Japanese chestnut (C. crenata).—Fig. 912. A dwarfish close-headed tree of slender growth, said to attain a height of 50 feet in Japan, with small buds, leaves smaller than other chestnuts, lanceolate-oblong, usually pointed, with a truncate or cordate base, finely serrated, with shallow sharp-pointed indentations, whitish tomentose beneath, pale green above, less subject to injury by fungi than other species. Burs small, with a thin papery lining and short widely branching spines. Nuts large to very large, glossy, usually three, sometimes five or seven in a bur, usually inferior to the other chestnuts in quality, although good when cooked, and in a few varieties excellent in the fresh state. Many cultural varieties are recognized. Introduced to the United States in 1876 by S. B. Parsons, Flushing, New York.

Aside from these three types, there are certain dwarf and small-fruited castaneas known as chinquapins. The two native chinquapins may be contrasted as follows (page 682):

Common or tree chinquapin (C. pumila).—Fig. 913. A shrub 4 or 5 feet tall, rarely a tree, attaining a height of 50 feet, with slender branchlets marked with numerous minute lenticles, and coated with a pale tomentum, which disappears during the first winter. Leaves oblong, acute and coarsely serrate at apex, bright yellowish green, changing to dull yellow before falling in autumn. Flowers strong-smelling, the catkins of staminate ones appearing with the unfolding leaves in May or June, the spicate androgynous aments later, with pistillate flowers in spiny involucre, producing solitary cylindrical nuts $\frac{3}{4}$ to 1 inch in length and $\frac{1}{2}$ inch in diameter, with sweet seeds. This species occurs in dry lands from southern Pennsylvania to Florida and Texas, and its nuts, which ripen earlier than the American chestnut, are esteemed for

food, and marketed in considerable quantities. The species is sparingly introduced to cultivation and in its native region is being somewhat grafted upon in place with the choicer varieties of chestnuts. It has some promise as a dwarfing stock but is subject to the troublesome fault of suckering rather abundantly. Two named varieties, the Fuller and the Rush, have been published and somewhat propagated. (Upper part of Fig. 913 illustrates common chinquapin bur, and nut in natural size.) Apparent intermediates between this species and the American chestnut, probably of hybrid origin, are found in various localities from Pennsylvania southward and westward to southern Arkansas and eastern Texas, in some localities attaining truly arborescent proportions. (Lower figure in Fig. 913 illustrates bur of hybrid chinquapin.)

Bush chinquapin (*C. alnifolia*)—A shrub, rarely more than 3 feet in height, forming small thickets, by means of stolons, in sandy barrens. South Atlantic states, westward to Louisiana and Arkansas. Distinguished from *C. pumila* by larger, oval-lanceolate, mostly obtuse leaves, which are but slightly tomentose beneath, and by its larger nuts, which ripen earlier.

The cultural range of *Castanea* in America is not well defined, but extends from Florida and Texas to Massachusetts and Wisconsin, and on the Pacific slope. The three species cultivated in America thrive best on dry, rocky or gravelly ridges or silicious uplands, failing on heavy clays and on limestone soils unless deep, dry and rich.

Propagation of chestnuts.

Propagation of species is by seeds. Certain types reproduce their striking characteristics in their seedlings, but varieties are perpetuated by grafting, occasionally by budding. Seeds for planting should be free from insect larvae, and should not be allowed to dry out before planting. They may be planted in drills in fall on deep and well-drained loam, or, to avoid damage by rodents, may be stratified in damp sand until spring. Nuts held in cold storage at 15° F from October to April have germinated well at Washington, D. C. Young trees destined for removal to orchard should be transplanted in nursery at one year old, to promote symmetrical development of root system. Grafting may be done on any of the species of *Castanea*, and on some of the oaks, notably the chestnut oak, *Quercus Prinos*, though the durability of grafts on the oak is questionable. Where the chestnut is indigenous, bearing orchards of improved varieties are quickly secured by cutting down and removing the timber, and grafting the young sprouts which spring up in abundance about the chestnut stumps (Fig. 914). Recently the chinquapin has been similarly used with good success where chestnut does not occur. Grafting may be by splice method on one-year-old seedling roots, by splice or cleft at crown on two- or three-year trees in place; or by veneer, splice or cleft methods on one- to three-year-old sprouts or branches. Top-working of old trees is uncertain and practised only in special cases. Cions should be dormant, and work may be done at any time after freezing ceases, but in trunk- and branch-grafting best results are secured by most grafters if work is done after leaves begin to unfold. Two- or three-bud scions are preferred. The fitting of cion to cleft or splice and the waxing should be carefully done. If strips of waxed muslin are wrapped about the stubs, the danger of loss by summer cracking of wax is lessened. In cleft-grafting young sprouts or seedlings, the stub should be cut 2 or 3 inches above the departure of a branch, to prevent too deep splitting of cleft. Two or three weeks after growth begins the waxing should be inspected and repaired if cracked. If grafts make rank and brittle growth they should be checked by pinching, and if in exposed situations, tied to stakes to prevent breaking out of cions. Budding is sometimes

practised, usually by use of dormant buds inserted in shoots of previous year, when the bark "slips" after growth has begun in spring. There is a growing conviction in the minds of close observers that certain of the popular varieties, especially Paragon, under certain conditions do not find the American chestnut a congenial stock. In several orchards, Paragon, when grafted on native sprouts, although apparently making a good union at the start, has within eight to ten years developed weakness at the point of union, followed by loss of vigor and death of the top without other apparent cause than lack of congeniality of cion to stock. For this variety, at least, the grafting upon seedling stocks grown from nuts of the variety appears advisable.

The chestnut is admirably adapted to ornamental planting, either singly or in groups on suitable soils.

913. Chinquapin. (Nut and bur natural size.)

The native species is successfully used as a roadside tree in many sections outside of its natural range. It requires a space of at least 40 feet for development when thus used, the European species 30 feet, and the Japanese 20 feet. If in orchard, the last-mentioned may be planted as close as 20 feet, and thinned when the trees begin to crowd, thus securing several crops of nuts from land otherwise unoccupied.

Care of chestnut orchards.

Planted orchards are yet few in America, most of the extensive commercial efforts having consisted in the grafting of sprouts on rough lands where the American chestnut is indigenous. On such lands no cultivation is attempted, the brambles and undesired sprouts being held in check by occasional cutting in summer, or by pasturing with sheep. Much care is necessary

to protect against damage of the sprouts by fire on such land. Clean cultivation, at least during the first few years, is probably best in planted orchards, although heavy mulching may be found a satisfactory substitute. The Japanese and some of the American varieties of the European species require thinning of the burs on young trees to avoid over-bearing, with its consequent injury to the vitality of the tree.

Special difficulties.

Leaf diseases are apparently subject to control by bordeaux mixture, but for the weevils, which damage the nuts previous to maturity, no satisfactory remedy has yet been discovered except the yarding of poultry in sufficient numbers to destroy the adult insects and their larvæ when they reach the ground.

The most serious difficulty confronting the present or prospective chestnut-grower in North America is the chestnut-bark disease which, during the last decade, has worked havoc in the native chestnut forests throughout a region of country extending from central Connecticut through southeastern New York, New Jersey, and eastern Pennsylvania into northern Delaware, northeastern Maryland and northern Virginia. As this region contains most of the commercial plantings of improved chestnuts they have also suffered severely, especially since about 1908. The distribution of the native chestnut, together with the known distribution of the disease February 1, 1912, is shown on the accompanying map (Fig. 915), which was prepared by Metcalf to accompany a special report on the disease in response to a resolution of the United States Senate.

This disease, caused by a parasitic fungus (*Duportia* or *Endothia parasitica*), attacks trees of all ages and kills by girdling at various points. It is known to attack all species of chestnut and chinquapin grown in this country, although some, at least, of the Japanese varieties, are practically resistant, so far as observed. A few cases of the disease have also been found on living trees of the chestnut oak in Pennsylvania, though with less evidence of destructive effect than on chestnut.

914. Chestnut sprouts two years grafted. The cion was inserted where branching begins.

The disease is spread by the spores of the fungus, which are sticky, and are carried by rain, insects, and man, and probably by birds and small mammals. It is known to have been carried on nursery stock for long distances and is easily transported on newly cut

915. Distribution of the chestnut blight.

timber and cordwood from which the bark has not been removed. Infection frequently occurs through wounds made by bark-borers.

Although first attracting attention in New York City in 1904, it appears certain that it had secured a firm foothold in southeastern New York, including Long Island and adjacent portions of Connecticut and New Jersey, prior to that time, there being some indication that it was introduced from Japan, although satisfactory evidence of this is still lacking. The presence of the disease in chestnut forests in China was discovered by Meyer in 1913, where, upon an unidentified species of chestnut, it is reported to be less virulent than in American chestnut forests.

For several years after publication of the cause of the disease by Murrill, in 1906, little effort was made in a systematic way to accomplish its control until 1911, when the legislature of Pennsylvania appropriated \$275,000 for this purpose and inaugurated a state-wide, two-year campaign of eradication. The work is being done in cooperation with the Federal Department of Agriculture which, since 1907, has been investigating the disease with a view to developing effective methods of controlling it. Several other chestnut-producing states are also giving more or less attention to the problem. Up to the present time, systematic cutting out of infected trees coupled with destruction of their bark by fire has proved the only practicable control method. This is being vigorously applied in Pennsylvania and those portions of Maryland, West Virginia, and Virginia in which the disease has appeared.

In forests, the disease is exceedingly difficult to eradicate after it has once gained a foothold, owing to the minute examination of the entire tree which is required to locate infections in their early stages. In any district in which there is a general infection of the forests, the only practicable course is to clear off the timber while it is sufficiently sound to be merchantable.

The relative disease-resistance of the Japanese chestnuts, coupled with their precocity and productiveness, renders them now the most promising sorts to the American chestnut-grower. Planted in sections

outside of the native range of the American chestnut, they may reasonably be expected to remain practically free from the disease, especially if care is exercised to prevent its introduction from infested regions on nursery stock or clones. The poor flavor and eating quality of most of these varieties is their worst fault, but in view of their wide range of variation in this respect, the problem of producing resistant varieties of good quality appears relatively simple. The few trees of Korean and Chinese chestnuts thus far grown in the eastern United States are apparently quite resistant to the disease and therefore of much interest to the tree breeder as parents of possible resistant forms. Systematic work on the breeding of resistant varieties is being prosecuted in the Bureau of Plant Industry.

Varities of chestnuts.

The varieties of the three species, although possessing many points in common, differ sufficiently in important characteristics to justify separate grouping for cultural discussion. As chestnut-culture is new in this country, it seems best to append descriptions of all the varieties which are in the American trade. For fuller discussion of cultivated chestnuts, see *Nut Culture in the United States* (Bull Div of Pomology, U S Dept. of Agric.), from which Fig. 913 is adapted, *Nut Cultivist*, A S Fuller, 1896, European and Japanese Chestnuts in Eastern United States, G Harold Powell (Bull Del Exp Station), 1898, *Nut Culture for Profit*, Jno R Parry, 1897.

AMERICAN GROUP—Although the wild nuts exhibit wide variations in size, form, quality, productiveness, and season of ripening, but few varieties have been identified by names and propagated. Solitary trees are frequently sterile, although producing both staminate and pistillate flowers, apparently requiring cross-fertilization to insure fruitfulness. This is especially true of planted trees of this species on the Pacific slope, where productive trees are reported to be rare. The susceptibility of the species to injury by leaf diseases, as pointed out by Powell, and the injury to nuts by larvae of weevils, are drawbacks to its extensive culture.

The following varieties are propagated to some extent.

Dudley—Hocking Green, Ky. Large, and of fine quality. Original tree productive, though isolated.

Griffin—Griffin, Ga. A large, very downy nut, of good quality.

Huthaway—Little Prairie Ronde, Mich. A large, light-colored, sweet nut, annually productive, frequently having five to seven nuts to the bur.

Kitcham—Mountainville, N Y. Above medium in size, oblong, tomentose, sweet. Tree productive and vigorous in heavy soil at fifty years of age.

Murrell—Colman's Falls, Va. A large, light-flavored nut, bearing three nuts to the bur.

Otto—Otto, Tenn. Large, oblong, very downy at tip, very sweet and rich.

Rochester—Rochester, N Y. First fruited at Alton, Ill. Nuts medium to large, somewhat rounded, usually three in a bur, of dull brown color, downy at tip, quality excellent. Tree a very rapid grower and a heavy bearer, ripens late.

Watson—Fay, Pa. Medium to large, slightly downy, compressed, very good.

EUROPEAN GROUP—It is a significant fact that, during the century that has elapsed since the introduction of this species, the imported named varieties of Europe have not found favor in eastern America. Seedling trees have been found productive and profitable at many points in New Jersey, Pennsylvania, Delaware, and Mary-

land, however, and these form the basis of the culture of the species east of the continental divide. West of the Rocky Mountains, several of the choice French "Marrons" are reported to succeed in California and Oregon. Among the more important varieties of the European group in America, are the following.

Anderson—Flushing, N J. Bur medium to small, nuts of medium size, bright reddish brown, pubescent at the tip and over leathery leaves. Very productive.

Bartram—Millsboro, Pa. Bur medium to small, nut medium, thickly pubescent at tip, dark reddish mahogany color, three in a bur, unusually free from insect attack, quality good. Tree vigorous, spreading, with large leaves, productive.

Comble (Marron Comble)—France. A large and handsome, bright brown striped nut, with but little tomentum at tip, usually two, sometimes but one in a bur. Somewhat grown in California, where it was introduced from France about 1870.

Chalon (syn., Marron Chalon Early)—France. Sparingly grown in California. Nut of medium size, early, productive, precocious.

Corson—Plymouth Meeting, Pa. Bur large, with thin husk, nuts large, usually three in a bur, dark brown, ridged, heavily pubescent at tip, quality very good. Tree vigorous, spreading, very productive.

Dager—Camden, Del. Bur medium, nut medium to large, dark brown, thickly tomentose, usually three in a bur, quality good. Tree vigorous, spreading, productive, a seedling of Rudely.

Darlington—Wilmington, Del. Bur medium to small, nut medium to large, usually three in a bur, dark, distinctly striped, thickly tomentose at tip, sweet, good. Tree vigorous. One of the earliest to ripen of this group.

Lyon (Marron de Lyon)—France. A large, round nut of fair quality, grown in a small way in California, but less productive than Comble, which it resembles.

Marron—This term is used by the French to designate the larger cultivated chestnuts, most of which have relatively few nuts, often only one in a bur.

Moncur—Dover, Del. A seedling of Rudely. Bur medium, nuts medium, of light color, heavily tomentose. Tree vigorous, spreading, very productive.

Nouillard—France. A large, handsome variety from central France, and here considered very productive and valuable. Has been tested in New Jersey, Pennsylvania and California without marked success in any locality.

Numba—Morrisville, Pa. Bur medium conical, nut large, from two to three in a bur, bright brown striped, thinly tomentose, of good quality. Tree compact and drooping, rather uncertain in bearing.

Paragon (syn., Great American, Sobers Paragon)—Germantown, Philadelphia, Pa. Bur very large, nut huge, usually three in a bur, broad, plump, thickly tomentose at the tip, and thinly over two-thirds of surface, coral dull brown, quality very good. Tree hardy, spreading, vigorous, with narrow, coarsely serrate leaves having a narrow base, subject to leaf-blight, but very productive.

The most widely planted and most uniformly successful variety of chestnut yet cultivated in the United States. Possibly a hybrid with *C. dentata*.

Quercy (syn., Marron Quercy)—France. A beautiful, medium-sized nut, commended in portions of California for precocity, earliness, productiveness and quality.

Rudely (syn., Du Pont)—Dover, Del. Bur medium, nut medium to large, moderately tomentose, dark, of very good quality. Tree vigorous, with narrow leaves free from blight, spreading, very productive, hardy.

Scott—Burlington, N J. Bur medium; nut medium, slightly pointed, usually three in a bur, glossy, dark brown, slightly tomentose at the tip. Tree open, spreading, very productive, said to be comparatively free from attacks of weevil.

Styer—Concordville, Pa. Bur medium, nut medium pointed, dark brown, striped, tomentose at tip, 1 to 3 in a bur. Tree very vigorous, upright, with large, dark green leaves, free from disease.

JAPANESE GROUP—Though most of the imported Japanese chestnuts have been found of poor quality for eating in the fresh state, the product of many imported seedling trees, and of a number of American-grown seedlings of this type, is equal to the European nut in this respect. The Japanese varieties in general have the advantage, also, of greater precocity and productiveness, larger size and earlier maturity of nut, greater freedom from injury

916. Successive stages in the ravages of the chestnut blight. 1909, 1910, 1911.

by leaf diseases and nut-eating insect larvæ. As productiveness and earliness are the most important points in chestnut culture at the present time, this type is the most important to commercial nut-growers. Because of the ease with which chestnuts hybridize, the disease-resistance of varieties that have originated from seed produced within the habitat of the American chestnut must be regarded as doubtful until thoroughly tested. Information as to the place of production of the seed from which the several varieties originated is therefore of importance in selecting varieties for planting. The more important named varieties are as follows:

917. Boone chestnut.

medium; nut large, bright brown, broad, rather thickly tomentose, two to five in a bur, of medium season and fair quality. Tree regular, round-headed, vigorous. Grown from imported seed.

Black (syn. Dr Black)—New Jersey. First fruited in Maryland. Bur large, nut medium to large, three to seven in a bur, consequently irregular in shape, dark brown, slightly tomentose, very early and of good quality. Tree round, close-headed, vigorous, productive. Grown from imported seed.

Boone—Villa Ridge, Ill. Fig 917. A hybrid between Giant and a native chestnut. Bur of medium size, nuts large, usually three in a bur, of light brown color, rather heavily tomentose, quality very good. Tree vigorous, precocious and productive, nuts ripening early. Considered difficult to propagate.

Co—California. A large, very sweet variety, but recently disseminated. Tree upright, somewhat spreading. Grown from imported seed.

Fellon—New Jersey. First fruited in Delaware. Bur small, nut medium, dark brown, slightly tomentose, rather early and of excellent quality. Tree round-headed and fairly productive. Grown from seed of an imported tree.

Giant—Japan. A trade name, under which a number of varieties have been imported from Japan. See Parry.

Hale (syn. Eighteen Months)—California. A newly introduced variety, having a large, dark brown nut of excellent quality. Very precocious. Grown from imported seed.

Kent (syn. Extra Early)—New Jersey. First fruited in Delaware. Bur small, nut medium to large, dark, usually three in a bur, very early, of good quality. Tree round-headed, precocious, productive. Grown from seed of an imported tree.

Kerr—New Jersey. First fruited in Maryland. Bur small, nut medium to large, dark brown, broad, three in a bur, early, and of excellent quality. Tree vigorous, symmetrical, round-headed, very productive. Grown from imported seed.

Killen—New Jersey. First fruited in Delaware. Bur very large, nut very large, broad, light brown, slightly veined, of excellent quality, midseason. Tree upright, open, spreading, moderately vigorous, productive. The largest chestnut yet brought to notice. Grown from seed of an imported tree.

Mammoth—A trade name for the imported Japanese nuts and trees, not restricted to any particular variety.

Martin (syn. Col Martin)—New Jersey. First fruited in Maryland. Bur large, nut large to very large, broad, bright reddish brown, slightly tomentose, three to five nuts in a bur. Midseason; of good quality for cooking. Tree vigorous, open, spreading, productive. Grown from imported seed.

McFarland—California. Bur very large; nut large, and of fine quality; early. Tree spreading, very productive. A newly disseminated variety of great promise. Grown from imported seed.

Parry—Japan. Bur very large, nut very large, one to three in a bur, broad, with apex sometimes depressed, dark brown, ridged, of fair quality. Tree moderately vigorous, open, spreading, with large leaves. One of the largest and most beautiful in this group. Selected for propagation as the best of 1,000 imported grafted Japanese chestnuts.

Prolific—Japan. Bur small, nut medium, rather long, striped, three in a bur, early. Tree vigorous, compact, with small narrow leaves.

Reliance—New Jersey. Bur medium, nut medium to large, rather long, light brown, ridged, midseason, and of fair quality. Tree dwarfish, spreading, drooping, very precocious and productive, inclined to overbear, and needs thinning. Seedling of Parry.

Success—New Jersey. Bur very large, nut very large, usually

three in a bur; midseason, of rather poor quality until cooked.

Seedling of Parry. Tree upright, productive.

Superb—New Jersey. Bur large, nut large, round, brown, usually three in a bur, early, and of fair quality. Tree vigorous and very productive. Seedling of Parry.

WIN. A. TAYLOR.

CHEVALIERA, CHEVALIERA, CHEVALIERA, CHEVALIERA. The species in the American trade are *Æchmeas*.

CHICK-PEA. *Cicer*.

CHICKWEED: *Cerastium* and *Stellaria*.

CHICORY, or **SUCCORY** (*Cichorium intybus*, Linn.) *Compositæ*. Fig 918. A native of Europe, naturalized in America and familiar to many as a weed, is a pot-herb, a salad, and the leading adulterant of coffee. It came prominently before the public in the late nineties and the early years of this century as an American farm crop. Prior to that year, its cultivation as an adulterant and substitute for coffee was largely prevented by the prejudice of the principal consumers, our foreign-born population, who insisted that American was inferior to European root, and also by the low tariff, which allowed the root to enter duty free, or with a very small impost. During 1898 and 1899 advantage was taken of a protective duty, and several factories were erected, for which farmers grew the roots. For a few years our home market was supplied from American fields in part. But even the substitution of horse-power for manual labor, improved plows and cultivating implements for crude ones, machine-digging of the roots for hand-digging, efficient slicing machines, and improved evaporating kilns did not make the business satisfactory. There was not enough money in it either to growers or to manufacturers, so it has been abandoned.

Chicory will probably succeed wherever the sugar beet is grown in this country, the climatic requirements being similar. In general, it may be said to thrive upon all stone-free soils that will produce paying staple crops, except clays, lightest sands and mucks. The first are too hard, the second too dry, the third too rich in nitrogen and too sour. The surface layer of soil should be deep, the subsoil open and well drained. If the water-supply be sufficient, high land is as good as low land of the same texture, though if too dry for profitable grain-growing, the former may yet be made to produce chicory, but if too wet for cereals, the latter will generally be found unsuitable for this root. The fertilizing of the land should be the same as for other root-crops, nitrogen being used sparingly, potash and phosphoric acid rather freely—one and one-fourth to one and one-half times as much of the former and two and one-half times the latter as has been removed by the preceding crop. It is best to apply these fertilizers to preceding crops that do not make heavy demands upon them. In rotation, chicory is classed with root-crops, and should be preceded by a small grain, since this is harvested in time for fall plowing. Clover should not immediately precede, since it leaves too much nitrogen in the soil. The ground being warm, fairly moist, thoroughly

918 Improved chicory root (X 1/4)

prepared by deep plowing, harrowing and scarifying with a weeder, the seed, which must be fresh and clean, is sown rather thickly but covered thinly, in drills 18 inches apart.

There are but few well-defined varieties of this plant used for field culture, and even the garden sorts are not so stable as could be desired. Of the former group, Magdeburg, Brunswick and Schlessische are the principal, of the latter, Witloof (so-called), Red Italian, Broad-leaved, Improved Variegated and Curled-leaved are best known. Witloof and Barbe de Capucin can be produced from any variety, the difference being brought about by the method of growing.

Chicory has no specific enemies in this country, and is troubled by only a few of the general-feeding insects, such as cut-worms and wire-worms.

From six to ten tons is the general average yield, although with good management fifteen tons may be produced. The cost of growing and the returns are about as follows: Rent, wear of tools, etc., \$5; preparation of land, \$4.50; seed, 75 cents; cultivating and tending, \$15; harvesting and delivering, \$12; total, \$37.25. Average price the ton, \$7.

From a purely horticultural standpoint, chicory is of interest as a root, a pot-herb, and a salad plant. The young tender roots are occasionally boiled and served with butter, pepper and salt, like young carrots, but they have never become widely popular in this form. As a pot-herb, the young leaves are equal to those of dandelion. They are cut when 6 to 8 inches long, boiled in two waters to remove the bitter flavor, and served like spinach. As a salad, chicory is famous in three forms: Common Blanché, Barbe de Capucin and Witloof. Barbe de Capucin is comprised of small blanché leaves. Witloof is a more solid head. The pink, red and curled varieties make a very pretty appearance, and, if well grown and served fresh, are delicious, there being only a slightly bitter flavor. The method of growing for salads is the same as for endive.

For Barbe and Witloof, well-grown roots are dug in October, trimmed of unnecessary roots and of all but an inch of top. For Barbe, the roots are laid horizontally in tiers in moist earth, the whole forming a sloping heap, the crowns of the roots protruding an inch or so. Since darkness is essential, a warm vegetable cellar is the usual place selected to grow this vegetable, which requires three or four weeks to produce its fine white leaves. These are cut when about 6 inches long, eaten as a salad, boiled like kale or cut up like slaw. If undisturbed, the roots will continue to produce for several weeks. The most rapid way to produce Witloof is to plunge the roots (shortened to 5 inches) in spent tanbark, or such material, and cover with 2 feet or more of manure, the space under a greenhouse bench being used. In about two weeks, heads resembling cos lettuce may be dug up, boiled like brussels sprouts, or served as salad. If the roots be left in place, protected from the light, but uncovered, a crop of leaves resembling Barbe may be gathered. Sowing and other cultural management is the same as for other garden roots, as beets and carrots. It is a pity that these vegetables are so little known in this country. Witloof is a popular winter vegetable in the larger cities of the East. Much of it is imported from Europe.

Chicory has run wild along roadsides and in dry fields in many parts of the country, and is considered to be a bad weed. However, the handsome sky-blue flowers (Fig. 962), which open only in sunshine, are very attractive.

M. G. KAINS.

CHILDSIA WÉCKLEI: *Hedysa.*

CHILIANTHUS (*a thousand flowers*) *Loganiaceæ.* Four or 5 S African trees or shrubs, very closely allied to *Buddleia*, from which it differs in having stamens

exserted from the short tube. lvs. opposite, entire or dentate, nearly always tomentose or scaly; fls. very numerous, in dense terminal cymes or panicles; calyx and corolla deeply 4-parted, the latter usually yellowish. Unknown to the American trade. The plants known as *Buddleia sahyefolia*, Jacq., and *B. saligna*, Willd., are *Chilanthus arboreus*, Benth. (which is probably identical with *C. oleaceus*, Burch.).

CHILÓPSIS (Greek, *lip-like*) *Bignoniaceæ.* One deciduous shrub or low tree, often planted in southern California and other parts.

Allied to *Catalpa*, differs in having 4 anther-bearing stamens and 1 rudiment, a more trumpet-shaped corolla and with jagged lobes, and lvs. linear and often not opposite.

linearis, DC. (*C. saligna*, Don). Slender-branched, 10-20 ft. fls. handsome, bignonia-like, in a short terminal raceme; corolla 1-2 in. long, 5-lobed and crumpled, the tube and throat lilac, and 2 yellow stripes inside. Dry districts from S Texas to Calif., and in Mex. -From its narrow-lanceolate or linear lvs., it is known as desert willow, also called flowering willow and mimbrres. There is a white-flid form.

L H B

CHIMAPHILA (Greek, *winter-loving*, green in winter) *Eri-cacæ.* *PURISSEWA* Perennial small plant, interesting for the white or pinkish flowers and the evergreen foliage, but little cultivated.

Half shrubby or herbaceous, with creeping st. lvs. evergreen, serrate, in irregular whorls, fls. nodding, forming a terminal, few-flid umbel, on a long naked peduncle, petals 5, spreading, stamens 10, the anthers opening with 2 pores at the apex, the filaments short, dilated, style short, with a peltate stigma, fr. a dehiscent, deeply furrowed, 5-celled caps, with numerous minute seeds. -Four species in N. Amer., Eu., and N. Asia to Japan; formerly united with *Pyrola*. Low evergreen plants, with pretty white or reddish fls. in summer. They grow best in a light, sandy soil, mixed with peat or leaf-mold, and prefer a half-shady position. Prop. by division of the creeping rootstock. Useful in wild borders.

A. lvs. broadest above the middle.

umbellata, Nutt. (*C. corymbosa*, Pursh). Five to 12 in. lvs. 3-6 in. in a whorl, short-petioled, cuneate-lanceolate to oblong-obovate, sharply serrate, dark green and shining above, 1-2 in. long, fls. 4-7, white or reddish, 1-2-3 in. wide. N. Amer., from Canada to Mex., Eu., Japan. B.M. 778. L.B.C. 5 463. Mn 7-161. -Lvs. said to be employed in rheumatic and kidney affections.

AA. lvs. broadest below the middle.

maculata, Pursh. Fig. 919. Lower and less branched than the foregoing. lvs. usually in 3's, ovate or oblong-

lanceolate, sparsely and sharply serrate, variegated with white along the nerves, 1-2 in long fs 2-5, white, $\frac{3}{4}$ in. wide. From Canada to Ga. and Miss. B.M. 897. Mn. 9 1. G C 32 318.

Ménziesii, Spreng. Slender plant, 3-8 in high: lvs. alternate or in 3's, ovate to oblong-lanceolate, acute at both ends, $\frac{3}{4}$ -1 $\frac{1}{4}$ in. long, sharply serrate, sometimes variegated fls 1-3, white, $\frac{1}{2}$ in across, filaments with a round dilated portion in the middle Brit Col. to Calif

ALFRED REHDER.

CHIMONÁNTHUS. *Merata*

CHINA ASTER. *Aster*

CHINA-TREE. *Melba*.

CHINA WOOD-OIL. *Aleurites Fordii*

CHINESE LANTERN PLANT: *Physalis*.

CHINESE LAUREL. *Antidesma*.

CHINESE SACRED LILY. *Narcissus*.

CHINKAPIN, CHINQUAPIN: *Chestnut and Castanea*

CHIOCÓCCA. *Rubiaceae* SNOWBERRY (which the name means in Greek). Shrubs, mostly climbing or trailing, of Trop Amer (a half-dozen or so species), and 3 in extreme S. Fla. Fls in axillary panicles, the corolla funnelform and 5-parted, stamens 5, inserted on the base of the corolla, the filaments cohering at base, style filiform, the stigma club-shaped; ovary 2-3-loculed, becoming a small globular 2-seeded drupe *C. racemosa*, Linn., of the Fla Keys and S., is sometimes cult in hothouses for its panicles of yellowish white fls and the white frs: lvs. ovate to lanceolate, thick and shining, entire drupes $\frac{1}{4}$ in diam twining, glabrous *C. angustifolia*, Mart (*C. brachiata*, Ruiz & Pav.), of S Amer, the root affording a native snakebite remedy, has appeared in cult (under the name var. *acutifolia*) woody, with erect branches lvs ovate, 3 in or less long, sharp-acuminate fls $\frac{1}{4}$ in long with recurved lobes, in axillary panicles shorter than the lvs.—In S Fla or on the Keys, 2 other species occur, but they apparently are not in cult. *C. alba*, Hitchcock. Large, erect or reclining lvs elliptic to ovate fls white, often becoming yellow. *C. punctatum*, Brit Small, trailing, lvs. mostly elliptic to oblong corolla always white

L. H. B.

CHIOGENES (Greek, *snow, offspring*, referring to the snow-white berries) *Ericaceae* SNOWBERRY. Creeping plant, rarely grown in rockeries for the carpeting effect of the evergreen foliage and for the attractive white berries, with small alternate 2-ranked lvs and inconspicuous axillary fls; corolla short-campanulate, 4-lobed, stamens 8, included, with short filaments, anthers opening by a slit; berry white, many-seeded.—Two species in the colder regions of N. Amer and Japan. Slender trailing evergreens, in appearance much like the cranberry, rarely cult. Thriving best in moist and peaty soil, in a shaded position, creeping amongst growing moss. Prop by seeds, by division or by cuttings in Aug under glass. The American species, *C. hispida*, Torr & Gray (*C. serpyllifolia*, Salisb.), has hirsute branches and ovate or oval, $\frac{1}{4}$ - $\frac{1}{2}$ in long ciliate lvs, greenish white fls. and white berries, $\frac{1}{4}$ in. across, usually hirsute.

ALFRED REHDER.

CHIONÁNTHUS (Greek for *snow and flower*, alluding to the abundance of snow-white fls). *Oleaceae*. FRINGE TREE. Woody plants grown for their profusely produced white flowers.

Shrubs or low trees, with deciduous, opposite and entire lvs: fls in loose panicles from lateral buds at the end of last year's branches, white, dioecious or only functionally dioecious, calyx 4-lobed; corolla divided nearly to the base in 4 narrow petals, stamens 2, short;

ovary superior, 2-celled; style very short with a 2-lobed stigma. fr a 1-seeded oval drupe.—Two species in E. N. Amer. and China. Ornamental shrubs, with large, dark green foliage, and very showy white fls in early summer. The American species is almost hardy N, but requires a somewhat sheltered position, the Chinese may be more tender, but has proved hardy at the Arnold Arboretum. They thrive best in a somewhat moist and sandy loam, and in a sunny position. Prop by seeds sown in fall or stratified, increased also by layers and by grafting under glass or budding in the open air on ash seedlings (in Europe, *Fraxinus Ornus* is preferred), sometimes by cuttings from forced plants in early spring

virginica, Linn. Fig 920. Large shrub or slender tree, to 30 ft lvs oval or oblong, acuminate, pubescent beneath when young, mostly glabrous at length, 4-8 in long panicles 4-6 in long, pendulous, fls functionally dioecious, petals 1 in long fr dark blue, ovoid, $\frac{1}{2}$ in long. May, June. From Pa to Fla and Texas. L B C 13. 1264 Gt 16 564 Mn. 2 154 G F 7 325. A G 22 362 F E 29 733 Gng. 16 306 G M 31 527 V 10 227 G W 8, p 293 M D G 1899 412, 413, 1900 413, 1907 73, 337.—Variable in shape and pubescence of the lvs, and several varieties have been distinguished, but none of them sufficiently distinct for horticultural purposes. The staminate plants are showier in flower on account of their larger panicles and broader petals, but lack the attractive pendulous blue frs in autumn. Root-bark tonic, febrifuge, laxative, reputed narcotic.

retusa, Lindl (*C. chinensis*, Maxim.) Shrub, with spreading branches, or small tree, to 20 ft lvs obovate or oval to oval-oblong, acute or obtuse, sometimes emarginate, pubescent on the veins beneath, at least when young, and reticulate, petioles densely pubescent fls dioecious, fragrant, in panicles 2-4 in long, petals about $\frac{1}{2}$ in long, narrow oblong drupe ovoid, dark blue, $\frac{1}{2}$ in long China P F G 3, p. 85 G C 11 23 821; 111. 47. 528, 329 Gt 35, p 667 A G. 13 374; 20 107; 22 363 Mn 2 157 G F 7 327 G 29:347; 33:521. Gn. W. 8 453.—Young plants have the lvs. serrulate.

ALFRED REHDER

CHIONODOXA (Greek, *snow and glory*). *Liliaceae* GLORY-OF-THE-SNOW. Very early-blooming hardy bulbs, flowers and leaves appearing together

Closely allied to *Scilla*, but differs, among other characters, in having a short tube to the corolla fls blue (running into white and red forms), with recurved-spreading acute segms, dilated filaments, and small or capitate stigma.—Four species, Crete to Asia Minor.

These are among the best of early-flowering plants, blooming in February, March and April, according to the locality, with the early snowdrops and *scillas*. Since their introduction to cultivation by Maw in 1877, they have been widely cultivated under the popular name of "glory-of-the-snow," in allusion to their early-blooming habit. *C. Lucida* is the most widely cultivated species. This varies much in color, the type having flowers whose petals are more or less deeply tipped with blue, shading to white at their bases. *C. Lucida* also occurs with pure white flowers, and in reddish and pink forms. *C. sardensis* has smaller flowers of a deeper tone of blue and without the white markings of the petals. There are two varieties of this, one with white

920 *Chionanthus virginica*.
(X 1/2)

and the other with black stamens. *C. grandiflora* is the largest-flowered of the group, the type being slaty blue with dark lines down the center of the segments; however, like others of the genus, there are pink and white forms sometimes found in collected bulbs, although somewhat rare. *C. Tmolusi*, one of the kinds sent out by Whittall of Smyrna some years ago, is very like *C. Luciae* in form but of a deeper blue and a distinctly later flowering habit. *Chionodoxa* hybridize with *Seilla*, and the hybrids are sometimes known as *chionoscellas*.—*Chionodoxas* thrive in any fertile soil, well drained and not too heavy, and in any exposure, the main requisite for growth being that they have light and an adequate supply of moisture while growing and until the foliage is ripened. The bulbs should be planted about 3 inches deep, and closely, say an inch or less apart. Lift and replant about the third year. They need no winter covering. They flower well in pots in winter in a coolhouse temperature. Must be forced only gently, and given abundance of air, light and moisture. They are increased by offsets and seeds, which they produce freely. Under favorable conditions they increase rapidly by self-sown seeds. Preferably, seeds should be sown in a frame, and may be expected to germinate the following winter. Under ordinary conditions, self-sown seeds germinate early in the year, or late winter (J N Gerard)

Luciflae, Boiss. Fig 921. Bulb ovoid, brown-coated. lvs long and narrow, 2 or 3 with each st. scape 3-6 in. high, bearing a dozen or less bright blue, more or less hanging, white-centered fls. Asia Minor and Crete. B.M. 6433. Gn 28, p 179.—Runs into many forms, one of which has white

921. *Chionodoxa Luciflae*. (X ½)

is a larger form of it, distinct in habit. *C. grandiflora*, Hort., is a large garden form, with fls. violet-blue and white in the throat. Var. *Förbesii*, Hort., somewhat taller and bearing more fls. *C. amabilis* Leichtlin, Hort., is a very handsome form, 2 weeks later than the others. fls 1½ in across, with broad full segms of soft creamy white shaded rose-purple. *C. Tmolusi*, Hort., is a late-blooming form, bright blue and white, apparently a variant of *C. Luciflae*.

sardensis, Drude. Fls 2-6, smaller, much darker blue with no white in the eye, the perianth-limb twice longer than the tube. lvs channeled. Sardis. Gn 28, 178.—Probably a form of *C. Luciflae*.

crética, Boiss & Held. Slender. fls smaller and fewer (1-2 on a scape) than *C. Luciflae*, white or very pale blue. Crete.—Of little horticultural value.

Allenii, Hort. (*Chionoscella Allenii*, Hort.). Perianth segms. cut to

the base; habit of *C. Luciflae*, but the white eye is indistinct. Supposed natural hybrid of *Seilla biflora* and *Chionodoxa Luciflae*. G.C. III 21:191. There is said to be another *C. Allenii* that is a direct selection probably from *C. Luciflae*, very like var. *grandiflora*. *Chionoscella Penryn* is another *Chionodoxa* x *Seilla* hybrid, the exact parentage not being stated. L. H. B.

CHIONOSCELLA: Hybrids of *Chionodoxa* and *Seilla*, consult these genera.

CHIRANTHODENDRON (Greek, signifying *hand-flower-tree*). *Sterculiaceae*. Odd-flowered ornamental tree of Mexico and to be expected in West Indies and elsewhere in cultivation.

A monotypic genus, which together with the Californian *Fremontodendron* forms the remarkable group *Fremontia*. The fls. are devoid of a corolla, but in its place have a large deeply 5-parted cup-shaped calyx, concave at the base, in which there are 5 glands which secrete an abundance of honey, stamens united together for about one-third their length, above which they separate into 5 rays bearing linear anthers which dehisce by a longitudinal groove, style issuing from the center of the stamens and terminating in a pointed stigma fr a woody caps with 5 valvate dehiscent lobes foliage linden-like and densely clothed with stellate hairs.

platanoides, Baill. (*Cheerostemon platanoides*, Humb & Bonpl.) The celebrated MACPALXOCHIQUAHUILL, or HANDFLOWER TREE of the Mexicans, also called MANO DE MUÑO, MONKEY'S HAND, and DEVIL'S HAND. Fig 922. The remarkable feature of the fl is the form of the bright red stamens, which resemble the fingers of a human hand and are tipped with appendages like claws, from the base of the fingers issues the style which is more or less like a thumb. A single tree growing near the city of Toluca was known to the ancient Mexicans, who regarded it with superstitious veneration. It was of great age and was supposed to be the only tree of its kind in the world. But an entire grove of the trees was discovered in Guatemala on the slope of the Volcans de Agua, near the town of Antigua, whence in pre-Columbian times the specimen had been brought. This established itself on the slope of the volcano of Toluca, where the conditions of soil and climate were similar to those of its original habitat. W. E. SAFFORD

CHIRITA (Hindustani name). *Gesneriaceae*. Plants much like gloxinias and streptocarpuses. A genus of 100 species, none of which is in the American trade. They are natives of E. Asia and are herbs or low undershrubs with opposite, often unequal lvs., fls. in shades of purple and blue, tubular, in clusters on the tops of short scapes. For cult., see *Gloxinia*.

C. barbata, Sprague. Perennial fls pedicellate, corolla funnel-shaped, bluish lilac, with yellow band in front. India. B.M. 8206.—*C. rupestris*, Bail. Bushy, compact annual. Malay Peninsula. B.M. 8333.—*C. enriensis*, Luedl., is the best known

922. *Chiranthodendron platanoides*. The hand-flower (X ½)

species and is well worth cult. It has bright green lvs. and scapose cymes of blue and white fls., the yellow anthers of which add attractiveness. B R. 30 59.—A variegated form is known

N. TAYLOR.†

CHIRŌNIA (classical mythological name) *Gen-tianaceae*. A dozen or so soft perennial herbs or shrubs of Afr., rarely seen in collections of greenhouse material. Fls. in shades of red and purple, terminal, with a salver-form corolla and short tube; lvs. opposite, sessile, on single or branching sts. Most of them are from the Cape region.

CHIVE, or **CHIVES** (written also Cive) *Allium Schenoprasum*, Linn., a perennial plant native to Europe and the northern borders of the United States and northward. See *Allium*. The leaves of chive are used green as seasoning in soups, salads and stews. Chive grows 6 to 8 inches high, making dense mats of narrow hollow leaves, and blooming freely in violet-colored heads, which scarcely overtop the foliage, bulbs small, oval. The plant makes an excellent permanent edging, and is worth growing for this purpose alone. It is easily propagated by dividing the clumps; but, like other tufted plants, it profits by having the stools broken up and replanted every few years. It rarely seeds. It thrives in any garden soil. The leaves may be cut freely, for they quickly grow again.

L. H. B.

CHLIDANTHUS (*del-cate flower*, from the Greek) *Amaryllidaceae*. Tropical American summer-flowering bulbs. Allied to *Zephyranthes*.

Flowers erect, yellow, fragrant, in a small 2-bracted umbel, terminating a solid scape, long-tubed, with wide-spreading segms; stamens 6, inserted at the throat, the filaments unequal and dilated at base; fr a 3-valved caps. lvs long and strap-shaped bulb tuncate.—Three or four species. Mex., and S. Amer.

Chlidanthuses are increased by offsets or by seeds. The bulbs should be kept dry and cool during winter and in spring started in a moderately warm house. After flowering, care must be taken to have the bulbs make their annual growth. They may either be grown in pots plunged in ashes, or planted out where they can be watered occasionally during dry weather. Like other similar plants, they will benefit by a mulching of spent hops or rotted manure. (G. W. Oliver)

frāgrans, Herb. (*C. luteus*, Voss) Bulb large and ovoid; lvs. about 6, appearing in spring or early summer with the fls., narrow, glaucous, obtuse fls. 4 or less in each umbel, 3 in. or less long, nearly sessile, erect, on a 2-edged scape or peduncle 10 in. or less high. Andes. B. R. 640 F. S. 4:326.—A good summer-blooming plant.

Ēhrenbergii, Kunth. Somewhat taller; fls. yellow, nearly horizontal, distinctly stalked, the 3 outer segms.

wider than the inner. Mex.—Perhaps a form of the above.

L. H. B.

CHLORANTHUS (*green flower*). *Chloranthaceae*. Tropical herbs, shrubs or trees, one of which is sometimes grown under glass in the North.

Perennial aromatic herbs or evergreen shrubs, with jointed sts opposite simple lvs., and small, inconspicuous fls., in slender terminal spikes. perianth represented by a single scale, in the axil of which is the 1-loculed ovary and mostly 3 united stamens (the side stamens sometimes obsolete).—Some 10 species in the eastern tropics. Two other genera (*Ascarina* and *Hedyosmum*) comprise the family *Chloranthaceae*, of the pepper-like series of plants

brachystachys, Blume. Shrub used for pot-growing, reaching a height of 1-2 ft., bearing glossy foliage and small yellow berries stamen single in each fl. lvs. long-lanceolate, acuminate, serrate.—Tropics and subtropics, Ceylon eastward. There is a variegated-leaved form. L. H. B.

CHLŌRIS (the goddess of flowers) *Gramineae* FINGER-GRASS. Annual or usually perennial grasses, some-

times grown for decoration

Plants with flat blades, compressed sheaths and digitate unilateral spikes. spikelets with 1 perfect fl. and 1 or more rudimentary sterile lemmas on the prolonged rachilla.—Species about 40, in the warmer regions of the world. A few are cult. for ornament on account of the attractive infl. Of simple treatment

ēlegans, HBK. Fig. 923. Annual, 1-3 ft.; uppermost sheaths usually inflated around the base of the infl.; spikes 6-12, pale or dark, 1-3 in. long, lemma fusiform, 1 line long, short-pilose at base and along the lower half of the keel, long-pilose on the margins near the apex, the awn about 5 lines long, rudiment cuneate, twice as long as broad, the single awn somewhat shorter than the awn of the perfect floret. Mex. Dept. Agrie, Div. Agrost., 7:192, 20 102

polydactyla, Swartz (*C. barbata*, Nash) Fig. 924. Perennial, 1-3 ft. spikes several, awns 2-3 lines, rudiment triangular-truncate, the 2 awns about as long as the awn of the perfect floret. Tropics of both hemispheres.

verticillata, Nutt. WINDMILL-GRASS. Perennial, 4-15 in. spikes several, slender, in 1-3 whorls, 2-4 in. long; awns 2-3 lines, lemma 1 line long, nearly glabrous; rudiment oblong-truncate, 1-awned. Dept. Agrie, Div. Agrost. 7 191. Kan. to Texas.

radiata, Swartz. Perennial, 2-3 ft. spikes several, about 3 in. long; spikelets slender; lemma slightly ciliate on callus and near apex, the awn 6 lines long; rudiment narrow, acute, the single awn about half as long as the awn of the perfect floret. W. Indies

gayāna, Kunth. RHODES-GRASS. Robust perennial, with abundant foliage and terminal umbels of 6-15 spikes.—An African species at present under experimentation in U. S. in dry regions. Cult. in Austral. (See Agr. Gaz. New S. Wales 19:19, 118, 389 [1908]).

923. *Chloris elegans*
($\times \frac{1}{2}$)

924. *Chloris polydactyla*. ($\times \frac{1}{2}$)

truncata, R. Br. (*C. barbata vera*, Host., not *C. barbata*, Swartz or Nash). STAR-GRASS. A stoloniferous perennial, with erect culms 1-3 ft.; spikes 6-10, 3-6 in., becoming horizontal or reflexed; spikelets $1\frac{1}{2}$ lines, dark at maturity, the awns 3-6 lines long. Austral. Turner, Austr Grasses 1:17—Cult for ornament

C. gracilis, Dur.—*Leptochloa virgata*, Beauv. This has been recommended as an ornamental.—*C. petraea*, Swartz, and *C. glauca*, Vasey, both handsome species from Fla., have been recommended for cult. as ornamentals

A. S. HITCHCOCK.

CHLORÓCODON (Greek for green and bell, alluding to the flowers) *Asclepiadaceae*. Twiners, one of which is planted far South

Large plants with opposite cordate entire heavy lvs, notched stipules and purplish or greenish fls in axillary panicles calyx 5-parted, corolla deeply 5-lobed, corona of 5 lobes coming from the base of the filaments, the lobes obovate or broader, sometimes with an erect or incurved projection or horn on the back, pollen granular—Two species in Trop and S Afr. *C. cernuulus*, N. E. Br., is apparently not in cult

Whitei, Hook f. Strong woolly twiner, with large opposite cordate-ovate thick lvs and axillary clusters of odd fls $\frac{3}{4}$ -1 in diam, corolla rotate-bell-shaped, thick, segments ovate and acute, purple and with margins and central stripe green, and bearing long-notched lobes, corona-lobes horned, authors comment over the capitate stigma. Guinea to Natal. B.M. 5898 G.C. III 18 243—It is now cult in S. Fla. and S. Calif. The roots are used medicinally in Natal, under the name of *munda*. The plant is an interesting greenhouse climber, but not handsome. L. H. B.

CHLORÓGALUM (green and milk, from the Greek, referring to the juice of the plant) *Liliaceae*. Hardy West American bulbs, allied to *Camassia*

Tall plants with a tuccated bulb. Lvs at base of st long-linear, wavy-margined, those on the st very small fls white or pink, in a panicle terminating in a nearly leafless st., on jointed pedicels, segments of perianth 6, 3-nerved, at length twisting over the ovary, stamens 6, not exceeding segments, style long and deciduous. Plants of easy cult., to be treated like *camassias* or *ornithogalums*. Three species, in Calif.

A. *Pedicels nearly as long as the fls: segments spreading from near the base*

pomeridianum, Kunth (*Anthriscum californicum*, Hort.) SOAP-PLANT. AMOL: St reaching 5 ft. many-branched, from a very large bulb, fls small (1 in or less long) and star-like, numerous, white with purple veins, on spreading pedicels, opening in the afternoon (hence the specific name *pomeridianus*, *post-meridian*)

—Bulb used by Indians and Mexicans for soap-making. Has been catalogued as *Anthriscum californicum*. Bulb 4 in long and half as thick, covered with coarse brown fibers.

AA. *Pedicels very short: segments spreading from above the base.*

parviflorum, Wats. Bulb small (1 in diam); st. 1-3 ft., slender-branched; lvs. narrow and grass-like; fls pinkish, $\frac{1}{4}$ in long, ovary broad and acute

angustifolium, Kellogg. Low, about $1\frac{1}{2}$ ft. Resembles the last, but fls white and green-lined and somewhat larger, the ovary acute above, perianth funnel-form campanulate, the segments narrow-oblong.

C. *Leichtlinii*, Baker—*Camassia Leichtlinii*.

L. H. B.

CHLORÓPHORA (Greek, referring to the fact that the fustic-tree bears a green dye). *Moraceae*. Two milky-juiced alternate-leaved trees, one in Trop. Afr. and one in Trop. Amer. Lvs entire or toothed; dioecious, male fls in cylindrical spikes, the females in nearly globular or oblong heads, these clusters solitary in the axils, perianth of male fls 4-parted, the segments

broad and obtuse, stamens 4; ovary a minute rudiment in the males, perianth of female fls 4-parted or -divided, the segments concave-thickened at the apex, style lateral on the oblique-ovoid ovary, achene equaling the perianth or somewhat exserted, covering the receptacle. *C. tinctoria*, Gaud. (*Maclura tinctoria*, Don) is the fustic of the W. Indies. It reaches a height of 50 ft., and a diam of trunk of 2 ft. usually not thorny lvs. nearly entire, oblong, acuminate. Variable. The handsome yellow wood yields a yellow dye, which is used also in the making of browns and greens, it is also a strong and resistant timber. L. H. B.

CHLORÓPHYTUM (name means, in Greek, green plant) *Liliaceae*. Rhizomatous herbaceous plants, one of which is familiar in greenhouses

Very like *Anthriscum*, but differing in the thickened filaments of the stamens and the 3 angled or 3-winged caps: inf. often denser lvs broader, often oblanceolate and petiolate seed disk-like—Some 60 or more species, in warm parts of Asia, Afr., and Amer. Consult *Anthriscum* and *Paradisva*

elatum, R. Br. (*Anthriscum variegatum*, A. Willd., *A. picturatum*, A. Willd., Hort.) Root fleshy and white lvs freely produced from the crown, often 1 in. wide, flattish and bright green, or in the garden varieties with white lines along the margins, and often (var. *picturatum*) also with a yellow band down the center. scape terete and glabrous, 2-3 ft. high, branched, fls. white, $\frac{1}{2}$ in long, with revolute oblanceolate segments, which are obscurely 3-nerved on the back. S. Afr. F. S. 21 2240-1—A valuable and common plant for vases and pots, and sometimes used in summer borders.

Three species that recently have been mentioned in horticultural literature are: *C. amanianse*, Engler, from German E. Afr., 10 in. lvs lanceolate-acuminate, 10 in. long and $\frac{3}{4}$ in. or less broad, somewhat fleshy, bronze, with white margin fls greenish white, in cluster 6 in long—*C. combeum*, Wood (Natal Plants, fig. 279), from Lake Albert, Cent. Afr., profluous lvs radical, linear, deep green, 2 ft. long fls small, white, soon fading, usually in 4's, in a branched cluster 3 ft. long—*C. Hughesii*, DeWald, Congo, lvs in a basal tuft, lanceolate, petioled, about 18-20 in long, 2-2½ in broad fls greenish white, about $\frac{1}{2}$ in. long, in a bracted raceme 2-3 ft. long

L. H. B.

CHLORÓSPIS BLANCHARDIANA: Trachelos

CHLORÓXYLON (green wood, Greek) *Rutaceae*.

One species of moderate-sized tree of India, slightly intro in this country, C. *Swietënia*, DC. (*Sweetënia* (*Chloroxylon*), Roxb.) Young parts gray-puberulent: lvs abruptly pinnate, the lvs 20-40, large and obtuse and entire fls small, 5-merous in terminal and axillary pubescent panicles, calyx deeply lobed, petals clawed, spreading, stamens 10, disk a 10-lobed pubescent body, in which the stamens are inserted for a coriaceous 3-celled caps. Heartwood fragrant, with a beautiful satiny luster, whence the name "Indian Satin-wood." An interesting tree for trial on the southern borders of the U. S. L. H. B.

CHOCOLATE: Theobroma.

CHOÍSYA (J. D. Choisy, Swiss botanist, 1799-1850). *Rutaceae*. One Mexican shrub, *C. ternata*, HBK., grown in S. Calif. and S. Fla., and sometimes under glass. It grows 4-8 ft. high, making a compact free-blooming bush, with opposite ternate lvs, the lvs lance-obovate or oblong, thick and entire, with pellucid dots fls in a terminal, forking cluster, white, fragrant, orange-like (whence the vernacular name "Mexican orange"), 1 in across, with pellucid dots. R. H. 1869. 330. Cn 50, p. 203. J. H. III 34:253—A handsome shrub, worthy of greater popularity. It will endure several degrees of frost, and should succeed in the open in many of the southern states. Blossoms in S. Calif. at different seasons; it can be made to bloom, it is said, every two months by withholding water and then watering liberally, as is done with roses in S. France. Hardy against a wall in parts of S. England. L. H. B.

CHOKE-CHERRY. *Prunus demissa* (West) and *P. virginiana* (East).

CHONDROBOLLEA (compounded from *Chondrorhyncha* and *Bollea*) A genus established to contain hybrids between these genera. See also *Bolleo-Chondrorhyncha*.

CHONDROPÉTALUM: hybrids of *Chondrorhyncha* and *Zygopetalum*, see those genera.

CHONDRORHYNCHA (*cartilage* and *beak*). *Orchidaceæ* Three species of S. American epiphytal orchids, practically unknown in the American trade. Cult. as for *Odontoglossum crispum*. They are short-stemmed herbs without pseudobulbs, and oblong, plicate, petioled lvs, the simple scape bearing a single large, odd, yellowish fl. *C. Chéstertoni*, Reichb. f. (O.R. 11:305; 16:57), *C. fimbriata*, Reichb. f., and *C. rosea*, Lindl. are the species. Keep cool and moist. A garden hybrid is reported between *C. Chéstertoni* and *Zygopetalum Mackayi* under the name of *Chondropetalum Fletcheri*. O.R. 1908, 56, f. 8.

GEORGE V. NASH.

CHORÍSIA (Ludwig Choris, born 1795, artist of Kotzebue's expedition) *Bombacææ*. Spiny trees of S. Amer. (3 species), one of which is somewhat cult. Lvs alternate, digitate, of 5-7 entire or serrate lfts. fls large, with 5 linear or oblong petals, the peduncles axillary or racemose; staminal tube double, the outer one short and with sterile anthers; ovary 5-loculed and many-ovuled fr. a pear-shaped caps. with many silky seeds. *C. speciosa*, St. Hil. of Brazil, the "floss silk tree," is cult. in S. Calif. and is adapted to warm glasshouses. It is a medium-sized tree, allied to *Ceiba* and *Bombax*. Lfts. lanceolate, acuminate, dentate; calyx irregular, shining outside, but silky inside, petals obtuse, yellowish and brown-striped at the base, pubescent on the back. The soft silk or cotton of the seed-pods is used for pillows and cushions. L. H. B.

CHORÍZEMA (fanciful Greek name) Sometimes spelled *Chorozeia* *Leguminosæ*. Evergreen coolhouse small shrubs grown for the showy pea-like yellow orange and red, usually racemose flowers; spring- and summer-blooming.

Woody plants of diffuse or half-climbing habit, with thick and shining simple often spiny-toothed lvs and pea-like red or yellow fls. calyx-lobes 5, the 2 upper ones mostly broader; petals clawed, the standard very broad, keel short, stamens not united; pod short, not constricted—About 15 species, in Austral., 3 of which

925. *Chorizema ilicifolium* (×½)

appear to be chiefly concerned in the garden forms. Handsome plants for the cool greenhouse, less popular in this country than abroad. When not grown too soft, they will stand slight frost at times. Grown in the open in S. Calif. and S. Fla. They are grown in a rather peaty soil, after the manner of azaleas, and usually rested in the open in summer. They are excellent for training on pillars and rafters.

Chorizemas are among the most attractive spring-flowering plants, and they are not difficult to grow. Cuttings should be secured in March from medium-ripened wood and may be either potted singly in small pots, or several placed together in larger pots. The

former method has the advantage, because when cuttings are well rooted in the small pots, they may be shifted along without so much disturbance to the roots. The cuttings root readily in a mixture of two parts sharp sand and one of peat, sifted through a fine sieve. They should be placed in a tight case or covered with a bell-glass in a temperature of 58° to 60° by night. A rise of 10° in the day will be sufficient. The inclosure that protects them from drafts should be opened a few minutes now and then to change the air. For potting chorizemas in the early stages, equal parts of good peat and sharp sand is about right. When a 5- or 6-inch pot is reached, much less sand should be used,—just enough to give the earth a gritty feeling and the peat may be in a rather rough state, just small enough to be conveniently used in potting. The potting should be firm, as loose potting is bad for all kinds of hardwood plants. Keep the plants shaded from the sun during the hot months, and use the syringe freely. Also pinching must be attended to from their early stages to insure a good bushy plant. It is best not to stop the plants after August, as they will begin then to set buds. A plant in a 5- or 6-inch pot may be grown the first year if properly attended to. The plants should be wintered in a night temperature of 40° with a rise of 10° or 15° during the day. The second summer, and from that on as long as the plants are kept, they do better if plunged in a bed of clean coal-ashes out-of-doors, provided there is no danger from frost, by so doing, a much shorter-jointed growth will be the result. Plants well established in their pots may be fed with liquid manure until they set buds. A 3-inch potful of cow- or horse-urine to two and one half or three gallons of water, will be sufficient, and for a change a handful of soft-coal soot to the same amount of water, but always water twice with clean water between applications. Brown scale sometimes gets a foothold on chorizemas and it may be eradicated by fumigation with cyanide of potassium. Red-spider may be kept down with the syringe (George F. Stewart.)

varium, Benth. (*C. elegans*, Hort.) The common cult. species, in several forms erect, 4-6 ft., pubescent on under side of lvs and on branches. Lvs cordate-ovate, undulate and prickly-toothed, 2 in. or less long; fls in many pubescent racemes, standard light orange, wings and keel handsome purple-red. B.R. 25.49.—Garden forms are *C. Chaudleri*, with yellow-red standard, and blood-red wings, the fls large and numerous, and such names as *grandiflorum*, *macrophyllum*, *latifolium*, *floribundum*, *multiflorum*. *C. Lövi*, Hort., is a form of this species, with larger and brighter-colored fls.

cordatum, Lindl. (*C. superbum*, Lom.). Tall slender glabrous shrub (7-10 ft.), with weak branches. Lvs cordate-ovate to ovate lanceolate, 2 in. or less long, small-toothed and more or less prickly fls many, standard scarlet-red, wings and keel purple-red. B.R. 24:10 I.H. 29. Var. *rotundifolium*, Hort., has roundish lvs. Var. *splendens*, Hort., is offered.

ilicifolium, Labill. Fig. 925. Low and diffuse, weak, glabrous, the branches slender and erect or drooping. Lvs. ovate to lanceolate, 1 in. long, often cordate at base, thick, coarsely veined, strongly undulate and with prickly teeth or lobes fls in few-fld loose racemes, orange-red in spring and summer. B.M. 1032 (as *C. nanum*). B.R. 1513 (as *C. triangulare*). L. H. B.

CHRISTMAS FLOWER: *Euphorbia pulcherrima*.

CHROSPERMA: *Zygadenus*.

CHROZÓPHORA (Greek, *color-bearing*, on account of their use). *Euphorbiacææ*. Dye-yielding herbs. Lvs. alternate, stellate hairy. fls. monœcious; staminate calyx 5-parted, valvate; petals free; styles biparted,

ovary 3-celled, 3-ovuled.—Nine, species chiefly of Old World deserts. *C. tinctoria*, Juss (*Crôton tinctorius*, Linn.), TURNSOLE, a Medit. annual, formerly used for its blue dye, is listed in some European catalogues.

CHRYSALIDOCÁRPUS (Greek for *golden fruit*). *Palmaeae*, tribe *Arceae*. Spinulose stoloniferous feathery palms, with medium fasciculate ringed stems. Leaves pinnatisect, long-acuminate; segms about 100, bifid at the apex, the lateral nerves remote from the midrib fr usually violet or almost black.—Species 1, which is a popular florist's plant. Madagascar. Treated

as a part of *Hyophorbe* by Engler and Prantl, but here kept distinct, as it is commonly known as *Chrysalidocarpus* by cultivators.

lutescens, Wendl (*Hyophorbe indica*, Gaertn. *H. Commersoniana*, Mart. *Arca lutescens*, Bory). Fig 926. St. 30 ft. high, 4-6 in. diam., cylindrical, smooth, thickened at the base. Lvs. very long, segms. almost opposite, lanceolate, 2 ft. long, $2\frac{1}{2}$ in. wide, acute, with 3 prominent primary nerves, which are convex below and acutely 2-fac'd above. Bourbon. A. G. 13. 141. A. F. 4. 566.—In growing *Chrysalidocarpus* (or *Arca*) *lutescens* in quantity, it will be found a good plan to sow the seeds either on a bench, in boxes or seed-pans, so prepared that the seedlings will remain in the soil in which they germinate until they have made 2 or more lvs. The first lf. made above the soil is small, and if plants are potted off at this stage they must be very carefully watered in order not to sour the soil. In the preparation of the receptacles for the seed, a little gravel in the bottom will be found good, as the roots work very freely through it, and when the time comes to separate the plants previous to potting, it is an easy matter to disentangle the roots without bruising them. Probably the plan which works best is to wash the soil and gravel entirely from among the roots. Pot in soil not too dry, and for the next few days keep the house extra warm and humid, and the plants shaded from the sun without any moisture applied to the soil.

JARED G. SMITH and G. W. OLIVER.

CHRYSANTHEMUM (Greek, *golden flower*). Including *Pyrethrum*. *Compositae*. Plate XXX. A diverse group of herbaceous and sub-shrubby plants, mostly hardy, and typically with white or yellow single flowers, but the more important kinds greatly modified in form and color, grown in the open or flowered under glass in fall.

Annual or perennial herbs, sometimes partly woody, glabrous or loosely pubescent or rarely viscid, usually heavy-scented lvs. alternate, various, from nearly or quite entire to much dissected; heads many-fl'd, terminating long peduncles or disposed in corymbose clusters, radiate (rays sometimes wanting), disk-fls. perfect and mostly fertile, ray-fls. pistillate, mostly fertile, the ray white, yellow, rose-colored, toothed or entire; receptacle naked, flat or convex, involucre-scales imbricated and appressed, mostly in several series, the margins usually scarious; achene of disk- and ray-fls. similar, striate or angled or torcite or more or less ribbed, those of the ray-fls. often 3-angled, pappus 0, or a scale-like cup or raised border.—Probably nearly 150 recognizable species, in temperate and boreal regions in many parts of the globe, but mostly in the Old World.

The genus *Chrysanthemum*, as now accepted by botanists, includes many diverse species so far as general appearance is concerned, but nevertheless well agreeing within themselves in systematic marks and by these same marks being separated from related groups. The marks are in large part set forth in the preceding paragraph. Bentham and Hooker make twenty-two sub-groups (of which about six include the garden forms), based chiefly on the way in which the seeds are ribbed, cornered, or winged, and the form of the pappus. The garden pyrethrums cannot be kept distinct from *chrysanthemums* by garden characters. The garden conception of *Pyrethrum* is a group of hardy herbaceous plants with mostly single flowers, as opposed to the florists' or autumn *chrysanthemums*, which reach perfection only under glass, and the familiar annual kinds which are commonly called summer *chrysanthemums*. When the gardener speaks of pyrethrums, he usually means *P. roseum*. Many of the species described below have been called pyrethrums at various times, but they all have the same specific name under the genus *Chrysanthemum*, except the most important of all garden pyrethrums, viz., *P. roseum*, which is *C. coccineum*. The feverfew and golden feather are still sold as pyrethrums, and there are other garden species of less importance. The botanical conception of *Pyrethrum* is variously defined, the presence of a rather marked pappus-border on the achene is one of the distinctions, the pyrethrums are mostly plants with large and broad heads either solitary or in loose corymbose clusters, the rays usually conspicuous and commonly not yellow, and the fruits five- to ten-ribbed. Hoffmann, in Engler & Prantl "Naturlichen Pflanzenfamilien," adopts eight sections, one of them being *Tanacetum* (tansy) which most botanists prefer to keep distinct.

Although the genus is large and widespread, the number of plants of interest to the cultivator is relatively few. Of course the common garden *chrysanthemum*, derived apparently from two species, is the most useful. The insect powder known as "pyrethrum" is produced from the dried flowers of *C. cinerariaefolium* and *C. coccineum*. The former species grows wild in Dalmatia, a long narrow mountainous tract of the Austrian empire. "Dalmatian insect powder" is one of the commonest insecticides, especially for household pests. *C. cinerariaefolium* is largely cultivated in France. *C. coccineum* is cultivated in California, and the product is known as *abuch*.

There are over one hundred books about the garden *chrysanthemum*, and its magazine literature is probably exceeded in bulk only by that of the rose. It is the flower of the East, as the rose is the flower of the West.

Aside from oriental literature, there were eighty-three books mentioned by C. Harman Payne, in the Catalogue of the National Chrysanthemum Society for 1896. Most of these are cheap cultural guides, circulated by the dealers. The botany of the two common species has been monographed by W. B. Hemsley in the *Gardeners' Chronicle*, series III, vol. 6, pp 521, 555, 585, 652, and in the *Journal of the Royal Horticultural Society*, vol. 12, part I. The great repositories of information regarding the history of the chrysanthemum, from the garden point of view, are the scattered writings of C. Harman Payne, his "Short History of the Chrysanthemum," London, 1885, and the older books of F. W. Burbidge and John Salter. For information about varieties, see the Catalogues of the National Chrysanthemum Society (England) and the *Liste Descriptive*, and supplements thereto, by O. Meulenaere, Ghent, Belgium.

There are a number of rather expensive art works, among which one of the most delightful is the "Golden Flower: Chrysanthemum," edited by F. Schuyler Mathews, Prang, Boston, 1890. "Chrysanthemum Culture for America," by James Morton, Clarksville, Tenn., published in New York in 1891, was the first authentic American work. Within the past few years have appeared "The Chrysanthemum," by Arthur Herrington, "Smith's Chrysanthemum Manual," by Elmer D. Smith, and recently "Chrysanthemums and How to Grow Them," by I. L. Powell.

Aside from the florist's chrysanthemum (*C. hortorum*), no particular skill is required in the growing of these plants, although great perfection is attained by some gardeners in the handling of individual plants of the marguerites (*C. frutescens*). The hardy border perennial chrysanthemums may be either small-flowered rugged forms of *C. hortorum*, as the "hardy pompons" and also the "artemisias" of old gardens, or they may be other species. Some of these other species are the "pyrethrums" of gardens, and some (as the *C. maximum* and *C. uliginosum* class) are the "moon daisies" and "moonpenny daisies" of the hardy perennial plantation. Some of the very dwarf tufted kinds (as *C. Tchahatchewi*) make excellent edging plants. The moon daisies deserve to be better known for mass planting and bold lines when a great display of heavy white bloom is wanted. Most of them bloom the first season from early-sown seed. The Shasta daisy and its derivatives are of the moon daisy group. They all profit by a covering of coarse mulch in the fall. See *Pyrethrum* and *Marguerite*.

The annual chrysanthemums are easily grown flower-garden subjects, suitable for a bold late display in places where delicate and soft effects are not desired.

C. carinatum, *C. coronarium* and *C. segetum* are the common sources of these annuals. They are hardy and rugged; and they need much room.

A. Plant annual (at least so treated in cult.): the "summer chrysanthemums"

B. Rays typically white.

1. *carinatum*, Schousb (*C. tricolor*, Andr *C. matricarioides*, Hort.) Fig. 927. Glabrous annual, 2-3 ft. high at much branched. lvs rather fleshy, pinnatifid-fls in solitary heads which are nearly 2 in across, with typically white rays and a yellow ring at the base, involucre bracts carinate (keeled). Summer. The two colors, together with the dark purple disk, gave rise to the name "tricolor." The typical form, intro. into England from Morocco in 1798, was pictured in B M 508 (1799). By 1856 signs of doubling appeared (FS 11 1099). In 1858 shades of red in the rays appeared in a strain intro. by F K Burridge, of Colchester, England, and known as *C. Burridgeum*, Hort (see B M. 5095, which shows a ring of red on the rays, adding a fourth color to this remarkably brilliant and varied fl., and FS 13 1313, which also shows *C. venustum*, Hort., in which the rays are entirely red, except the original yellow circle at the base) G 2 307. Gn W. 24.675. *C. annulatum*, Hort., is a name for the kinds with circular bands of red, maroon, or purple. R H 1869 450. *C. Dunnii*, Hort., is another seed-grower's strain. There are full double forms in yellow margined red, and white margined red, the fls 3 in. across (see R H 1874 410), under many names. See, also, Gn 26, p. 440; 10, p. 213; 21 22 R H. 1874, p. 412. S H. 2 477. G W 14, p. 99. -- The commonest and gaudiest of annual chrysanthemums, distinguished by the keeled or ridged scales of involucre and the dark purple disk.

BB. Rays typically light yellow

2. *coronarium*, Linn. (*Anthemis coronaria*, Hort.), Annual, 3-4 ft. lvs. bipinnately parted, somewhat clasping or eared at the base, glabrous, the segments closer together than in *C. carinatum* involucre scales broad, scarious; rays lemon-colored or nearly white. July-Sept. Medit. Gn 26 440. G C II 19.541. -- The full double forms, with rays reflexed and imbricated, are more popular than the single forms. This and *C. carinatum* are the common "summer chrysanthemums." This is common in old gardens, and is also somewhat used for bedding and for pot culture.

BBB. Rays typically golden yellow.

3. *segetum*, Linn. CORN MARGOLD. Annual, 1-1½ ft.: lvs sparse, clasping, oblong to oblanceolate, variable, the lower petioled and the upper clasping incisions coarse or fine, deep or shallow, but usually only coarsely serrate, with few and distant teeth, the lower ones less cut. bracts of involucre broad, obtuse; rays obovate and emarginate, golden yellow. June-Aug. Eu., N. Afr., W. Asia. Escaped in waste places. Gn 18, p. 195. R.H. 1895, pp 448, 449. Var. *grandiflorum*, Hort., is a larger-flid form of this weed, which is com-

927. *Chrysanthemum carinatum*, the form sold as *C. Burrigeum*. (×½)

mon in the English grain fields. Forms of the plant are cult; the var. *Cloth of Gold*, J.H. III. 12:445, is one of the best. Var. *pumilum*, Hort., very compact, 8 in. high. This species is much less popular than *P. carinatum* and *P. coronarium*. It is forced to a slight extent for winter bloom.

4 *multicaule*, Desf. Glabrous and glaucous annual, 6-12 in high; sts numerous, simple or branched, stout, terete; lvs. fleshy, variable, usually linear-spatulate, 1-3 in long and $\frac{1}{2}$ - $\frac{3}{4}$ in broad, very coarsely toothed or lobed, sometimes shorter, with few narrow-linear, acute, entire segms about 1 line broad; rays much shorter and rounder than in *C. segetum*, golden yellow. Algeria B M 6930—Rarer in cult than the last. Said to be useless as a cut-fl.

AA Plant perennial.

b. *The florist's chrysanthemum, and wild progenitors or near relatives, grown as pot or bench subjects because the seasons are not long enough, in the N, for full maturity in the open. Rays of many forms and colors in cult, heads often double: lvs usually lobed or strongly notched*

5 *morifolium*, Ram (*C. sinense*, Sabine) Fig 928. Perennial, one of the sources (with *C. indicum*) of the large florist's chrysanthemums; wild plant shrubby, erect and rigid, 2-3 ft., branching, few-lvd: lvs thick and stiff, 2 in long, densely white-tomentose beneath, variable in shape from ovate to lanceolate, cuneate at base, margin entire or coarsely toothed; outer bracts of involucre thick, linear, acute, white-tomentose, fl-heads small, with yellow disk and white rays somewhat exceeding the disk. China G C III 31.302 (adapted in Fig 928). Var *gracile*, Hemsl. Lvs thin or only moderately thick, palmately lobed or pinnately lobed, dentate, the teeth often mucronate; outer involucre bracts herbaceous, linear and acute, varying in pubescence, rays white, pink or lilac, equaling or exceeding the disk. China, Mongolia, Japan.

6 *indicum*, Linn Fig 929. Much like the last, but lvs. thin and flaccid, pinnately parted, with acute or

929. Wild form of *Chrysanthemum indicum*, as grown in England.

mucronate teeth; outer involucre bracts broad and scarious except the herbaceous midnerve, rays yellow, shorter than diam of the disk. China and Japan. B M 7874 G C III 8 565, 28 342, 31 303 (adapted in Fig 929)—This species is not native to India, and therefore Linnaeus' name is inappropriate. Abroad, *C. indicum* is often used in a wide sense, to include *C. morifolium*. In recent years, both *C. morifolium* and *C. indicum* have been grown in England from wild stock, and from such studies of them the present descriptions and figures are drawn. From these plants it is supposed, by endless variation and by hybridization, the highly developed glasshouse or florist's chrysanthemums have come, a group that may be distinguished as *C. hortorum*, Figs 938-50.

7 *ornatum*, Hemsl (*C. marginatum*, Hort.) Allied to the above two species, and perhaps a form of *C. morifolium*; bushy plant, 3-4 ft. lvs palmately lobed, ovate in outline, white-tomentose beneath and on the margin, $1\frac{1}{2}$ -2 in. long; fl-heads loosely corymbose, 2 in or less across, the disk yellow and rays white and broad, bracts of involucre in about 3 series, all similar, white in center, purple-brown on margin; achenes small, oblique, glabrous. B M 7965 G C III 35 51 Gn 71, p 53, 73, p 90—A recent introduction, grows well in the open in England, but does not bloom unless taken indoors.

nb *The garden pyrethrums and others, heads usually not highly double and modified*

c *Lvs cut to the midrib or nearly so*

d. *Heads borne in corymbs, i e., flat-topped, dense clusters*

e *Rays yellow*

8 *achilleaeifolium*, DC (*Achillea aurea*, Lam.) Perennial, 2 ft. st. usually unbranched, except along the creeping and rooting base; sts and lvs covered with fine soft grayish white hairs, oblong in outline, about 1 in long, $\frac{1}{4}$ in wide, finely cut; rays 7-8, short, a little longer than the involucre. Siberia, Caucasus—Rare in cult. Less popular than the achilleas, with larger fl.-clusters.

EE *Rays white.*

9 *corymbosum*, Linn (*Pyrethrum corymbosum*, Willd.) Robust perennial, 1-4 ft. st. branched at the apex. lvs sometimes 6 in long, 3 in. wide, widest at middle and tapering both ways, cut to the very midrib, the segms alternating along the midrib. Eu, N Afr, Caucasus G C II. 20:201—Rare in cult. Segms. may be coarsely or finely cut, and lvs glabrous or vilous beneath.

928. Wild form of *Chrysanthemum morifolium*, as grown in England.

10. *Parthénium*, Pers. (*Pyræthrum Parthénium*, Smith. *Parthénium Matricaria*, Guedl.). **FEVERFEW**. Fig. 930. Glabrous strong-scented perennial, 1-3 ft., much branched in the taller forms. lvs ovate or oblong-ovate in outline, pinnatisect or bi-pinnatisect, smooth or lightly pubescent; segms oblong or elliptic-oblong, pinnatifid or cut, the uppermost more or less confluent; fl-heads small, many, stalked, corymbose, disk yellow; rays white, oblong, equaling or exceeding the disk. Eu to the Caucasus.—Some authors regard this as one widely variable species, others make at least two species, one of them (*C. prædium*, Vent.) being the Caucasian form, distinguished by more deeply cut lvs, longer-peduncled heads, and rays longer than the disk rather than equaling it (as in *C. Parthénium* type).—There are double-fl. and also discoid forms. Var. *aëreum*, Hort. (*P. aëreum*, Hort.), is the **GOLDEN**

930 *Chrysanthemum Parthénium*. Feverfew. ($\times \frac{1}{2}$)

FEATHER commonly used for carpet-bedding. It has yellow foliage, which becomes green later in the season, especially if fls. are allowed to form. It is used for edgings and cover. Var. *aëreum crispum*, Hort., is dwarf, compact, with foliage curled like parsley. Var. *selaginoides*, and var. *lacinia-tum*, Hort., are distinct horticultural forms. Var. *glacum*, Hort., has dusty white foliage, and does not bloom until the second year. Intro by Damman & Co, 1895. All these varieties are prop. by seeds. The feverfew is common about old yards, and is much employed in home gardens as edging. In its undeveloped and prevailing forms, it is one of the "old-fashioned" plants

DD. Heads borne singly on the branches or sts. (or at least not definitely clustered).

E. Height less than 1 ft.

11. *Tchihatchewii*, Hort. (*C. Tchihatchewii*, Hort.). **TURFING DAISY**. Densely tufted perennial for carpet-

ing dry, waste places; height 2-9 in. sts very numerous, rooting at the base; foliage handsome dark green, finely cut, the segms. linear, persisting into winter; fl-heads solitary on axillary peduncles, borne profusely for several weeks; rays white, disk yellow. Asia Minor. R. H. 1869, p. 380, desc., and 1897, p. 470. Gn 26, p. 443.—Prop. by division of roots or simply by cutting the rooted sts, but chiefly by seeds. Highly recommended abroad for spring and early summer bloom in edgings and low formal plantings. Said to thrive in dry places and under trees

EE Height more than 1 ft

F. Group of greenhouse plants (at the N.), shrubby at the base; sts branched at the top; rays white or lemon.

G. Foliage not glaucous

12. *frutescens*, Linn. **MARGUERITE**. PARIS DAISY. Figs 931, 932. Usually glabrous, 3 ft. high, perennial. lvs fleshy, green; heads numerous, always single, rays typically white, with a lemon-colored (never pure yellow or golden) form. Canaries G C II 13 561; III. 35 216. Gn 12, p. 255; 17, p. 5, 26, p. 445, 70, p. 310.—Intro. into England 1699. This is the popular florists' *Marguerite*, which can

931 *Chrysanthemum frutescens*. The Marguerite or Paris daisy. ($\times \frac{1}{2}$)

be had in flower the year round, but is especially grown for winter bloom. Var. *grandiflorum*, Hort., is the large-fl. prevailing form. The lemon-colored form seems to have originated about 1880. Under this name an entirely distinct species has also been passing, yet it has never been advertised separately in the American trade. See No. 13

GG. Foliage glaucous.

13. *anethifolium*, Brouss. (*C. fœniculaceum*, Steud. *P. fœniculaceum* var. *bipinnatifidum*, DC.). **GLAUCOUS MARGUERITE**. Fig 932. Perennial rarer in cult. than *C. frutescens* (which see), but distinguished by its glaucous hue, and by the way in which the lvs are cut. The segms are narrower, more deeply cut, and more distant than in No. 12. The lvs. are shorter petioled. Canaries.—This species is doubtless cult in American greenhouses as *C. frutescens*. A lemon-fl. form is shown in R. H. 1845.61 but called *C. frutescens*.

FF. Group of hardy outdoor herbs, sts. usually unbranched: rays white or red, never yellow.

g. Foliage not glaucous. fls. sometimes double.

14 **coccineum**, Willd. (*Pyrethrum roseum*, Bieb., not Web. & Mohr. *P. hybridum*, Hort.). Fig. 933. Glabrous perennial, 1-2 ft. high: st. usually unbranched,

932. Leaves of *Chrysanthemum frutescens* (left) and *C. anethifolium* (right) ($\times 1$)

rarely branched at the top. lvs. thin, dark green, or in dried specimens dark brown. involucre scales with a brown margin; rays white or red in such shades as pink, carmine, rose, lilac, and crimson, and sometimes tipped yellow, but never wholly yellow. Caucasus, Persia. F.S. 9 917. Gn 26, pp 440, 443. Gng 2 7, 5 309. R.H. 1897, p 521. Not B.M. 1080, which is *C. coronopifolium*. The first picture of a full double form is R.H. 1864 71.—This species is the most important and variable of all the hardy herbaceous kinds. There have been perhaps 700 named horticultural varieties. There is an anemone-flid form with a high disk. The species is also cult in Calif and France for insect powder. *C. atrosanguineum*, Hort., is said to be a good horticultural variety with dark crimson fls. The *C. roseum* of Weber & Mohr being a tenable name, Hoffmann proposes Ascherson's name, *C. Marschallii*, for the *P. roseum* of Bieberstein, but Willdenow's *C. coccineum* is here retained.

gg. Foliage glaucous. fls. never double

15. **cinerariæfolium**, Vis. Glabrous perennial, slender, 12-15 in. high. sts. unbranched, with a few short, scattered hairs below the fl. lvs. long-petioled, silky beneath, with distant segms. involucre scales scarious and whitish at the apex. Dalmatia. B.M. 6781.—Said to be chief source of Dalmatian insect powder. Rarely cult. as border plant. Common in botanic gardens.

cc. Lvs. not cut to the midrib, pinnatifid or coarsely toothed (except perhaps in No. 22)

d. Heads borne in clusters, mostly flat-topped

16 **Balsámíta**, Linn. (*Tanacetum Balsámíta*, Linn. *Pyrethrum Balsámíta*, Willd. *Balsámíta vulgaris*, Willd.) COSTMARY. MINT GERANIUM. Sometimes erroneously called "lavender," from its sweet agreeable odor. Tall and stout perennial. lvs. sweet-scented, oval or oblong, obtuse, margined with blunt or sharp teeth, lower ones petioled, upper ones almost sessile, the largest lvs. 5-11 in. long, $1\frac{1}{2}$ -2 in. wide: pappus a short crown. W. Asia.—Typically with short white rays, but when they are absent the plant is var. *tanacetoides*, Boiss. Fig. 934. Rayless. This has escaped in a few places from old gardens. it seems to be the prevailing garden form.

dd. Heads borne singly on the branches or sts., or at least not in definite clusters, rays large, white.

17 **lactistre**, Brot. (*C. latifolium*, DC.) Fig. 935. Perennial, endlessly confused with *C. maximum* in gardens, and the two species are very variable and difficult to distinguish; the fls. can hardly be told apart. *C. lactistre* is a taller and more vigorous plant, and sometimes it is branched at the top, bearing 3 heads, while *C. maximum* is always 1-headed, and the lvs. in that species are much narrower. Height 3-6 ft.: st. sparsely branched. lvs. partly clasping, ovate-lanceolate, with coarse, hard teeth. rays about 1 in. long; pappus of the ray 2-3-eared. Portugal, along rivers, swamps and lakes. R.H. 1857, p 456.

18 **máximum**, Ramond. Fig. 936. This perennial species has narrower lvs. than *C. lactistre*, and they are narrowed at the base. Height 1 ft. st. more angled than the above, simple or branched at the very base, always 1-headed and leafless for 3-4 in. below the head: lower lvs. petioled, wedge-shaped at the base, or long-oblancoate; the upper lvs. becoming few, lanceolate but usually not very prominently pointed, the teeth not very large or striking. pappus none. involucre scales narrower and longer, whitish-transparent at the margin, while those of *C. lactistre* are broader, more rounded at the apex, and with a light brown scarious margin. Pyrenees. J.H. III 5 251. Gn 26, p 437, 73, p 567. G. 5 445. G.M. 46 676. Var. **Róbinsonii**, Hort., has finely cut or fringed rays, giving the bloom the appearance of a Japanese chrysanthemum.

R.H. 1904 515. Var. **Dávidsii**, Hort., has sts. of great length, suitable for cutting. Var. **filiforme**, Hort., has deeply serrate long and drooping rays. There are many other forms, differing in time of bloom as well as in habit and in form of fl. The **Shasta daisy** (said to be a

933. *Chrysanthemum coccineum*. The *Pyrethrum roseum* of gardens. ($\times \frac{1}{2}$)

934. *Chrysanthemum Balsámíta* var. *tanacetoides*. Costmary or mint geranium. ($\times \frac{1}{2}$)

hybrid) is an early-flowering very floriferous race, with several strains of fls, mostly large and pure white, although in one form the buds are reported as lemon-yellow but opening white; various sub-varieties are now offered. It is a good summer and autumn bloomer, and usually hardy in the northeastern states.

935 *Chrysanthemum uliginosum* A short-rayed form ($\times \frac{1}{2}$)

19 *uliginosum*, Pers (*Pyrrhtrum uliginosum*, Waldst.) GIANT DAISY Stout, erect bushy leafy-stemmed perennial, 4-7 ft. high, with light green foliage: st. nearly glabrous, striate, branching above, roughish: lvs. long-lanceolate, prominently pointed, with large coarse sharp teeth: heads often several together and not long-stalked, 2-3 in across, white, late Hungary. B M 2706 A F. 4:523; 8.813 Gng. 2 375, 5:183. A G 19:403 R H 1894, p 82 Gt 46, p. 103 G C II 10:493 Gn 26, p 442; 38, p. 523; 62, p 180 G W 15, p 316 G M 51.453 Gn W 23 415

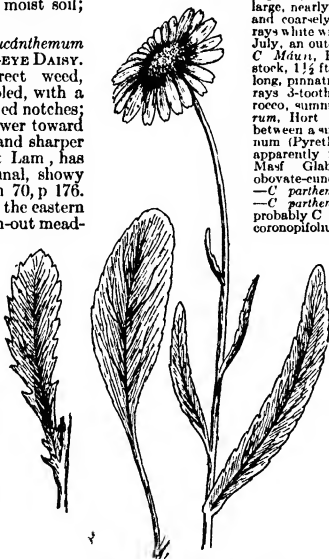

It blooms the first year from seed or division, and has been forced for Easter somewhat as *Hydrangea paniculata* can be

treated Excellent for cut-fls. The blossoms should be cut soon after opening, as the disks darken with age The plant needs a rich moist soil; it deserves a greater popularity

20 *Leucanthemum*, Linn (*Leucanthemum vulgare*, Lam.) WHITEWEED. OX-EYE DAISY. Fig. 937 Glabrous perennial erect weed, 1-2 ft high. root-lvs. long-petioled, with a large, oval blade and coarse, rounded notches; st-lvs lanceolate, becoming narrower toward the top, serrate, with few distant and sharper teeth. (Var *pinnatifidum*, Lec & Lam, has more divided lvs.) heads terminal, showy white June, July Eu, N. Asia Gn 70, p 176.

—One of the commonest weeds in the eastern states, being characteristic of worn-out meadows The daisies are not cult., but they are often gathered for decoration, and make excellent cut-fls. The plant is very variable, and forms adapted to fl-garden uses will probably be developed Rayless plants are sometimes found.

21. *nipponicum*, Hort. (*Leucanthemum nipponicum*, Franch.) Differs from others of this set in being shrubby at base and lvs broadest above the middle: to 2 ft., the st. strong, simple, few-fl'd.: lvs. thick, oblong-spatulate to oblanceolate, sessile, irregularly denticulate but entire at base, 3-4 in. long, pale beneath: fl-heads 2-3½ in. across, with a hemispherical involucre of oval

936. *Chrysanthemum maximum* ($\times \frac{1}{2}$)

obtuse bracts, rays bright white, linear, minutely 5-toothed; disk pale greenish yellow. Japan. B M 7660. R H. 1905, p 47. F E. 20. 434—Hardy in the N., in the root, but the sts. killed down by frost, has the general appearance of *C. lacustre* A beautiful large-fl'd species, producing its large blooms in late autumn

22 *arcticum*, Linn Low perennial, 3-15 in, glabrous or nearly so. lvs. cuneate, long-tapering at base, toothed or cut at the apex, sometimes 3-5-lobed, the uppermost ones small and very narrow and nearly entire involucre-bracts broad and brown-margined, rays clear white, about 1 in long. pappus wanting Arctic Eu, Asia and Amer.

—An attractive very hardy species, making a clump of dark green foliage and producing in autumn many large white fls, sometimes tinged lilac or rose

C. coronopifolium, Willd. = *C. roseum* — *C. grande*, Hook f. (*Plasium grandiorum*, L'Her.) Stout erect perennial of Algeria. 2-3 ft lvs oblong to linear-oblong, often lyrate, coarsely toothed fl-heads large, solitary, rayless, golden yellow, to 2 in across B M 7886. — *C. grandiflorum*, Willd. Shrubby smooth, from the Canaries, with ovate lobed lvs., the parts lanceolate or linear and toothed or entire fl-heads solitary, the rays white and disk yellow allied to *C. frutescens*, variable — *C. inodorum*, Linn = *Marrubium inodorum* — *C. macrophyllum*, Waldst & Kit Perennial herb, 2 ft. lvs very large, nearly sessile, pinnatisect, the lobes lanceolate and coarsely toothed heads very many, corymbed, rays white with yellowish tinge, the disk yellow June, July, an outdoor plant Hungary G W 12, p 410 — *C. Mauii*, Hook f. Herbaceous, with woolly rootstock, 1½ ft lvs about 1 in long, triangular to oblong, pinnatifid fl-heads 1½ in diam, long-stalked, rays 3-toothed, white with reddish backs. Mt. Morocco, summer in the open B M 5907 — *C. multiflorum*, Hort Fls greenish white said to be a cross between a single-fl'd chrysanthemum and *C. pallasiarum* (*Pyrethrum pallasiarum*, Maxim; of N. Asia, apparently not a garden species) — *C. ochroleucum*, Masf Glabrous undershrub of the Canaries lvs obovate-cuneate, coarsely toothed rays pale yellow — *C. parthenioides*, Willd. a form of *C. parthenium* — *C. parthenoides*, Voss One of the feverfew forms, probably *C. praerubrum* — *C. rœsum*, Web & Mohr (*C. coronopifolium*, Willd., not Vill.), not Bieb Perennial herb, 2½ ft lvs ovate-pinnate fl-heads solitary, rays rose-red or flesh-color Caucasus — *C. tomentosum*, Loisel An alpine Corsican species tufted, 2 in high when in bloom lvs pinnatifid, densely tomentose fl-heads 1 in across, white-rayed, on sts 1 in long — *C. viscidum*, Desf Annual disk-orange-yellow, rays sulfur-yellow Medit — *C. vulgare*, Bernh = *Leucanthemum vulgare* — *C. WILHELM MILLER.
L. H. B.†

Types of the common chrysanthemum.

The common chrysanthemums of the florists (*C. hortorum*) are often called "large-flowering," and "autumn chrysanthemums," to distinguish them from the hardy outdoor kinds, although

neither of these popular names is entirely accurate or distinctive.

They are the blended product of *C. indicum* and *C. morifolium*, two species of plants that grow wild in China and Japan. The outdoor or hardy chrysanthemums are derived from the same species, being less developed forms. The florist's chrysanthemum is not necessarily a glasshouse subject, but it is bloomed under glass for protection and to secure a longer season. Ten to fifteen dominant types of chrysanthemums have been recognized by the National Chrysanthemum Society of England. The words "types," "races," and "sections," have always been used by horticulturists to express much the same thing, but types can always be defined clearly, while sections cannot, and the word race should be restricted to cultivated varieties that reproduce their character by seed, which is not the case with the large-flowering chrysanthemums. The following explanation and scheme, it is hoped, will clearly set forth the main types, and explain some of the many terms that confuse the beginner. The horticultural sections are wholly arbitrary, being chiefly for the convenience of competitors at exhibitions, and therefore changing with the fashions. The present classification is based on the form of the flower, as each type can be had in any color found in the whole genus.

A Single forms: rays in 1 series, or few series: disk low and flat

1 *The Small Single Type*—Fig 950. Fls about 2 in across, star-like, i. e., with the rays arranged in one series around the yellow disk. "Single," however, is a relative term, and in Fig 950 there is more than one series of rays, but this does not destroy the "singleness" of effect. All fls are either single, semi-double, or double, but all the intermediate forms between the two extremes of singleness and doubleness tend to disappear, as they are not desired.

2 *The Large Single Type*—Like the preceding, but the fls. 4 in or more across, and fewer. The large and small single types are practically never grown outdoors and are best suited for pot culture, each specimen bearing 20-80 fls. They are also grown by florists in considerable quantity for cutting.

939. Japanese anemone chrysanthemum when fully expanded.

938. The small and regular anemone type.

AA. *Anemone*-fld. forms rays as in A: disk high and rounded.

B. Fls (florets) small, numerous, regular.

3. *The Small Anemone Type*—Commonly called "Pompon Anemone." Fig 938. Fls 2-3 in across, and usually more numerous than in the large anemone type. All the anemone forms are essentially single, but the raised disk, with its elongated tubular fls, usually yellow but often of other colors, gives them a distinct artistic effect, and they are, therefore, treated as intermediates in character between the single and double forms. Like the single forms, they are less popular than the double kinds, and the varieties are, therefore, less numerous and more subject to the caprices of fashion.

BB. Fls. large, fewer, regular

4. *The Large Anemone Type*—Fls 4 in or more across and fewer. Heads must have large size, high neatly formed centers, and regularly arranged florets, the disk being composed of long tubes or quills and the rays flat and horizontally arranged.

BBB Fls large, few, irregular.

5 *The Japanese Anemone Type*—Fig 939. Fls. 4 in or more across, and irregular in outline, fantastic and extreme anemone forms.

AAA. *Double*-fld forms rays in many series: disk absent or nearly so

B Fls small, rays short

6 *The Pompon Type*—Figs 940, 949. Fls. 1-2 in. across. The outdoor kinds are likely to be small, flat and buttonlike, while those cult indoors are usually larger and nearly globular. Fig 940 shows the former condition. It is from one of the old hardy kinds long cult in the gardens as "Chinese" or "small-flowered" chrysanthemums, and commonly supposed to be the product of *C. indicum*, as opposed to the "Japanese" or "large-flowered" kinds intro. in 1862, which marked a new era by being less formal and more fanciful than any of the preceding kinds. Pompoms are little cult under glass in Amer., being regarded mostly as outdoor subjects.

BB Fls. large

c. Blossoms hairy.

7 *The Hairy Type*.—Fig 941. Also called "Ostrich Plume" and "Japanese Hairy." The famous prototype is the variety Mrs. Alpheus Hardy, pictured in Gn 35, p 307, which was sold for \$1,500 in 1888, and started the American chrysanthemum craze. White fls with long hairs are very delicate and pretty, but the hairs are often minute, and on many of the colored fls they are

940 Type of pompon chrysanthemum. Grown outdoors, with no special care

considered more curious and interesting than beautiful. So far, nearly all hairy chrysanthemums are of the Japanese Incurved type. Since the hairs are on the backs of the florets, they show best in incurved types.

cc. *Blossoms not hairy.*

d. *Rays reflexed.*

941. Hairy type.

8. *The Reflexed Type*—Also called "Recurved." Fig. 942. The reflexed forms can be easily broken up into 3 types (a) the small and regular, (b) the large and regular, and (c) the large and irregular types. The latest standard requires that reflexed flowers have hemispherical heads, with no trace of thinness in the center, and broad overlapping florets.

dd *Rays incurved.*

e *Form absolutely regular.*

9. *The Incurved Type*—Fig. 943 shows the general idea, but such a fl. would hardly win a prize at an English show, where anything short of absolute regularity is relegated to the "Japanese Incurved" section (No. 10). This form is by far the most clear-cut ideal of any of these types, and for many years this ideal of the florists so completely dominated the English chrysanthemum shows that the incurved section came to be known there as the "exhibition" or "show type." In America the Japanese types, which are less formal and fanciful, early prevailed, but in England this has been the most important section of all.

ee *Form more or less irregular.*

10 *The Japanese Incurved Type*—This section and the next have been the most important in America. There are many variations of this type. It often happens that the outer 4 or 5 series of rays gradually become reflexed, but if most of the rays are incurved, the variety may be exhibited in this section Fig. 943.

ddd. *Rays of various shapes forms diverse*

11 *The Japanese Types*—The word "Japanese" was originally used to designate the large-fld fantastic kinds, intro by Robert Fortune from Japan in 1862. It has never been restricted to varieties imported directly from Japan, but has always included seedlings raised in the western world. Before 1862, all florists' fls. in England were relatively formal and small. The informal, loose, grotesque, Japanese chrysanthemums, intro by Fortune broke up the conventional era, and the demand for large specimen blooms that resulted in fl-shows all over the world reached Amer. in 1889. The "Japanese section" now means little more than "Miscellaneous." The 10 types previously mentioned can be rather accurately defined, but the Japanese section is purposely left undefined to include everything else. All the tubular and quilled sorts are now included in it, although formerly kept distinct.

942. Reflexed type.

Relative importance and uses of the foregoing types.—

In general, the large-flowered forms are more popular than the small-flowered forms, especially at exhibitions, where great size is often the greatest factor in prize-winning. Types 9, 10 and 11 are the most important in America, especially the Japanese section. The flowers of types 9 and 10 are likely to be more compact and globular, and hence better for long shipments than the looser and more fanciful types. Types 9, 10 and 11 are those to which most care is given, especially in disbudding and training. They are the ones most commonly grown by the florists for cut-flowers, and whenever one large flower on a long stem is desired. The anemone-flowered forms are all usually considered as curiosities, especially the Japanese anemones, which are often exhibited as freaks and oddities. The single and anemone-flowered forms are used chiefly for specimens in pots with many small flowers, but all the other types are used for the same purpose. For outdoor culture, the hardy pompons, with their numerous small flowers, are usually better than the large-flowering or Japanese kinds.

As an indication of the constant change in standards of appreciation, may be cited the present popularity

943. Type of Japanese incurved chrysanthemum

of short-stemmed chrysanthemums (Fig. 944) as distinguished from the greatly elongated stem that was exclusively desired some years ago; and also the demand for bushy many-flowered plants, producing small bloom as compared with the former excessively large detached flowers.

The current English classification.

The Floral Committee of the National Chrysanthemum Society (of England) in 1912 published the following "new classification of Chrysanthemums" (published also in American Florist, Sept 21, 1912, by Elmer D. Smith):

SECTION I. INCURVED (Fig. 945)

The distinguishing characteristics of this section are the globular form and regular outline of the blooms. The flower should be as nearly a globe as possible, as depth is an important point in estimating its value. The florets ought to be smooth, rounded, or somewhat pointed at the tip, of sufficient length to form a graceful curve, and be regularly arranged. A hollow center or prominent eye are serious defects, as also are a roughness in the blooms, unevenness of outline and a want of freshness in the outer florets.

The section is now subdivided into.

Sub-section (a) —Large-flowered varieties.

Sub-section (b) —Medium- and small-flowered varieties.

944. New type with short stem, which is becoming very popular with commercial growers

SECTION II JAPANESE (Fig. 946).

Japanese varieties include a wide range of form, size and color. Their florets may be either flat, fluted, quilled or tubulated, of varying length, from short, straight, spreading florets, to long, drooping, twisted or irregularly incurved. In breadth the florets may vary greatly, ranging from those an inch in width to others scarcely broader than a stout thread. Some also either have the tips of the florets cupped, hollowed, curved or reflexed.

Sub-section I Japanese
(a) Large-flowered varieties
(b) Medium-flowered varieties
(c) Small-flowered varieties

Sub-section II. Incurved Japanese

(a) Large-flowered varieties
(b) Medium- and small-flowered

Sub-section III. Hairy Japanese

Reflexed section to be deleted as these varieties are now referred to other sections

SECTION III ANEMONES (Figs 947 and 948, also Figs 938, 939)

The distinctive characteristics of anemone varieties are their high, neatly formed centers and regularly arranged ray-florets. There are two distinct sets of florets, one quilled and forming the center or disk, and the other flat and more or less horizontally arranged, forming the border or ray. The flowers may have the ray or guard florets broad or twisted, or narrow, and forming a fringe, but should be so regularly arranged as to form a circle round the center; the latter should be a hemispherical disk, with no trace of hollowness and every floret in its place.

- (a) Large-flowered, 1 e., with a diameter of 3 inches and upwards
(b) Small-flowered, 1 e., with a diameter of less than 3 inches

SECTION IV POMPONS (Fig 949, also Fig 940)

Pompon varieties have blooms that may be somewhat flat or nearly globular, very neat and compact, formed of short, flat, fluted or quilled florets, regularly spreading or erect, the florets of each bloom being of one character.

- (a) Large-flowered, 1 e., with a diameter of 2 inches and upwards
(b) Small-flowered, 1 e., with a diameter of less than 2 inches.

SECTION V SINGLES (Fig. 950).

Single varieties may be of any size and form, but the florets, whether short and rigid or long and drooping, should be arranged sufficiently close together to form a regular fringe.

Sub-section I Varieties with one or two rows of ray florets

- (a) Large-flowered, 1 e., with a diameter of 3 inches and upwards
(b) Medium and small-flowered, 1 e., with a diameter of less than 3 inches.

Sub-section II Varieties with three to five rows of ray florets

- (a) Large-flowered, 1 e., with a diameter of 3 inches and upwards
(b) Medium and small-flowered, 1 e., with a diameter of less than 3 inches

Sub-section III. Anemone-centered varieties.

SECTION VI SPIDERY, PLUMED AND FEATHERY.

Varieties in this section have small or medium-sized flowers of

eccentric shape, but most frequently of a light and graceful character, some have threadlike florets, and some have broader florets, but they may be either erect, horizontal or drooping and of various shapes and colors.

Market, Decorative and Early-flowering varieties will be dealt as such, but lists will be drawn up under each heading for general guidance.

WILHELM MILLER.

Culture of the florist's chrysanthemum (C. hortorum)

The first step towards success in chrysanthemum-culture is good healthy cuttings, and as they become established plants they should receive generous culture throughout their entire growing season. This requires close attention to watering, airing, repotting, and a liberal supply of nutriment.

Chrysanthemums are propagated in four ways,—by cuttings, division, seeds, and grafting. By far the most important is the first, because it is the most rapid. It is the method of the florists. In localities in which the plants can remain outdoors over winter without injury, they may be increased by division. This system is practiced more by amateurs than florists, being the easiest method for the home garden but not rapid enough for the florist. Propagation by seeds is employed only to produce new varieties, and is discussed at length elsewhere (page 764). Grafting is seldom practised. Skilful gardeners sometimes graft a dozen or more varieties on a large plant, and the sight of many different colored fls. on the same plant is always interesting at exhibitions.

Section I.—Culture of chrysanthemums for cut-flowers.

This account is intended to describe the method chiefly employed by florists, the plants being grown in benches under glass.

1 *Propagation by cuttings*—Plants of the preceding year afford stock from which to propagate the following season. They produce quantities of stools or suckers, which form excellent material

for the cuttings. These are usually taken from 1½ to 3 inches in length, the lower leaves removed, also the tips of the broad leaves, then placed in propagating-beds close together, where they are kept continually wet until rooted. To insure a large percentage, the condition of the cuttings should be moderately soft. If the stock plants are allowed to become excessively dry, the cuttings are likely to harden, and thus be very slow in producing roots. Single-eye cuttings may be used of new and scarce varieties when necessary. These are fastened to a tooth-pick with fine stemming wire, allowing half of the tooth-pick to extend below the end of the

947. Japanese anemone type.

945. Incurved type.

946. Japanese type.

948. Pompon anemone type.

cutting, and when inserted in the cutting-bed the end of the cutting should rest upon the sand. It requires more time to produce good plants by this system than when fair-sized cuttings can be taken, but it is often of service when stock is limited.

The propagating-house should be well aired, and it is advisable to change the sand after the second or third batch of cuttings has been removed, to avoid what is termed cutting-bench fungus. The cuttings should never be allowed to wilt, and this is avoided by giving abundance of air, and when the temperature reaches over 70° from sun heat, by shading with some material, either cloth or paper. Fig. 951 shows a good form of chrysanthemum cutting.

2 *Planting*—Cuttings should not be allowed to remain in the cutting-bench after the roots are $\frac{1}{2}$ inch in length, or they will become hardened, which will check the growth. As soon as rooted, they should be potted into 2- or 2½-inch pots, using good mellow

949 A pompon chrysanthemum. (× $\frac{1}{2}$)

soil, with a slight admixture of decomposed manure. Most of the large flowers are produced under glass, and the bench system is generally employed, which consists of 4 or 5 inches of soil placed upon benches. In these benches the small plants are planted 8 to 12 inches apart each way, from the latter part of May to the middle of July. Those planted at the first date usually give the best results. The soil should be pounded rather firm either before planting or after the plants have become established.

3 *Soil*—There are many ideas as to what soil is best suited for the chrysanthemum, but good blooms may be grown on clay or light sandy loam, provided the cultivator is a close observer and considers the condition of the soil in which they are growing. Clay soil, being more retentive of moisture, will require less water and feeding than soil of a more porous nature. The chrysanthemum is a gross feeder, and, therefore, the fertility of the soil is very important in the production of fine blooms. Each expert has a way of his own in preparing the soil, but as equally good results have been secured under varied conditions, it is safe to conclude that the method of preparing the soil has little to do with the results, provided there is sufficient food within their reach. All concede that fresh-cut sod, piled late the preceding fall or in early spring, with one-fourth to one-fifth its bulk of half-decomposed manure, forms an excellent compost. Many use 1 or 2 inches of manure as a mulch after the plants have become established. Others place an inch of half-decomposed manure in the bottom of the bench. Thus the roots find as soon as they require it. Good blooms have been grown by planting on decomposed sod and relying on liquid applications of chemicals.

4. *Feeding*.—No definite rule can be given for this work, as so much depends on the amount of food

incorporated in the soil. If the soil be very rich, the liquid applications should be only occasional and very dilute. There is more danger of overfeeding by the use of liquids than by using excessively rich soil. Each grower must depend on his own judgment as to the requirements, being guided by the appearance of the plants. When the leaves become dark-colored and very brittle, it is safe to consider that the limit in feeding has been reached. Some varieties refuse to bud when overfed, making a mass of leaves instead. Others show very contorted petals, giving a rough unfinished bloom. Still others, particularly the red varieties, are likely to be ruined by decomposition of the petals, called "burning," especially if the atmosphere is allowed to become hot and stuffy. The same result will follow in dark weather, or when the nights become cool, if the moisture of the house is allowed to fall upon the blooms. Under such conditions, the ventilation should remain on during the night, or heat be turned in according to the outside temperature.

5 *Watering and shading*—Let the foliage be the index to watering. If it appears yellow and sickly, use less water, and see that the drainage is perfect. There is little danger of over-watering as long as the foliage is bright green. A little shading at planting time is not objectionable, but it should be removed as soon as the plants are established. It is often necessary to shade the pink and red flowers, if the weather continues bright for some time, to prevent their fading.

6. *Training*—When the plants are 8 inches high, they should be tied either to stakes or to jute twine. In the former system, use one horizontal wire over each row, tying the stake to this after the bottom has been inserted into the ground. Two wires will be necessary when twine is used, one above the plants and the other a few inches above the soil to which the twine is fastened. From the first of August until the flowers are in color, all lateral growths should be removed as soon as they appear, allowing only the shoots intended for flowers to remain. The above remarks refer to the training of bunched chrysanthemums as grown by florists for cut-flowers. Other kinds of training are described under Section II, pages 763-4.

7 *Disbudding*—No special date can be given for this work, as much depends on the season and the earliness or lateness of the variety to be treated. Buds usually begin to form on the early sorts about August 15, or soon after, and some of the late varieties are not in condition before October 10. Golden Glow and Smith Advance among the large-flowering, and several of the early-flowering of the hardy varieties, are exceptions to the foregoing, as they will set buds in June and July that will develop very good blooms during the month of August and later. The advent of these kinds has advanced the flowering season four to six weeks. The object of removing the weak and small buds and retaining the best is to con-

950. Single type

951 One kind of chrysanthemum cutting.

centrate the whole energy of the plant and thereby increase the size of the flower.

There are two forms of buds, crowns and terminals. A crown bud (Fig 952) is formed first, never coming with other flower-buds, and is provided with lateral growths which, if allowed to remain, will continue their growth and produce terminal buds later. Terminal buds come later, always in clusters (Fig. 954), are never associated with lateral growths, and terminate the plant's growth for that season. If the crown bud is to be saved, remove the lateral growths as shown by Figs. 952, 953, and the operation is complete. If the terminal bud is desired, remove the crown and allow one, two or three (according to the vigor of the plant) of the growths to remain. In a few weeks these will show a cluster of buds, and, when well advanced, it will be noticed that the largest is at the apex of the growth (the one saved, if perfect, as it usually is), and one at each of the leaf axils (see Fig. 955). The rejected buds are easiest and safest removed with the thumb and forefinger. Fig. 956. Should the bud appear to be one-sided or otherwise imperfect, remove it and retain the next best. In removing the buds, begin at the top and work down. By so doing there are buds in reserve, in case the best one should accidentally be broken, while if the reverse course were taken, and the best bud broken at the completion of the work, all the labor would be lost. A few hours' disbudding will teach the operator how far the buds should be advanced to disbud easily. Early and late in the day, when the growths are brittle, are the best times for the work. Some growers speak of first, second and third buds. The first is a crown, and usually appears on early-propagated plants from July 15 to August 15. If removed, the lateral growths push forward, forming another bud. In many cases in which the crowns are removed early, the next bud is not a terminal, but a second crown, which is termed the second bud. Remove this, and the third bud will be the terminal. Plants propagated in May and June usually give the second and third bud, not forming the typical crown. Those struck in July and planted late give the terminal only. Most of the best blooms are from second crown and terminal. Pink, bronze and red flowers from first crowns are much lighter in color than those from later buds. They are large, but very often abnormal to such an extent as to be decidedly inferior. This is doubtless due to the large amount of food utilized in their construction, owing to the long time consumed in development. The hot weather of September and October must have a detrimental effect upon the color.

Enemies—Green aphid (*Aphis rufomaculata*) and the black aphid (*Macrosiphum sanboni*) are sometimes very troublesome. They may be controlled by spraying with "Black Leaf 40" tobacco extract, one part to 800 parts water with soap added. Fumigation with hydrocyanic acid gas is also widely practised by commercial growers. In moderately tight greenhouses, use one ounce potassium cyanide for each 3,500 cubic feet of space for all-night fumigation. For details, see *Fumigation*. Red Spider (*Tetranychus bimaculatus*) becomes injurious if neglected. It may be easily controlled by spraying with water, using much force and little water to avoid drenching the beds. The use of sulfur has also a beneficial effect.

Thrips (See *Carnation*).

Leaf-tyer (*Phlyctania ferrugalis*) is frequently very abundant in some parts of the country. It is essentially a greenhouse pest although it can live out-of-doors. The greenish whitish striped caterpillars, $\frac{3}{4}$ inch in length when full grown, feed on the under side of the leaves which they roll or tie together. The moth is pale brownish with an expanse of about $\frac{3}{4}$ inch. The leaf-tyer is most destructive during the summer months when the temperature is highest. It can be controlled by spraying with arsenate of lead. It is advisable to

begin the work early in the season when the insects are less numerous and the plants are small. Care should be taken to hit the under surface of the leaves.

The tarnished plant-bug (*Lygus pratensis*) often injures the blossom buds by its feeding punctures. This causes wilting and blind growths. The bugs may be excluded from greenhouses with screens. Out-of-doors no satisfactory means of control has been devised. But it has been noticed that plants growing in partial shade are less subject to injury.

Grasshoppers are sometimes injurious. They may be controlled by the use of arsenate of lead or by hand-picking.

Diseases—Damping-off in the cutting-benches is not uncommon. See *Damping-off*, page 961. Rust (*Puccinia chrysanthemi*) is the only serious fungous disease of the chrysanthemum. It is characterized by the reddish brown pulverulent masses on the foliage consisting of the spores of the fungus. The disease is usually not destructive but may make the foliage unsightly. Any leaves appearing diseased should be removed promptly. In watering care should be taken not to wet the foliage, as moisture on the leaves allows new infections. Leaf-blight (*Cylindrosporium*) and leaf-spot (*Septoria*) occur on mature or languishing foliage and usually do little damage.

Section II—Culture of chrysanthemums in pots.

The same principles are employed in pot culture as when planted upon the bench, with the exception that the plants are generally allowed to produce more blooms. The most popular type of pot-plant for home growing, or for sale by florists and intended for home use, is a compact, bushy plant, $1\frac{1}{2}$ to 2 feet high, branched at the base, and bearing four to twenty flowers averaging 3 to 4 inches across. They are here called "market plants." "Single-ten plants" are also popular. Great quantities of large flowers (say twenty to one hundred) are rarely grown on a potted plant, except for exhibitions. Such plants are commonly called "specimens," and the three leading forms are the bush, the standard and the pyramid, the first mentioned being the most popular.

1 Market plants—Dwarf plants of symmetrical form, with foliage down to the pots, are the most salable, and when thus grown require constant attention as to watering and stopping, allowing each plant plenty of room to keep the lower leaves in a healthy condition. Cuttings taken June 1 and grown in pots, or

952. The crown bud

953. Crown bud after it has been selected or taken.

planted on old carnation benches or in spent hotbeds (light soil preferable), and lifted by August 15, will make very good plants 1 to 1½ feet high. The reason for lifting early is to have them well established in their flowering pots before the buds are formed.

2. *Single-stem plants*—Same culture as market plants, except that they are restricted to one stem and flower. Those from 1 to 2 feet in height are more effective and useful than tall ones. For this reason, many prefer plunging the pots out-of-doors where they have the full benefit of the sun and air, making them more dwarf than when grown under glass.

954. The terminal bud.

3. *Pot-plants for cut-flowers.*

—Culture same as for specimen plants, except that the nipping should be discontinued July 1 to give sufficient length to the stems. If large flowers are desired, restrict the plants to eight or ten growths. Such plants can be accommodated in less space than specimens,

when the chief object is symmetry

4. *Bush plants*—For large bush plants, the cuttings should be struck early in February, and grown along in a cool airy house, giving attention to repotting as often as necessary. The final potting into 10- or 12-inch pots generally takes place in June. They are potted moderately firm, and watered sparingly until well rooted. As soon as the plants are 5 or 6 inches high the tips should be pinched out, to induce several growths to start. As the season advances and the plants make rapid growth, pinching must be attended to every day up to the latter part of July, to give as many breaks as possible and keep them in symmetrical form. By the middle of August (if not previously attended to), staking and getting the plants in shape will be a very important detail. If stakes are used, they must be continually tied-out, as the stems soon begin to harden, and this work can be best accomplished by looking them over daily. Light stakes of any material may be used. Many other methods are in use, such as wire hoops and wire framework, to which the growths are securely tied.

5. *Standards* differ from bush plants in having one stout self-supporting stem, instead of many stems. They require the same culture as bush plants, with the exception that they are not stopped, but allowed to make one continuous growth until 3, 4 or 5 feet high, and are then treated the same as bush plants. They require the same attention as to stopping and tying to secure symmetrical heads.

6. *Pyramids* are only another form of bush plants, and it is optional with the grower which form he prefers.

Section III.—Culture of chrysanthemums for the production of new varieties.

The object of seed-saving is the improvement of existing varieties. It is not conclusive, however, that all seedlings will be improvements; in fact, it is far from this, as the greater proportion are inferior to their antecedents. Only those who give the most careful consideration to cross-fertilization are certain of marked success. Hand-hybridized seeds possess value over those haphazardly pollinated by wind and insects only according to the degree of intelligence employed in the selection of parents. What the result will be when a white flower is fertilized with a yellow one, the operator cannot determine at the outset. It may be either white, yellow, intermediate, or partake of some antecedent, and thus be distinct from either. Improvements in color can be secured only by the union of colors,

bearing in mind the laws of nature in uniting two to make the third. Red upon yellow, or vice-versa, may intensify the red or yellow—give orange or bronze, as nature may see fit. The operator is more certain of improving along other lines, such as sturdiness or dwarfness of growth, earliness or lateness of bloom, or doubleness of flowers. The selection of those most perfect in these particulars is very sure to give similar or improved results. Always keep a record of this work showing the parents of a seedling. The satisfaction of knowing how a meritorious variety was produced more than pays for the trouble, and may lead to further improvements along certain lines.—The operation begins when the flower is half open, cutting the petals off close to their base with a pair of scissors, until the style is exposed. Should the flower show signs of having disk or staminate florets, remove these with the points of the scissors and thus avoid self-fertilization. When the styles are fully grown and developed, the upper surface or stigma is in condition to receive the pollen. By pushing aside (with the thumb) the ray-florets of the flower desired for pollen, the disk-florets which produce the pollen will become visible. The pollen may be collected on a camel's-hair pencil or toothpick and applied to the stigma of the flower previously prepared. If a toothpick be used, never use it for more than one kind of pollen. By allowing the camel's-hair pencil to stand in an open-mouthed vial of alcohol a few moments after using, it may be again used, when dry, upon another variety without fear of the pollen of the former operation affecting the present.—Cuttings struck in June and July and grown to single bloom in 4-inch pots are the most convenient for seeding. Such flowers, if not given too much food are more natural and furnish an abundance of pollen, as well as being easier to trim than the massive blooms produced for the exhibition-table. The pollinating should be done on bright, sunny days, and as early in the day as possible. As soon as the seed plants are trussed, they should be placed by themselves to avoid fertilization by insects, and should there remain until the seeds are ripe. Keep the plants rather on the dry side, and give abundance of air. Seeds, which ripen in five to six weeks, should be saved without delay, and carefully labelled. In sowing seeds,

955. Terminal buds of chrysanthemum at an early stage. None too early for disbudbing.

they should be covered very lightly and kept in a temperature of 60°. When the seedlings are large enough to handle easily, remove to small pots, or transplant farther apart in shallow boxes. Chrysanthemums flower the first season from seed.

Section IV.—Varieties.

Of the long list of new varieties sent out each year, but few are retained after the second year's trial. This is probably due to the fact that most American growers are more interested in the commercial value of the flower than the curious forms or striking colors they present. Exhibitions have not reached the people here

as in England and France. There are a few varieties that have stood the test for several years, such as Ivory, 1889, Geo W Childs, 1892; Golden Wedding, 1893; Major Bonnafton, 1894; Yanoma, 1896, W H Chadwick, 1898, John K Shaw and Nagoya, 1899; Monrovia, Col D Appleton and White Bonnafton, 1900. There are many other varieties that have stood the test for four or five years.

It is not the purpose of this article to recommend varieties of chrysanthemums, but the following list includes the best varieties known in North America at the present time. The list will be valuable as showing a serviceable classification, and also for reference when other varieties have come into existence:

Selection of varieties based on main types—(1) *Turned* Aesthetic, Emberta, Major Bonnafton, Pink Gem, Mary Donnell, Naomah, Smith's Sensation, William Turner. (2) *Japanese* Puchi-Supreme, Crocus, Ramapo, December Gem, F S Valls, Glen Cove, Golden Robin, Reginald Valls. (3) *Japanese* Turned Chrysolora, Col D Appleton, W H Chadwick, Mlle Jeanne Nonin, Artistic Queen, Christy Mathewson, Lulu Ray, Dakota. (4) *Extra* Arvedo Barine, Beauty of Turin, Erson d'Or, Leonadie Gentils, Louis Boehmer, L'Enfant des Deux Mondes, R M Gray, White Swan. (5) *Reflected* Smith's Advance, Dick Witterstaetter, Harvard, Yanoma, Mrs J Wells, Rose Pockett, Phyllis, Helen Newberry, Maud, Julie Lagravere, Quinola. (6) *Pompon* Anemone Diantha, Ada Sweet, Gertrude Wilson, Lida Thomas, Vayenne, Bessie Flight. (10) *Large-flowering* Singles Arlee, Catherine Livingston, Elchity, Hana, Lady Lu, Red Light. (11) *Small-flowering* Single Lady Smith, Anna, Blazing Star, Little Bader.

Selection of varieties based on color—White—Smith's Advance, Chadwick Improved, Christy Mathewson, Mrs Gilbert Drabble, Naomah, William Turner. Yellow—Chrysolora, Comelota, Golden Glow, Golden Eagle, Banger, Leno, Pink, Phyllis, Helen Newberry, Unaka, Patty, Glen Cove, Morningstar, Smith's Sensation. Crimson—Dick Witterstaetter, Harvard, Intensity, J W Moyleux, Pockett's Crimson, Mrs Harry Turner. Bronze and Lavender—Glenview, Mrs J A Miller, Mrs H Stevens, Mrs Harry Turner, William Klomchuz. Crimson, golden reverse—Harry L Converse, Howard Gould, Mrs O H Kdin, W Woodmason. Amaranth or purple-pink crimson—George J Bruzard, Mrs G C Kelly, Reginald Valls, E Carrington, Leslie Morris.

Selection based on special uses—Bush plants Golden Aig, Brutus, Dick Witterstaetter, Dr Lugichard, Garza. Single stemmed cut-plant Naomah, Chrysolora, Aesthetic, President Roosevelt, Ben Wells, Glen Cove, Mrs George Hunt, Mrs O H Kahn, Pockett's Crimson, Chrysantheum Montgomery, F S Valls, George J Bruzard, Glen Cove, Glenview, Harry F Converse, Lady Hopeston, Leno, Elberton, Morningstar, M Loiseau-Rousseau, Mrs Gilbert Drabble, Mrs H Stevens, Mrs Harry Turner, Naomah, Pockett's Crimson, Rose Pockett, William Turner, W Woodmason, Ben Wells, Merza, Reginald Valls. Commercial blooms—Extra-early-flowering, July to October Golden Glow, Smith's Advance. Second-early-flowering, last of September into October Early Snow, Glory of Pacific, Monrovia, October Frost, Rosee. Early-mid-season-flowering, middle of October Chrysolora, Comelota, Gloria, Ivory, Pacific Supreme, Unaka, Virginia Pochmann. Mid-season-flowering, last of October to November Col D Appleton, Crocus, Dick Witterstaetter, Pink Gem, Ramapo, Mrs W E Kelley. Late-mid-season-flowering, November 10 to Thanksgiving Dr Enguehard, Lulu Ray, Golden Eagle, Golden Wedding, Major Bonnafton, Patty, President Roosevelt, Timothy Eaton, W H Chadwick, Mrs Jerome Jones, White Bonnafton. Late-flowering, Thanksgiving and later December Gem, Harvard, Helen Frick, Intensity, John Burton, Mlle Jeanne Nonin, Thanksgiving Queen, Yanoma.

Section V.—Culture of chrysanthemums for exhibition.

This branch in which the highest standard must be attained if the slightest hope of success at the exhibitions is entertained, requires a thorough knowledge of the most suitable kinds for the purpose and the ability to bring them to the highest state of perfection. The methods are not very different from those employed in the production of high-grade commercial blooms. The most successful growers usually propagate earlier, and if grown on benches they are also planted earlier to secure all the vigor possible. The finest blooms are those produced on the private estates, where one man has charge of a few hundred plants, giving them his undivided attention, so that every need is provided at the proper time. During the past few years, the majority of such expert growers have adopted a system of growing in pots, each plant restricted to one bloom, which is practically the same method as the one used

throughout England for many years. Here they are kept under glass the entire season, while in England the climate permits them to be grown out-of-doors during the summer months. By this method, the roots are more closely confined, which has a tendency to produce short-jointed plants with stronger stems, and gives the grower perfect control, so that each

variety may be treated according to its needs, especially when liquid fertilizers are necessary to promote the maximum in size and finish. The other factors necessary to the successful exhibitor are full consideration of the requirements of the schedules, so as to select the best varieties for the various classes, and a complete knowledge of packing and staging the blooms. During the past decade, those originating new varieties have scrutinized more closely in making a decision, and, as the commercial and exhibition varieties are considered from an entirely different standpoint, these two sections are drifting further and further apart. Size is the foremost quality from the exhibition point of view.

956. Terminal bud after the disbudding operation.

At the present time (1912) the varieties generally shown in prize-winning exhibits are White—Beatrice May, Lady Carmichael, Merza, Mrs David Syme, Naomah, Wm Turner. Yellow—F S Valls, Leno, Mrs G C Hunt, Mrs J C Neill, Yellow Miller, Pink—Lady Hopeston, M Loiseau-Rousseau, Mrs C L Totty, O H Brookland, Wm Duckham, Wells' Late Pink Bronze—Glenview, Harry E Converse, Mrs O H Kahn, Mrs H Stevens. Red—J W Moyleux, Pockett's Crimson, W Woodmason.

A few of the commercial section are suitable for this purpose, especially when the schedule calls for twelve or more blooms of a kind for one variety at exhibitions at which artificial supports are prohibited. The best are as follows: White—Lyonwood Hall, Timothy Eaton, Chadwick Improved, Mrs Jerome Jones. Yellow—Col D Appleton, Golden Eagle, Golden Wedding, Yellow Eaton, Golden Chadwick, Major Bonnafton. Pink—Dr Enguehard, Mayor Weaver, Maud Dean. Red—Dick Witterstaetter, Geo W Childs.

Section VI.—Culture of chrysanthemums out-of-doors

The kinds most suitable for out-of-door culture are those making abundance of rhizomes or underground stems, which withstand the winter and furnish the new growths for the successive years. The Pompons are more hardy than the large-flowering sorts, and, as hardiness is of vital importance to those interested in this subject, especially north of the Ohio River, it should be fully considered in selecting for this purpose. It is more practicable to choose varieties which perfect their flowers early, during August, September and October when grown in the northern states, as the buds are less likely to be injured while in a soft growing state by frost. In the South many of the later varieties will live over and be satisfactory, owing to the continuance of mild weather. In the past few years, some improvements in this section have been attained, many of which are the results of crosses between the Pompons and the large-flowering Japanese, in which the progeny have combined the hardiness and dwarf habit of the former with the larger and more irregular-formed flowers of the latter, producing aster-like flowers rather than the symmetrical form of the pompons. All of the types may be successfully grown out-of-doors if provision is made to protect the bud, blooms and roots from severe frost. A temporary covering of cloth or sash in early autumn will protect the blooms, but the roots will require artificial heat or should be removed to the greenhouse or frame where the temperature can be maintained a few degrees above freezing. In growing exhibition blooms out-of-doors, all the important details, such as watering, airing, disbudding, feeding

staking and tying, must be complied with, if the grower expects to be rewarded for his efforts.

The oldest of the outdoor types are the Pommpons, which produce from forty to one hundred buttons an inch or two across, with short and regular rays. Such plants can be left outdoors all winter.

Since the large-flowering or Japanese types have come in, numberless attempts have been made to grow them outdoors, but with poor results. The greenhouse varieties are not so hardy. In the North they are likely to be killed by the winter. Their flowers usually lack in size, depth and symmetry, largely because there are more of them on a plant than a florist allows for his best blooms, but chiefly because they do not have so much care in general as is given to plants under glass, where space is precious. For the very best results, chrysanthemums must be flowered under glass, and they need the greatest care and forethought practi-

957. Suggestion for protecting chrysanthemums that are to bloom outdoors.

cally all the year round. Half-way measures are unsatisfactory. Thus it happens that the Japanese varieties are usually unsatisfactory out-of-doors, and the Pommpons are chosen by those who can give very little care to plants and would rather have many small flowers than a few large ones. This also partly explains why no two dealers recommend anything like the same list of Japanese varieties for outdoor culture. Nevertheless, it is possible to grow excellent flowers 4 and 5 or even 6 inches across outdoors, but it requires staking, disbudding, and some kind of temporary protection, as of a tent or glass, during frosty weather. Fig. 957 shows a cheap and simple structure of coldframe sashes resting on a temporary framework. In severe weather a canvas curtain can be dropped in front, and the window of a warm cellar in the rear opened to temper the air. For general outdoor culture, however, when no special care is given to the plants, the Japanese kinds are usually less satisfactory than the Pommpons. These Pommpons are a much-neglected class since the rise of the large-flowered Japanese kinds, but they are unlike anything else in our garden flora. Their vivid and sometimes too artificial colors harmonize with nothing else at Thanksgiving time, and they are so strong and commanding that they should have a place by themselves. It is not uncommon for the flowers to be in good condition even after several light falls of snow, and they may be considered the most resistant to frost of any garden herbs. In fact, their peculiar merit is blooming after the landscape is completely desolated by successive frosts. The flowers are not ruined until their petals are wet and then frozen stiff. They are essentially for mass effects of color, and great size is not to be expected. Masses of brown and masses of yellow, side by side, make rich combinations. The whole tribe of crimsons, amaranths, pinks, and the

like, should be kept by themselves, because their color are variable and because they make a violent contrast with yellow, which few persons can find agreeable.

WILHELM MILLER.
ELMER SMITH †

CHRYSOBÁCTRON (*golden wand*, from the Greek). *Liliac.* Two New Zealand rhizomatous herbs, usually classed with "bulbs" by gardeners, bearing many small yellow fls in a long raceme on the top of an elongated scape plant often dioecious or polygamous. perianth 6-parted, the segms nearly equal; stamens 6 caps 3-celled and 3-valved. The genus is now commonly united with the S. African *Bulbinella*, the combined species becoming 13 or 14. **C. Hoökeri**, Colenso (*Bulbinella Hoökeri*, Benth & Hook, now the accepted name. *Anthérceum Hoökeri*, Colenso) is in cult in this country. It is a hardy plant 2-3 ft high, with sword-like foliage, fls $\frac{1}{2}$ in diam, bright yellow, perfect, on slender pedicels, the segms linear-oblong, and obtuse and spreading. B M 4602 — Cult. in the ordinary border, and treated like the asphodel, they do well. But they are improved in rich, deep and rather moist soil, strong clumps, 4-6 years old, are then at their best and are very excellent plants. After that they should be divided. Prop by division or seed. Blooms in June and July.

J B KELLER and L H B

CHRYSOBÁLANUS (*golden acorn*, from the Greek, referring to the fruit) *Rosac.* Bushes or trees, planted far south for ornament, fruit often edible.

Leaves thick and coriaceous, entire, glabrous fls white, rather small, in axillary or terminal short cymes, calyx 5-parted, petals 5, clawed, stamens 15 to many, some of them perhaps sterile. fr. a drupish-pulpy drupe, with stone pointed at base and ridged. Two species in tropics of Amer. and Afr., reaching

Fla., and another one in S. U. S.

Iceaco, Linn *Coccol-plum*. **ICEACO**. On coasts and along streams in S. Fla., to S. Amer., and also in Afr., and is sometimes planted in the extreme S. (and in the tropics) as an ornamental shrub and for its sweetish but misap and dry plum-shaped frs. which are sometimes used for preserves. It is a mere bush on the northern limits of its distribution, and on elevations, but in extreme S. Fla. it reaches a height of 25-30 ft. Lvs glossy, thick, obovate (sometimes obovate) fls small and white, in axillary erect racemes or cymes, calyx 5-cleft, pubescent, petals 5, stamens about 20 fr. 1-seeded, 1-1 $\frac{1}{4}$ in long, varying from nearly white to almost black, globular or nearly so. Wood close-grained and heavy, hard, brown or reddish. It is best prop by seeds, but may also be had from cuttings of half-ripened wood. *C. pellocarpus*, Meyer, the small-fruited coccol-plum, is a smaller plant, with smaller lvs, petals spatulate, drupe obovoid or oblong, about half the size of that of *C. Iceaco*, it grows in extreme S. Fla. and farther south; probably not planted. *C. oblongifolius*, Michx., occurs from Ga. to Fla. and Miss. It is a low shrub, spreading widely by means of underground sts. lf-blades longer than broad, sharp-tipped fr. ovoid or obovoid, about 1-1 $\frac{1}{2}$ in. long not in cult.

L. H. B.

CHRYSOCOMA: *Linomyia*.

CHRYSODIUM: *Elaphoglossum*.

CHRYSOGONUM (Greek-made name, *golden knee* or *joint*). *Compositae*. A few composites, of which *C. virginianum*, Linn., is a perennial yellow-fl'd plant of S. Pa. and south; sometimes cult as a border plant. It blooms in spring or early summer on sts which become 1 ft high, the heads being solitary and pedun-

cled in the axils or some of them terminal lvs. opposite and basal, ovate and mostly obtuse, crenate. Prop by creeping rootstocks and runners. Of little merit horticulturally

CHRYSOPHYLLUM (Greek, *golden leaf*, in reference to the color of the under surface of the leaves) *Sapotaceae* Handsome trees, grown far south for fruit and for ornament.

Juice milky. lvs. alternate, thick and stiff, usually shining and copper-colored or golden beneath with

958 *Chrysophyllum Cainito* (X 1/2)

silky pubescence, with many parallel cross-veins. fls. small, sessile or stalked, clustered at the nodes or in the axils, calyx mostly 5-parted, corolla tubular-campulate or somewhat rotate, mostly 5-lobed, without appendages, stamens as many as the corolla-lobes, and stammodia 0, ovary 5-10-celled fr. fleshy and usually edible, 1- to several-seeded—About 60 species in tropics, the larger part American

The various species of *Chrysophyllum* have beautiful broad green leaves, with under surfaces of a silky texture, varying in color from a silvery white through golden to a russet-brown, and are well worth a place in the conservatory as ornamental trees. By giving them sufficient room, they will bear fruit in the course of a few years, under glass, which in the case of *C. Cainito*, the star-apple of tropical America, is edible, and well liked even by people of a temperate clime. All species are strictly tropical and cannot be grown where frosts occur unless properly protected. Propagation is ordinarily effected by seed, which readily germinate if planted when fresh, and it is stated that all species may be grown from cuttings of well-ripened shoots placed in strong, moist heat. The soil most suited for their growth is of a sandy character, and if not of a good quality should be well manured, using a considerable proportion of potash in the fertilizer for fruiting specimens. They seem to do well on a great variety of soils, however, that are sufficiently well drained, wet land not agreeing with them. (E. N. Renssler)

Cainito, Linn. STAR-APPLE CAIMITO. Fig. 958. Thick-headed evergreen, to 50 ft. lvs. oval or oblong, silky-golden beneath, corolla-tube twice as long as the calyx, stigma 8-10-crenate or lobed; fls. purplish white. W. Indies, Panama, Cent. Amer. Ill. 32: 567. A. G. 11: 405.—The fr. is the size of an apple, symmetrically globular and smooth, hard, a cross-section shows the star-shaped core, whence the common name, it varies from white to purple in color of skin and also of flesh. The pulp is delicious (used uncooked) if the fr. is allowed to remain on the tree until ripe. It has large, pumpkin-like dark seeds. It is very impatient of frost.

olivifforme, Lam. (*C. monopetrum*, Swartz). SATIN-LEAF. To 35 ft. lvs. like those of *C. Cainito* fls. white; stigma 5-crenate fr. ovoid-oblong or oval, 1-seeded by abortion of ovules, blackish, 1½ in. long,

said to be insipid. S. Fla. and S. B. M. 3303.—Sparingly transferred to grounds as an ornamental tree.

imperiale, Benth. (*Theophrasta imperialis*, Lind.). Plant strict and simple, to 20 ft. or more, unarmed; lvs. obovate-oblong to oblong-oblancoate, 3 ft. long, on large plants very sharply serrate. fls. yellowish green, small, in clusters along the trunk, the cluster sessile but the fls. pedicellate, corolla rotate, 5-lobed, thick fr. 5-angled, nearly globular, size of a small apple, with a hard thick flesh, seeds 1 in. long and ¾ in. wide, compressed. Brazil B. M. 6823. Ill. 21: 184. (t. 1864: 453)—This species was grown 30 years before its genus was determined, but upon flowering in European gardens it was found to be a *Chrysophyllum* (by some referred to *Martusella*, which see). L. H. B.

CHRYSOPOGON: *Sorghastrum*.

CHRYSOPSIS (*golden appearance*, from the heads). *Compositae*. Mostly low and hairy perennials, sometimes planted in borders. Heads of medium size and many-fl'd, usually with numerous yellow rays, involucre bell-shaped or hemispherical, of imbricated narrow bracts, achenes compressed, bearing a pappus of numerous hair-like bristles. About 20 species of *Chrysopsis* are known. Mex. and N. C. *villosa*, Nutt. (*C. Bolanderi*, Gray), is one of the species in the trade. It is widely distributed from Ill. west, north, and south: 1-2 ft., grayish pubescent. lvs. oblong to lanceolate, entire or few-toothed heads usually at the ends of leafy branches, aster-like in shape. Extremely variable, and has several named forms. Mn. 7: 101. Var. **Rütteri**, Roth., is larger and later. Of value as a border plant. Cult. the same as *Aster*. Perennials, but bloom the first year from seed, if sown early.

C. mariana, Nutt. Differs from *C. villosa* in having corymbose-paniculate fl.-clusters. F. N. Amer. Aug.-Sept. Offered by dealers in native plants. It has showy yellow fls. and prefers dry sandy places.

N. TAYLOR †

CHRYSOPLÉNium (name from *golden* and *splen*, referring to some old medicinal tradition). *Saxifragaceae*. GOLDEN SAXIFRAGE. Low semi-aquatics, sometimes used in bog-planting. **C. americanum**, Schw., is a native plant creeping in mud. Sts. forking, bearing roundish or cordate small mostly opposite lvs., with very small, nearly sessile, greenish, inconspicuous fls. Scarcely known in cult. and, except for wet places where a cover or carpet is wanted, of no value horticulturally.

CHRYSORUS
CYNOSUROIDES:
Lamarckia

CHUFA. The edible subterranean tubers of *Cyperus esculentus*, Linn., (which see) much prized in the South. Fig.

959 *Chufa*—*Cyperus esculentus*. (X 1/2)

959. Chufas are eaten raw or baked, or used for the making of coffee. The plant is sometimes cultivated in the North, but it will not withstand the winter. The tubers are oblong, $\frac{1}{2}$ to $\frac{3}{4}$ inches long, cylindrical, hard. The plant is grass-like, and in the North does not flower. Tubers are planted in the spring, and the new crop is ready for digging in the fall. It thrives easily in loose and warm soils. The nutty flavor of the hard tubers is very agreeable.

CHUSQUEA: *Bamboo*, p. 449, Vol. I.

CHYSIS (Greek for *melt-ing*, in allusion to the pollen-masses). *Orchidaceae*. Orchids, pendulous from trees; grown in hothouses.

Stems fusiform, leafy, thickening after the lvs. drop: fls. fleshy, in short racemes, which are produced freely in the axils of the young growths; dorsal sepal and petals similar in shape, the lateral sepals with the foot of the column forming a long foot; lip jointed to the column foot, lamellate longitudinally, the lateral lobes upright, loosely surrounding the column; pollinia 8—About 6 species in Trop. Amer. Cult. as for Vanda, in baskets, pans or pots. They require tropical temperature when growing, then cooler.

A. Ground-color of fls. yellow.

aërea, Lindl. Fls. 5-8, about 2 in across; sepals and petals yellow, oblong-oval; lateral lobes of lip yellow, the middle lobe white, downy, spotted with red and yellow. S. Amer. BR 1937. B.M. 3617.

lævis, Lindl. Fls. 8-12, about $2\frac{1}{2}$ in across; sepals and petals yellow, tinted above with lines of purple-carmine, sepals oblong, the dorsal one inflexed, the lateral falcate; lip yellow, marked with red. Mex.

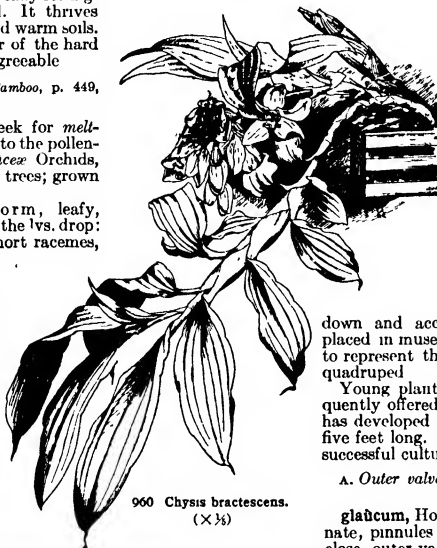

Chelsonii, Hort. Fls. 5-7, about $2\frac{1}{2}$ in across; sepals and petals yellow, with a large blotch of reddish fawn at the apex; lip yellow spotted with red. Hybrid: *C. bractescens* \times *C. lævis* F.M. 1878. 297.

AA. Ground-color of fls. white.

bractescens, Lindl. Fig. 960 Fls. 3-5, about 3 in. across; sepals and petals ivory-white; lip with the lateral lobes white outside, the inner surface yellow, streaked red, the middle lobe yellow, streaked and stained with red. Mex. B.M. 5186. R.H. 1859, pp. 294, 295. I.H. 27-398. O.R. 9 371; 13:236, 19:201. J.H. 111. 28 263 C.O. 1. A.F. 28 747.

Limminghei, Lindl. & Reichb. Fls. 4-7, $1\frac{1}{2}$ -2 in. across; sepals and petals white, with an apical blotch of purple; lip with lateral lobes yellow, marked with reddish purple on the inside, the middle lobe white, streaked with bright purple. Mex. B.M. 5265. I.H. 7:240. C.O. 3.

Sedenii, Hort. Fls. 3-6; sepals white; petals white with an apical rose-purple blotch; lip with the side

lobes sulfur-yellow, purple-streaked within, the middle lobe white, streaked with amethyst. Hybrid: *C. Limminghei* \times *C. bractescens*. GEORGE V. NASH †

CIBOTIUM (Greek, *a little seed-vessel*). *Cyathaceae*. A small group of tree-ferns from Mexico and Polynesia,

with bivalved coriaceous indusia, differing from Dicksonia in having the outer valve entirely distinct from the leaf. For culture, see *Dicksonia*. *C. Barometz* is the plant that gave rise to the wonder stories of the Barometz or Scythian lamb (Fig. 961), which, according to Bauhin, 1650, had wool, flesh and blood, and a root attached to the navel! The plant was said to resemble a lamb in every respect, but grew on a stalk about a yard high, and turning about and bending to the herbage consumed the foliage within reach, and then pined away with the failure of the food until it died. In 1725 Breyne, of Dantzig, declared that the Barometz was only the root of a large fern, covered with its natural yellow

down and accompanied by stems, which had been placed in museums in an inverted position, the better to represent the appearance of the legs and horns of a quadruped.

Young plants of *C. Schieder* and *C. regale* are frequently offered by florists at a stage before the trunk has developed and when the leaves are about four or five feet long. They require greenhouse conditions for successful culture.

A. Outer valve of the indusium larger, or the valves subequal

glabrum, Hook & Arn. Lvs ovate-lanceolate, tripinnate, pinnules about 6 in long, taper-pointed, segms. close. Outer valve of indusium larger, broader than the inner. veins once- or twice-forked. Hawaiian Isls.

Barometz, J. Smith. SCYTHIAN LAMB. Trunkless; lvs scented, tripinnate the lower pinnae ovate-lanceolate; pinnules short-stalked, 4-6 in long, with falcate segms. valves of the indusium nearly equal; veins prominent, rarely forked. China.

961. The Scythian Lamb; reproduced from an old book. See *Cibotium Barometz*.

AA. Outer valve of the indusium smaller than the inner.

Schiedei, Hook. Trunk 10-15 ft high lvs oblong-deltoid, tripinnate, with pinnae 1-2 ft long; segms. falcate, sharp-pointed; sori sparse veins forked, on the lowest pinnate. Mex.

regale, Lind. Trunk 10-12 ft. high lvs oblong-deltoid, tripinnate, with pinnae 18-24 in long; pinnules sessile, with close, falcate, deeply incised segms.; veins pinnate in the lobes. Mex.

I. M. UNDERWOOD.

R. C. BENEDICT.†

CICCA: *Phyllanthus*.

CICER, (old Latin name for the vetch). *Leguminosae*. Pea-like annual or perennial herbs, with 5-parted calyx, the lobes being nearly equal or the 2 upper ones somewhat shorter and connivent, oblong turgid 2-valved pod, mostly 1-fld. peduncles, odd-pinnate lvs and toothed lflets: standard ovate or nearly orbicular, wings obovate and free, keel rather broad and incurved: fls white, blue or violet terminal lft often represented by a tendril or spine—A dozen or more species, with a Mediterranean-Asian range. **C. arietinum**, Linn, the CHICK-PEA or GARBANZO, is sometimes cult. in vegetable-gardens for the edible ripe seeds. It is an annual and is cult. the same as bush beans. It withstands dry weather well. It grows 2 ft high, making a bushy, hairy plant, seeds are planted as soon as warm weather comes, usually in drills, the plants standing 8-12 in apart. Lvs with small, roundish lflets. fls white or reddish, small, axillary. Seed roundish, flat flattened on the sides, with a projection on one side, shaped like a miniature ram's head (hence the name *arietinum*, in vars of red, black and white. Much cult. in S. Eu. and Asia, and widely known in Calif. and in Mex., and other Spanish-American regions. The peas are eaten boiled, or roasted like peanuts, often used for soup or as a substitute for coffee, and some kinds are used for horse-feed. It is a promising crop for some purposes; yield sometimes 500 to 1,000 lbs to the acre.

L. H. B.

CICHORIUM (from an old Arabic name) *Compositae*. Seven or eight herbs, one of which is chicory and one endive.

Perennial, biennial or annual, branching and diffuse when in bloom, mostly with deep hard roots, milky juice and alternate lvs., and sessile axillary and terminal fl-heads fls several to many in the head, all ligulate and perfect, blue, purple or white, involucre double, pappus of bristle-like scales—Mostly in the Mediterranean region and to Abyssinia.

Intybus, Linn. *CHICORY*. Succory. Fig 962. Stout deep-rooted tall perennial (3-6 ft.) lvs. broadly oblong, oblanceolate or lanceolate, hairy, rapidly becoming very small toward top of plant so that the branches appear nearly naked and wand-like, more or less clasping and the lower ones runcinate. fls. bright-azure-blue, $1\frac{1}{2}$ in. or more across, closing about noon; pappus about 8 times shorter than fr. July-Oct.—Now a wide-spread weed of hard roadsides and fields but producing one of the clearest of light blues and worthy a place in the fl-garden. Recent experiments promise attractive color forms. For cult. for the root and for the salad lvs. see *Chicory*.

Endivia, Linn. *ENDIVE*. Annual or biennial lvs many at the base, oblong, lobed and cut, smooth: st 2-4 ft., branching, grooved. fls pale blue; pappus about 4 times shorter than fr. India; but by some thought to be a derivative of *C. Intybus*, or of *C. divaricatum* of the Medit. region. For cult. as a salad plant. see *Endive*.

L. H. B.

CIEŃKÓWSKIA: *Kaempferia*.

962. Flowers of chicory.—*Cichorium Intybus* ($\times \frac{1}{2}$) A familiar weed along roadsides in the eastern part of the country.

CIMICIFUGA, Linn (*cimex*, a bug; *fugere*, to drive away) *Sanunculaceae*. **BUGBANE**. Tall hardy herbaceous perennials, ornamental, but bad-smelling, suited for the back of plantings or for partially shaded places in the wild garden. The leaves and tall plants are admired in the hardy border.

Leaves large, decomposed: fls. white, in racemes, sepals 2-5, petaloid, deciduous, petals 1-8, small, clawed, 2-lobed or none: foliicles 1-8, many-seeded, sessile or stalked; stigma broad or minute. Allied to *Actaea*—About 10 species, natives of the north temperate zone, practically all of which have been used in gardens.

Cimicifugas thrive in half shady or open places in any good garden soil, but are much taller and more showy if the soil is very black and rich. Propagated by seeds and division of roots in fall or early spring. Seeds should be sown in cool moist soil soon after ripening.

americana, Michx (*Actaea podocarpa*, DC.) Slender, 2-4 ft high lvs pale beneath fls in elongated raceme; petals 2-horned; pedicels nearly as long as the fl. foliicles 3 or 5, stalked, seeds in 1 row, chaffy, stamens and pistils usually in same fl. Aug-Sept. Moist woods N. Y. and S.

fétida, Linn. Lvs bipinnate, terminal lft 3-lobed, petals of the white fls. often tipped with anthers, no stamens; foliicles 3-5, seeds very chaffy. Summer Siberia—Following forms are more commonly cult.

racemosa, Nutt (*C. serpentaria*, Pursh) Fig 963 St 3-8 ft high: lvs. 2-3 times 3-4-parted, lflets mostly ovate, firm texture racemes few, rigidly erect, often becoming 2 ft long foliicles rather shorter than the pedicel, nearly $\frac{1}{2}$ in. long, short style abruptly recurved July, Aug. Ga to Canada and westward. Intro 1891. Gt 13:443. Gn 46, p. 269. G C II 10 557; III 48:218—Very pretty in fr., with its 2 rows of oval foliicles always extending upward from the lateral branches. The commonest in gardens. Rhizome and roots valued in medicine.

Var dissécta, Gray (*C. spicata*, Hort.) Lvs more compound than the type small white fls closely packed on lateral and terminal branches. Lasting until Sept. Conn to S Pa J H III. 33. 381.

Var simplex, Regel (*C. simplex*, Wormsk.) Tall and handsome. fls short-pedicelled, forming a fine, dense raceme, and at first pubescent foliicle short-stalked. Kamtschatka. Gn 67, p. 8. Gn.W. 21 115, 23.899.

C. cordifolia, Pursh. Lvs very broadly ovate or orbicular U S B M 2069—*C. dahurica*, Nutt. Higher and more branched than former Cent Asia—*C. alta*, Nutt (*C. foetida*, Pursh *Actaea Cimicifuga*, Linn.) Used in medicine Ore, Wash—*C. pinnata*, Spreng 3 ft high lvs very large. F S 22 2463 (as *Pthyroserpa acernum*)—*C. palmata*, Michx=Trautvetteria carolinensis, Vail.

K. C. DAVIS.

CINCHONA (from the Countess Cinchon, wife of a Spanish Viceroy of Peru, who was cured of fever in 1638 by the use of Peruvian bark) *Rubiaceae*. Plants widely known as yielding a remedy, in the bark, for malaria.

Some of the species are lofty trees, others are mere shrubs. They grow isolated in various districts of the Andes, at elevations ranging from 2,300-9,000 ft., and between 22° south and 10° north latitude. Lvs opposite, with deciduous stipules, fls. much frequented by humming-birds, fragrant, white and pink in color, growing in terminal panicles; calyx small, 5-toothed,

and persistent; corolla has a long tube with 5 short spreading valvate lobes, hairy at the margins, stamens 5, included in the corolla; ovary 2-celled, with very numerous ovules inserted on linear axile placentae; caps. opening septically from the base upwards; seeds small, numerous, flat and surrounded with a wing. There are 30-40 confused species. Specimens are sometimes seen in collections of economic plants, but they are not horticultural subjects.

From the pharmacopoeial point of view there are two distinct kinds of cinchona bark: (1) Cinchona, also called yellow cinchona and calisaya bark, which is probably the bark obtained from *Cinchona Ledgeriana*, Moens, and hybrids of this with other species of Cinchona. The bark secured from these sources is said to contain 6 to 7 per cent of alkaloids, of which one-half to two-thirds is quinine. (2) *Cinchona rubra*, or red cinchona, which is obtained from *Cinchona succirubra*, Pavon, or its hybrids. In this bark the alkaloid cinchonidine exists in greater proportion.

The cinchona trees are considered to yield the maximum of alkaloids at six to nine years of age. The bark of the trunk and roots is removed; the latter is used mostly in the manufacture of quinine. Effort has been made to adopt the spelling Chinchona, although Linnaeus, in founding the genus, used only one h. see

Clements R. Markham "A Memoir of the Lady Ana de Osorio, Countess of Chinchon and Vice-Queen of Peru (A D 1620-39), with a Plea for the Correct Spelling of the Chinchona Genus," London, 1874.

The febrifuge reached Spain as early as 1639. Knowledge of it was spread by the Countess of Chinchon, hence it was called Countess' powder and Peruvian bark, and also Jesuits' bark, from the knowledge of it spread by Jesuits. The word quinine is derived from the name by which it was known in Peru, *quinaquina*, or "bark of barks." In 1849, trees were sent by the Jesuits to Algeria, but the experiment was not successful. In 1852-4, Hasskarl successfully introduced living plants into Java. In 1859, Clements R. Markham was entrusted by the government of India with the task of collecting plants and seeds on the Andes, and establishing them in India. In his fascinating book "Peruvian Bark a popular account of the introduction of Chinchona cultivation into British India" (1880), Markham recounts the difficulties in South America and his final success. Cinchona is now grown commercially in India and also in Jamaica, but most of the commercial product is secured from trees grown in Java, it is also cultivated in New Zealand and Australia. *C. Ledgeriana*, Moens (*C. Calisaya*, Wedd., var. *Ledgeriana*, How), is a small tree with small thick elliptical lvs., reddish beneath, and with yellowish not fragrant fls., and a short caps. *C. succirubra*, Pav., has large and thin broad-elliptic lvs., purple-red calyx and rose-colored petals, and an elongated caps. *C. officinalis*, Hook f., has oval-lanceolate acute shining lvs., and rose-colored silky fls. It is sometimes seen (in some of its forms) in collections. Var. *Condaminia* (*C. Condaminia*, Humb. & Bonpl.) is one of these forms and has been intro. in S. Calif. and said to be easily grown there. L. H. B.

Cultivation of cinchona (By Wm Fawcett)

The seedlings may be raised either in boxes or in beds. The boxes should not be more than 3 or 4 inches deep. Three-quarter-inch drainage-holes should be made in the bottom, about 6 inches apart. Whitewash the boxes or dust them inside with lime. Put pieces of broken flower-pots over the drainage holes, and cover the bottom with gravel to a depth of 1 inch. The soil should be made up of one-third leaf-mold, one-third good soil and one-third fine river gravel. These should be thoroughly mixed and passed through a ¼-inch sieve. Fill the boxes to within ½ inch of the top, and slightly water. Sow the seed evenly, and sprinkle over it some of the sifted soil, only just covering it. The boxes should be under shade, sheltered from rain, and watered every day with a very fine spray from a watering-can. The seedlings will appear in three or four weeks. If the seeds are sown in beds, they require the protection of a roof sloping south, and supported by posts 4 feet 6 inches high on the north, and 3 feet 3 inches on the south side. The sides may also have to be covered in. The breadth of the beds is 3 feet. The roof projects beyond the south posts sufficiently to keep off direct sunlight, and in the summertime, at any rate, a narrow north roof must be added at right angles. If the sheds are built under the shade of tall trees, the roof is needed only for shelter from rain.

When the seedlings are 1½ to 2 inches high, they should be transplanted into nursery beds, made up in the same way as for seeds. In transplanting, use a wooden peg 4 or 5 inches long, ¾ inch thick at one end and tapering to a dull point. A seedling is picked up with the left hand from a bundle brought from the seed-beds, a hole is made with the peg in the right hand, big enough to receive the roots without bending or crushing them. The soil is then pressed closely over the rootlets with the peg. Two inches between each plant is enough room. At first the plants should be shaded, but

when they are twice or thrice as high as when transplanted the shading may be gradually removed to harden them for putting out in their permanent positions.

The soil and subsoil should be free and open to insure good drainage; newly cleared forest land on a hillside is the best for Cinchona trees. In Jamaica, *Cinchona officinalis* flourishes best at an elevation of about 5,500 feet, with a mean annual temperature of about 60° F., ranging from a minimum of 46° to a maximum of 75° and with a total annual rainfall of 120 to 150 inches.

The distance when planted out in their permanent positions is 3 by 3 feet, and as soon as they begin to interfere with each other's growth they should be thinned out just sufficiently at first to prevent this. The bark of those cut down may be worth stripping if the price of bark is high.

Several methods have been used in taking the bark from the trees. In South America, the tree is uprooted, and the whole of the bark may be taken from both root and stem. A second plan is used if shoots spring from the root; the trunk is cut through above the ground, the bark stripped, and the stump left to coppice, one or two of the shoots being allowed to grow. The third method is to make the same tree yield bark in successive seasons, for this purpose longitudinal layers of the bark are removed from the trunk, and the exposed surface is sometimes covered with moss, the bark renews itself, and the "renewed bark" is as rich (or richer) in alkaloids as the original. In this way, by taking successive strips of bark in different years, the tree yields a continuous supply of bark. L. H. B.†

CINERARIA (ash-colored, from the Latin, referring to the gray foliage) *Compositae*. Herbs or undershrubs, closely allied to *Senecio*, from which they are separated chiefly by technical characters of the achene. The genus is variously understood by different authors. As limited by Bentham & Hooker, and also by Engler & Prantl, it comprises about 25 South African species, and the common garden *Cineraria* becomes a *Senecio* (*S. cruentus*, DC.) The genus *Cineraria* differs from *Senecio* in having a cone-like rather than branched style, and a usually flattened or many-angled rather than torate achene, the species are herbs or undershrubs with yellow flower heads.

The *cineraria* of the florists (Fig. 964) is now much modified by cultivation. There are two views of its origin, one holding that it is a direct development of *C. cruenta*, Mass. (*Pericallis cruenta*, Webb & Berth.), B.M. 406; the other that it is a hybrid, into which *C. cruenta*, *C. Heritieri*, *C. populifolia*, and perhaps others, have probably blended. These are all natives of the Canary Islands. For important literature respecting the origin of the garden *cineraria*, see Nature, 51.461, 605, 52.3, 29, 54, 78, 103, 128, 55.341 G.C. III. 3.654, 657; 17.588, 655, 742, 18.89, 186, 29.297.

The florists' *cinerarias* run in white, and in shades of blue, pink and purple-red. There is promise of yellow-flowered strains by hybridizing with yellow *senecios* or related plants.

See *Senecio* for *Cineraria acanthifolia*, *C. candelabris*, and *C. maritima*. To the garden or florists' *cineraria* (*C. cruenta*) belong the horticultural names *C. grandiflora*, *C. kewensis*, *C. nana*, *C. stellata*, and others. There are full-double forms (see R.H. 1874, p. 17, 1886, p. 41. F.S. 22.2347-8. 111. 32.556) — *C. fluvescens*, Hort., is a garden hybrid between *Cineraria* "Feltcham Beauty" and *Senecio auriculatus* (Mass.) G.C. III. 45, 322 Gm. 73.252. It is a compact grower, originating with James Veitch & Sons, giving promise of a new strain of winter-blooming plants. fls. creamy yellow, the younger blooms almost canary yellow. If peculiarly constricted at the middle and much enlarged at the top — *C. hybrida*, Hort., is a hybrid between *Senecio cruentus* and *S. tussilaginis*, with white fls. having pale blue tips on the rays and purplish centers. G.M. 55.337 — *C. stellata*, Hort., now a popular race of florists' *cineraria*, has open spready panicles of star-like single fls. Fig. 965. Most excellent.

The true yellow-fl. South African *cineraria* seem not to be in cultivation, although *C. polactina*, Hook. f., has been recorded in horticultural literature within recent years. slender and climbing, with lax paniculate inflorescence, pale red flower-stems and five golden yellow rays in each head. B.M. 7799. Elegant greenhouse climber. L. H. B.

Culture of the florists' *cineraria*.

The single hybrid *cinerarias* are among the most useful and beautiful of all greenhouse flowering plants.

The ease with which they can be raised, the little heat required, together with their free-blooming qualities, brilliant and various-colored flowers, which last for a considerable time in blossom, make them popular with most people possessing even only a small greenhouse. Though they are herbaceous in character and may be propagated by cuttings or division of the roots, the single varieties are best treated as annuals,

raising them from seed each year and throwing away the plants after flowering. Although one may save one's own seed, the *cinerarias*, like most hybrids, will deteriorate both in size and quality of the flower after one

or two generations unless they are crossed; therefore, unless one cares to cross one's own plants, it is best to purchase fresh seed from some reliable firm that secures its stock from hybridists. For florists' use, or when a succession of

964. Small plant of the florists' *cineraria* — Botanically *Senecio cruentus*.

these flowers is required, two sowings of seed should be made—the first about the middle of August, and the second a month later. The seed should be sown in pans or shallow boxes 1 foot square, these should be well drained, and the soil should consist of one part fine loam, one part leaf-mold, and one part clean sharp silver sand. The surface should be made very fine and pressed down evenly. The seed should then be sown evenly and rather thinly, and covered with sand about the eighth part of an inch. This will in a great measure prevent the seedlings from what gardeners term "damping off," which they are very apt to do if the atmospheric conditions become at all stagnant. The seed-pans or boxes should be carefully watered with a fine rose and then placed in some cool shaded

place, such as a frame placed on sifted coal-ashes on the north side of a wall or building, where they will germinate in about a week or ten days. As soon as large enough to handle conveniently, the seedlings should be potted into thumb-pots and grown on as rapidly as possible, shifting on into larger size pots as often as required, never allowing them to become the least pot-bound, or suffer in any way during the season of growth. The soil should consist of half leaf-mold and half fine fibrous loam, with a good sprinkling of silver sand, until the final shift into their flowering pots, when the soil should be three parts fibrous loam and one part well-decayed cow-manure or pulverized sheep-manure. About the first of October the plants should all be removed to the greenhouse, where the atmosphere should be kept cool and moist, but not stagnant. If a rainy spell should set in, a little artificial heat should be given to cause a circulation of the atmosphere, and as autumn advances the temperature should be kept about 45° at night, with a rise of 10° by day. Liquid stimulants should not be given until the flower-buds begin to appear, when they are greatly benefited by an occasional watering of clear liquid cow- or sheep-manure. The plants should be well in bloom after the holidays.

If bloom is wanted in late fall or early winter, seed may be sown in May, keep the plants growing all summer, but do not let them bloom till they are established in 5- or 6-inch pots.

The Star Cineraria (Fig. 965), now popular, is an open grower, 2 feet, not having the large solid masses of flower-heads of the older larger-flowered kinds. The blooms are single and mostly smaller, and the rays are separated as in a wild aster. These plants go under the

name of *C. stellata*. They are very free flowering, and as pot plants are more decorative than the large-flowered types, they meet the present demand for simplicity. In color they have the same range as the ordinary florists' cinerarias, and there are cactus-flowered strains, with narrow rolled petals. The star cinerarias require the same handling and treatment as the others.

Double-flowered varieties of cineraria are not commonly grown, neither are they so beautiful as the single varieties. They may be propagated by seed or by cuttings, the latter being the best method, as a large percentage of seedlings are sure to turn out single, which will be inferior in size of flower as compared with the best single varieties. Double-flowering varieties must be propagated each year to secure the best results. As

soon as the plants have finished blossoming, the flower stalks should be cut away to induce the plants to make fresh growth, which, as soon as large enough for cuttings, should be taken off and inserted in an ordinary propagating bed, where they will soon root, after which they should be potted and shifted on as often as required, growing them during the hottest months in as cool and shaded a position as can be provided.

Cinerarias are very subject to the attacks of greenfly. To keep these in check, the house in which they are grown should be fumigated with tobacco about once in ten days, or tobacco stems placed among the plants if fumigating is objectionable, or the cyanide treatment used. See *Diseases and Insects*.

Of the different species of Cineraria from southern Europe (properly Senecios), *C. maritima* is perhaps the best. It is of

dwarf habit, with tomentose, silvery, pinnatifid leaves, and is a most useful subject for edging flower-beds. It is not hardy in the North, consequently must be treated as an annual, sowing the seeds early in March in the greenhouse, afterward treating it as an ordinary summer bedding plant. The other species from south and eastern Europe do not prove hardy North, and if grown should be treated as tender annuals, planting them in the herbaceous borders for the summer. The species from the Cape of Good Hope require greenhouse treatment, the culture being the same as for the common cineraria, although, from an ornamental point of view, most of them would hardly pay for the money they would occupy.

EDWARD J. CANNING.

CINNA (old Greek name for a kind of grass). *Gramineae*. Tall perennials with flat leaf-blades. Spikelets 1-fl., numerous, in nodding panicles, the

905. *Stellata*, a popular form of cineraria. ($\times \frac{1}{2}$)

XXVII. Coconut in flower and fruit. Southern Florida.

rachilla prolonged; lemma short-awned below the apex. There are two species, *C. arundinacea*, Linn., with contracted panicle, the spikelets $2\frac{1}{2}$ lines long, (Dept. Agric. Div. Agrost. 7, 140, 20, 79) and *C. latifolia*, Griseb. (*C. pendula*, Trin.), with open panicle, the spikelets 2 lines long. Both species are native in cooler parts of N. Amer. A. S. HITCHCOCK.

CINNAMOMUM (the ancient Greek name) *Lauraceæ*. Evergreen trees and shrubs of Asia and Australia, with aromatic leaves and wood, of which a few are cultivated in the extreme southern United States.

Leaves usually thick, mostly opposite, strongly 3-nerved or pinnate-nerved buds not scaly (exception in *C. Camphora*) fls. usually perfect, with 9 (or less) perfect stamens in 3 unlike rows and a row of imperfect ones, perianth short-tubed, segments 6 and nearly equal for a small 1-seeded berry, in the cup-like perianth.—Upward of 50 species, among which are plants yielding cinnamon (*C. zeylanicum*), camphor (*C. Camphora*), cassia-bark (*C. Cassia*), and other aromatic and medicinal products. Various species may be expected in collections of economic plants, but most of them are not strictly horticultural subjects. It is not known whether some of the species in cult. in this country are passing under the proper names; possibly *C. Tamala*, Fr. Nees, widely distributed in the Far East, may be confused in our cultures.

The genus *Cinnamomum* embraces tropical and semi-tropical shrubs and trees, which are mostly of economic value, and in one or more cases are valuable shade trees for lawn and street planting. The leaves are evergreen, usually of a rich shining green, and in *C. Camphora* have a silvery blue color on the under surfaces. *C. Camphora*, the camphor tree, is hardy in the lower Gulf states, and is now being extensively planted, both for shade and extraction of gum. *C. Cassia* is not quite so hardy, but withstands a temperature of 20° F. without injury, and has been planted in Florida for manufacture of its various products,—oil, gum, buds and cinnamon bark. *C. zeylanicum*, is likely to be extensively grown in Mexico and the West Indies.—The various species are usually propagated by seeds, which are sown as soon as ripe in a shaded bed, the seedlings being transplanted when very small into pots and kept thus growing until permanent planting out. The species, without exception, are very difficult to transplant from the open ground, and hence pot-grown plants are almost a necessity. Cuttings of half-ripened wood of some species may be rooted in the spring in moderate heat, following the usual method of preparation, and planting in coarse sand. The soil best suited to cinnamomums in general, and *C. Camphora* in particular, is sandy loam, although a heavy loam, when well prepared, answers fairly well. The sandy soil of Florida, when moderately manured, suits all species so far tried admirably. (E. N. Reasoner.)

Camphora, Nees & Eberm. (*Camphora officinarum*, Nees *Laurus Camphora*, Linn.) **CAMPHOR TREE**. Stout tree with enlarged base, to 10 ft. lvs. alternate, ovate-elliptic, acuminate, not large or very thick, pinkish on the young growths, with a pair or more of strong side veins buds scaly fls. small, yellow, in axillary panicles, perianth membranaceous fr. a drupe the size of a large pea China, Japan B.M. 2658.—A handsome dense-topped tree when young, becoming bare below with age; withstands some frost. The young growth is very attractive. It is hardy in central peninsular Fla., where it thrives well if attention is given to fertilizing and cultivating; it does not thrive in wet soils. Camphor is a common roadside planting in S. Calif. Commercial camphor is extracted from the wood.

zeylanicum, Nees. **CINNAMON TREE**. Small tree (20-30 ft.) lvs. very stiff, 4-7 in long, ovate to lance-ovate, glossy, 3-5-nerved, obtuse or somewhat acute, reticulate on under side: fls. small ($\frac{1}{4}$ in. long), yellow-

white, in loose somewhat silky clusters, which often exceed the lvs.: fr. $\frac{3}{4}$ in long, dry, pointed India, Malaya, and widely dispersed in tropical countries as a cult. plant. B.M. 2028 L.B.C. 1:91.—Variable; and many forms have been described.

Cassia, Blume. **CASSIA-BARK TREE**. Handsome tree: lvs. stiff, 3-6 in long, oblong to nearly lanceolate, long-acuminate, glossy, 3-ribbed; petiole slender fls. very small, in terminal or axillary silky-tomentose panicles 3-6 in long fr. size of a pea. China.—Young branches somewhat 4-angled. Hardy and successful in central peninsular Fla. (Nehrling), thriving best in moist and rich land, and making specially fine specimens near residences where now and then it receives applications of fertilizer and water.

pedunculatum, Presl. **GLABROUS tree**: lvs. thick, oblong-lanceolate, acuminate, 3-nerved, glossy above; petiole to $\frac{3}{4}$ in long, blade 2-3 in long and somewhat glaucous or areolate beneath: fls. very small ($\frac{1}{4}$ in or less long), in axillary corymbs that about equal the lvs., perianth glabrous outside and whitish-puberulent inside, the lobes oval-obtuse: berry globose-ovoid, $\frac{1}{4}$ in. long. Japan.—This species is said to have been intro. at Los Angeles some 35 years ago, where a handsome tree still exists, seedlings of which are to be found in other parts of S. Calif. In central peninsular Fla., this species and *C. Lourierii* are hardy and attractive, thriving particularly well in rich and rather moist land.

Lourierii, Nees. **CASSIA-FLOWER TREE**. Middle-sized tree, glabrous lvs. opposite or alternate, rigid, elliptic or oblong, attenuate-acuminate; petiole to $\frac{1}{2}$ in long, the blades 3-5 in long fls. very small (there is a variegated-lvd form) China, Japan.—Perhaps a form of the last, with nerves on upper side of lf. less prominent or sunken, and other minor differences.

L. H. B.

CINNAMON FERN: *Osmunda*.

CINNAMON VINE: *Dioscorea*.

CINQUEFOIL: *Potentilla*.

CIPURA (origin of name unexplained). *Iridaceæ*. Four Trop. American bulbous plants, rarely grown under glass. Allied to *Nemastylis* fls. with 6 parts or petals, the inner 3 being much smaller, white or light blue, borne in terminal heads, short-tubed. The only species likely to be in cult. is *C. patuloides*, Aubl., with white fls. and radical linear-lanceolate lvs.; bulb conical-globose B.M. 646 (as *Marica*). Prop. by seeds and offsets; to be kept on the dry side through winter.

CIRCÆA (Circæ, the enchantress). *Onagraceæ*. **ENCHANTER'S NIGHTSHADE**. Six or seven herbs of low or moist woods in North America and other temperate and cold regions of the northern hemisphere, two of which have been offered for growing in shady places and about garden bogs.

Perennials, small and soft lvs. opposite and stalked: fls. perfect, small, and white, in terminal and lateral racemes, calyx-tube hairy, prolonged beyond the ovary, 2-lobed, petals 2, notched: fr. a small, bristly bur. They are interesting little plants, but not showy. Of easy cult. in shady, damp spots.

Luteitiana, Linn. Erect and branching, 1-3 ft., the st. swollen at the nodes: lvs. ovate-acuminate, more or less rounded at the base, somewhat toothed: pedicels slender, reflexed in fr.: fr. 2-celled, bristly. Woods, E.

pacifica, Aschers & Mag. From 6-12 in., from a little tuber; smaller than the above, lvs. less acuminate, fls. smaller, fr. 1-celled and less bristly. Wyo., west

L. H. B.

CIRRHÆA (from *Cirrhus*, a tendril) *Orchidaceæ*. About a half-dozen Brazilian orchids, of no special importance, one of which, *C. viridipurpurea*, Lindl., is sparingly offered abroad, and two or three others of

which are mentioned in horticultural literature. Allied to *Gongora*; cultured as for *Cymbidium*; warmhouse. Fls mostly greenish and red (or purple), on long pendulous racemes that arise from base of the pseudobulbs.

CIRRHPÉTALUM (*tendrīl petal*, alluding to the narrow lateral sepals). *Orchidaceæ*. Epiphytes, grown in baskets or on blocks in a warmhouse.

Pseudobulbs from a creeping st.; dorsal sepal free; lateral sepals much longer than the dorsal, cohering excepting at the base; petals much shorter, often ciliate; lip entire, usually recurved; column short, 2-winged at the apex; pollinia 4.—About 90 species in Trop. Asia, Mascarene Is., and Australia.

Being of rambling habit, with creeping rhizomes, cirrhopetalums should be grown in baskets sufficiently large to afford plenty of growing surface, and suspended from the roof where they will get abundant light and free access of air to the roots, which is equally essential. Liberal allowance must be made for drainage, which should consist of either broken potsheerds or charcoal, the latter being preferable, as it is light, durable and contains nothing detrimental. Two-thirds osmundine, or other clean fiber, and one-third chopped live sphagnum moss, well mixed together, afford a good compost, and after this has been carefully tugged in about the roots and interstices, the plant should be held firm with brass or copper wire until reestablished. The compost should be used rather sparingly to prevent over-watering. Many of the smaller-growing species do very well on orchid blocks, firmly attached, with a small quantity of compost beneath them. During the winter months, little or no shade is required. The temperature may range from 58° to 65° F. by night, with about 10° rise through the day, or even a little more, with sun-heat, will do no injury. No artificial heat is necessary in summer, except in extreme cold or wet weather, but a shaded moist location should be chosen, such as is afforded in the cattleya or palm department. When the plants are dormant, light syringing overhead will keep the compost moist and the plants in healthy condition, but as the growing season advances, a liberal quantity of water and copious syringing in bright weather will be necessary. The stock is increased by division, the most judicious method being to cut nearly through the rhizome with a sharp knife, about three pseudobulbs behind the lead, just before growth action, allowing the part to remain until the dormant eyes start to grow, when it may be removed and treated as an established plant. A little extra heat and moisture at this period will prove beneficial with the weak plants. All are of moderately easy culture. (Robert M. Grey.)

Medusæ, Lindl. Pseudobulbs ovoid, ribbed; lvs. 5-8 in. long, oblong-elliptic sepals with large sheathing bracts; umbel many-fld; fls creamy, yellow-spotted; dorsal sepal lanceolate; lateral sepals with long pendent tails, 4-5 in. long; petals and lip minute. Singapore. B.R. 28:12. B.M. 4977. I.H. 39:154. G.C. III 21 25.

picturatum, Lindl. Pseudobulbs ovoid, about 2 in. long, angled; lvs 3-5 in. long, linear-oblong scape with sheaths pale yellowish-green, red-speckled; umbel 10-15-fld, sepals and petals green, the dorsal sepal erect, obtuse, red-spotted, with a thread-like purple-knobbed summit, the lateral sepals linear; petals small, rounded, curved; lip blood-red, obtuse. India. B.M. 6802.

C. Andersonii, Kurs. Dwarf habit; fls in umbels, lateral sepals whitish, with fine rose dots, dorsal sepal marked with purple lines. Sikkim.—*C. appendiculatum*, Rolfe. Dorsal sepals and petals pale yellow, lip rose purple. E. India.—*C. byttarum*, J. J. Smith. Sepals purple-spotted, the dorsal elliptic, about 1½ in. long, including the seata, the lateral sepals linear-lanceolate, 2-3 in. long. Java. B.M. 8321.—*C. brevicaule*, Rolfe. Dorsal sepal oblong-lanceolate, about ¾ in. long, dull purple, the lateral sepals yellow, spotted red-brown, about 1 in. long, the lip rose-purple, broadly cordate, ovate-cuneate, hairy at base. Penak. B.M. 8033.—*C. caudatum*, King & Pantl. Dwarf species dorsal sepals short;

lateral sepals tail-like, about as long as scape. Himalayas.—*C. chinense*, Lindl. Fls. pale fawn-color, the dorsal sepal hooded, crimson-spotted, the lateral sepals linear-lanceolate, the lip crimson-spotted. China. B.R. 29:49.—*C. chrysanthum*, Krnzl. Scape filiform, 1-fld, fls. yellow. Philippines.—*C. Camuign*, Lindl. Umbel 9-12-fld, fls. purple, the dorsal sepal glandular-ciliate, the lateral sepals 1 in. long, linear-oblong, lip with 2 erect processes. Philippines. B.M. 4996.—*C. Hookeri*, Duthie. Fls. 3 in. long, yellow, the dorsal sepal about ¾ in. long, obtuse, purple-streaked, the lateral linear-lanceolate, acuminate. Himalayas. B.M. 7869.—*C. lepidum* (Bulbophyllum lepidum, J. J. Smith). Dorsal sepal, erect, ciliate, ¾ in. long, brownish yellow, lateral sepals united, spreading, bright brownish yellow, somewhat red-flushed, at base, the upper portion pale yellow, marbled with brown-red, about 1 in. long, petals ½ in. long, ciliate. Java.—*C. longicaule*, Riddell. Fls. whitish, rose-streaked, the dorsal sepal lanceolate, ¾-1 in. long, the lateral sepals linear, 8-12 in. long, with slender tails, petals falcate, ciliate. Sum. B.M. 8396.—*C. Micholitzii*, Rolfe. Umbels 8-12-fld, lateral sepals deep yellow, dorsal sepal and petals blotted with dark purple on a pale ground. Annam.—*C. minutum*, Rolfe. Fls. vermilion-colored with hairs of dorsal sepal and petals yellow, lateral sepals caudate, almost thread-like. Annam.—*C. papillosum*, Rolfe. Umbels usually 6-fld, dorsal sepals and petals lined with dark purple on a pale ground, lateral sepals speckled with red-brown. Siam.—*C. pulchrum*, N. E. Br. I.H. 33:608. O.R. 17:328. A.F. 6:609.—*C. retusacaulum*, Reichenb. Fls. ¾ in. length, upper sepals dark purple, lower coherent, yellow, marked with dark red. China.—*C. Röhrigii*, Lindl. Small, with ovate reddish green lvs. and almost globose umbels, the corolla fls tinged with rose or purple. India. A pretty dwarf species.—*C. Thoudirii*, Lindl. Umbel of 10-12 fls., sepals and petals tawny yellow, the dorsal ovate, cuspidate, with purple warts, the lateral lanceolate, acute, stained claret, petals small, oval-lanceolate, pale yellow, purple-spotted, with a thread-like tail at apex, lip oblong. Madagascar. Java, Philippines, Society Is. B.R. 24:11. B.M. 4237.—*C. sinense*—*C. chinense*. GEORGE V. NASH

CIRSIIUM (old Greek name, referring to the use of the plant in an ailment) (*Compósitæ* *Thusiæ*). Prickly-leaved plants (largely biennial) of bold habit and showy purple, pinkish, white or even yellowish heads, sometimes planted in wild gardens.

The thistles are botanically confused. By some authors, *Cirsium* is combined with *Carduus*, but others keep it distinct because of the plumose or feathery pappus (which is most constant on the inner florets), and this disposition is here accepted. The *Cirsiums* are herbs or subshrubs, more or less spiny; lvs. alternate, sessile, often pinnatifid; fls. heads large, mostly terminal, involucre ovoid or spherical, with many rows of imbricated often spiny-tipped scales, many-fld, florets all tubular and alike (seldom more or less dimerous).—More than 120 species of annuals, biennials or perennials, widely spread in the northern hemisphere.

Other generic names partaking in the confused usage are *Cardenia*, now a synonym of *Cnicus*, *Chamaepuce*, now a section of *Cirsium*; and *Cnicus* (which see), a genus of one species, distinguished by sterile marginal florets, pappus of ten long bristles and equal numbers of shorter ones and of horny teeth, and achene attached obliquely near the base rather than squarely on the base.

A number of the thistles are field and pasture weeds. The most pernicious of these weeds is the Canada thistle, *C. arvense*, Scop. (*Carduus arvensis*, Rebs.), Fig. 795. The common bull thistle or pasture thistle (Fig. 966) is a stately biennial, and very decoar-

966. Head of pasture or bull thistle. (x ¾)

tive. It is *C. lanceolatus*, Hill (*Carduus lanceolatus*, Linn.). Both these species are introduced from Eu., as well as two or three others of lesser distribution in this country. There are a number of showy native species, one of which, *C. muticum*, Michx., (*Carduus muticus*, Pers.) is shown in Fig. 967. This purple-fl. species occurs in low grounds from Newfoundland to W Va.

A few species of *Cirsium* (as the genus is here defined) may be expected to occur in cult. *C. oleraceum*, Scop., (*Carduus oleraceus*, Vill.), of Eu., has very decorative foliage, and thrives in the moister parts of a garden; the fls are not very handsome, whitish or yellowish, 3 ft. The *Chamaepeuces* are sometimes grown for the large prickly spreading rosettes of lvs that are produced the first year, the bloom appearing the second year. They combine well with plantings made for subtropical effect: *C. Casabonæ*, DC (*Chamaepeuce Casabonæ*, DC *Carduus Casabonæ*, Linn.), has lvs deep green veined white, spiny, the fl-heads pale purple; *C. Diacantha*, DC (*Chamaepeuce Diacantha*, DC *Carduus Diacantha*, Labill.), has thick lvs shining green with silvery lines, white beneath, linear-lanceolate, the principal nerve or rib terminated by a single spine and the lateral nerves usually 2-spined, and dense clusters of purple heads, *C. afrum*, DC (*Chamaepeuce afrum*, DC *Carduus afrum*, Jacq.), has dark green blotched white linear-lanceolate lvs tomentose beneath, and large bright purple heads, *C. Sprengeri*, Hort., a garden hybrid, perennial, with dark green white-veined spiny lvs, and white fragrant heads, *C. lauricum*, Hort., is probably *C. Diacantha*.

967 *Cirsium muticum* (X 1/2)

L H B

CISSAMPELOS (Greek for *wy* and *vine*) *Menispermaceæ*. Mostly twining plants, shrubs and herbs, one of which is cultivated for south.

Leaves various, mostly cordate or reniform, often peltate, alternate, fls in axillary racemes or clusters, the plant dioecious, sterile fls with 4 sepals and 4 petals united, the anthers 2-5 on a staminal column or disk, fertile fls with 2 united fleshy sepals, subtended by a sepal-like bract, and solitary ovary, with 3 styles fr a subglobose drupe, with a flattened and tuberculate stone. Many species or distinct forms in tropical regions, but many of them are evidently forms of the widely distributed *C. Pareira*, Linn. This plant, as *C. heterophylla*, DC, and under other names, is cult in S Fla and the tropics. It is known as VELVER-LEAF and FALSE PAREIRA. It is an exceedingly variable vine, with downy round-cordate or peltate entire or lobed lvs, the very small sterile fls in stalked corymbs and the fertile in large-bracted clusters, and a hairy or glabrate nearly globular red drupe. It occurs in all tropical countries. "*Pareira brava*" of the pharmacopœas is derived from the root of the related perennial climber, *Chondrodendron tomentosum*, of Peru and Brazil. Whether the genus *Cissampelos* contains 20 or 70 species depends mostly on the rank given to the many forms of the cosmopolitan *C. Pareira*.

L H B

CISSUS (Greek name of *wy*). *Vitaceæ*. Mostly tendril-climbing shrubs, a few of which are grown in the open, and others under glass for the handsome often colored foliage.

Very like *Vitis* (with which some authors unite it): at best a mixed group botanically, and capable of good definition only when certain groups or subdivisions are removed from it. For the characters of related genera, see *Ampelopsis*, *Parthenocissus*, *Vitis*. As constituted by Gilg in Engler & Prantl's "Pflanzenfamilien," the genus includes *Cayratia* but which might well be kept distinct. This subgenus, of which two or three interesting species from China and Japan are in cult., differs from *Cissus* proper in the always compound lvs., which are usually pedate, the axillary infl., the thin or even membranous disk, the 2-4-seeded fr., and the plants mostly herbaceous. Excluding *Cayratia*, *Cissus* is known by usually simple lvs, 1-seeded fr., and the disk being deeply 4-lobed or separated into 4 gland-like bodies. From *Ampelopsis*, as that genus is characterized in this work, *Cissus* differs in the 4-merous fls., often herbaceous, and fleshy st., the 1-seeded rather than 2-4-seeded fr. and in the disk not being cup-like and not irregularly lobed. From *Vitis*, it differs in its 4-merous fls., its expanding petals (the corolla not falling off as a cap), the 4-parted disk, its 1-seeded mostly dry and inedible fr., and other characters. *Cissus* comprises probably 200 species, widely dispersed in tropical regions and a few of them reaching extra-tropical areas (as in the southern U S.) mostly climbers by means of tendrils without enlarged or disk-like ends, rarely erect shrubs or even perennial herbs, sometimes with greatly thickened sts. either under ground or above lvs alternate, simple or compound, with tendril (if present) opposite or at same node fls usually perfect, in mostly umbel-like cymes that are terminal or axillary, parts of the fl in 4's, the petals at length spreading and falling separately, disk around the ovary 4-parted or -separated, style long and mostly slender rather than conical fr typically a dryish 1-seeded berry (2-4-seeded in *Cayratia*).

In cultivation there are very few species of *Cissus*, and these are mostly the tendril-climbing *Vitis*-like species grown under glass for the handsome foliage. The best known is *C. discolor*, although other species are likely to become widespread and popular in greenhouses. The fleshy-stemmed erect species are sometimes grown in botanical collections for the cactus-like forms and for illustrations in adaptive morphology. The species are readily propagated by cuttings.

A *St herbaceous*.

1. *japonica*, Willd (*Cayratia japonica*, Gagnep.). Herbaceous, glabrous or minutely puberulent, the branches striate, climbing by tendrils lvs pedately 5-foliate, long-stalked, the lfts lanceolate or obovate-oblong, serrate fls in a long-peduncled 2-3-forking cyme, greenish; petals ovate-triangular, blunt, berry size of a small pea, 2-4-seeded, the seeds 3-angled-ovate, keeled. Japan, Java, Austral—Appears to be root-hardy N., when covered.

2. *oligocarpa* (*Vitis oligocarpa*, Lev. & Van *Cayratia oligocarpa*, Gagnep.). Differs from the above in the acuminate and more sharply and closely serrate lfts., which are puberulous when young; anthers orbicular. China—Very recently intro.

3. *adenopodus*, Sprague. Herbaceous, climbing by tendrils, slender, terete root tuberous lvs red and decorative, 3-foliate, petioled, 3-6 in long, hairy,

flts. stalked, ovate, abruptly acuminate, coarsely serrate, green with sunken nerves above and red with prominent nerves beneath; fls. light yellow, in a loose panicle or cluster about 4 in. long, the pedicels recurved after flowering, petals oblong, much reflexed (about $\frac{1}{4}$ in. long) berry globose, $\frac{3}{8}$ in. diam., dark purplish black. Trop. Afr. (Uganda). B.M. 8278—A quick-growing plant requiring warmhouse conditions. Readily prop. by cuttings or seeds, and of very easy cult. Thrives well in sunlight. A recent intro.

AA. *St. not herbaceous at maturity, although perhaps fleshy.*

B. *Lvs. fleshy, 3-lobed or 3-foliolate.*

4. *ácida*, Linn. Low glabrous climber, with slender and striate somewhat fleshy branches and long stout tendrils: lvs. rigid, petiolate; flts. or lf-divisions rather small, broad-cuneate and sharply toothed near the apex fls. small, in corymb-like or umbel-like clusters; fr. an ovok. and abruptly pointed dark purple berry, with 1 or 2 large seeds, the pedicel being recurved at maturity S. Fla. and Trop. Amer.; also, in Ariz and S.—Sometimes planted.

5. *incisa*, Desm. (*C. Rocheana*, Planch.) Climbing 20-30 ft., the sts. warty and very fleshy and the tendrils root-like lvs. pale green, very fleshy; flts. or divisions wedge-ovate, notched on both sides and top, the middle one sometimes again lobed and the lateral ones 2-lobed fls. in umbel-like mostly 3-forking cymes opposite the lvs. fr. an obovoid blackish berry, with 1 or 2 seeds, the pedicel being strongly recurved Fla. to Ark and Texas R.H. 1884, pp. 272-3—Often planted in the extreme S. Sometimes called "marine ivy."

BB. *Lvs. not fleshy*

C. *The lvs. 3-5-foliate.*

6. *gongylodes*, Planch. (*Vitis gongylodes* and *V. pterophora*, Baker) Vigorous tendril-climber with 4-angled branches, desirable for large greenhouses where tropical effects are desired, sending down long bright red aerial roots lvs. large, stalked, 3-foliate; flts. rhomboid or the middle one often 3-lobed, the lateral ones sometimes lobed on the outside at the base, hairy on margin and nerves; fls. red-brown, in pedunculate cymes opposite the lvs.: a tuber (reaching 5-6 in. long) is borne at the end of each branch when the season's growth has ceased, and this drops and produces new plants Brazil. B.M. 6803. Gt 37 1273 R.H. 1908. 203.

7. *striata*, Ruiz & Pav. (*Ampelopsis sempervirens*, Hort.) Low, shrubby evergreen vine, tendril-climbing, the branches striate and usually lightly hairy: lvs. small, 3-5-foliate, with cuneate-obovate or lanceolate coriaceous flts., serrate above the middle. fls. yellowish, in many-fld pedunculate cymes opposite the lvs. fr. depressed-globose, size of small pea, often 2-celled and 2-4-seeded Chile, S. Brazil.—Graceful small climber for the cool greenhouse; robust in S. Calif.

CC. *The lvs. not compound although perhaps lobed.*

8. *discolor*, Blume. Fig 968 Tendril-climber, smooth, but not glaucous, the branches slender and with 4 or 5 ribs or angles, red: lvs. oblong-ovate or cordate-ovate, acuminate, bristly serrate, reddish beneath, velvety green and mottled with silvery white

above; fls. small and yellowish, in dense and very short axillary peduncled clusters; fr. globular, 1-seeded Java. B.M. 4763. Lowe 13. F.S. 8. 804-5.—One of the best of warmhouse foliage plants Easily grown Prop. by cuttings It must have a season of rest, usually in spring or early summer If wanted for winter growth, temp must be about 75° It thrives in rich somewhat moist soil and responds to small applications of fertilizer now and then. The plant is very susceptible to

root-knot. Variable. Known to some as "trailing begonia"

Var. *mollis*, Planch (*C. velutinus*, Lind.) Pubescent or velvety. lvs. green and boldly veined with white above, blood-red beneath fls. intense bright red, in large laxer and longer-peduncled cymes Habitat unknown. B.M. 5207

9. *antártica*, Vent (*C. Baudiniana*, Brouss.) KANGAROO VINE Upright shrub, but the branches climbing by tendrils, hairy lvs. rather thick, glossy, ovate to oblong, sometimes more or less cordate, very short-acuminate, mostly toothed or notched,

green: fls. green, in few-fld., axillary clusters; fr. a globular- or few-seeded berry, said to be edible Austral B.M. 2488—Valuable for cool greenhouses, but does not withstand frost Grows well on walls in darkish and neglected places

10. *sicyoides*, Linn. Tall, tendril-climbing, pubescent, the branches terete or compressed, tuberculate or smooth, striate lvs. ovate or oblong, often cordate at base, margin more or less serrate with bristle-tipped teeth or even cut, thickish, green: infl. corymb-like, opposite the lvs., the fls. small, and varying from greenish to white and purplish, fr. an obovoid, 1-seeded black berry. Very widely distributed in Trop. Amer. and exceedingly variable, and extending into Fla. The *C. argentea* of horticulturists is var. *ovata*, Baker, which has glabrous ovate or ovate-oblong remotely serrate and somewhat glaucous lvs. Called "season vine" in tropics

It is probable that some of the plants listed as *Cissus* belong to other genera, and some of the trade names are unidentifiable botanically—*C. albo-nitens*, Hort. Lvs. oblong-acuminate, more or less cordate at base, silvery white and shining over the upper surface Brazil Warmhouse climber—*C. amazonica*, Lind. Lvs. glabrous and glaucous, oval-acuminate and narrow, reddish beneath and silvery veined above Brazil Warmhouse climber.—*C. Darwina*, Carr., is a *Vitis* (which see)—*C. Lindeni*, André (11 17 2), has large ovate-cordate silver-blotched lvs. a glabrous climbing shrub, with terete branches Colombia—*C. paraphyllis*, Lind., is a *Piper*—*C. Velutina*, Hort., is *Parthenocissus*.

L. H. B.

CISTUS (ancient Greek name). *Cistaceæ*. Rock Rose. Low shrubs grown for their red or white hairy flowers.

Plants usually with villous and glandular tomentum, aromatic lvs. opposite, mostly persistent, entire, the opposite petioles connate at the base fls. large, in terminal and axillary cymes at the end of the branches, rarely solitary, white to purple; sepals 3 or 5; petals 5. stamens numerous; style elongated or short with a

large 5-10-lobed stigma caps many-seeded, splitting into 5 valves.—About 20 species in the Medit. region and many natural and garden hybrids. Monograph by Grosser in Engler, Pflanzenreich, hft. 14, pp. 10-32 (1903) and an illustrated monograph by R. Sweet, *Cistineae* (1825-30) quoted below as S C.

The cistuses are ornamental free-flowering shrubs, usually only a few feet high, with very showy purple or white flowers similar to a small single rose, appearing in early summer. They are hardy only in warmer temperate regions, but many of them will stand 10° of frost without injury, and *C. laurifolius* and *C. villosus* var. *tauricus* even more. They thrive best in a well-drained light soil, mostly preferring limestone soil, and in a sunny position; the dwarfier species are well adapted for rockeries with southern aspect. They do not bear transplanting well, and should be grown in pots until planted out. Some species yield ladanum, a resin used in perfumery. Propagated by seeds sown in spring in pans or boxes and the young seedlings shaded; increased also by layers and cuttings in spring or late summer, inserted in sandy peat under glass. In the Old World, the cistuses are important garden plants, but they are little known in America.

A. Color of fls. purple or red.

b. Fls. $1\frac{1}{2}$ -2 in. wide, petals imbricate.

c. Lvs. penninerved, 3-nerved only at the base.

d. Petals without a dark blotch at the base.

1 *villosus*, Linn (*C. incanus*, Linn.) Erect shrub, 3-4 ft, villous or tomentose. Lvs. penninerved, roundish-ovate or oblong, narrowed into a very short petiole, rugose above and grayish green, tomentose or villous beneath, 1-2 in long fls. 1-3, long-peduncled, reddish purple, 2 in. wide, petals light pink or yellowish at the base. May, June. Medit. region B M 43 S C 35 Gn 27, p. 571.—A very variable species. Var. *creticus*, Boiss. Lvs. smaller, more spatulate at the base, very rugose, undulate at the margin fls. purple S E Eu, Asia Minor. Sibthorp, Fl. Græcia 5 195 S C 112 Gn 27, p. 571, 33, p. 490.

Var. *rotundifolius*, Loud. Dwarfier, with more roundish lvs. S C 75. Garden form Var. *tauricus*, Grosser (*C. tauricus*, Presl.) Lvs. obovate-spatulate, the upper ones lanceolate, scarcely undulate. pedicels twice as long as sepals. Asia Minor. Var. *undulatus*, Dunal. Lvs. linear-oblong, acute, undulate: fls. solitary S C 63. Garden form.

2 *heterophyllus*, Desf. Erect, to 2 ft.: lvs. short-petioled, elliptic- or oval-lanceolate, green on both sides and slightly hairy, $\frac{1}{2}$ -1 in long: fls. 1-3, 2 in wide; petals red, yellow at the base. N. Afr. S C 6.—More tender.

bb. Petals with a dark blotch at the base.

3 *parviflorus*, Lam (*C. ladaniferus* × (*C. villosus*)) Shrub to 4 ft., somewhat glutinous lvs. nearly sessile, lanceolate or oblong-lanceolate, acute, rugose above, slightly undulate and revolute at the margin, 1-2 in. long: fls. usually 3, lilac-purple, 3 in. across, the petals yellow at the base and with a maroon blotch. Of garden origin. Gn. 31:326; 45, p. 33; 53, p. 134. B R. 5:408 S C. 17. G C III. 48.118-19.—One of the most beautiful rock roses.

cc. Lvs. 3-nerved to the apex.

4. *crispus*, Linn. Compact shrub, to 2 ft., villous: lvs. sessile, linear-lanceolate or oblong-elliptic, undulate,

rugose above, villous beneath fls. 3-4, nearly sessile, $1\frac{1}{2}$ -2 in. wide, deep rose-colored. June-Aug. S W. Eu. S C. 22. Gn. 34.252.

5. *albiflorus*, Linn. Shrub to 4 ft., the young parts white-tomentose: lvs. sessile, elliptic or ovate-oblong, revolute at the margin, reticulate beneath, whitish tomentose, $\frac{1}{2}$ -2 in long fls. 3-6, lilac or rosy, $2\frac{1}{2}$ in across, style longer than stamens. S W. Eu. N. Afr. S C. 31. G C III. 45.117. G M. 51:783.

bb. Fls. 1 in. wide; petals not imbricate.

6. *parviflorus*, Lam. Much-branched shrub, 1-2 ft.; tomentose: lvs. 3-nerved, elliptic-ovate, undulate, rugose above, reticulate beneath, twisted, 1 in. long: fls. 3-5; petals pale rose, yellow at the base. June. Greece, Crete. S C. 14.

AA. Color of fls. white: lvs. 3-nerved.

n. Sepals 3.

c. Lvs. nearly sessile: plant very glutinous: fls. usually solitary.

7 *ladaniferus*, Linn. Shrub, to 4 ft, glutinous: lvs. lanceolate, glabrous and viscid above, whitish tomentose beneath, $1\frac{1}{2}$ -4 in long fls. usually solitary, long-peduncled, 3-3 $\frac{1}{2}$ in wide, petals yellow at the base. June S W Eu. S C 84 FSR 2, p. 44 G. 22:213 Gn 58, p. 171; 66, p. 257 F. 1874, p. 160. Var. *maculatus*, Sweet. Petals with a dark brownish crimson spot above the base. Gn 30:30; 33, p. 490. S C 1 G 26:598. Grosser 23.—Probably the most beautiful of all cistuses.

cc. Lvs. distinctly petioled: fls. several.

8. *cyprius*, Lam (*C. ladaniferus* × *C. laurifolius*). Erect shrub, to 6 ft., somewhat glutinous lvs. oblong-lanceolate, glabrous above, villous-tomentose beneath: fls. 5-7, nearly 3 in wide, petals blotched purple at the base. June. Garden origin. S C 39. Gn 76, p. 438. B M 112 (as *C. ladaniferus*).

9 *laurifolius*, Linn. Fig 969.

Shrub to 6 ft.: lvs. petioled, ovate or ovate-lanceolate, glabrous above, whitish or brownish tomentose beneath, 1-2 $\frac{1}{2}$ in long. fls. 3-8, 2-3 in wide; petals with yellow blotch. June-Aug. S. W. Eu. Gn. 53, p. 131; 64, p. 234 G M. 34: 95. S C. 52.—The hardiest species.

bb. Sepals 5.

10 *salvifolius*, Linn. Shrub, to 2

ft, sometimes procumbent: lvs. petioled, oval to ovate-oblong, rigid, very rugose above, tomentose on both sides, $\frac{1}{2}$ -1 $\frac{1}{2}$ in long; bracts deciduous fls. solitary or several, white, $1\frac{1}{2}$ in. across. S Eu, N. Afr. Orient. S C 54. Gn 76, p. 352 G. 30:593.—A very variable species.

969. *Cistus laurifolius*. (× $\frac{1}{2}$)

11. *populifolius*, Linn. (*C. cordifolius*, Mill. *C. Cupanidius*, Presl). Shrub to 6 ft.; lvs long-petioled, cordate-ovate, acuminate, penninerved, rugose, glabrous, 2-3½ in., long. fls. 2-5, white, 2 in. across. S. W. Eu S C 23, 70.

ALFRED REHDER

CITHARÉXYLUM (*Zither-wood* used for the making of certain musical instruments) *Verbenaceae* Shrubs or trees, sparingly planted in southern California, and perhaps elsewhere South for ornament

Spiny or unarmed, tomentose or glabrous, with opposite entire serrate often spinose-dentate lvs: fls white or sometimes yellow, odorless, small, in spiciform terminal or axillary racemes, calyx 5-toothed or 5-lobed, corolla-tube cylindrical, the limb broad and 5-lobed, the lobes spreading and obovate, stamens 5, included, one of them abortive, the 4 polliferous ones didynamous, ovary more or less 4-celled, each cell 1-seeded; style often 2-lobed fr. a fleshy drupe, partly inclosed in the calyx — About 20 species, Mex. to S. Amer

cinereum, Linn. Tree, to 20 ft, the branches 4-angled and becoming cylindrical. lvs elliptic-oblong or lance-oblong, usually obtuse, glabrous or nearly so beneath fls. white, in long lax and nodding spike-like racemes; calyx unequally lobed, corolla-tube twice as long as calyx fr. nearly globular, red becoming black. W. Indies. L.D. 7 493.

quadrangulare, Jacq. Larger tree, the branches permanently 4-angled: lvs elliptic-oblong: fls. white; calyx nearly truncate. W. Indies — These two species are here defined as understood by Grisebach, as it is probable that the plants in cult. were determined on that basis. Schulz, however (Symbole Antillane), refers *C. cinereum*, Linn., to *C. frutescens*, Linn.; and *C. quadrangulare*, Jacq., to *C. spinosum*, Linn. *C. quadrangulare* of Grisebach, at least in part, he refers to *C. frutescens*; and *C. cinereum*, Jacq., to *C. spinosum*. What are the plants catalogued cannot be determined without a bringing together of material.

lilicifolium, HBK. Low shrub, very branched, not spiny, the branches 4-angled: lvs. elliptic-oblong, narrowed into a short petiole, entire or spinose-dentate, thick, the margin revolute, shining above and punctate beneath: fls. white, in a short terminal raceme; calyx 5-toothed; corolla scarcely exceeding the calyx, the lobes pilose: drupe size of a pea. Ecuador.

barbinerve, Cham. Spiny shrub, the branches 4-angled: lvs. obovate or elliptic-lanceolate, acute or obtuse or retuse, narrowed into a petiole, nearly entire, glabrous and shining above and paler and somewhat pilose beneath, bearded at the axils of the nerves. fls. white, in a terminal laxly-fld. raceme. Brazil, Uruguay. L. H. B.

CITRANGE (from *Citrus trifoliata* and orange by synecopation: *Citrus trifoliata* [orange] *Rutaceae*). A hybrid between the common orange and the hardy trifoliolate orange, *Poncirus trifoliata* (*Citrus trifoliata*)

Citranges have trifoliolate lvs, but the lateral lfts are much smaller than the terminal one lvs semi-deciduous, falling completely only during a very severe winter: fls borne on new wood in spring, very large, white, sometimes over 2½ in. diam, but with long and narrow petals, which vary much in size in different citranges: frs. variable, from 1-4 in. diam, globose, or depressed-globose, red-orange or lemon-yellow, smooth or hairy, the pulp abundant and very juicy, acid or subacid, with an agreeable aromatic flavor; peel often full of a disagreeably flavored essential oil.

The citranges are very cold-resistant if in a dormant condition, being able to stand temperatures as low as 15° or even 10° F. without injury. They are not adapted to commercial culture but are of much interest for home use in the cotton-belt of the southern states where the winters are too severe to permit of the culture of oranges or other citrus fruit. The flowers are showy and fragrant and the hand-some fruits are used for making ale and for culinary purposes. The first successful hybrids between these plants were made by the writer at Eustis, Florida, in March, 1897, where eleven were secured. These remarkable hybrids were named citranges by H. J. Webber and the writer in 1903 (Yearbook, Department of Agriculture for 1904).

The principal varieties now grown in the southern states are.

Rusk (Fig 970). — This is the most precocious of the citranges and has the smallest fls and smallest (1½-2 in. diam) and reddest frs. Young grafted trees often bear in 3 years. The foliage is dense and dark green. The frs are thin-skinned, aromatic, juicy, and almost seedless. The peel contains a disagreeable oil and care must be taken to keep this out of the juice of the fr. Many thousand trees of this variety are now growing in the southern states and are prolific bearers

Colman — This is very unlike all the other citranges. The frs are large, 3-3½ × 2½-3½ in., flattened, light yellow, and with a thick fuzzy peel, usually nearly seedless; the pulp is greenish, juice abundant, strongly acid, agreeably aromatic. It can be used for ado.

Morton. — The largest of the citranges, fr. often weighing more than 1 lb. Fr. round, resembling a large orange, rind medium, pulp sprightly acid, with a pecthary taste, usually seedless. Tree a vigorous grower, cold-resistant.

Saunders. — A small-fruited variety. Frs. 2-2½ in. diam. with 5-10 seeds, orange-yellow, peel thick with prominent oil-glands. The thick skin of this hybrid makes it keep well.

970. Rusk citrange. (×30)

The juice is sharply acid. This is probably the most cold-resistant of the citranges tested as yet.

Flora.—This hybrid is remarkable for its profuse bloom. The large white fragrant fls. make this a good ornamental in the cotton-belt; frs. small, very few.

Cunningham.—This resembles the Colman in having fuzzy frs. which are, however, small and nearly spherical. The juice is sharply acid, aromatic, and makes very good ade.

Navage.—Fr. similar to an orange in appearance, 2-3 x 2½-3½ in., light yellow, ridged medium thick, bitter, pulp tender, translucent, juice with a sprightly acid flavor, aroma pleasant. Tree very vigorous and prolific. Foliage dense.

WALTER T. SWINGLE.

CITRON (*Citrus Medica*, Linn.) *Rutaceae*. Fig 971. A large lemon-like fruit with a very thick peel and a small amount of very acid pulp, the peel is candied and used in confectionery and for culinary purposes.

The citron is grown in the Mediterranean regions, especially in Corsica, and large quantities are preserved in brine and shipped to the United States to be candied. The Corsican citron of commerce was introduced into this country in 1804 by David Far-chukl for the Division of Pomology of the United States Department of Agriculture, and it has been grown to some extent in California.

The plant usually is propagated by cuttings but it can be grafted on rough lemon or other stock. In the region of Valencia, in eastern Spain, the citron is used in propagating oranges, since citron cuttings strike root more easily than oranges. A piece of citron twig is grafted into branches of orange which are afterwards set as cuttings whereupon the citron strikes root and later on the orange.

Then the roots are exposed and the citron roots cut away, leaving the orange growing on its own roots.

The citron can be planted and cultivated much as the lemon in cool equable climates, such as in the coastal region of southern California. In Corsica, the trees are kept low and trained in vase form, but otherwise treated like lemons.

There are but few citron orchards in the United States, one at West Riverside, California, about 10 acres in extent, is perhaps the largest.

The Etrog or sacred Jewish citron, used by the Jews at the Feast of Tabernacles, has small greenish yellow fruits which, if they are of exactly the prescribed size, form and color, may bring as much as \$5 or \$10 each. This variety is grown principally in the island of Corfu. See *Citrus* and *Etrog*.

The word citron is also applied to the preserving watermelon. see *Citrullus* and *Melon*, *Water*.

WALTER T. SWINGLE.

CITRÓPSIS (*Lamonia* § *Citropas*, Engler). *Ruticeae*. **AFRICAN CHERRY ORANGE**. Very interesting and as yet little-known citrus trees, of interest for use in hybridizing and for stocks, also promising as ornamentals.

Small spiny trees, lvs. compound, 3-12 in length; lfts. 3, 5 or even 7, coriaceous; petioles and rachis usually very broadly winged, fruiting twigs sometimes with unifoliate lvs. spines usually paired, sometimes single fls. large, white, in the axils of the lvs., tetramerous (rarely 5-merous), with 8 free stamens; frs. small, ¾-1½ in diam, borne in tufts in the axils of the lvs., bright orange-colored, with an agreeable odor and a pleasant flavor, 3-4-celled, with a single seed in each cell; cells in some species filled with pulp-vesicles full of pleasantly flavored juice.

There are several species of this interesting genus in the tropical forests throughout central Africa. These plants, because of their sweet high-flavored fruits borne in tufts like cherries and their unusually large compound leaves, should prove very interesting for use in hybridizing. Tests made in the green-houses of the Department of Agriculture, at Washington, have shown that at least two species of *Citropsis* can be budded readily and grow very well on the common citrus stocks. This genus is undoubtedly closely related to *Citrus*. See deser in Journ. Ag. Research, 1419-430, w figs.

Preussli, Swingle & M. Kellerman (*Lamonia Prussii*, Engler & L. Demeusei, De Wild?) Lvs. 3-5-foliate, with very broadly winged petioles and rachis, lfts. large, broadly oval fls. large, axillary; style long, slender, broad at the base; frs. small, apiculate Kamerun. W Congo Ill Engler & Prantl, Nat. Pflanz III 4 189, fig 109, E H De Wildeman, Etudes Fl. Congo, pl 41.

Schweinfurth, Swingle & M. Kellerman (*Lamonia Schweinfurthii*, Engler & *Lamonia ugandensis*, Baker). Fig 972. A species named from sterile leafy twigs collected by Schweinfurth at Uando at the headwaters of the Ghazal branch of the Nile. Lvs. 3-5-foliate, lfts. narrowly lanceolate, acute at both ends; fls. large, usually 4-merous; style rather short and thick frs. lime-like, 1½ in. diam., sweet. Sudan, Uganda, Congo.

gabonensis, Swingle & M. Kellerman (*Lamonia gabonensis*, Engler). Lvs. of medium size, sometimes unifoliate like orange lvs., sometimes 5-7-foliate; rachis narrowly winged; lfts. caudate fls. small, borne on long pedicels, 4-merous; style not broad at base frs. globose, small, about 1 in diam, almost dry, having only rudimentary pulp-vesicles, seeds large French Congo, Kamerun.

WALTER T. SWINGLE.
MAUDE KELLERMAN.

971. Citron—*Citrus Medica*, Corsican variety (×½)

CITRULLUS (diminutive of *Citrus*, said to be in allusion to the shape of fruits and color of flesh resembling those characters in fruits of the orange or citron). *Cucurbitaceæ*. Annual or perennial tendrill-bearing herbs of three or four species, one yielding the watermelon and one the colocynth.

Climbing or long-trailing, hispid or rough, with 2-3-parted tendrils, often with a strong odor. lvs. alter-

972. *Citropos Schweinfurthii*. (× ¼)

nate, petiolate, mostly round-cordate in general outline, deeply 3-5-lobed, and the divisions often again lobed, and the segms commonly obtuse fls monocious, solitary and peduncled in the lf-axils, the corollas 5-lobed, stamens 3, included and united or cohering by the anthers, and rudiments of stamens in the pistillate fls, pistil 1, the ovary ovoid or globose, bearing a short style and 3-lobed stigma fr a globular pepo, morphologically 3-celled, usually smooth and with a hard rind—Trop Afr and Asia, 2 of the species now widely distributed in warm and tropical countries.

vulgans, Schrad. **WATERMELON** (see *Melon*, for culture). Annual, glabrous or pubescent. lvs not rough, either deeply or moderately divided, the sinuses open and obtuse fr in the wild state from the size of an apple to that of a man's head, sweet or slightly bitter. Trop and S Afr—When the fr. is sweet and edible (*C. Caffer*, Schrad.), it is the watermelon, or "kaffir watermelon" of S Afr; when bitter (*C. amarus*, Schrad.), it is the "bitter-apple" of S Afr. The fr now varies widely in cult., in size, season, shape and quality. The soft pink flesh is much prized in its natural state for eating. A form with hard and inedible white flesh is known as "citron," and the rind is used for the making of preserves (as is the rind of the true citron).

Colocynthis, Schrad. (*Colocynthis officinalis*, Schrad. *Cucumis Colocynthis*, Linn.) **COLOCYNTH. BITTER-APPLE**. Perennial (in the wild), the st. angular and rough: lvs rough, 2-4 in long, 3- or 7-lobed, the middle lobe sometimes ovate, the sinuses open and the lf. in general form like that of *C. vulgaris*: ovary villous: fr. globose, green-and-yellow variegated, about 3-4 in diam., intensely bitter; seeds small (¼ in or less long), smooth. Trop. Asia and Afr, now widely distributed in

Afr. and the Medit. region.—The dried frs are used in medicine (as purgative), being imported from Turkey and Spain. Sometimes cult in this country as a curiosity or in collections of economic plants; culture for official purposes has been attempted in New Mex., but the frs., although larger than the official product, are reported to be less active.

L. H. B

CITRUS (ancient name of a fragrant African wood, afterward transferred to the Citron). *Ruticææ*. **CITRON LEMON. ORANGE** Small evergreen, more or less spiny trees or shrubs, grown for their edible fruits, and also attractive in foliage and flower.

Leaves glandular-dotted, persistent, apparently simple (in reality unifoliate compound lvs.), borne on more or less winged or margined petioles, which are usually articulated with the blade and at their attachment to the twig spines usually present, borne singly at the side of the bud in the axils of the lvs fls clustered or rarely solitary in the axils of the lvs, or in small lateral or terminal cymes or panicles, white or pinkish purple in the bud, petals 5 (rarely 4 or 6) thick, strap-shaped, not clawed at the base, imbricated, stamens numerous (16-60, usually 20-40) at least four times as many as the petals, polyadelphous, cohering toward the bases in a few bundles, ovary 8-15-celled, with a prominent usually deciduous style containing as many tubes as there are cells in the ovary fr a hesperidium, globose, oval or oblate-spheroid, the segms. filled with juicy pulp composed of stalked pulp-vesicles, seeds 1-8 in a cell, oval or oblong, ¼-¾ in long, with a pergameneous testa and thick fleshy cotyledons, usually with adventive embryos arising as buds from the nucellar tissue of the mother plant. Natives of Trop and Subtrop Asia and the Malayan Archipelago—Half a dozen species are commonly cult and have given rise to very many varieties as well as numerous hybrids, making the delimitation of the species exceedingly difficult. See *Citrange*, *Citron*, *Etirog*, *Grapefruit*, *Lemon*, *Lime*, *Limequat*, *Orange*, *Pomelo*, *Tangelo*.

The nomenclature here followed is based on the writer's treatment of the species of *Citrus* in "Plantas Wilsonianæ." The fewest possible number of changes have been made consistent with presenting a clear account of the genus. A careful study of *Citrus* and the genera most nearly related to it has shown that the trifoliate orange differs in so many and such important characters that it seems necessary to recognize it as a separate genus (*Poncirus*). The same is true of the kumquats and the Australian limes.

KEY TO THE SPECIES

- A Winged petiole nearly as large as the blade of the lf seeds very large, thick fr rough, oval, lemon-yellow when ripe fls solitary
- AA Winged petiole much smaller than the blade of the lvs seeds small or medium sized fls usually in clusters
- B Lvs apparently not jointed between blade and petiole, oblong-serrate, petiole wingless fl-buds tinted reddish fr with a very thick peel, fragrant, pulp acid
- BB Lvs with an obvious joint between the blade and petiole, crenate peel thin or only moderately thick
- C Fl-buds tinted reddish on outside: petioles merely margined: lvs. crenate frs oval, more or less aviculate

9 *ichangensis*

1 *Medica*

2 *Limonia*

cc. Fl buds white petioles more or less winged

D. Frs oval, often slightly papillate, small, 1-1½ in diam, greenish-yellow when ripe, thin-skinned, smooth fls small petioles plainly winged lvs small, palled above, crenate, more or less punctate, obtuse spinis short, very sharp

DD Frs globose, depressed globose, rarely oval or pyriform, never papillate, orange-colored, or if yellow, frs large and thick-skinned

E Size of fr very large, pale yellow when ripe twigs pubescent when young petioles broadly winged

EE Size of fr medium or small, orange or orange-yellow

F The frs with a solid core and a light skin, pulp sweet petioles slightly winged

FF The frs with a hollow core when fully ripe, skin loose or, if tight, pulp acid and petioles broadly winged

G Skin tight petioles broadly winged pulp acid

GG Skin loose petioles only narrowly winged or margined

H The fr borne singly at tips of branches, small, segms 7-10, pulp very acid fls pale beneath

HH The fr borne in axils of the lvs, segms 8-15, pulp sweet fls dark green below

1. *Médica*, Linn (from Medea whence the species first came to the notice of the ancient Greeks and Romans) CITRUS Fig 971 A shrub or small tree, with long irregular branches thorns short, stout and stiff lvs rather pale green, large, oblong, 4-6 or 7 in long and 1½-2 in wide, bluntly rounded at the tip with serrate margins, not articulated with the petioles, which are wingless fls large, reddish tinted when in the bud, usually in terminal panicles, or clustered, in the axils of the lvs, petals large, white above, reddish purple below, stamens numerous, 30-40 or more, ovary tapering gradually into the often persistent style fr large, oval or oblong, 6-10 x 4-6 in, bluntly apiculate, often rough or bumpy, lemon-yellow when ripe, skin very thick, fragrant, pulp scanty, acid; seeds oval, smooth, white inside —The citron is

very sensitive to cold because of its ability to grow at low temperatures, which causes it to start into a fresh and very tender growth after a few days of warm weather in winter. It is cult in the Medit. region, especially in Corsica, whence large quantities of the peel are exported in brine to Amer to be candied. The candied peel is much used in confectionery and in cakes. Sparingly cult in Calif and Fla. A number of ill-defined varieties are grown, the most important being the Corsean, intro from Corsica in 1894 by David Fairchild. The Etrog or sacred Jewish citron is grown in Corfu. See Citron.

Var *sarcodactylis*, Swingle (*Citrus sarcodactylis* v.

973 Fingered citron — *Citrus medica* var. *sarcodactylis*. (X ¼)

Nooten. *C. Médica* var. *digitata*, Auct., not Lour.). Fo SHU KAN (Chinese) BUSHUKAN (Japanese) Fig 973. Differs from the common citron in having the segms of the fr separated into finger-like processes. The frs are very fragrant and are used by the Chinese and Japanese for perfuming rooms and clothing. It is sometimes grown as a dwarf potted plant for ornament. It should be intro into this country.

2 *Limonia*, Osbeck (from Arabic *limūn*, a lemon) (*C. Médica* var. *Limon*, Linn. *C. Limonium*, Russo).

LEMON Fig 974 A small tree with long irregular branches thorns short, stout and stiff; lvs rather pale green, elongate-ovate, pointed at the tip, with serrate or sub-serrate margins; petioles wingless but sometimes narrowly margined, articulated both with the blade and the twig fls rather large, solitary or in small clusters in the axils of the lvs, reddish-tinted in the bud; petals

974 *Citrus Limonia* (X ¼, fr ¼)

white above, reddish purple below, stamens 20-40; ovary tapering into the deciduous style fr oval or oblong, with an apical papilla, 3-5 x 2-3 in with 8-10 segms, lemon-yellow when ripe, with a prominently glandular-dotted peel, often more or less rough and moderately thick, pulp very abundant, very acid; seeds small, ovate, smooth, often few or none, white inside. —The lemon is very sensitive to cold as, like the citron and the lime, it is readily forced into new growth by a few days of warm weather in winter. It is found in all tropical and warm subtropical regions and is cult on a large scale in the Medit. region, especially in Sicily, whence large quantities of the frs are exported to the U. S. In this country the lemon is widely cult in Calif and to a much smaller extent in Fla. The frs are gathered just before they ripen while still green in color and often before they attain their full size and are then ripened in curing-houses, in which temperature and humidity are artificially controlled. The juice is used for making lemonade, for cooking, and the arts, the peel is used in cooking and the oil extracted from it is used in cooking and in perfumery. The principal cult varieties have rather small smooth frs. The more important varieties are listed here: *Eureka* Frs oval-oblong, medium size, usually seedless, ripening early tree small, nearly thornless *Genoa* Frs oval, pointed at base and tip, ripening early, seedless tree dwarf *Lisbon* Frs oblong, with a large papilla at the tip, few-seeded tree of medium size, thorny, a vigorous grower *Villa Franca* Frs oval-oblong, medium to large, apex abruptly papillate; seeds numerous tree of good size, nearly thornless *Kennedy* Frs oval, with a very small papilla, thin-skinned, nearly seedless *Pondrosa*. Frs very large, sometimes weighing 2½ lbs, with a neck at the base; seeds numerous *Everbearing* Frs large, abruptly papillate at the tip, with a narrowed neck at the base, rough all over, seeds rather numerous: everbearing, borne on a straggling bushy tree that sprouts from the roots. Grown for home use in Fla. *Rough* (Florida Rough) A tree of doubtful origin, occurring wild in the Everglades of S Fla. frs round-ovate, very rough, apical papilla surrounded by a depressed ring; seeds numerous, tree large and vigorous. The frs. of this variety are useless for commercial purposes, but the seeds are in considerable demand by

nurserymen as the tree makes an excellent stock for very poor sandy or calcareous soils. See *Lemon*.

3. *aurantifolia*, Swingle (*Limonia aurantifolia*, Christmann. *C. limetta* Auct. not Risso) LIME A small tree, with rather irregular branches spines very sharp, short, stiff lvs. small, 2-3 in. long, elliptic-oval, crenate, rather pale green; petioles distinctly but narrowly winged fls small, white in the bud, occurring in few-fld. axillary clusters; petals white on both surfaces; stamens 20-25; ovary rather sharply set off from the deciduous style: fr. small, oval or round-oval, 1½-2½ in. diam., often with a small apical papilla, with 10 segms., greenish yellow when ripe; peel prominently glandular-dotted, very thin; pulp abundant, greenish, very acid, seeds small, oval, smooth, white inside — The lime is perhaps the most sensitive to cold of any known species of Citrus. Even a few days of moderately warm weather in winter suffice to force it into a tender and succulent growth that is killed by the slightest frost. It is found in all tropical countries, often in a semi-wild condition. It is cult. in the warmest parts of Fla., especially on the Keys. Large quantities of the fr. picked when still green and often not full-sized, are packed in barrels and shipped to the cities of the N. U. S., where they are extensively used for making limeade. Large quantities of bottled lime juice are exported from Montserrat and Dominica Isls in the W. Indies, and used on shipboard for preventing scurvy. Limes are too thin-skinned to keep well and are not processed as are lemons. It is usually prop. from seed—rarely from cuttings. The principal varieties grown in the U. S. are *Mexican* (West Indian). Frs small, smooth, often with a slight apical papilla; seeds few: tree small, very spiny, usually branching from the base. This variety, almost always grown from seed, is the only one planted on any considerable commercial scale. *Tahiti* (Persian?) Frs large, smooth, with a broad apical papilla; seedless, about the size and shape of an ordinary lemon: poor keepers. See *Lime Hybrids*. *Sweet* (*C. limetta*, Risso?) Frs about the size of a lemon, with a sweet and insipid pulp. Commonly grown in the W. Indies and Cent. Amer. Limequats are new hardy hybrids between the common Mexican lime and a kumquat, these hybrids vary much in size, shape and flavor, but some are about the size of a lime and have abundant very acid pulp. See description under *Limequat*.

4. *gracilis*, Osbeck (*C. Aurantium* var. *gracilis*, Linn. *C. Aurantium* var. *decumda*, Linn. *C. decumda*, Linn.) GRAPEFRUIT (or POMELO) SHADDOCK. PUMMELO. Fig. 975. A large round-topped tree, with regular branches: spines, if present, slender and flexible, rather blunt: lvs large, dark glossy green above, oval or elliptic-oval, with a broadly rounded base; petiole broadly winged, more or less cordate fls axillary, borne singly or in clusters, large, white in the bud; petals white on both sides; stamens 20-25, with large linear anthers, ovary globose, sharply delimited from the deciduous style: fr. very large, 4-6 in. diam., globose, oblate spheroid or broadly pear-shaped, smooth, with 11-14 segms., pale lemon-yellow when ripe, peel ¼-½ in. thick, white and pithy inside; seeds usually very numerous, large, flattened and wrinkled, white inside.—The grapefruit (or pomelo) is now one of the most appreciated citrus frs grown in the U. S. The culture of this delicious fr. was limited to the Fla. pioneers until some 25 years ago, when the first commercial plantations were made. Since then, there has

been a steady increase in the area devoted to this fr. in Fla., and plantings have been made in Calif., Ariz., and the West Indies. The pummelo of India, called shaddock in Fla., is not grown on a commercial scale, but occurs in many tropical countries. The grapefruit is usually served as a breakfast fr. cut in half and seeded. It is a vigorous grower, even on light sandy loam soils and is coming increasingly into use as a stock upon which to graft other citrus frs. The young trees are tender, but the mature ones are well protected by a dense canopy of lvs. and may stand more cold than an orange tree. The grapefruit is much like the orange in its ability to resist cold and is much less easily forced into a new growth by a few warm days in winter than the lime or lemon. The varieties of grapefruit grown in the U. S. have almost all originated in Fla., where the early settlers prop. this tree from seed, thereby originating many slightly different varieties, the more important of which are listed here. *Duncan* Fr. large, keeps well on the tree, seeds few, tree rather hardy. *Hall* (Silver Cluster) Frs. medium size, produced in large clusters, seeds numerous. *Triumph* Fr. small or medium size, early tree rather tender. Does not succeed well when budded on sour orange stock. *McCart*. Fr. large, late borne singly, seeds numerous. A variety recently found in the Indian River region of Fla. Besides these standard varieties of grapefruit of the Fla. seedling type a large number of other similar varieties are cult. locally in the state, such as the Bowen, Excelsior, Josselyn, Leonardy, Mauville, May, McKinley, Standard (or Indian River), Walters, and many others. The following varieties differ more or less widely from the old Fla. seedling type. *Marsh* Frs large, depressed globose, often seedless, pulp subacid, less bitter than in the other varieties. This variety, though it originated as a seedling in Fla., is best adapted to cult. in Calif., where many of the ordinary Fla. varieties do not succeed well. *Pernambuco* Frs large, skin very smooth, light-colored, late, seeds abundant. Intro. from Pernambuco, Brazil, to the U. S. by the U. S. Dept. of Agric.—The shaddocks or pummelos are seldom cult. in the U. S. The Tresca variety from the Bahama Isls has large pyriform frs., with pink flesh of good flavor and abundant seeds the tree is tender. A pummelo from near Canton, China, is imported into San Francisco on a small scale by the Chinese resident there. The frs. are pyriform, very thick-skinned, not pink within, seeds numerous. Some seedlings of this variety are to be found at various points in Calif. They are very leafy and of vigorous growth, and make excellent stocks upon which to graft other citrus frs. Many other sorts of pummelos are known from Asia and the Malayan Archipelago and some have been intro. for trial by the Office of Foreign Seed and Plant Introduction of the U. S. Dept. of Agric. The true grapefruit seems to be scarcely known outside of U. S. and the W. Indies. See *Grapefruit and Pomelo*.

5. *Aurantium*, Linn. (*C. vulgaris*, Risso. *C. Bigaradia*, Risso. *C. Aurantium* var. *Bigaradia*, Hook f.) SOUR or SEVILLE ORANGE. Fig. 976. A medium-sized tree, with a rounded top and regular branches: spines long but flexible and blunt lvs light green when young, medium-sized, 3-4 in. long, tapering to the somewhat wedge-shaped base, and more or less acuminate at the tip; petiole broadly winged fls medium-sized, axillary, single or clustered, white in the bud; petals white on both sides, very fragrant; stamens 20-24; ovary globose, sharply delimited from the deciduous style. fr. 2½-3½ in. diam., globose, slightly flattened at the

975. Citrus grandis. (×½)

976 Citrus Aurantium. (×½)

tip, with a hollow core when fully ripe; pulp acid, membranes with a bitter taste, segms. 10-12; seeds cuneate-oval, flattened, with raised lines, white inside.—The sour or Seville orange is grown all over the world. It is able to withstand more cold than most of the other citrus frs. and is rarely forced into new growth by warm weather occurring in winter. The sour orange is found in a thoroughly naturalized condition in many parts of Fla. where it doubtless was brought by the Spaniards. Most of these wild sour orange trees were dug up and transplanted for use as stocks when orange-culture was being rapidly extended some 25-30 years ago. The Seville orange, as its name would indicate, is grown on a commercial scale in the vicinity of Seville, Spain, whence the frs. are shipped in large quantities to England and Scotland for use in making orange marmalade, for which this species is best adapted. The petals yield a valuable perfume, oil of Neroli, which is produced in the south of France and the Italian Riviera. The peel of the fr. is sometimes candied and, when fresh, yields an essential oil. The sour orange is grown in a small way in Fla. for home use, the frs. being used for making "orangeade." In the U. S. the sour orange is used almost exclusively as a stock on which to bud other citrus fr. trees. The seeds are in demand by nurserymen at a good price for this purpose. The sour orange is well adapted to grow on a great variety of soils but is especially well fitted for low wet soils, where it is valuable because it is immune to the *mal di gomma* or foot-rot so destructive to the common orange and lemon on such soils. There are no named varieties of the sour orange in cult. in the U. S. — Mutations. The so-called *Citrus myrtifolia*, a narrow-lyd form with spineless twigs and short internodes, bearing small flattened sour oranges is a mutation arising from the root of the sour orange *Chinotto* (the Choise of the French confectioners). This is a broader-lyd form of the above described mutation. It is cult. along the northern shore of the Medit from Genoa to Toulon, yields the small green frs. used for candying. This variety, which should be called the Chinotto, is being tested in the U. S. and may prove adapted for commercial culture on a small scale in this country. Hybrids *Bittersweet*. A good-sized tree occurring wild in Fla., is undoubtedly a hybrid between this species and the following. Frs. oblong, flattened at the ends, pulp sweet, but the membranes separating the segms. have a bitter taste. The fr. ripens very late on some trees and keeps well on the tree.

6 *sinensis*, Osbeck (*C. Aurantium* var. *sinensis*, Linn. *C. Aurantium*, Lour. et Auct. not Linn.) COMMON or SWEET ORANGE. Fig. 977. A medium-sized tree, with a rounded top and regular branches; spines, when present, slender, flexible, rather blunt. lvs. medium-sized, rounded at the base, pointed at the apex, petiole narrowly winged, articulated both with the blade and the twig; fls. medium-sized, smaller than those of the sour orange, white in the bud, petals white on both surfaces; stamens 20-25; ovary subglobose, clearly delimited from the deciduous style. fr. subglobose or oval, pith solid, pulp sweet, membranes not bitter in taste, segms. 10-12 or 13 in number, seeds cuneate-ovoid with rugose margined plane surfaces, white inside.—The common or sweet orange is widely cult. in all the tropical and subtropical regions of the world. It is rather tender, not so hardy as the sour or Seville orange, but much more cold-resistant than the lemon or lime. A very few orange trees occur in a semi-wild state in S. Fla. Sweet oranges were doubtless intro into Fla. by the Spaniards nearly four centuries ago and, as they were prop. by seeds until within the last half-century, many local varieties have arisen there. Orange-culture has reached its highest development in S. Calif., where it constitutes one of the most important agricultural industries. Fla. is second only to Calif. in the extent and value of the orange groves,

while some oranges are grown in favored spots in La., Texas, and Ariz.—Oranges are the best known and probably the most highly esteemed dessert fr. A few are used in cooking and the peel is sometimes candied. An essential oil is also pressed from the peel. The sweet orange is commonly used as a stock on which to graft other species of citrus frs. It grows well on light well-drained loam or sandy loam soil. On heavy soil it

977. *Citrus sinensis* (×½)

is subject to the *mal di gomma* or foot-rot. Very many varieties are in cult. Some of the principal sorts grown in the U. S. are listed here: (1) Florida seedlings—varieties originated in Fla. as a result of prop. oranges from seed, mostly strong-growing trees: *Parson Brown*. Frs. medium-sized, very early. *Pineapple* Frs. medium or large, very juicy; seeds rather numerous. *midseason* tree a strong grower. *Honosassa* Frs. medium-sized, very juicy, a good bearer and keeper. tree nearly thornless. *Madam Vinous* Frs. medium or large, pulp coarse-grained, juicy, midseason. *Nanparal* Frs. rather large, flattened, pulp fine-grained, juicy, tree vigorous. Also *Arcadia*, *Summit*, *Foster*, *Hick*, *Magnum Bonum*, *May*, *Old Vin*, *Osecola*, *Stark*, *Whittaker*, and very many others of the same general type. (2) Florida mutations or hybrids—new sorts originated in Fla., usually differing in some striking way from the old Fla. seedling oranges, perhaps through hybridization with foreign varieties. *Boone* (Boone's Early). Frs. medium-size, strongly oval or oblong, very juicy, very late, keeping well on the tree; lvs. with petioles varying in width. *Lae Gum Gong* Frs. oval, juicy, ripening very late and holding very well on the tree, even until late summer. A variety newly intro into cult. *Drake Star* A rare variety with variegated foliage, usually a poor bearer but sometimes bearing a good crop of excellent fr. (3) Mediterranean varieties, largely intro into Fla. by Sanford and Lyman Phelps, about 30-40 years ago. *Ruby*. Frs. small or medium-sized, peel red-orange, pulp streaked with red when fully ripe, juicy, seeds rather few. rather late tree vigorous, nearly thornless, prolific. *St. Michael*. Frs. medium-sized, oblong, red-blotched when ripe; flesh wine-red, seeds few, rather early. *Jaffa* Frs. large, oblong, juicy; seeds few. Possibly not the same as the celebrated orange of Jaffa, Palestine. *Mediterranean Sweet*. Frs. large, oval, juicy, late tree nearly thornless. *Majorca* Frs. round or slightly flattened, juicy. rather late. *Hart* (Hart's Tardiff). Frs. round or slightly oval, medium to large size, juicy; seeds few; ripens very late—similar to the next and thought by some to be identical. *Valencia* (Valencia Late). Frs. medium to large, oval or rounded, juicy, nearly seedless, very late. A prolific variety, largely grown in Calif. and held in cold storage until early autumn. There are many other Medit. varieties of nearly or quite as much value as some of the above, such as, *Centennial*, *Dr. Roi*, *Joppat*, *Paper Rind*, *Prata*, *Saul Blood*, *St. Michael* (Blood), etc.—The navel oranges all show a second smaller more or less included fr. formed at the tip of the main fr. Many varieties are of foreign origin. *Washington* (Bahia, Washington Navel) Fr. large, rounded slightly, pointed at apex; flesh firm, juicy; skin

very tough, seedless. early midseason. The most famous variety of oranges intro. from Bahia, Brazil, by Wm. Saunders of the U. S. Dept. of Agric. in 1870. Its cult. has steadily extended in Calif. until it is the principal variety grown there. It does not succeed well in Fla. *Thompson* (Thompson's Improved Navel). A smooth-skinned hard-fleshed variety found by A. D. Shamel to arise as a mutation from the preceding, to which it is inferior in quality though better in appearance. *Australian*. Frs. large, coarse, tree vigorous, but a shy bearer. Also found by Shamel as a variation of the Washington Navel (Bahia) *Surprise*. Fr. medium-sized, rounded or even slightly flattened, juicy, early, seedless. A variety originated by E. S. Hubbard, of Fla. *Double Imperial*. Fr. small or medium-sized, navel hidden, pulp firm; seeds few or none. A Brazilian variety, said to fruit well in Fla. when budded on trifoliate orange stock. There are many other varieties of navel oranges occasionally grown on a commercial scale. In Calif., among others, Golden Nugget and Navelencia, in Fla., Egyptian, Melitensis, and Sustan are known. There are doubtless many more navel oranges which should be tested. See *Orange*. Hybrids. Citranges are hardy hybrids between the common sweet orange and the trifoliate orange, *Poncirus trifoliata*. The principal varieties are the Rusk, Morton, Colman, Savage, Cunningham and Saunders. See description under *Citrange*.

978
Citrus ichangensis
(×½)

Magee, of Riverside, Calif., in 1880, from Saigon, Cochinchina, which introduction became known as the King orange. It has frs. of large size, very juicy, and of delicious vinous flavor. Its rough skin seems to be no obstacle to its ready sale at good prices.

Var. *deliciosa*, Swingle (*C. deliciosa*, Tenore). MANDARIN ORANGE. A small tree, with slender branches, willow-like lvs, with merely margined petioles, fls. small, frs. depressed globose, bright orange-yellow or reddish orange, with a very loose peel; seeds small, beaked, bright green within.—This variety comprises the many varieties of Mandarin oranges, including the so-called tangerine varieties. These are delicious dessert frs., attractive in appearance and easy to handle because of the loose skin and the easily separable segments. Aside from the greater ease of preparing them for the table, Mandarin oranges are used exactly as are the common oranges. The principal varieties grown in the U. S. are the following. *Mandarin* (China, China Mandarin, Willow-leaved). Fr. medium-sized, 2-3 in diam, depressed-globose, early, orange-yellow; very juicy; sweet; seeds abundant. *Oneco*. Fr. medium to large, orange-yellow, midseason. Intro. from India in 1888. *Tangerine* (Dancy's Tangerine). Fr. red-orange, medium size, depressed-globose, juicy, seeds rather

abundant; midseason; tree of good size; lvs much broader than those of the Mandarin variety. Other Mandarin oranges are occasionally grown, especially in Fla., such as the Beauty, Cleopatra, Kino Kumi, and Mikado. Hybrids. Tangelos, are a striking new group of citrus frs. *Sampson*, the first tangelo to be grown commercially, was obtained by the writer in 1897 by crossing the tangerine with Bowen grapefruit, it is unlike either parent in quality, being more like a choice sprightly flavored sweet orange. Many other tangelos are now being tested. See *Tangelo*.

Var. *unshiu*, Swingle (*C. nobilis* subsp. *geniuna* var. *unshiu*, Makino). SATSUMA or UNSHIU ORANGE. A small spineless tree, with a spreading dwarf habit lvs. broad, abruptly narrowed toward the apex, with strongly marked veins on both faces, fls. small, very abundant; fr. depressed-globose, 2-3¼ in diam, deep orange; pulp orange, very juicy, of a peculiar but agreeable flavor, pith hollow, segments 9-13, seeds often lacking, when present only few in number, broadly top-shaped, not beaked as in the Mandarin oranges, greenish within.—This very marked orange seems to constitute a botanical variety distinct from the King or the Mandarin oranges. It is commonly grown in Japan, whence it was intro into Fla. by Geo. R. Hall in 1876, according to H. H. Hume, "Citrus Fruits and Their Culture," p. 112. 1900. The Satsuma orange is one of the hardiest of all edible citrus frs. Budded on the trifoliate orange, it can be grown in many parts of the Gulf Coast region, where all other citrus frs except citranges are killed by cold. The Satsuma can be grown best on the trifoliate orange stock. It grows on sweet stock but does not produce as much nor as good fruit and is not so hardy. It makes only a stunted growth on sour orange stock and soon dies. It cannot be grown satisfactorily on light sandy land or on black waxy lands with a marly subsoil where the trifoliate orange does not grow well. It could be grafted on Rusk citrange for the black waxy lime soils of Texas.

8 mitis, Blanco CALAMONDIN ORANGE. A small tree, with upright branches lvs broadly oval, pale green below like those of kumquat, petiole narrowly winged fls. small, angular in the bud, borne singly at the tips of the twigs. Fr. small, depressed globose, deep orange-yellow when ripe, loose-skinned, segments 7-10, easily separable; pulp very acid, seeds few, small.—This tree, a native of the Philippine Isles, is commonly cult. in Hawaii, where it is wrongly called "China orange." It was intro into Fla. by the U. S. Dept. of Agric. from Panama, and was for a time distributed by nurserymen under the erroneous name of To-Kumquat. It is very hardy, probably as hardy as the Satsuma, or even more so. It can be budded on sour orange or on trifoliate orange stock. A promising fr. for home use, for culinary purposes and for making ade.

9 ichangensis, Swingle Fig. 978. A small tree, with long slender spines. lvs narrow, with oblong broadly winged petioles nearly or quite as large as the blade fls. white; stamens 20, cohering in bundles fr. lemon-shaped, 3-4 in long, with a very broad low apical papilla surrounded by a shallow encular furrow; segments 8-11; pulp acid, of good flavor, seeds very large, thick, truncate-ovate, ½-¾ in long and ¼-¾ in thick, white within.—This interesting new species, not closely allied to any other of the known members of the genus *Citrus*, is native in highlands of S. W. China. It is the northernmost evergreen tree of the citrus group and grows at high altitude, 3,000-5,000 ft. It is able to withstand considerable cold in winter, so it is very likely to prove of value in breeding new types of hardy substitutes for the lemon. E. H. Wilson, who collected excellent material of this plant for the Arnold Arboretum, is endeavoring to secure it for trial in U. S.

C. bergamota, Russo BERGAMOT. A small tree lvs oblong-oval, with long-winged petioles fls. small, white, very fragrant, frs.

pyriform, 1-4 in diam., thin-skinned, pale yellow when ripe, pulp acid, seeds oblong, many. Extensively cult in Calabria for the essential oil which is expressed from the peel and used in making Eau de Cologne and other perfumes—*C. aurantium*, see *Papeda*—*C. repens*, see Kunz. —*C. latifolia*, Risso. *Orangerie*. *Onasus*. A dwarf plant, having lemon-like fls and lemon-shaped fr orange in color with a mawkish taste. Commonly grown by florists as an ornamental pot-plant. Rarely used as a stock for dwarfing common citrus frs. This plant is not a native of Tahiti as the name would indicate, but is probably of hybrid origin—*C. trifoliata*=*Poncirus trifoliata*.

WALTER T. SWINGLE.

CIVE: *Chre*.

CLADÁNTHUS (Greek, *klados*, branch, and *anthos*, flower; alluding to the branching, which distinguishes this genus from *Anthemis*). *Compositæ*. An annual yellow-rayed herb, sometimes planted in the open garden. Plant branched from the base in a forking manner; a fl. terminates each branch, whereupon 2 new branches start from directly beneath the fl., each of these is temporarily stopped by a fl., and so on. involucre hemispherical, receptacle conical or oblong, with scales about fls, ray-fls pistillate, disk-fls perfect—One species, allied to *Achillea* and *Anthemis*.

arábicus, Cass (*C. profliferus*, DC. *Anthemis arábica*, Linn.) Glabrous, 2-3½ ft high lvs alternate, pinnately parted, lobes linear, trifid fl-heads solitary, bracted. S Spain and Morocco—A free-flowering heavy-seented plant of easy culture. L. H. B. †

CLADOTHÁMNUS (*klados*, branch, and *thamnós*, bush, from the Greek) *Ericææ*. Shrubs, rarely cult for their handsome pink fls. Erect, with many virgate branches. lvs deciduous, alternate, entire fls pink, terminal, 1-3, nodding, corolla divided to the base or nearly so into 5 oblong petals, stamens 10 caps 5-felled—One or 2 species in Pacific N Amer, from Alaska to Wash. Hardy, with handsome rather large pink fls in summer, rarely cult. They will probably grow best in peaty and sandy soil, in a half-shady position, prop by seeds or by cuttings of soft wood under glass, and by layers

C. pyrolæiflorus, Bong. Shrub, 1-10 ft lvs nearly sessile, obovate-lanceolate, mucronulate, glabrous, pale green, 1½-2½ in long fls solitary, with 5 separate petals, 1 in across. Alaska to Ore. G.F. 10 215 B.M. 845 f. *complanatus*, M. Greene. According to Greene, this species differs from the preceding chiefly in the petals being united at the base and the anthers opening with a pore at the apex, and occurs in Wash., while *C. pyrolæiflorus* is restricted to Alaska, but the specimens from Ore and Wash. do not differ from *C. pyrolæiflorus*, possibly *C. cuspidatus* was based only on an abnormal form

ALFRED REIDER

CLADRÁSTIS (Greek, *brutle branch*) *Virgilia* of gardens. *Leguminosæ*. YELLOW-WOOD Trees grown chiefly for their large panicles of white flowers and for their handsome foliage

Deciduous winter-buds naked, several superposed and concealed during the summer in the enlarged base of the petiole lvs alternate, odd-pinnate, with few rather large entire short-stalked lfts fls in long, usually panicle racemes, white, papilionaceous; calyx campanulate, 5-toothed, stamens 10, nearly free, pod narrow-oblong, compressed, 3-6-seeded, with thin membranous valves—Four species in N Amer and E Asia. Hardy ornamental trees of medium size, with showy fls and handsome foliage, turning bright yellow in fall. They thrive in almost any soil. Prop by seeds, sown in spring, or by root cuttings, dug up in fall and kept in sand or moss, moderately moist and cool, until spring.

lutea, Koch (*C. tinctoria*, Raf. *Virgilia lutea*, Michx.) Tree, with yellow wood and smooth bark, sometimes 50 ft. lfts 7-9, oval or ovate, glabrous, bright green, 3-4 in long; panicles loose, drooping, 10-20 in long; fls. white, fragrant, over 1 in. long. June. Ky, Tenn., and N. C. S.S. 3:119-20. B.M. 7767. Mich. Hist. Arb. III. 266 Gng. 2:401; 5 98 F.E. 8.427. G.F. 1:92. Gn. 24, pp 96-7, 34, p. 329. G.C. III. 42:186-7. M.D.G. 1899 44-5. G.W. 12, p

397 V. 4.307 A.G. 15 270—One of the most beautiful flowering native trees, with wide, graceful head and a short trunk, well adapted as single tree on the lawn. Hardy north to New England and Ont. The wood yields a clear yellow dye. There is a var *discolorata* with lvs variegated with yellow.

sinensis, Hemsl. Tree, to 80 ft. lfts. 9-13, oblong to oblong-lanceolate, usually rounded at the base, yellowish green, pubescent beneath along the midrib, 2-4 in long, rachis and petiole pubescent: fls. in loose, upright, much-branched panicles, 5-12 in. long and 4-8 in across, white or pinkish, about ½ in. long. June, July W. and China

C. amurensis, Koch = *Maackia amurensis*—*C. platydrapa*, Makino (*Sophora platycarpa*, Maxim.) Tree lfts 9-15, ovate to elliptic-lanceolate, 2-4½ in panicles broadly pyramidal, upright, fls ½ in long, white, standard with yellow spot at the base, pod narrowly winged. Japan. S.F. 2 32 Very rare in cult—*C. Tashiroi*, Yatabe = *Maackia Tashiroi*—*C. Wilsoni*, Takeda. Tree, to 50 ft. lfts 7-9 elliptic-ovate to ovate-oblong, usually broadly cuneate at the base, panicles upright, 5-8 in long, fls ½ in long, ovary pubescent. Cent China

ALFRED REIDER

CLÁRKIA (Capt Wm Clark, companion of Lewis, explorer of the Rocky Mt region and beyond, 1806) *Onagraceæ*. Flower-garden annuals

Herbs, with alternate mostly entire lvs, and showy fls in the upper axils or in terminal racemes fls regular, the calyx tubular, the petals 4, narrow at the base and entire or lobed, wide-spreading; stamens 8, the alternate ones short or rudimentary; stigmas 4, large and spreading; pod oblong or linear, 4-sided—Half dozen or more species in W N Amer. See also *Eucharidium*.

Clarkias are hardy annuals of easy cultivation. They thrive in a warm, light soil, either fully exposed to the sun or in partial shade. They are useful for low masses or for edgings; also for vases and baskets. They have been much improved by domestication.

A Stamens (8) all perfect lvs broad.

élegans, Douglas (*C. unguiculata*, Lindl. *C. nervifolia*, Hort.) Fig 979 From 1-6 ft high, glabrous or nearly so, the sts reddish and glaucous, simple or sparingly branched lvs broad-ovate to linear, remote-dentate fls purple or rose-colored, running into white vars., double forms in cult; claw of the petal about as long as its rhomboidal entire limb caps sessile B.M. 3592 B.R. 1875 R.H. 1845 385 Mn 1:22.—One of the commonest annual fls

rhomboides, Douglas Not so tall and more slender lvs thin, lance-oblong or ovate-oblong, entire: claw

979. *Clarkia elegans* (× ½)

often toothed, shorter than the rhomboidal limb: caps. stalked. B.R. 1981. R.H. 1864:151(?).—Not much cult.

AA. *Stamens 4 perfect and 4 rudimentary: lvs. very narrow.*

pulchella, Pursh. Fig. 980. One ft. to 18 in high, branchy, often tufted and dwarf, the sts. mostly puberulent, lvs narrowly lance-oblong to linear, narrowed into a petiole, entire fls lilac, running into white vars.; petals $\frac{3}{4}$ in or less long in wild plants, with 3 wide-spreading lobes and a pair of recurved teeth on the claw. caps stalked B.M. 2918. B.H. 1100. R.H. 1845 385, 1886, p. 557.—Common in cult. There are semi-double and dwarf forms. Var. *holopétala*, Voss (*C. integripétala*, Hort.) is a garden form or race with entire petals. There are also dwarf forms of it. The garden names *kermesina* and *limbata* belong with *C. pulchella* L H B

CLARY. The dried leaves of *Salvia Sclarea*, which are used for seasoning other species of *Salvia* have been used for the same purpose. See *Salvia*.

CLAUCÈNA (a personal name) *Ruticææ* Small inermous trees lvs pinnate: fls in terminal panicles or loose racemes, ovary raised on a short disk, 4-5-celled, with 1-2 ovules in each cell; style short, deciduous; stamens 8-10: fr 4-5-celled, with usually 1 seed in each cell, cotyledons aerial in germination, first foliage-lvs opposite or alternate.

Lánsium, Skeels (*Claucaena Wámp*, Oliver. *Quandria Lánsium*, Lour. *Cookia Wámp*, Blanco) WÁMP. Low spinescent tree, with spreading branches: lvs. spirally arranged, pinnate; lfts 5-9, ovate-elliptical, 3-5 in long, petiolate, light green, shiny above: fls. 4-5-parted, small, white, in large terminal panicles; ovary villous, 5-celled, with 1 ovule in each cell, style short; stamens 10: fr ovate-globose, about 1 in long; skin glandular, pubescent, seeds green.—The wámp is a native of S China, where it is commonly grown for its frs. It is cult to some extent in Hawaii and could probably be grown in the warmer parts of Fla. and Calif. It can be grafted on grapefruit and other species of Citrus, which makes it desirable to test it as a stock for common citrus frs.

WALTER T. SWINGLE.

CLAVIJA, (Don José de Viera y Clavijo, of Madrid). Syn. *Horta Myrsinææ*; by Mez separated in the family *Theophrastaceæ*. Thirty and more tropical American evergreen unbranched trees or shrubs, a few of which are sometimes grown in the warmhouse. The sts are simple, often spiny, bearing at the top a cluster of large rigid, simple, entire or spiny-toothed lvs: fls. polygamous-dioecious in axillary racemes; calyx 4-5-parted, the segms round; corolla white, yellow or orange, the tube short and fleshy, the limb mostly spreading and 4-5-lobed, stamens 4 or 5, the filaments often united in the sterile fls; staminodia 4 or 5, being scales in the throat; ovary fusiform, narrowed into a short style, the stigma obtuse or capitate: fr. several-seeded, berry-like. The claviyas thrive in a

peaty potting soil, and prop. by cuttings of half-ripened growths. They are old plants. The features are here given as apparently understood by horticulturists.

A *Lvs entire, or only repand.*

nóbilis, Mez, (*C. clavata*, Deene). Plant 4-5 ft: lvs. long-petioled thick, $1\frac{1}{2}$ ft or less, elliptic or oblong or oblanceolate, entire, acute or semi-acute. fls. yellow, with a very large disk, $\frac{3}{4}$ in long, the corolla fleshy, in drooping racemes 2-4 in long. Venezuela. B.M. 6928 (as *C. Ernstii*, Hook., f).

integrifolia, Mart (*Theophrasta integrifolia*, Pohl). Allied to *C. longifolia*, differing chiefly in the less rigid, broader and entire leaves, longer petioles and larger fls. Lvs distinctly petioled (petioles $\frac{1}{2}$ -1 in long), obovate-oblong to lanceolate-oblong, acute and mucronate, cuneate at the base, quite entire or slightly undulate, 8-18 in long racemes erect, 5-7 in. long; fls larger than in *C. ornata*, on slender pedicels, 5-merous; appendages of the corolla rounded, short. Brazil.

grándis, Deene (*Theophrasta macrophylla*, Lind, not Link *T. grándis*, O Kuntze) Lvs large (to 3 ft), long-oblong, narrowly pale-margined, entire or sinuate-repand, petiole thick and dark violet, the secondary nerves slender and simple or forked fls orange-yellow, in short and erect racemes; calyx-lobes orbicular and nearly glabrous, the corona 5-lobed Colombia.

AA *Lvs serrate, often spiny-toothed*

longifolia, Mez (*C. ornata*, Don, *Theophrasta longifolia*, Jacq.) Plant 10-20 ft lvs many, in a crowded head or tuft at the top of the st oblong-spatulate to lanceolate, leathery, narrowed at base and stalked, acute, spiny-toothed, $1\frac{1}{2}$ ft or less long fls orange- or saffron-colored, fragrant, in drooping racemes 4-10 in long Venezuela, Colombia. B.M. 4922. B.R. 1764. Blooms in June and July

spinosa, Mez (*C. Riedeliana*, Regel) Plant 5-6 ft, glabrous, stout and erect lvs obovate-lanceolate, sessile, 20 in or less long, spinose-serrate fls orange-yellow, in slender racemes 5-8 in long Brazil

fúlgens, Hook f Plant 3 ft or more, very stout: lvs spatulate-obuncate, narrow, remotely toothed near the apex, narrowed into a very short petiole, very coriaceous, 1 ft or so long, fls deep red, with yellow disk, handsome, in erect racemes 4 or 5 in. long. S. Amer. B.M. 5626.

C. latifolia, Radlk (*Theophrasta latifolia*, Willd.) Lvs gracefully elliptic, petioled, narrowed at both ends, mucronate-serrate, racemes erect. Colombia

L H B.

CLAYTONIA (after John Clayton, of Virginia, one of the earliest American botanists upon whose collections Gronovius based the Flora Virginica) *Portulacææ*. **SPRING BEAUTY** Little smooth succulent herbs sometimes transferred to gardens for their bright flowers.

Perennials with slender, 2-lvd sts from a deep, globular corm, and loose racemes of white or rose-colored fls with deeper veins, appearing among the first wild fls and lasting only a few days. The genus is characterized by its oval, persistent sepals and 5 stamens. Plants can be secured from dealers in native plants. They can be naturalized in moist places, and do well in half-shady spots at the bottom of a rockery. For *C. parvifolia*, *C. parviflora* and *C. perfoliata*, see *Montia*.

virginica, Linn. Plant 4-8 in. long, often forcing an irregular way through the leaf-mold of damp, rich woods: lvs. linear-lanceolate or linear, 2-6 in. long, including the gradually tapering base: fls. larger and more numerous than in *C. caroliniana*, whitish, tinged with pinkish. Colo. to Atlantic and south to Gulf. B.M. 941. L.B.C. 7.643.

caroliniana, Michx. Lower and fewer-fl'd.: lvs. 1-2 in. long, oblong, oblong-lanceolate, somewhat spatulate, or even ovate-lanceolate, with a blade 1-2 in. long, abruptly contracted into a marginal petiole: fls. smaller than in the preceding and more deeply colored. Minn. to Atlantic and south to mts. of N C—Should be grown only in cool places above 1,000 ft.

lanceolata, Pursh. About 4 in. high: lvs. oblong or lanceolate, $\frac{1}{2}$ -1 $\frac{1}{2}$ in. long, the base broad or narrow; petiole as long as the blade. raceme short-peduncled; petals cinnarinate or almost obcordate N W. N. Amer.—Considered by some to be a mere form of the preceding

WILHELM MILLER
N TAYLOR †

CLEISÓSTOMA (Greek, *closed mouth*, referring to the structure of the spur) *Orchidaceæ*. Epiphytic orchids, adapted to the warmhouse.

Stems leafy lvs. coriaceous, flat or nearly terete: sepals and petals adnate to the column, spreading; labellum with a large saccate spur, column short, thick, pollinia 2. From E Asia and Austral—A genus comprising in the neighborhood of 40 species, which suggest *Saccolabium*. The plants are little known in Amer. They require the treatment usually given *Aerides*. The leading species are *C. crassifolium*, Lindl., from India, with small green rosy-lipped fls. in nodding panicles, and thick recurved lvs. 10 in. long. J F 4 397; and *C. ringens*, Reichb f., Philippines, with yellowish white purple-lipped fls. with orange spot on side lobes, spur large, in few-fl'd racemes: lvs. 3-4 in. long. *C. Dawsonianum*, Reichb f., is a Trichoglottis; *C. multiflorum*, Hort., is probably *Aerides multiflorum*. *C. secundum*, Rolfe, a recent introduction from Burma, has light rose-pink fls. that are turned sidewise, the front lobe of the lip rose-purple, borne on a scape 3-4 in. long. lvs. lance-oblong, about 4-5 in. long and $\frac{1}{2}$ in. broad.

CLEISTANTHUS COLLINUS. *Leibrodierops*.

CLEISTOCÁCTUS (*closed Cactus*, referring doubtless to the peculiar flowers) *Cactaceæ*. Slender columnar cacti, with few branches and many-ribbed. fls. short and narrowly curved, orange-red, ovary covered with small appressed bracts bearing hairs in their axils, filaments somewhat exserted and grouped together near the upper lip. fr. spineless, pulp white; seeds slightly punctate—About 14 species have been described in this genus.

Baumannii, Lem. (*Cereus Baumannii*, Lem. *C. colubrinus*, Otto) Sts. dark green, slender, flexuose, columnar, reaching a height of 6 ft. and a diam. of 1-1 $\frac{1}{2}$ in., the few branches ascending, slender, parallel with the main st.: ribs 12-16, rounded. areoles close together, brown: spines fine, slender, very sharp, 15-20, fasciated, white to yellow or dark brown, about $\frac{1}{4}$ in. long; sometimes a single one from the center reaches a length of $\frac{1}{4}$ in.: fls. numerous, tubular, zygomorphous, 2 $\frac{1}{2}$ -3 in. long by about $\frac{1}{2}$ in. diam throughout, red or sometimes with orange-red petals and red tube. Uruguay, Paraguay and Argentina. J. N. ROSE.

CLÉMATIS (Greek name of a climbing plant). *Ranunculaceæ*. Familiar garden plants, prized for their handsome and often very showy flowers followed in many species by attractive feathery-tailed fruits.

Climbing vines, or erect or ascending perennial herbs, more or less woody. lvs. opposite, mostly slender-

petioled, usually pinnately compound, lobed, or in some species entire and rarely sessile: sepals usually 4 or 5, sometimes more, valvate in the bud, rarely imbricate, petaloid; petals none (or small in *Atragene* section, usually considered as petaloid staminodes); stamens many; pistils many. achenes in a head, 1-seeded; style persistent, long, plumose, silky or naked. Fig. 983.—About 150 species of very wide geographical distribution, most abundant in temperate regions. About 20 species found native in N Amer. and about 80 in E Asia. Les Clematites, Alphonse Lavallée, Paris, 1884; referred to below by "Lav."—The Clematis as a Garden Flower, Thomas Moore and George Jackman, London, 1872, referred to below by "M & J"—Clematites, Dr Jules le Béle, in Bull. de la Société d'Hort. de la Sarthe, republished in The Garden (vol. 53), June-Oct., 1898.—O Kuntze, Monogr. der Gattung Clematis in Verh. Bot. Ver. Brandenburg. 26 (1885)—A Gray, Fl. N Amer. 1 4-9, 1895.—Finet & Gagnepain, Contrib. Fl. As Orient 1: 1-42 (1905).

The culture of clematites. (K C Davis)

A rich soil of a light, loamy character is the best for clematites, and a little mixture of lime will make it better. The soil must be well drained, and must be kept rich by at least annual applications of horse- or cow-manure. On dry, hot soils cow-manure is best, while on heavy soils a thorough dressing of rich leaf-mold would best serve the purpose. Mulching with half-rotted manure on the approach of winter tends to increase the strength of the plants and the size of the flowers. In dry seasons, spraying is always helpful during the growing period.

Clematites belonging to the Montana, Patens, Florida, and Lanuginosa types should be pruned in February or March, by cutting away all weak, straggling and overrowed branches. The first three mentioned flower from the ripened wood, it is essential, therefore, that in order to secure blossoms, enough of the strong one-year-old wood should be retained. Viticella, Jackmanii and Lanuginosa should be vigorously cut back, say in November, they blossom from the new shoots. Those of the Patens type should be pruned very little, soon after the flowers have disappeared, by simply trimming off useless branches and seed-bearing peduncles.

Clematites of the vigorous climbing varieties are used in many places to cover walls, root-fences, mounds, arbors, balconies, trellises, small buildings, and, in fact, many other places the ingenious gardener will think of. For pot culture in the greenhouse, and for conservatory walls, the less vigorous species are best suited. All the many varieties and hybrids of the Patens and Lanuginosa types, including Henryi and the forms of Jackmanii, are well adapted to this use, as well as for outdoor purposes. The dwarfier and more bushy species are used in greenhouses to some extent, but are found principally in borders or on large rockeries. Of the latter J B Keller says, "Their flowers are not so large as we see them in most of the climbers, yet they are indispensable in the flower-garden, being prolific bloomers and free growers in ordinarily rich, deep garden soil. There is room for improvement in this class, however, and specialists, who hitherto have done so much for the climbers, ought to direct their efforts now to the long-neglected bush clematites. A noble beginning has been made, resulting in the large-flowering *C. Durandii*, but we expect more of them in the future." See special notes on culture and hybrid-forming qualities after the descriptions of some of the species and varieties.

The most common method of propagation is by grafting. Roots of *C. Flammula* or *C. Viticella* are used; the cions are taken from plants that have been grown under glass, and are used before the wood is entirely ripe. Cions taken from plants grown in the

garden in summer are rarely successful. The grafts, in pots or trays, are grown in a moist coolhouse, over gentle bottom heat. Another method of propagation, involving less labor but usually successful, is to take cuttings of nearly ripe wood, grown under glass, and treat them as the cions first above mentioned, without the roots. The latter method is practised preferably in summer in gentle hotbeds; shading, spraying, and later on airing, must be strictly attended to. Layering is practised when large old stools are at hand. The knife is not used in the operation, but a twist of the stem will split the inner bark lengthwise. Every other joint is thus treated, pegged down, and covered with soil. It is best to leave the layers undisturbed until the following spring. Many of the species are often propagated by seed, and many new varieties have thus been secured. The number of hybrids is almost countless; in this account are carefully recorded those in the American trade which are traceable to their origin.

The clematis is subject to a very serious disease, due to the depredations of a nematode worm in the roots. This trouble is most serious under glass and alongside buildings where the ground does not freeze deep. The parasite is probably distributed in the soil adhering to pot-grown plants. It is probable that hard freezing kills the parasite. There is no remedy, so far as known, for affected plants. Using only soil which has been frozen is to be recommended to the propagator.

The kinds of clematis (Jackson & Perkins Co)

The hybrid varieties of Clematis, commonly known as the large-flowering sorts, are, when successfully grown, among the most beautiful of hardy climbing plants. The commercial propagation and growing of most of the large-flowering varieties, however, is attended with so many difficulties and disappointments that it has never been very generally attempted by nurserymen or florists in this country. At the present time there are scarcely half a dozen houses on this continent who attempt the propagation of clematis to any considerable extent, and it is only within the past thirty years that clematises have been commercially grown even by this limited number. Prior to that, practically all of the large-flowering clematises planted in this country were imported from Europe, the major part being supplied by Holland, whose moist atmosphere and black soil produces large, vigorous plants, but whose climatic conditions are so entirely different from those usually found in this country that the plants often failed to adapt themselves to their new surroundings, and did not thrive to the extent that their good size and vigorous condition seemed to give promise.

The propagation of clematis throughout Europe is usually effected by grafting pieces of well-ripened, year-old wood upon roots of almost any of the more

vigorous-growing species, *Clematis Flammula* being most commonly used. In this country, on the contrary, the method commonly pursued is by means of cuttings from young wood, stuck in sand, with gentle bottom heat, usually during May or June. So far as concerns the comparative vigor and desirability of plants produced by these two methods, there is small choice between them. Propagation by cuttings is, in this country, the more rapid and economical way, and further, it removes the possibility, sometimes realized in grafted plants, of sprouts being thrown up from the roots, and, if in the hands of an uninformed amateur, entirely "running out" the variety grafted in; thus considerable annoyance is avoided.

Clematises hybridize so readily that the number of varieties resultant from various crosses forms a long list. But while so many have been dignified with names and places in the catalogues of nurserymen, yet the varieties of large-flowering clematis that have proved so valuable as to secure permanent places for themselves in popular demand can almost be counted upon one's fingers. There are many varieties possessing most beautiful shades and variations of coloring that fail to attain popularity, chiefly on account of deficiency in two essential characteristics—vigorous habit of growth and abundance of bloom. *Clematis Jackmanni*, purple, originated in 1862, by Mr George Jackman, was one of the first hybrid clematises introduced, and still stands as the most popular, and, of its color, the most valuable variety yet known. The variety, Madame Edouard André, a deep rich crimson, is distinct and novel, being at this time about the best large-flowering sort of a truly crimson shade. It is not quite so vigorous habit as the Jackmanni, but its flowers are similarly massed, though not produced in quite such profusion. *Clematis Madame Baron Veillard* is a distinct variety. It is of exceedingly vigorous habit, and the flowers are quite freely produced, though, being more dispersed over the plant, they do not make so much of a show as do varieties whose flowers are closely massed. The flowers are of very large size and of a light rose-color, shaded with lilac. Of white varieties, Henry, Mrs George Jackman and Lamignosa Candida, all of them introduced long ago, still remain about the most desirable ones known. Ramona, deep sky-blue, is a variety which originated some twenty-five years ago. It is of extra-large size, often 9 to 10 inches across, of very vigorous habit and free-flowering.

Of double-flowered varieties, Duchess of Edinburgh, white, is the best known in this country, and about the most desirable. John Gould Veitch is a double sort with flowers of lavender-blue, but has seemed a shy bloomer and of weak habit. Mme Grange (purplish violet), Star of India (purple), Velutina Purpurea (purple), and Viticella Venosa (reddish purple), are all desirable varieties.

Although they are in reality slightly less hardy than the Florida and Patens types, varieties of the Lamignosa, Viticella and Jackmann types, which produce their flowers from young growing wood, are recommended for northern localities. Plants of these types, even if frozen back to the ground, will still produce a good show of flowers, since, as stated, they bloom from the recent vigorous wood, even if the old tops are killed. Indeed, they need to be pruned back considerably anyway to induce a free growth of young vigorous blooming wood. With plants of the Patens and Florida types, however, which blossom from year-old wood, a severe freezing back of the plants would destroy the crop of flowers for the year.

Of the small-flowering varieties, *Clematis paniculata* (white), introduced from Japan, has proved to be a wonderfully valuable acquisition in this country, and has become exceedingly popular. It is of remarkably vigorous habit, often making a growth of 20 to 25

feet in a season. It seems thus far to be entirely free from disease, is delightfully fragrant, and so floriferous that the blossoms form a dense sheet of bloom, remaining in full beauty for several weeks. The foliage is very thick and heavy, thus making it very desirable for covering porches and arbors.

Crispa (blue) and texensis (red) are species with very pretty, bell-shaped flowers. They are easily grown and do well in almost all situations.

The perennial, non-climbing varieties of clematis are most pleasing border plants, succeeding well in all ordinary soils and making a rich show of bloom at their flowering season. Davidiana (blue) and recta (white) are about the best known and most desirable varieties of this class.

To grow clematis most successfully, they should be given a good depth of loamy soil, with a fair supply of well-rotted manure spaded in and thoroughly distributed through the soil. In hot, dry weather, the plants should be regularly watered in order to obtain the greatest number of flowers possible, for the plants are very susceptible to injury by drought. A point of great importance, especially in caring for newly set plants, is to provide a firm support for them to climb upon. A solid wooden or metal trellis is preferable, for the reason that it prevents the plants from being whipped about by the winds, which often results in breaking the stalks just above the ground or else in cracking the outer bark of the stalks and rendering them more liable to the attacks of insects and fungous diseases. Training the vines upon strings, or a pliable support of any kind, is not to be advised for this reason. Propagation of the hybrid varieties is effected both by cuttings and by grafts. All of the type varieties grow readily from seed.

 BB. *Fls with petaloid stamnodes, sepals more or less spreading, stamens upright, appressed pubescent.*
 C. *Lvs always 3-foliate, lfts ovate, subcordate.* 17. *verticillaris*
 CC. *Lvs partly ternate, lfts ovate to ovate-lanceolate.* 18. *alpina*
 AA. *Sepals spreading, stamens more or less divergent.*
 B. *Stamens glabrous or only with a few hairs below the anthers (or hairy at the base only in No 19).*
 C. *Fls solitary or in 3's or in axillary fascicles, blue, violet, red or white, usually large.*
 D. *Lfts entire fls on the new growth after the lvs, solitary or in 3's.*

- B. Plant herbaceous, upright; sepals imbricate in bud; stamens pubescent at the base 19. Stanleyi
- BB. Plants woody, climbing sepals valvate, stamens glabrous
- F. Achenes with short style, pedicels longer than the sepals
- G. Number of sepals 4; fls. open campanulate, usually 1-2 in across.
- H. Style glabrous fls 1-2 in across, often in 3's 20 Viticella
- HH. Style pubescent except at the apex, fls 1 in or less across 21 campaniflora
- GG. Number of sepals usually 5-6 fls flat, 2-4 in across 22. florida
- FF. Achenes with long plumose style
- G. Pedicels shorter than sepals lvs simple or ternate 23. lanuginosa
- GG. Pedicels longer than sepals fls from last year's wood in spring or early summer lvs ternate or pinnate 24 patens
- DD. Lfts or lvs serrate fls in axillary clusters, or solitary on last year's branches with the lvs in spring, white or pink
- E. The sepals with a small involucre below their base, fls nodding, open campanulate
- F. Lvs simple fls whitish 25 cirrhosa
- FF. Lvs ternate fls greenish yellow, spotted red inside 26 balearica
- EE. The sepals without involucre
- F. Lvs pinnate, lfts small, about $\frac{1}{2}$ in long 27 gracifolia
- FF. Lvs. ternate, lfts 1-3 in long
- G. Lfts glabrous or sparingly pubescent 28. montana
- GG. Lfts densely silky pubescent beneath, less so above 29. Spooneri
- CC. Fls. in terminal or axillary panicles or cymes, rarely 3 (if solitary, with bracts about the middle of the pedicel) white, rarely pinkish, sepals 4 (sometimes 4-6 in No 37), usually small (except in No 37)
- D. Lvs 3-foliate, lfts always entire, often sub-coriaceous or coriaceous
- E The fls from the old wood from scaly buds 30 Armandi
- EE. The fls from the new growth
- F Lfts ovate or ovate-oblong
- G Filaments as long or shorter than anthers lfts rounded or subcordate at the base 31. Meyeniana
- GG. Filaments longer than the anthers lfts cuneate at the base 32 crassifolia
- FF. Lfts narrow-lanceolate or oblong-lanceolate 33 Pavoliniana
- DD. Lvs pinnate or bipinnate (if 3-foliate, lfts lobed or dentate or fls dioecious)
- E. The fls perfect
- F. Lfts entire or nearly entire, or 3-lobed anthers linear, much longer than broad
- G. Plant herbaceous, upright 34. recta
- GG. Plant climbing, half-woody
- H. The lvs pinnate 35 paniculata
- HH. The lvs bipinnate 36. Flammula
- FF. Lfts serrate, occasionally nearly entire anthers oval or oval-oblong, not more than twice as long as broad (longer in Nos. 37 and 38)
- G. The fls 1-3, long-stalked, 2-3 in across lvs. pinnate 37. Fargesii
- GG. The fls in panicles or cymes, not exceeding 1 in diam
- H. Lvs ternate or biternate fls $\frac{1}{2}$ in. across, in many-fl'd cymes 38. apiifolia
- HH. Lvs usually bipinnate, lfts ovate-lanceolate tails of fr about $\frac{3}{4}$ in long 39. brevicaudata
- HHH. Lvs pinnate tails longer
- I. Sepals glabrous inside lfts pubescent beneath 40. grata
- II. Sepals pubescent inside and outside lfts glabrous or nearly so 41. Vitalba
- EE The fls dioecious
- F Foliage deciduous sepals 4.
- G Fls appearing on the young wood in summer, less than 1 in across
- H. Lvs ternate, lfts 2-3 in long 42. virginiana
- HH. Lvs pinnate, lfts 1-2 in long
- I. Plant glabrous lfts rounded or subcordate at the base 13 ligusticifolia
- II Plant pubescent lfts truncate or cuneate at the base 44 Drummondii
- GG. Fls on last year's branches from scaly buds in early spring, $1\frac{1}{2}$ in across 45 lasiantha
- FF Foliage evergreen, lvs ternate sepals 5-7 46 indivisa
- BB. Stamens pubescent, fls yellow or yellowish, nodding achenes with plumose tails
- C. Lvs pinnate or bipinnate
- D. Fls usually several, 1-2 in. across, pale yellow lvs bluish or grayish green, lfts usually entire, often lobed
- E. Lfts often oblong or lanceolate sepals pubescent inside 47. orientalis
- EE. Lfts usually ovate or oval, pale bluish green sepals glabrous inside 48 glauca
- DD. Fls solitary, 2-3 in across, on stalks to 10 in long, sepals glabrous inside lfts usually lanceolate, serrate, green 49 tangutica
- CC. Lvs biternate, lfts serrate, green fls solitary 50. serratifolia

Section VIORNA.

Group CRISPAE.

1. integrifolia, Linn Herbaceous, erect, becoming 2 ft. high lvs. rather broad, entire, ovate-lanceolate: fls solitary, nodding; sepals 4, rather narrow, blue, coriaceous, 1-2 in. long. June-Aug. Eu and Asia. B.M 65

The following are supposed to be hybrids of this species *C. cylindrica*, Sims (x *C. crispa* *C. integrifolia* var *diversifolia*, Hort. *C. integrifolia* var *pinnata*, Hort.) Lvs more or less irregularly lobed or pinnate fls solitary, cylindric-campanulate with the sepals more or less recurved from the middle, blue or bluish-violet B.M.

1160. *Lav.* 13 *G.W.* 14, pp 562-3 *R.H.* 1856 341 Here also belongs probably *C. discaricata*, Jacq., with short-petioled pinnate lvs. and blue, less spreading sepals

2 *Frémontii*, Wats. Fig. 981. Closely allied to *C. ochroleuca*, but with lvs 3-4 in long, nearly sessile, either entire or with a few coarse teeth fls. often drooping; sepals thick, purple, nearly glabrous, except the tomentose edges; styles when young downy rather than feathery July, Aug. Mo. to Colo. *G.F.* 3.381 (adapted in Fig 981). *G.W.* 14, p. 563.

3. *ochroleuca*, Ait. Herbaceous, 1-2 ft. high, silky-pubescent, becoming glabrate: lvs ovate, entire fls. erect, solitary, terminal, sepals yellow outside, cream-colored within; styles becoming somewhat plumose. July, Aug. Dry grounds, N Y to Ga *L.B.C.* 7:661. —Intro 1883

4 *Douglasii*, Hook. Has habit of *C. integrifolia*, about 2 ft high: st. and petioles angled and ribbed: lvs twice pinnately or ternately compound, fls narrow-linear or lanceolate fls. tubular or bell-shaped, 1 in long, sepals recurved, deep purple within, paler without June. In mts., Mont to New Mex —Intro. 1881 Var *Scottii*, Coulter, has the lvs ovate- or oblong-lanceolate A hybrid of *C. Douglasii* var *Scottii* × *C. texensis* is *C. globulosa*, Hort., with deep purple pitcher-shaped fls *Gn* 75, p. 472.

5 *aromatica*, Lonné & C Koch (*C. carulea* var. *odorata*, Hort.) Slender, herbaceous or somewhat climbing, reaching 6 ft high if supported lvs of 3-7 ovate, nearly entire fls fls. solitary, terminal, very fragrant, 1½-2 in across, sepals 4, spreading, reflexed, reddish violet, stamens white July-Sept Nativity, perhaps S France It is thought by some to be an old garden hybrid, probably *C. Flammula* × *C. integrifolia*. *R.H.* 1877, p. 15. *Lav.* 9.

6 *crispa*, Linn. A slender climber, reaching 3-4 ft: lvs very thin, fls 3-5 or more, variable in outline and sometimes undivided, often 3-5-lobed fls purple, varying to whitish, cylindrical or bell-shaped, 1-2 in long, points of sepals recurved, styles of fr hairy but not plumose June-Sept. Va to Texas *B.R.* 32 60. *B.M.* 1892 *I.H.* 2 78 (as *campaniflora*) *G.* 30 503; 34 147. *V.* 6 379 *Lav.* 14—This and the allied species are fragrant A hybrid of this species is *C. cylindrica*, Sims (× *C. integrifolia*) See No 1 A number of hybrid forms, the off-spring of a cross between this species and *C. texensis* are figured and described in *M.D.G.* 1898 500 and one as "blue bells" in *Gn.* 49, p 189

7 *Simsii*, Sweet (*C. Pitcheri*, Torr & Gray) High climbing branchlets pubescent: lvs of 3-4 pairs of fls and a terminal lit reduced almost to a midrib; fls coarsely reticulated, lobed or 3-parted, usually mucronate fls 1 in long and ¾ in diam, with swollen base, sepals dull purple, recurved at the tips achenes pubescent, styles not plumose June-Aug S Ind to Mo, southward to Mex *Lav.* 15 *B.M.* 1816 (as *C. cordata*). Var *Sargentii*, Rehd (*C. Sargentii*, *Lav.*) Fls. smaller, paler. fls rarely lobed *Lav.* 18—A hybrid of this species with *C. texensis* is figured in *R.H.* 1893:376

8. *reticulata*, Walt. A slender climber, allied to *C. crispa*: fls much reticulated and very coriaceous fls. solitary in the axils of the lvs, nodding, bell-shaped; sepals recurved, crisp at the margin: mature fr. with plumose tails. June, July. S. C to Ala. and Fla. *B.M.* 6574. *Lav.* 16.

9. *Viorna*, Linn. Fig. 982. Climbing, 8-10 ft, sparingly pubescent or glabrous: lvs. not glaucous nor coriaceous; fls. subcordate-ovate to ovate-lanceolate, slightly reticulated: fls solitary, on long peduncles, pitcher-shaped; sepals 4, 1 in. long, variable in color, often dull purple, thick and leathery, finely pubescent outside, tips often recurved; styles plumose when

mature, 1 in. long June-Aug. Pa. to Ala. and westward *Lav.* 17. *Gn.* 45, p 240

10. *texensis*, Buckl (*C. coccinea*, Engelm. *C. Viorna* var *coccinea*, Gray) Climbing, to 6 ft; glabrous: lvs glaucescent, subcoriaceous, fls broadly ovate, often obtuse, subcordate, 1½-3 in long, fls solitary, pitcher-shaped, nodding, carmine or scarlet, glabrous out-side achenes with plumose style, 1-2 in long, glabrous at the tip Texas. *Lav.* 19. *B.M.* 6594 *Gn.* 19 284. *G.W.* 10, p 498 *G.C.* II. 15 405. *W.G.* 2. 111 *F.* 1880, p 115 *Gt.* 32 86. *R.H.* 1878:70; 1888 348 —Much superior to the preceding because of its beautiful fls Some of the garden hybrids of this species, which have been classed under *C. pseudo-coccinea*, Schneid (× *C. Jackmanni*), are found under the names. *Countess of Onslow*, deep scarlet. *Gn.* 57, p 376 *M.D.G.* 1898:481. *G.M.* 37 381 *G.C.* III.

982 *Clematis Viorna* (×½)

with recurved tips, densely brownish pubescent outside, violet inside pubescence of achenes and plumose tails fulvous June-Aug E Siberia, Japan *Lav.* 20 Var *violacea*, Maxim (*C. janthina*, Koehne). Less pubescent fls violet *Gt.* 13 455

Group TUBULOSÆ.

12 *heracleæfolia*, DC (*C. tubulosa*, Hook). Stout, erect, woody only at the base lvs ternate, large, bright green, fls broadly ovate, rounded at the base, slightly pubescent, mucronately toothed, 4-6 in long: fls. numerous, in corymbs, either axillary or terminal, polygamous, tubular in form, with 4 light blue sepals, becoming reflexed, peduncles and pedicels downy; recurved stigmas club-shaped. Aug., Sept. China. *M.* & *J.* 17 *B.M.* 4269, 6801 (as var *Hookeri*). *P.M.* 14 31. *F.S.* 3 195 *R.H.* 1858, p. 42 —Prop. by root division. Var *Davidiana*, Hems. (*C. Davidiana*, Deane.) About 4 ft high, hardly strong enough to stand without support. lvs. usually cuneate at the base, nearly glabrous fls brighter blue, fragrant, in clustered heads, 6-15 together, and also singly or clustered in the lf-axils *R.H.* 1867, p 90 *Gn.* 31, p. 145; 45, p. 241, 49, p. 99, 68, p. 273 *G.M.* 37 48. *G.W.* 6, p. 124 *Mn.* 9:76 *A.F.* 25 1055 Var *ichangensis*, Rehd. & Wilson. Fls. broad at the base, sparingly pubescent above, densely beneath. achenes densely villous Cent China

A hybrid of this species is *C. Jowndana*, Schneid. (var *Davidiana* × *Vitalba*). Half-climbing, to 6 ft. fls. in large panicles, bluish white, first tubular with the sepals finally spreading *G.C.* III 51 34 Another hybrid is *C. Davidiana hybrida*, Lem. var *Davidiana* × *C. stans* (of which Lemoine advertises several named forms varying from light to deep blue, very floriferous)

13 *stans*, Sieb & Zucc (*C. heracleæfolia* var *stans*, Hook). Herbaceous, upright, to 6 ft: branches grayish pubescent. fls. broadly ovate, lobed and coarsely

toothed, more or less pubescent; fls. in terminal panicles sometimes 2 ft long and in axillary clusters, whitish or bluish white, tubular, with revolute sepals, less than $\frac{1}{2}$ in. long, ducuous. Sept., Oct. Japan. B.M. 6810.—Used chiefly because of the striking foliage and its late-blooming qualities. Var. *Lavallei*, Schneid. (*C. Lavallei*, Deene.). Fls. $\frac{1}{2}$ – $\frac{3}{4}$ in. long, monœcious.

Group CONNATÆ.

14 *nūtans*, Royle. Slender woody climber lvs pinnate, lfts ovate-oblong or lanceolate, deeply 3-5-lobed, rarely entire, 1-3 in long fls nodding in many-fld. panicles, yellowish white, tubular, $\frac{1}{2}$ – $\frac{3}{4}$ in long, pubescent outside, filaments silky pubescent below the middle; achenes silky with plumose tails. July–Oct. Himalaya. Var. *thyrsoides*, Rehd. & Wilson. Climbing to 20 ft. lfts broadly ovate, usually cordate at the base, silky pubescent beneath; panicles larger and more compact, on upright stout peduncles 3-6 in long. W. China. G.C. III 48, 310. Gn 75, p. 557 (as *C. nutans*). R.H. 1905, p. 438 (as *C. Buchananiana vitiifolia*). See page 3507.

15 *lasiandra*, Maxim. Climbing, to 12 ft. young growth viscid lvs pinnate with 3-foliate or 3-fid segms.; lfts ovate to ovate-lanceolate, long-acuminate, serrate, glabrous or sparingly pubescent on both sides, $1\frac{1}{2}$ – $2\frac{1}{2}$ in long; fls axillary, solitary or in 3's on stalks 1-3 in long, campanulate, reddish purple, about $\frac{3}{4}$ in long; sepals with recurved tips, as long as the stamens. Aug.–Oct. Cent and W. China.

16 *æthusifolia*, Turcz. Slender, climbing. lvs bipinnate, pubescent; lfts. finely cut, usually unequally 3-lobed and deeply incisely serrate with obtusish mucronulate narrow lobes, $\frac{1}{2}$ – $\frac{3}{4}$ in long fls. 1-3, axillary, on slender stalks, whitish, tubular, $\frac{3}{4}$ in. long, sepals with recurved tips; achenes pubescent with long plumose whitish tails. Aug., Sept. Mongolia, Manchuria. Var. *latisecta*, Maxim. Lfts larger, to $1\frac{1}{2}$ in long with oval or oblong rounded lobes. Gt 10:342. B.M. 6542. Gn 6, p. 423; 31, p. 186; 45, p. 241. R.H. 1869, p. 10.—This is the form usually cult; the type with much more finely divided foliage is very rare in cult.

Group ATRAGENÆ.

17 *verticillaris*, DC (*Atrægene americana*, Sims) Fig 983. Trailing or sometimes climbing, 8-10 ft. usually 4 trifoliate lvs from each node, lfts thin, ovate, acute, toothed or entire, somewhat cordate; fls. solitary, blue or purple, nodding at first, 2-4 in. broad when expanded, 4 thin sepals, silky along the margins and veins; staminodes spatulate, narrow, scarcely half as long as sepals. May, June. Woodlands, Va. to Hudson Bay, west to Minn B.M. 887.—Intro.

983. Achene of *Clematis verticillaris*. (X1)

1881. Var. *columbiæna*, Gray. Sepals narrower and more pointed than in the type. Rocky Mts.

18 *alpina*, Mill. (*Atrægene alpina*, Linn.) Sts. 3-5 ft., slender, with prominent joints becoming swollen with age, lvs. once or twice ternate, with ovate or ovate-lanceolate lfts, serrate or incised; many petal-like stamens, which are devoid of anthers, sepals 4, bright blue. Spring. N.W. Amer., Siberia to S. and Cent. Eu. B.M. 530 (as var. *astræcea*). Gn. 46:318; 57, p. 481. R.H. 1855 321. L.B.C. 3.250. G.W. 10, p. 82

H.W. 3, p. 16.—A very hardy climber, preferring a northern exposure. Var. *sibirica*, Kuntze (var. *alba*, Hort. *Atrægene sibirica*, Linn.). Fls white or nearly so. B.M. 1951 L.B.C. 14 1358. R.H. 1855.321. Var. *occidentalis*, Gray. Petal-like stamens very few, and often bearing rudimentary anthers. Rocky Mts.

Section PSEUDANEMONE.

19 *Stanleyi*, Hook (*C. Stanleyana*, Hort.) Fig. 984. Erect robust herbs, 3 ft high lvs biternate, lfts sessile or petioled, variable in size, cuneate, silky.

984. *Clematis Stanleyi*. (X $\frac{1}{2}$)

fls 1-3 in across, white to pink-purple, sepals becoming widely expanded, stamens yellow; styles becoming very plumose, white July–Oct. Transvaal. Intro 1893. B.M. 1766. Gn 39.76. G.F. 3 513 (adapted in Fig. 984). G.C. III 8 327. G.M. 34:320.—Suitable for greenhouse cult, in the northern states it is apt to winterkill if left unprotected.

Section VITICELLA.

20 *Viticella*, Linn. Climbing 8-12 ft. lvs sometimes entire, but usually divided into 3 nearly entire lfts., fls $1\frac{1}{2}$ –2 in diam., growing singly on peduncles or sometimes in 3's; sepals 4, blue, purple or rosy purple, obovate, pointed, reflexed; stamens yellow fr. with rather short glabrous tails. June–Aug. S. Eu to Persia. R.H. 1860, p. 183; 1876.110, 1879.350 (vars.). B.M. 565. G. 22 310, 8-399. H.W. 3, p. 15. Lav. 7.—This is the type of one of the leading groups of garden clematisses, and is one of the parents of the Jackmanni type of hybrids.

The following are garden varieties:

Var. *albiflora*, Kuntze. Fls white.

Var. *rubra*, Hort. Fls purple.—Var. *rubra grandiflora*, Jackman, has larger bright crimson fls and 6 sepals. F.S. 20 2053 (1783). F. 1872 285.

Var. *kermesina*, Lem. (*C. kermesina*, Hort.) Fls of bright wine-red color, purple being absent. Gn 39 30.

Var. *iliciflora-floribunda*, Hort. (*C. iliciflora-floribunda*, Hort. *C. floribunda*, Hort.). Fls pale gray-lilac, conspicuously veined. Gn 18, p. 389 (note).—An abundant bloomer. Produced in an English garden in 1880.

Lady Bonill, Jackman (*C. Lady Bonill*, Hort.) Fls cup-formed, sepals being concave and little or not at all recurved at the ends, fls 4 in across, sepals 4-6, grayish blue, stamens light brown. M. J 15. R.H. 1876-190.

Var. *marmorata*, Jackman (*C. marmorata*, Hort.) Fls rather small, with 4 broad sepals, light grayish blue with darker veins, 3

longitudinal bars M & J. 1, f 2, same plate in F S 20 2050-55 (2008) F 1872 205

Hybrids of *C. viticella* which are closely allied to that type.

C. erioctemon, Deene. (× *C. integrifolia*, *C. Hendersonii*, Henderson, *C. Chandleri*, Hort.) Fig 985. St. and habit of *C. viticella* like, and fls much like *C. integrifolia* climbing 8-10 ft.; 4 blue sepals, spreading, reflexed at the tips R H 1852 341. F S 13 1364 (as var venosa), Lav 12. Here belong also *C. intermedia*, Bonamy, smaller, with more pubescent branchlets and paler fls *C. Bergeronii*, Lav, resembling more *C. integrifolia* lvs usually entire fls pink, about 2 in across in terminal panicles Lav. 10 *C. distorta*, Lav with rose-lilac twisted sepals Lav 11 *C. Boskoop*, Hort (*C. Boskoop* Seedling, Hort = *C. V* × *C. integrifolia*). A new rise in 1892 growing 3-5 ft fls blue, lavender, rose or reddish rose

C. rotunda, DC (× *C. flammula*) Fls in several to many-6d terminal panicles, pale violet, about 1 in across, petals sometimes 6. Here belongs also *C. Otello*, Cripps (= *C. V* var *rubra* × *C. flammula*) Fls of medium size, of a deep velvety purple, continues blooming until Oct — *C. rubro-marginata*, Jouin (*C. flammula* var *rubromarginata*, Cripp) Similar to *C. flammula*, sepals white bordered reddish violet

C. parviflora, DC (× *C. campaniflora*, *C. revoluta*, Desf.) Fls white, small, scarcely 1 in across, sometimes larger achenes with the tail usually pubescent at the base A P De Candolle, Pl. Rar. Geneva 12—Of no ornamental value

C. venosa, Krampfen (× *C. florida*, *C. florida* var *venosa*, Lav.) Similar to *C. florida*, but petals obovate Lav 6 R H 1860, p. 183 G 2 251 G Z 6 160 F S 13 1364 Here also belongs *Louise Carrier*, fls like with paler veins R H 1860 10 and several forms described by Carrière as *C. contorta*, *C. atrovirens* and *C. viticella alba* R H 1879 350

For other hybrids of this species see *C. Guasco*, Lem., under *C. patens*, *C. splendens* under *C. lanuginosa* as form of *C. Jackmanni*.

21 *campaniflora*, Brot. Climbing, 10-15 ft. fls. reflexed and bell-shaped as in the above type or more so, usually 1 in or less diam, purple or whitish fr. with short pubescent tail. June, July Native of Portugal. L B C 10 987. Gn 31, p 187. Lav. 8.—This has been called *C. viticella* because of its close resemblance in fl, fr. and lf; but the lvs. are often twice ternate, and the plant is much more slender in habit.

22 *florida*, Thunb. (*C. japonica*, Makino, not Thunb.). A slender plant, climbing 9-12 ft.: lvs. variable, more or less ternate or binate; lfts. small, ovate-lanceolate: fls. 2-4 in across, flat when expanded; the 5-6 broad, ovate sepals creamy white, barred with purple beneath; stamens purplish. May, June. Japan. B.M. 834. R H. 1856:41. Lav. 5. J.H. III 44:321. G C. III 35:51. Var. *bicolor*, Steud. (*C. Sieboldii*, D. Don). Fig 986. Like the type, but with the purple stamens somewhat petal-like, and forming a dense, purple head in the center. F.S. 5:487.

985 Clematis erioctemon (× ½)

986 Clematis florida var. bicolor. (× ½)

Lav. 5. M. & J. 16. B.R. 24 25. P.M. 4 147. Gn. 22: 142. R.H. 1856:401. S B F G II. 4. 396 F. 1872, p. 200 Var. *Fortunei*, Moore (*C. Fortunei*, Hort.). Fls. large, very much doubled, sepals creamy white, becoming pink. F S 15 1553 G C 1863:676. I.H. 10, p. 86. M. & J. 13. F. 1863 169. F.M. 3. 153

Bells of Woking A hybrid form fls very full and double, sepals purple

John Gould Veitch (*C. Ventenii*, Hort.) Fls. velvety, double, resembling var *Fortunei*, except in the color of the sepals From Japanese gardens F S 18 1875-6

Hybrids of this species are *C. venosa*, Krampfen, see *C. viticella*, *C. lutea non var.*, see *C. lanuginosa*

23 *lanuginosa*, Lindl (including var *pallida*, Hort.). Climbing only 5 or 6 ft. lvs simple or of 3 lfts, cordate-acuminate, woolly beneath fls erect on stout stalks shorter than the sepals, woolly in the bud, the largest of the wild species, being 6 in across; sepals 5 or 6, broadly ovate, leathery, rather flat, overlapping, lavender or bluish gray, center of stamens pale reddish brown; styles plumose. Summer Native near Ninkpo, China. F S 8.111 I H 1 14 Lav 1 M & J 4 J. F 4 363. H F 1855 1 1854 225. G C III 29 23 G. I, p 257. Gng. 5:38—It is to this species, more than to any other, that the beauty and popularity of the garden varieties and hybrids are due. The finest hybrids, including *C. Jackmanni* and its section, and *C. Lawsoniana*, contain more or less of the blood of *C. lanuginosa*.

Forms of *C. lanuginosa* are

Var *candida*, Lemoine (*C. candida*, Hort.) Like the type, except that the simple lvs and lfts of the compound lvs are much larger, and the fls are larger, being 7-8 in across, and white with a purplish shading around the margins F M 5 410 V 6 225—Perhaps a hybrid of *C. patens*

Var *nivea*, Lemoine (*C. nivea*, Hort.) Sepals 6-8, narrowish, pure white, anthers pale brown—Thought to be of same origin as the above var

alba magna, Jackman Fls very large, pure white, with about 6 broad sepals and purplish brown anthers G C II 3 685

Lady Caroline Nevill, Cripps Fls often 7 in across, sepals 6, nearly white, with mauve-colored stripe down center of each G 46, p. 33—One of the finest light-colored varieties

Princess of Wales, Jackman Fls 6 in across, sepals 8, satiny bluish mauve, very broad G C III 27 53. Gn 59, p 366

Mare Lefebvre, Cripps Resembles the last, but has 5 sepals, more pointed, and darker in shade

Perfection, Froebel Fls very large, sepals 8, very broad, lilac-mauve R P 6 191

Sensation, Cripps Fls like the type, but with 6-7 grayish blue sepals, 6 in across

Madame Emile Sorbet, Paillet Fls bright blue R H 1878 291

Madame Van Houtte, Cripps Late-blooming, sepals pale blue, becoming white

Madame Thibaut Fls very abundant—Thought to be a hybrid with *C. viticella*

The President, Noble A rich violet-blue fl

Ercelvor, Cripps Fls double, sepals grayish purple, with a reddish bar down the center of each F S 20 2055

roborea, Noble Fls violet-blue, 7 in. across F M 1876 217

Robert Hanbury, Jackman Sepals bluish lilac, flushed at the edges with red, and the bar slightly tinted with red Gn 16 128.

This species has given rise to numerous beautiful hybrids which in many cases are the product of so much interesting that it is impossible to recognize the exact parentage

By far the most important group of these hybrids may be classed under *C. Jackmanni*, which, however, by some is considered not a hybrid, but a species intro from Japan

C. Jackmanni, Moore (*C. lanuginosa* × *C. Hendersonii* and *C. lanuginosa* × *C. viticella*, *C. hakonensis*, Franch & Sav.) Fig 987.

Habit and lvs of *C. lanuginosa*, fls fls 5-6 in broad, usually in 3's and forming

panicles at the ends of the branches; sepals 4-6, very broad, velvety purple, with a ribbed bar down the center, broad, central tuft of pale green stamens. M & J. 5, 6, 9, 10, 11, 12, 14. I. H. 11 414. P. S. 16 1620. G. M. 22 142: 5.5, p. 202, 1, p. 107. G. 12 125, 10 269. A. F. 10 1329, 14 995-7, 16 283. R. H. 1808. 390 G. 4 261, 9 17, 7 230-2. C. L. A. 5 379. G. M. 4 223, G. M. 47 102. G. Z. 9 96. F. 1884 193. V. 6 129, 9 340, 18 70. Lav. 4. Var. *alba*, Hort. Fls. nearly pure white. 23, 185.

987. Clematis Jackmanii

France, Gégou (C. lanuginosa) × C. Jackmanni. Lvs smooth; buds woolly, sepals deep cobalt-blue, pointed, with wavy edges. *Reine des Bleues*, Boisselot (same cross as the last). Fls large, blue, with broad, recurved sepals *debonnaire*, Lem (same cross). Fls 8-9 in across, sepals 8, delicate lavender-blue. G. 9, p. 563 (note). *epiandria*, Simon-Louis (× C. Viticella). Fls, very dark purple, changing to reddish violet. R. H. 1865 71.

Gipsy Queen, Cripps. Deep violet. *Alexandra*, Reddish violet. *Star of India*, Cripps. Five in across, purple, barred with red. *Cambridge*, Cripps. Reddish purple, barred with light blue. Lav. 4 bis. I. H. 18 50. *magnifica*, Jackman. Rich purple, shaded with crimson, 3 bars of red in each sepal. F. M. 8 453. R. H. 1876 110. *Madame Grandé*, Hort. Sepals very concave, purple crimson. R. H. 1877 150. *Mrs James Bateman*, Noble. Pale lavender, a probable cross of G. J. with C. lanuginosa. M. 4 12. f. 1 F. S. 20 2053 (1779). *Mrs Moore*, Jackman. Eight to 9 in. across, sepals rather narrow, white. *Thomas Moore*, Jackman. As large as the last, rich violet, with white stamens. *Madame Baron Veillard*, Baron Vol. Rose-lilac. *Madame André*, cardinal purple. R. H. 1893 180. *violata-purpurea*, Jackman. Fls 4-6 in across, usually 4, sometimes 5 or 6 sepals, blackish purple. *Françoise Morel*, Morel. Fls 4 in across, sepals usually 4, bright violet-red. R. H. 1884 444. *Ville de Lyon*, Morel. Fls 5 in across; sepals usually 6, broad, deep amaranth-red. R. H. 1899 184.

Other hybrids of C. lanuginosa are the following
C. *Durandii*, Kuntze (C. integrifolia or possibly C. Jackmanii) × C. integrifolia. Upright, to 6 ft. lvs simple, petioled fls and inf. similar to C. Jackmanni, fls blue, 4-5 in broad, fls with usually 4, rarely 5 or 6 recurved sepals. June-Sept. G. M. 49 98. G. 5, 270. G. 31 257—Here belongs probably C. *Pellers*, Carr, though the author gives C. lanuginosa × Cretica as the parents. R. H. 1880, p. 228.

C. *Lavonensis*, Anderson-Henry (× C. florida var. Fortunei). Fig 980 (adapted from Floral Magazine, 1872) Fls very large;

sepals 6-8, broad, rose-purple, marked with darker veins. Aug. Nov. G. 31 411. Var. *Symeandina* (C. Symeandina, Anderson-Henry × C. florida var. Fortunei) Fls 7 in across, sepals 6-8, pale mauve, a profuse bloomer. Var. *Jenny*, G. Henry, Anderson-Henry. Fls 6-8 in across, robust plant, free bloomer. Fls creamy white, becoming fully expanded when grown in the open sun or under glass. Aug.-Nov. G. M. 13 448. G. M. 43 318—It resembles more the lanuginosa parent. It is not to be confused with C. Henryi, Oliv., a Chinese species allied to C. orientalis and not in cult.

C. *Glabrensis* (× C. patens; C. patens var. *Glabrensis*, Hort.). Lvs, simple or 3-parted, ovate, suborbate fls large deep violet-blue; sepals 6-8. Z. 11 80—Here is a better form.
Oto Froebel, Lemoine. Lvs leathery, simple or 3-parted fls of fleshy texture, grayish white, sometimes becoming bluish, sepals 8, blunt, broad, anthers brownish. *Impératrice Eugénie*, Carré (C. 1 var. pallidus × C. patens). Lvs simple or 3-parted, fls broad and woolly fls 8-9 in across, with 8 broad, white sepals. *Jeanne d'Arc*, Dauvesse. Same cross as last and much like it, but the sepals are grayish white, with 3 blue bars down the center of each. *Gloire de St Julien*, Carré, (× C. patens var. plena). Plant much like C. lanuginosa, but with larger fls; sepals 6-8, white or pale gray at first, stamens yellow. *Gem*, Baker (× C. Standishii). Lvs 3-parted or simple fls like C. lanuginosa in form, grayish blue.

24. *patens*, Morr. & Deene (C. *carileuca*, Lindl. C. *azuren*, Hort. ex Turcz.). Taller and more slender, and fls. smaller and narrower than C. lanuginosa fls, appearing on last year's branches on slender stalks longer than the sepals, spreading; sepals about 8, rather narrow, delicate lilac, stamens purple. Spring. Isle of Nippon, Japan. M. & J. 3. Lav. 2 and 3. B. R. 23 1955. P. M. 4 193. B. 3, 126. I. B. 4 78. R. H. 1856: 261—Should be grown on a northern exposure to preserve the color of the fls. It is almost as prolific as C. lanuginosa in producing garden varieties and hybrids, and it is the most likely of all to produce double-flid forms. Var. *grandiflora*, Davis (C. *carileuca* var. *grandiflora*, Hook.) Fls larger than the type. B. M. 3983. Var. *Standishii*, Moore (C. *Standishii*, Hort.). Fls. about 5 in. across, sepals light lilac-blue, elliptic of metallic luster. Fls. 3, ovate, acuminate, small—A fine variety from Japanese gardens flowering profusely in spring.

The following other garden varieties or crosses belong here.
Mrs James Bateman. Sepals nearly white, marked with dark carmine. *Miss Bateman*, Noble. Fls more compact than the type, 6 in across, sepals ovate, shortly acuminate, pure white, with cream-colored bars, anthers brown. Probably of hybrid origin, allied to Mrs. Standishii. *Stella*, Jackman. Fls not so large as the last, sepals deep mauve, with a red bar down the center of each. F. S. 22 2431. *Amalia*, Sieb. Sepals 6 or more, oblong-lanceolate, light lilac. From Japanese gardens. F. S. 10 1051. *Lanesborough*, Noble. Sepals bluish line, each with a metallic purple bar—A good variety to gradually force to blossom in the greenhouse by March. *Lady Lanesborough*, Noble. Sepals silver-gray, the bar being lighter colored—It will blossom in March in the greenhouse. *Marie*, Simon-Louis. Fls darker than the type. *Mrs G. Jackman*, Jackman. Sepals bluish-white with indistinct wine-red bars. G. M. 128. *The Queen*, Jackman. Fls rather compact, the sepals being broader than the type. *John Murray*, Jackman. Habit and foliage bolder than the type fls somewhat later. G. M. 46 32. *Fair Rosamond*, Jackman. Sepals apiculate, broader than the type, and of the same color. F. S. 22 2432. G. M. 10 128. *Countess of Loercher*, Jackman. Fls double, blue-violet, sepals much imbricated. In the second crop of blossoms the fls are as large as, or often the outside of the petals are larger than the fls. *Vicar*, Noble. Fls much like the type, but large and more compact—Suitable for forcing under glass. *Duchess of Edinburgh*, Jackman. Fls double, white, strongly unbricated. *Reverend Mover*, Moser. Fls 7 in across, sepals 8, mauve with a reddish violet bar. J. 1897 104, 1900. p. 85. *Nelly Mover*, Moser. Fls 5 in across, sepals 8, mauve-pink, with a darker red bar. R. H. 1898 236. *Louis van Houtte*, Hort. Semi-double, rosy white. *Vesta*, Endl. Sepals gray, anthers red. G. 30 1343. G. 9 408. R. B. 6 193. Fls pale, white, with a reddish line. *Edith*, Sieb. Fls pure white. I. H. 1 21. R. H. 1855 341. *Louisa*, Sieb. Fls pure white, with purple stamens. F. S. 10 1052. *monstrata*, Planch. Fls semi-double, pure white. F. S. 9 960. R. H. 1856 9. *Sophia*, Sieb. Fls pale blue-lilac-purple on the edges, with light green bars. F. S. 8 852. I. H. 1 21. B. H. 4 77. R. H. 1855 401. *violacea*, Lem. Fls violet-blue; stamens yellow. I. H. 7 254.

Some double-flowered varieties which possibly belong here are, *Snowdrift*, with white, very double fls. G. 49, p. 189. M. D. G. 1898 496. *Edith Plume*, also white and very double with narrower wavy sepals. M. D. G. 1898 496. *Waverly*, blue, semi-double. M. D. G. 1898 497.

Hybrids of this species are the following: C. *Gudeoni*, Lem. (× C. Viticella pubescens) Fls 3, nearly glaucous, with solitary, violet-purple, 3 in across, with 4 sepals, strongly 3-nerved, tomentose outside. J. H. 4 117. I. H. 7 226—C. *francofurtensis*, Lav. supposed to be a hybrid of C. Jackmanni (C. *batemana*) and C. *patens*, is hardly different. Lav. 7 bis. C. *lanuginosa* × C. *patens*, see the preceding section—C. *florida* × C. *patens*. Some believe that C. *patens* var. *Standishii* represents this cross.

Section VITALBA.

Group CIRRHOSÆ.

25 *cirrhus*, Linn. Climbing, to 10 ft.; glabrous: lvs. persistent, slender-petioled, simple, ovate to ovate-oblong, crenately serrate, 1-1½ in. long, fls. 1-2 in. on the old wood, axillary, whitish, open campanulate, nodding, 1½ in. across, with a short involucre below the sepals; achenes with long plumose tail. Spring. S. Eu., Asia Minor. B.M. 1070. L.B.C. 19:1806.—Tender, only for warmer temperate regions.

26 *baleárica*, Rich. (*C. calycina*, Ait.). Closely allied to the preceding lvs. ternate; lfts. incisely serrate, often deeply 3-lobed, ½-1 in. long; fls. greenish yellow, spotted red inside. Spring. S. Eu. Asia Minor. R.H. 1859, p. 190; 1874, p. 280. G.C. II. 9:500. Gn. 6, p. 425, 31, p. 187, 45, p. 240. L.B.C. 8:720. B.M. 959.—Tender.

Group MONTANÆ.

27 *gracilifolia*, Rehd. & Wilson. Climbing, to 10 ft.; lvs. deciduous, pinnate, lfts. 5-7, ovate to oblong-ovate, cuneate at the base, coarsely serrate, pubescent, about ½ in. long fls. 1-4, axillary, fascicled, white, 1-1½ in. across, on slender stalks 1-2 in. long; sepals 4, spreading, obovate to oblong-obovate achenes glabrous, with long plumose tail. June. W. China.—Very graceful and floriferous species, has proved hardy at the Arnold Arboretum.

28 *montana*, Buch-Ham. (*C. odorata*, Hort, not Wall.) A vigorous climber, often reaching a height of 15-20 ft. lvs. ternate, with oblong-acuminate cut-toothed lfts. fls. several in each axil, following each other in succession of time, resembling white anemone blossoms, sweet-scented, sepals 4, elliptic-oblong, 1 in. long, spreading, becoming pink, stamens conspicuous, yellow achenes glabrous with plumose tails. May. Himalaya region. B.R. 26:53. M. & J. 8. Gn. 30, p. 309, 49, p. 39, 51, p. 319, 60, p. 79, 68, p. 379, 75, p. 371. A.G. 19:391. R.H. 1856:161; 1899, p. 529. G.C. III. 18:303, 20:589. M.D.G. 1902:423. Lav. 22. J.H. III. 49:533. G. 27:237. G.M. 38:661, 46:121, 51:319. Var. *grandiflora*, Hook. (var. *anemoniflora*, Kuntze). Fls. larger, 3-4 in. across. B.M. 4061. M.D.G. 1902:422. G. 34:477. Var. *rubens*, Wilson. Foliage reddish, particularly when unfolding fls. pink or light pink. June. R.H. 1909:35. R.B. 33:232. F.S.R. 3:252. Gn. 77, p. 84. G.M. 50:395; 54:168. J.H. III. 59:325. —Offsprings of a cross between this variety and the preceding are: Var. *lilacina*, Lemoine, with bluish lilac fls. G. 34:345. Var. *perfecta*, Lemoine, and var. *undulata*, Lemoine, with bluish white very large fls. Var. *Wilsonii*, Sprague (*C. repens*, Veitch, not Finet & Gagnep.). Lfts. ovate, usually rounded or subcordate at the base, puberulous on the veins beneath; sepals obovate-oblong, ¾-1 in. long fls. in July and Aug., nearly 2 months later than the type. B.M. 8365. M.D.G. 1912:26. R.B. 35:108. See page 3567.

29 *Spoëneri*, Rehd. & Wilson (*C. montana* var. *sericea*, Franch.) Climbing, to 20 ft. lvs. ternate; lfts. ovate or oval, usually rounded at the base, with 1 or few teeth on each side, silky pubescent above and beneath, 1-3 in. long fls. 1 or 2, white, 3-4 in. across on pedicels 3-6 in. long; sepals broadly obovate, densely pubescent outside; achenes pubescent, with long plumose tail. Spring. W. China.—Beautiful species; has proved fairly hardy at the Arnold Arboretum.

Group RECTÆ.

30 *Armandii*, Franch. Climbing, to 15 ft. lvs. ternate, evergreen, glabrous; lfts. ovate to ovate-oblong, acuminate, rounded or subcordate at the base, entire, 4-5 in. long, coriaceous: fls. white, 1-2½ in. across, with oblong-obovate sepals, in loose axillary

cymes in the axils of last year's branches, with persistent bud-scales at the base, achenes hairy, with long plumose tails. April, May. Cent. and W. China. G.C. III. 38:30. R.B. 35, p. 281. R.H. 1913, p. 65. Var. *Farquhariana*, Rehd. & Wilson. Fls. light pink, large, about 2 in. across. lfts. oblong-ovate.—This handsome species is like the following 3 species, adapted only for warmer temperate regions.

31 *Meyeniana*, Walp. Climbing rapidly; glabrous or slightly pubescent lvs. ternate, lfts. coriaceous, ovate to ovate-lanceolate, cordate or rounded at the base, entire, 2-3 in. long panicle loose and many-fld.; fls. white, less than ½ in. across sepals 4, obtusish, anthers as long or longer than filaments achenes with long feathery tails. Japan, E. China and Indo-China. Summer. B.M. 7897.—Hardy only in warmer temperate regions.

32 *crassifolia*, Benth. Closely allied to the preceding species climbing, quite glabrous lfts. thicker, cuneate at the base, usually obtusish, sepals acuminate, anthers shorter than the filaments. Late summer. China.—Suitable for greenhouse, more tender than the preceding.

33 *Pavoliniæna*, Pampanini. Climbing, glabrous: lvs. subcoriaceous ternate, lfts. long-petioled, lanceolate or oblong-lanceolate, acuminate, 2-3 in. long slender-pedicelled, white, 1-1½ in. across in axillary racemes; sepals linear-oblong achenes fulvous-pubescent, with a long plumose tail. May. Cent. China.

34 *recta*, Linn. (*C. erecta*, Linn.). Herbaceous, somewhat tufted, 2-3 ft. long; lvs. pinnate, lfts. stalked, ovate, acuminate, entire fls. numerous, on a large, branching terminal panicle, white, sweet-scented,

988 *Clematis Lawsoniana* var. *Henryi*, a derivative from *C. lanuginosa* (×¼)

1 in. across. June-Aug. S. Eu. Gn. 52, p. 510; 53, p. 547; 66, p. 152. R.H. 1899, p. 528. G.M. 45, 866. G.W. 14, p. 561. Var. *plena*, Lemoine. Fully doubled, button-like blossoms. H.F. 1860:13. R.H. 1860, pp. 512-13. Var. *mandshurica*, Maxim (C. *ternstroflora*, DC. C. *mandshurica*, Rupr.). Taller and slenderer. lfts. 3-5, ovate, subcordate at the base, rarely cuneate, obtuse, reticulate beneath; fls. pure white in axillary and terminal panicles. R.H. 1909, p. 423.

35 *paniculata*, Thunb. Figs. 990, 991. A vigorous climber. lfts. 3-5, often lobed, acuminate, 1-4 in long, glabrous; fls. fragrant, 1-1½ in across, in axillary and

numerous, in axillary and terminal panicles, sepals 4, linear-oblong, white; stamens white. fr. bearing white plumes. Aug.-Oct. Medit. region. Gn. 52, p. 499; 55, p. 114; 58, p. 319; 76, p. 23. Gn. M. 13 347 H.W. 3, p. 14. V. 5:321.—Must have a sunny exposure; very beautiful. Var. *rubella*, Bole (C. *rubella*, Pers., not Hort.). Differs from the type in having the fls. red outside. Var. *rotundifolia*, DC. (C. *fragrans*, Tenore). lfts. broader, obtuse; fls. fragrant. S. Eu. R.F.G. 4:62 (4666).

There are hybrids of this species with C. *integrifolia* for which see No. 5, C. *aromatica* and with C. *viticella*, see C. *violacea* under No. 20.

Group EUVITALÆ.

37. *Fargesii*, Franch. Climbing, to 20 ft: lvs pinnate; lfts. 5-7, ovate, incised-serrate, sometimes 3-lobed or 3-parted, nearly glabrous or sometimes sparingly silky-pubescent, particularly beneath, 1-2 in long fls 2 in across, white, in 3-fld axillary cymes, long-stalked, sepals 4-6, obovate, finely pubescent outside; achenes glabrous with feathery tails. July. W. China. Var. *Souliei*, Finet & Gagnep. Fls larger, 3 in across, solitary.—A handsome species, resembling C. *montana*.

38. *apiifolia*, DC. Climbing, to 10 ft branchlets pubescent lvs ternate, long-petioled, lfts usually ovate, coarsely serrate and sometimes 3-lobed or occasionally the terminal ternate, glabrous above, pubescent on the veins beneath fls in axillary, many-fld short cymes, white, about ½ in across, sepals pubescent on both sides. achenes pubescent with plumose tails. Sept., Oct. Japan. Var. *obtusidentata*, Rehd. & Wilson. lfts broader, usually truncate or subcordate at base, less deeply serrate with shallow rounded teeth, more pubescent. Cent. China.—Resembles C. *grata* in the shape of the lfts.

39. *brevicaudata*, DC. (C. *brevicaudata*, Hort.) Climbing vigorously; lvs pinnate to bipinnate; segms ovate-lanceolate, acuminate, coarsely toothed, sometimes nearly entire, nearly glabrous or pubescent; fls in axillary panicles, white, ¼-¾ in. across; achenes hairy, rarely glabrous with rather short plumose tails. Aug.-Oct. China. G.F. 5:139.—A very variable species, but little used. Var. *tenuisepala*, Maxim. Segms with only 1-3 teeth on each side or sometimes entire; fls about 1 in. across with glabrous sepals.

40. *grata*, Wall. High climbing: young branchlets pubescent; lvs pinnate; lfts usually 5, broadly ovate, usually cordate at the base, incisedly serrate, sometimes 3-lobed, 1-2 in. long, pubescent on both sides or glabrous above; fls ¾-1 in. across, creamy white, in large panicles; sepals tomentose outside; achenes densely pubescent, with long feathery tails. Sept., Oct. Himalayas. G.M. 47:642 Gn. 66, p. 365; 71, p. 506. Var. *lobulata*, Rehd. & Wilson. lfts. with coarser and fewer

990. Clematis Lawsoniana, one of C. lanuginosa derivatives. (×½)

terminal panicles; sepals 4, dull white. Sept. Japan. G.F. 3:621 (adapted in Fig. 990); 5:91; 9:75 and 185. F.R. 2:581; 6:471. Mn. 7:113. Gng. 1:101 and 165; 4:161, 229; 6:291; 7:246. A.F. 13:1314 M.D.G. 1898: 487-9. G.W. 11:127. V. 16:18. A.G. 20:847. F.E. 16:375. Gn. 57, p. 155; 61, p. 91. R.H. 1874, p. 465 and 1899, p. 527 (as C. *flammula robusta*). 1902, p. 86. Prop. by seed. By far the most common of the fall-blooming species in American gardens. Thrives best in sunny situations. Will stand severe pruning in winter.

36. *flammula*, Linn (C. *Pallasii*, J. F. Gmel.). A slender but vigorous climber, reaching 10-15 ft: lvs. usually bipinnate, dark green, remaining fresh till mid-winter; lfts. small, ovate, oblong or linear: fls. small,

rounded teeth, often 3-lobed or 3-parted, densely pubescent on both sides. Cent. China. Var. *grandidentata*, Rehd. & Wilson. Lfts. occasionally only 3, densely dentate, usually rounded at base, glabrescent above, silky pubescent beneath, chiefly on the veins, 2-3½ in. long. Cent. China.

990 *Clematis paniculata*. (X½)

41 *Vitalba*, Linn. In England called TRAVELER'S JOY. The most vigorous climber of the genus, ascending 20-30 ft. lvs. pinnate, lfts. ovate to ovate-lanceolate, acuminate, cordate at the base, partly cut, 2-3½ in. long. fls. numerous, in axillary panicles, dull white, ¾ in. across, with a faint odor of almonds; styles of fr. long and feathery, from which it is given the name "old man's beard." July-Sept. Eu., N. Afr. Caucasus region. Gn 31, p. 187, 45, p. 389, 53, p. 546. M. D. G. 1898, 319. J. H. III 54 441. H. W. 3, p. 13. — There is a hybrid of this species with *C. heracleifolia*, for which see No. 12.

42 *virginiana*, Linn. Fig. 992. Climbing 12-15 ft. lvs. ternate, lfts. glabrous, cut-toothed, bases often cordate, 2-3 in. long. fls. white, in leafy panicles, often monœcious or dioecious, about 1 in. across when expanded, plumose styles 1 in. or more in length. July-Sept. Nova Scotia to Ga., westward to Kan. G. W. F. A 12 V 3 19, 9 36. Var. *Catesbyana*, Brit. (*C. Catesbyana*, Pursh). Lvs. somewhat pubescent, often binate. Southeastern states. Intro 1883.

43 *lucicifolia*, Nutt. Allied to *C. virginiana*, but having 5-7 lfts., of firmer texture, rather more pubescent, variable in form and margin, but usually 3-lobed or coarsely toothed, 1-2 in. long. fls. white, ¾ in. across, in terminal and axillary panicles; styles densely silky-pubescent, with long straight hairs. Aug. Mo. to New Mex. and Brit. Col. Intro. 1881. Var. *californica*, Wats., has no marked difference. lvs. usually smaller and perhaps more tomentose.

44 *Drummondii*, Torr. & Gray. Climbing; st. and lvs. ashly pubescent; lvs. pinnate; lfts. coarsely cleft, with the segms. more or less flaring and sometimes toothed, ½-1 in. long. fls. dioecious, white, ¾ in. across, in 3-fld. cymes or sometimes solitary; styles becoming 2-4 in. long. Sept. Dry ground, Texas to Ariz.

45. *lasiantha*, Nutt. Climbing; tomentulose. lvs. ternate; lfts. roundish, few-toothed, tomentulose on both sides or glabrous above, 1-2 in. long; fls. 1-3, axil-

lary from sealy buds on last year's branches, white, fragrant, 1½ in. across, sepals tomentulose outside. achenes pubescent, with long feathery tails. Spring. Calif.

Group HEXAPETALÆ.

46. *indivisa*, Willd. Large woody climber: lvs. ternate, coriaceous; lfts. ovate-oblong to narrow-oblong, subcordate, 1-4 in. long, usually entire. fls. in axillary panicles, white, 2-4 in. across with 6-8 oblong sepals; achenes pubescent with a long plumose tail. New Zeal. — Only the following var. seems to be in cult.: Var. *lobata*, Hook. Lfts. more or less lobed or even 3-parted. B. M. 4398. R. H. 1853: 241. F. S. 4:402. G. n. 12 400:41, p. 336, 53, p. 547, 74, p. 527; 77, p. 67. H. F. 1853. 144. G. C. III 29 215; 38 135. G. M. 50: 267. G. 8:289; 32 281-3. J. H. III 62 387. A. F. 13 879, 16 56; 30 221. G. n. 16 199, 8 356. G. F. 6 167. — Only for warm or temperate regions, often cult. as a greenhouse plant and flowering profusely in winter and early spring.

991
Flower of *Clematis paniculata*. (X½)

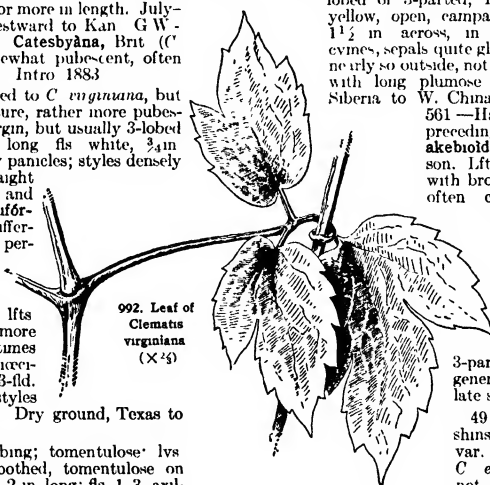

Group ORIENTALES.

47 *orientalis*, Linn. (*C. graveolens*, Lindl.) A rapid climber, reaching 12-15 ft. lvs. thin, glaucous and shiny, pinnate, lfts. 3-parted or -lobed, with small, ovate or oblong-ovate, entire or cut-toothed divisions ½-1½ in. long. fls. in few-fld. cymes, sometimes solitary, becoming erect or nearly so, 1½ in. across; sepals 4, yellow, tinted with green, pubescent on both sides, spreading, somewhat reflexed, styles plumose. Aug., Sept. Himalaya region to Persia. Lav 21. B. M. 4495. G. n. 31, p. 186, 45 240, 52, p. 501. F. S. 4 3746 (pl. 336), 6 548. R. H. 1855 321, 1899, p. 530. J. F. 2 128. P. F. G. 2, p. 67. G. n. 5 227, V 3 302.

48 *glauca*, Willd. (*C. orientalis* var. *glauca*, Maxim.) Slender climber, glabrous. lvs. pinnate, very glaucous, lfts. usually oblong, obtusish, entire or sometimes 3-lobed or 3-parted, 1-2 in. long. fls. yellow, open, campanulate, nodding, 1½ in. across, in few-fld. axillary cymes; sepals quite glabrous inside and nearly so outside, not reflexed; achenes with long plumose tails. Aug.-Oct. Siberia to W. China. R. H. 1890, p. 561. — Hardier than the preceding species. Var. *akebioides*, Rehd. & Wilson. Lfts. usually 3-lobed with broad rounded lobes often coarsely crenate, about 1 in. long; fls. usually in 3's, rarely solitary. W. China. Var. *angustifolia*, Ledeb. (*C. intricata*, Bunge). Lfts. usually

3-parted with narrow generally linear-lanceolate segms. Mongolia.

49 *tangutica*, Korsunsky (*C. orientalis* var. *tangutica*, Maxim. *C. eriopoda*, Koehne, not Maxim.) Climb-

992. Leaf of
Clematis virginiana
(X½)

ing, to 10 ft.; young branchlets slightly villous or nearly glabrous; lvs. green, pinnate; lvs. oblong-lanceolate or lanceolate, acuminate, irregularly serrate with spreading teeth, sometimes 3-lobed or 3-parted, 1-3 in. long; fls. solitary, bright yellow, nodding, 3 in. across, sepals glabrous, except at the margin, acuminate or obtusish; achenes with very long plumose tails. June, sometimes again in Aug., Mongolia to W. China. B.M. 7710. R.H. 1902 528. G.W. 14, p. 651.—Very handsome with its showy bright yellow fls. and later in summer with its large heads of feathery frs.; hardy.

50. *seratufolia*, Rehd. (*C. korœna*, Hort., not Komarov). Shrubby climber: lvs. binate, bright green, glabrous; lfts. ovate-lanceolate to lanceolate, acuminate, inequally serrate, 1-2½ in. long; fls. 1-3, axillary, long-stalked, yellow, nodding, 2 in. across; sepals glabrous, except at the margin; achenes with long plumose tails. Aug., Sept. Korea.—Handsome and quite hardy. The true *C. korœna* belongs to the Atragene group and has petaloid stamens.

C. acutidigula, Hook f & Thoms. Allied to *C. lasandra* Sta. deeply grooved lvs bipinnate, with ovate or ovate-lanceolate crenate lfts. fls. axillary, brownish yellow, with the sepals winged on the back. Sept., Oct. Himalayas. Not hardy N.—*C. Adonis*, Brit. Allied to *C. Victoria* Upright herb, glabrous lower lvs. simple, upper pinnate fls. purplish May, June Va and N.C. G.F. 9 325 —*C. angustifolia*, Jacq. Allied to *C. recta* Lvs. pinnate with simple or 3-parted linear lfts. fls. solitary or in 3's with 4-8 sepals. S. Eu. R.F.G. 62 (4605) —*C. aristata*, R. Br. Allied to *C. indivisa* Evergreen lvs ternate, with ovate to ovate-lanceolate, cordate lfts. fls. cæcescent, white, in few-fld axillary corymbs 2 in. across, fragrant. Austral. Allied to *C. ligusticifolia* Lfts. 5, ovate, to ovate-oblong, 1-1½ in. long fls. in axillary racemes or panicles, white, 1 in. across, sepals reflexed achenes few-fld. Brit. Col. G.F. 9 255 —*C. Thunbergii*, Steud. Climbing, pubescent or glabrous lvs. pinnate with ovate to lanceolate, often 3-lobed or 3-parted fls. fls. in axillary panicles, sepals spreading, lanceolate, filaments hairy at the base. S. Afr. G.C. III 50 253

K C DAVIS

ALFRED REIDER †

CLEMATIS, MOCK: *Agdestis clematidis*.

CLEMATOCLETHRA (*Clematis* and *Clethra*, referring to the similarity of the flower to that of *Clethra* and to the climbing habit) *Dillenaria*s. Shrubs grown for the profusely produced fragrant flowers and the attractive black or red berries.

Deciduous climbing plants, branches with solid pith winter-buds conspicuous, free, with several imbricate scales lvs. petioled, usually serrate, fls. in axillary cymes or panicles, sometimes solitary, white; sepals 5, imbricate, persistent; petals 5, imbricate, stamens 10, short, ovary 5-celled, each cell with 10 ovules, style simple, cylindric fr. berry-like, with thin flesh, subglobose, usually 5-seeded.—About 12 species in Cent and W. China. Closely allied to *Actinidia* which is easily distinguished by its numerous stamens, many styles, many-seeded fr. and in the winter state by its winter-buds being hidden by a swelling of the tissue around their base. Several species have been recently intro., but the names of most of them have not yet been determined. They are apparently harder than the Chinese *actinidias* and superior from an ornamental point of view on account of their profusely produced fls. and frs. though the foliage as a rule is smaller and not quite so handsome. Prop. by seeds and probably, like *actinidias*, by greenwood cuttings in summer and also by hardwood cuttings and layers.

Hémsley, Baill.

Climbing, to 20 ft. young branches pubescent at first, soon glabrous. lvs. slender petioled, ovate to oblong-ovate, acuminate, denticulate, glabrous above, brownish pubescent on the veins beneath, 2-4 in. long fls. white, about ½ in. across, 4-12 in. stalked axillary cymes: fr. globose, black, about ½ in. across. Cent. China. H.I. 29:2803.

integrifolia, Maxim Quite glabrous: lvs. ovate to ovate-lanceolate, acuminate, finely serrulate or entire, dark green above, glaucous beneath, 1½-3 in. long.

993 *Clematis spinosa*.

fls. solitary or in 2- or 3-flid cymes on slender stalks, white, $\frac{1}{8}$ – $\frac{1}{2}$ in. across; fr. globose, black. W. China.

ALFRED REHDER.

CLEOME (meaning uncertain). *Capparidaceae* Odd spider-flowered plants sometimes grown in the flower-garden

Sub-shrubs or annual herbs, simple or branched, glabrous or glandular, with simple lvs. or 3–7 lfts., and white, green, yellow or purplish fls borne singly or in racemes; petals entire, with claws.—Seventy tropical species, in both hemispheres. The genus is distinguished from *Gynandropsis* by its short torus, which often bears an appendage, and by the 4–6, rarely 10, stamens

The garden cleomes are chiefly interesting for their long purple spidery stamens and showy rose-colored petals. They succeed in sandy soils and sunny situations, and can be used like castor-oil plants to fill up large gaps in a border. *C. spinosa* is the best, and has lately been planted considerably in public parks amongst shrubbery. Propagated by seeds, which are produced freely in long slender pods borne on long stalks

A *Lfts more than 3.*

spinosa, Jacq (*C. pinnatifida*, Willd. *C. gigantea*, Hort., not Linn.) GIANT SPIDER PLANT Figs 993, 994 Clammy, strong-scented, 3–4 ft high lfts usually 5, sometimes 7, oblong-lanceolate, with a pair of short stypular spines under the petioles of most of the lvs., and in the tropics some little prickles on the petioles also fls rose-purple, varying to white, petals 4, obovate, clawed, $\frac{1}{2}$ in long, stamens 2–3 in long, blue or purple. N C to La (naturalized from Trop Amer) and escaped from gardens B.M. 1640 G.C III 45' 115—A tender biennial north, but annual in the tropics. The plant recently intro as *C. gigantea* is not the true species, which is a green-flid N American plant as yet apparently unknown in the trade in this country. *C. spinosa* differs widely in the extent and character of its spines. The fls vary in the development of the style, Fig 994 shows a fully perfected style

speciosissima, Deppe Annual or half-shrubby, sometimes 5 ft high fls strongly hairy without spines, lfts 5–7, lanceolate, dentate, narrowed at the base, conspicuously hairy on both sides fls light purple or purplish rose July to fall Mex B.R. 1312—Said to be the showiest of cleomes Under this name a very different plant is passing, the lfts of which have only minute hairs but rather numerous spines.

AA *Lfts 3*

serrulata, Pursh (*C. integrifolia*, Torr & Gray) ROCKY MOUNTAIN BEE-PLANT. Glabrous, 2–3 or even 6 ft. high lfts 3, lanceolate to obovate-oblong, entire, or rarely with a few minute teeth bracts much narrower than in *C. spinosa* petals rose,

rarely white, 3-toothed; receptacle with a flat, conspicuous appendage. Along streams in saline soils of prairies—In cult over 30 years as a bee-plant.

C. dendroidea, Schult Tree-like, 10–14 ft fls blackish purple. Broad B.M. 4206—*C. grandis*, Lam. Shrubby, 4–5 ft, downy; lfts 7, lanceolate, lance-oblong or oblanceolate, the entire fls shorter than petiole fls greenish, petals linear, 2 in or more long, cohering by their margins and opening only on one side, sepals long-linear, glandular, becoming revolute. Trop Amer B.M. 3187—*C. speciosa*, HBK=*Gynandropsis* N. TAYLOR.†

994. *Cleome spinosa*. (× $\frac{1}{2}$)

CLERODENDRON (Greek, *chance* and *tree* of no significance) Includes *Siphonanthus* and *Volkameria* *Verbenaceae*. Greenhouse climbers and hardy shrubs and other ornamental plants, grown for the showy white, violet or red flowers

Shrubs or trees, often scandent lvs opposite or verticillate, mostly entire or not compound fls in mostly terminal cymes or panicles; calyx campanulate or rarely tubular, shallowly 5-toothed or 5-lobed, corolla-tube usually slender and cylindrical, the limb 5-parted and spreading, the lobes somewhat unequal, stamens 4, affixed on the corolla-tube, long-exserted and curved, style exserted, 2-cleft at the end, ovary 4-loculed fr a drupe enclosed in the calyx—About 100 species, in the tropics, mostly of the eastern hemisphere

Clerodendrons are divided into two garden sections, —those with a shrubby habit, and the twining kinds. The culture is about the same for both kinds. They may be grown from seeds or from cuttings of the half-ripened wood. In either case, use 2-inch pots filled with a mixture of equal parts of leaf-mold or peat and good sharp sand. Place a cutting or a seed in each pot, and press moderately firm. Leave the pots in a tight case with a temperature of 70°, and keep the soil at all times fairly moist. When the pots are filled with roots, shift into a 4-inch pot, using a compost consisting of fibrous loam two parts, leaf-mold and sand one part each, and a fifth part of well-rotted manure. Pot rather firm, as this insures a stronger growth, and during the growing season keep in a night temperature of 65°—Clerodendrons may be flowered in any size pot desired, and some of the species, notably *C. Balfourii* (or properly *C. Thomsonae*), can be had in flower from Easter until late September. This species is probably the best and most useful, either for decorative work or exhibition purposes, when it is grown in large pots, a good rough material may be used for potting. A good stiff fibrous loam

with about one-third part of decayed manure is best. When the season's growth is completed, gradually withhold water for two months and lower the night temperature from 65° to 55°. Many of the leaves under the above treatment will drop and the wood will become firm. If plants are wanted in flower about Easter,

995. *Clerodendron Thomsonae*. (× $\frac{1}{2}$)

give them a thorough soaking with water about January 1, and raise the temperature again to 65° by night, letting it rise during the day to 75° to 80°. Syringe the plants two or three times a day, which will encourage the young growths to start all over the ripened wood. When this takes place, the plant will either have to be repotted or fed liberally with liquid manure and fertilizers, repotting usually resulting in larger panicles of flowers. If feeding is resorted to, a handful of green cow-manure to a watering-pot containing two and a half or three gallons of water is sufficient; and if any of the popular fertilizers are used for a change, a small handful to the same amount of water will answer. Water twice in between with clean water. Plants for a succession may be started when the first are beginning to show the crimson at the end of the flower, and so on until the end of July or first of August. —Clerodendrons are not subject to insect pests if kept thoroughly syringed during their growing season. If this is neglected, the shrubby kinds may become affected with brown-scale or mealy-bug, which should be immediately treated with the usual hydrocyanic gas fumigation. (George F. Stewart.)

A Plant of twining habit.

1 *Thomsonae*, Balfour (*C. Balfourii*, Hort.) Fig 995. Tall, twining, glabrous evergreen shrub lvs opposite, oblong-ovate and acuminate, strongly several-nerved, entire, petioled fls in axillary, and terminal forking lax cymes, calyx strongly 5-angled, narrowed at the apex, white; corolla-limb light crimson and spreading; corolla-tube 1 in long; stamens $\frac{3}{4}$ in long. W Afr B M 5313 R.H. 1867.310, 1902:504 G.M. 46:173 G.W. 4, p. 439; 8, p. 173; 13, p. 340. F.E. 28:261 —A greenhouse plant of great merit, and the most popular of the tender species. Blooms profusely on the young wood. Var *delectum*, Hort (*C. delectum* and *C. delectatum*, Hort.) Fl-clusters very large; calyx pure white or green-tinged; corolla large, rose-magenta.

2. *splendens*, Don (*Siphonanthus splendens*, Hiern). A most excellent stove climber. sts. slender, woody, glabrous, slightly angled lvs opposite, variable, oblong-cordate, or elliptic, 4-6 in long, dark green, petiole rather short. fls in dense many-flowered cymes on leafy growths from the ripened wood of the previous year, bright scarlet passing into bright yellow, an inch or more in diam; stamens 1 in long. Trop. Afr. B.R. 28:7 R.H. 1902:504. H.U. 5, p. 325.

3. *speciosum*, Hort. A garden hybrid between *C. splendens* and *C. Thomsonae*, intermediate in habit and foliage. the fls. are produced in profusion, are dull red, and are continuously borne throughout the summer months; old calices more or less persistent, and ornamental pale red after fls. are past. —As figured in R. H. 1873, 471 and Gn. 1877, 404, this reseedes very little from typical *C. splendens*, according to Baker, but the *C. speciosum hybridum* of I. H. 1869, 5593 is intermediate between *C. splendens* and *C. Thomsonae*.

AA. Plant of erect or self-supporting habit.

B. Corolla-tube not much if any longer than the large calyx: fls. white or light bluish

4. *fragrans*, Vent (*C. coronaria*, Hort.? *Volkameria fragrans*, Vent?). Pubescent,

half shrubby, with angled branches, 3-5 ft. lvs broadly ovate, with truncate or cordate base, acuminate, coarsely toothed: fls. white or bluish, in terminal, compact, hydrangea-like corymbs, usually double, delicately scented. China, Japan. B.M. 1834 —Very desirable and fragrant plant for the coolhouse. Hardy in S. Lvs ill-scented.

5. *infortunatum*, Gaertn (*C. vicosum*, Vent.) Height 5-7 ft., pubescent, with square branches: lvs opposite and stalked, cordate-ovate, acuminate, entire or toothed, hairy fls in a loose villous terminal panicle, white, with a flesh-colored center, flaring, the tube projecting beyond the loose, hairy, large, 5-angled calyx. E. Indies B.M. 1805 —Fls sweet-scented. Greenhouse.

6. *trichotomum*, Thunb (*C. serotinum*, Carr *Volkameria japonica*, Hort., not Thunb.) Fig. 996. Slender but erect, graceful, pubescent sub-shrub, 4-10 ft high or even higher lvs mostly opposite, soft and flaccid, ovate-acuminate, narrowed at the base, very closely serrate or entire, hairy, fls. white, with a reddish brown calyx, on forking, slender, reddish peduncles, the corolla-tube sometimes twice as long as the calyx; segments of calyx turning red and affording pleasing contrast to bright blue frs. Japan B.M. 6561. Gn. 43:504; 51, p. 320; 75, pp. 67, 447 G. 26:492 J.H. III. 55:355 F.E. 29:653. R.H. 1867, p. 351. —A very handsome, hardy shrub or small tree. In the N. it kills to the ground, but sprouts up if the crown is protected.

7. *Fargesii*, Dode (*C. trichotomum* var. *Fargesii*, Hort.). A recent shrub, reported as being hardy in England, rapid-growing lvs. dark green or purplish, opposite, petioled, the blade ovate and acute or acuminate, strongly veined, abruptly narrowed at the base, entire: fls in panicles in summer, whitish, fragrant; sepals lance-ovate, becoming reflexed: fr. globular,

996. *Clerodendron trichotomum*.

($\times \frac{1}{2}$)

size of a sweet pea seed, peacock-blue, set on the purple or crimson old calyx. China. G.M. 54:817. R.H. 1911, p. 522, 523.

8 *inermis*, Gaertn. Tall shrub or becoming small tree; lvs opposite or ternate, obovate or elliptic, entire, scentless, privet-like, $1\frac{1}{2}$ in or less long; fls white, fragrant, on 3-7-fld. axillary peduncles, corolla-tube $\frac{3}{4}$ in. long, the lobes very short fr. $\frac{1}{2}$ in. long, smooth, separating into 4 parts India, where it is said to be used for hedges—Offered in S. Calif.

BB. Corolla-tube markedly longer than the small calyx (usually 2-3 times or more longer).
c Fls white

9 *tomentosum*, R. Br. Shrubby and erect (often becoming a small tree), pubescent, often purplish; lvs opposite and petioled, ovate-elliptic to sub-lanceolate, short-acuminate, 2-4 in long, entire or sparingly toothed, pubescent on both sides, but thickly so on the under side; fls in opposite, forking compact clusters, the calyx not enlarged, the slim, corolla-tube long-exserted (3-4 times length of calyx), and the clear white corolla-lobes reflexed-curved, anthers yellow, protruding Austral B.M. 1518—Cult in S. Calif.

10 *macrocephalum*, Hook f. (*C. incisum* var. *macrocephalum*, Baker) Elegant erect shrub, finely pubescent; lvs opposite, oblanceolate-oblong, acuminate, notched or pinnatifid; fls in a nearly sessile terminal cyme or head, pure white; calyx green, very small; corolla-tube very narrow, 4-5 in long, hairy, the hmb 1-sided, $\frac{1}{2}$ in. long; filaments 2 in long, red E. Afr B.M. 6695—Warmhouse plant of merit, but the handsome fls are short-lived.

11 *Siphonanthus*, R. Br. (*Siphonanthus indica*, Willd.) TURK'S TURBAN. TUBE-FLOWER. Shrub, 2-3 ft. high, open-branched; lvs opposite or verticillate, nearly sessile, narrowly lanceolate, entire or nearly so; fls. long-tubed and white (tube 3-4 in. long) in very large terminal racemes, the lobes $\frac{3}{4}$ in long, obovate-oblong; fr a showy, red and purple berry, which persists a long time. E. Indies. Hardy in Fla.

cc. Fls. red, orange or distinctly lilac.

12 *squamatum*, Vahl (*C. Kaempferi*, Sieb.). Shrub 6-10 ft., thinly pubescent; lvs. large, opposite, round-cordate, entire or denticulate, acuminate. Infl and fls. brilliant scarlet; fls. with small red calyx and reflexed, spreading, unequal corolla-lobes; corolla-tube 1 in. or less long, very slender; drupe blue-black or greenish blue, rather fleshy. China B.R. 649 R.B. 22:253. (In 42:562. Gt. 5:352.—Very showy. Cult. in warm greenhouses, and in the open in S. Calif. and S. Fla. The fls. are in an erect branchy, panicle-like cluster.

13 *fallax*, Lindl. Fig. 997 A highly ornamental species st. erect, shrubby, branching after flowering, bluntly 4-angled; lvs. large, cordate-ovate, hairy, rich

dark green, often 1 ft in length and supported by a stout hairy petiole. Infl erect, often 18 in. or more in length; fls bright scarlet, numerous, $1\frac{1}{2}$ -2 in. diam., tube narrow, lobes reflexed Java G.C. 111. 45:324. Gn. 59, p. 179, desc. G.W. 10, p. 247—Should be in every collection of warmhouse plants, as it may be induced to bloom practically all the year round; it should be given a fairly light position, with slight shade from strong sun

14 *myrmecophilum*, Ridley Shrub, sparingly branched, 3 ft., with terete sts and white bark lvs opposite and alternate, 1 ft long, linear-oblong, shining dark green, with a dozen pairs of conspicuous nerves short-petioled. fls yellow-red, in a large, showy terminal pubescent panicle, calyx about $\frac{1}{2}$ in long; corolla-tube considerably longer than calyx, corolla-lobes $\frac{1}{2}$ in. long, obovate to oblong and obtuse; filaments red, much exserted Singapore B.M. 7887 G.C. 111 33 291; 35 237 R.H. 1907, p. 443 G. 26.359 G.M. 47 259 Gng 13 376 A.F. 25.78.—The hollow sts afford nesting-places for ants, whence the name *myrmecophilum* ("ant-loving")—Blooms well in 6-in. pots in a warmhouse, producing panicles 8 in. long on plants 2 ft high

15 *fœtidum*, Bunge (*C. Bungei*, Steud.) Shrub, 3-6 ft., pubescent, spiny, of a dwarf spreading habit, sparsely branched; lvs opposite, broad-ovate and acuminate, stalked, coarsely toothed, often 1 ft. long, dark green above and red-hairy beneath; fls rosy-red, $\frac{3}{4}$ in across, tube 3-4 times as long as calyx, in a dense capitate corymb 4-8 in across China B.M. 4880 F.S. 9 863 G. 27 152, 30 361—Coolgreenhouse, hardy in middle and southern states August Killed to the ground in the latitude of Philadelphia, but sprouts up and blooms Fls not fetid, but name given because of the odor of the bruised lvs Spreads by suckers from the root, and soon forms a mass of beautiful free flowering growths.

L H B

CLETHRA (ancient Greek name of the Alder, transferred to this genus on account of the resemblance of the leaves) *Clethraceae* WHITE ALDER Shrubs or small trees grown for their handsome spikes of white fragrant flowers appearing in summer

Leaves alternate, usually serrate, deciduous or persistent; fls white, in terminal often panicle racemes, petals 5, erect, stamens 10; caps splitting into 3 valves, many-seeded—About 25 species in Amer. E. Asia, Madeira. Only a few hardy deciduous species are generally cult., valuable for their showy spikes of white fragrant fls, appearing late in summer. They grow best in a moist, peaty or sandy soil Prop. by seeds, sown in spring in pans in sandy and peaty soil, and by greenwood cuttings under glass, growing best if taken from forced plants in early spring and placed in slight bottom heat, also, in-

997. *Clerodendron fallax* (× $\frac{1}{2}$)

998. *Clethra tomentosa*. (× $\frac{1}{2}$)

creased by layers and by division of large plants. Handsome when forced under glass.

A. *Lvs. deciduous: stamens exerted.*

B. *Racemes usually solitary, stamens pubescent.*

acuminata, Michx. Tall shrub or small tree, to 15 ft: lvs petioled, oval or oblong, acuminate, rounded or narrowed at the base, sharply serrate, pubescent beneath at least on the veins, 3-7 in long: racemes usually solitary, nodding, sepals acute, style glabrous. July-Sept. Alleghany Mts, Va to Ga. L.B.C. 15:1427.

Shrub lvs. obovate-oblong, tomentose beneath: racemes panicle Mex. B.H. 28.23 — *C. tinifolia*, Swartz Shrub lvs oblong, entire, tomentose beneath: racemes panicle. Jamaica — The last two are evergreen and hardly only in subtropical regions.

ALFRED REHDER.

CLEYÈRA (after Andrew Cleyer, Dutch physician of the seventeenth century). *Ternstroemiaceae*. Greenhouse evergreen shrubs distinguished by the petals free or scarcely coalesced, the pilose anthers, numerous ovules, and scarcely bracted fls: sepals 5, with 2 bractlets; petal 5, stamens 2-3, 1-nerve 2-3-celled. — About 9 species

ochnácea, DC. (*C. japonica*, Sieb. & Zucc.) Height about 6 ft.: lvs oval-oblong, acute at both ends, veined above, entire Himalayas. — A tender shrub rarely cult in northern greenhouses. In the S. it is cult. outdoors. It has glossy foliage, numerous creamy white, fragrant fls., borne in June, and red berries, which last all winter — *C. japonica* was distinguished by DeCandolle by its oblong-lanceolate lvs., which are veinless, and minutely serrate at the apex. Var. **tricolor**, Hort., has dark green lvs, with grayish markings, and a margin of white and rose, the variegation being more brilliant in younger lvs.

WILHELM MILLER.

CLIANTHUS (Greek, *glory-flower*) *Leguminosae*. **GLORY PEA. GLORY VINE. PARROT'S BILL.** Tender half-trailing shrubs, with large, showy flowers of unique appearance. Swansona is an allied genus, but its general appearance is very different and it has acuminate, not obtuse petals. Interesting plants, with pinnate lvs. of many lfts., and fls in racemes, scarcely papilionaceous. pod stalked, many-seeded. — Two or 3 species

Chanthus Dampieri is somewhat difficult to grow on its own roots. In Germany, a method has been found whereby it is as easy to succeed with this species as with the better-known *C. puniceus*. The method consists of using small seedling plants of *Colutea arborescens* as stocks, these are cut over near the soil and seedlings of *C. Dampieri*, while in the cotyledon stage, are separated from the root, the base cut wedge-shape and inserted in a cut made in the *colutea* stock. While the union is taking place, the pots should be placed under a bell-jar *C. puniceus* is an old-fashioned greenhouse plant, grown sometimes to cover rafters or trellis work, but more frequently trained around sticks placed about the edge of the pot. The flowers, not very unlike those of the common *Erythrina*, are freely produced in hanging clusters. Cuttings rooted in early spring may be grown into good-sized plants during the summer. Water should be given sparingly during the dull months. Pruning, repotting and tying the shoots should be done just before the growth begins. A sharp lookout should be kept for the red spider, frequent syringings being the only remedy for this pest. Propagated by seeds and cuttings. (G. W. Oliver.)

Dampieri, A. Cunn. **GLORY PEA** Fig. 999. Height 2-4 ft: plant glaucous and hoary, with long whitish silky hairs, sts slightly tinged with red: petioles longer than in *C. puniceus*, lfts 15-21, nearly opposite, sessile, usually acute, stipules larger than in *C. puniceus* fls 4-6 in a raceme, large, drooping, about 3 in. long, rich crimson or scarlet, with a handsome velvety, purple-black area on the raised center. Austral. B. M. 5051. R.H. 1898-230 Gt 48, p. 272. Gn. 20.86. Var. **germianicus**, Hort., is also sold, and is probably var **marginatus**, Hort., which has one petal white, margined scarlet. See Gn 37 298 and p. 299 for an account of grafting this species on stocks of *C. puniceus*. Var. **tricolor**, Hort. Keel white except the tip, which is bright scarlet. Gn W. 20:409 (desc.)

puniceus, Banks & Soland. **PARROT'S BILL. RED KOWHAI.** Height 3-6 ft., much branched: plant glabrous lfts 16-28, each with a very short petiole, alternate (at least toward the end of the lf), blunt or

999 *Chanthus Dampieri*. (× ¾)

XXVIII. Stowell Evergreen sweet corn.

slightly notched: fls 8 or more in a raceme, crimson, fading with age, at least 3 in. long. New Zeal. B.M. 3584.—Cult. in eastern greenhouses, and a favorite Californian outdoor shrub. Blooms all winter in Golden Gate Park, San Francisco. A white-fl. form has been grown in Calif, but is not so popular as the type. It is commonly cult. in New Zeal. Var. *magnificus*, Hort. Clusters of bright scarlet fls.

WILHELM MILLER.
N. TAYLOR.†

CLIDÈMIA (old Greek name). *Melastomaceæ*. About 100 Trop American species of horticulturally rather unimportant plants in a family famous for its foliage plants. Lvs broad, entire, 5-7-nerved, opposite, petioled fls in panicles or axillary clusters, white, pink, or purple; petals 5 or 6, stamens 10 or 12; branching shrubs, mostly hairy. *C. vittata*, Lind. & André, has large, oval, pointed lvs. with 5 strong nerves, and a narrow band of white down each side of the midrib. I. H. 22.219. R.H. 1876, p. 233.

CLIFF BRAKE: *Pellaea*.

CLIFTONIA (after Dr. Francis Clifton, an English physician, d 1736) *Cyrtaceæ*. BUCKWHEAT TREE. Glabrous evergreen shrub or small tree, rarely cult. for its early appearing racemes of white or pinkish fragrant fls. lvs alternate, short-petioled, without stipules, entire fls in terminal racemes; sepals and petals 5-8, stamens 10, shorter than the petals, the filaments flattened below, ovary superior, 3-4-celled, with a 3-4-lobed nearly sessile stigma; fr indehiscent, ovoid, with 3-4 wings and as many seeds. The only species is *C. monophylla*, Sarg (*C. ligustrina*, Spreng. *C. nitida*, Gaertn. *Mylocaryum ligustrinum*, Sims). Occasionally 50 ft tall lvs oblong-lanceolate, obtuse, cuneate at the base, dark green above, $1\frac{1}{2}$ -2 in long racemes $1-2\frac{1}{2}$ in long, fls white or pinkish, fragrant, about $\frac{1}{4}$ in across fr $\frac{1}{4}$ in long Feb, March; fr in Aug, Sept. Ga to Fla and La, swamps S S 2 52 B M 1625—Little known in cult and now not in the trade, but well worth cult. for its early, delicate and fragrant fls, also the buckwheat-like frs are attractive. Hardy as far north as Philadelphia. Thrives best in humid sandy and peaty soil. Prop by seeds and probably like *Cynilla* by cuttings of half-ripened wood under glass with slight bottom heat.

ALFRED REHDER

CLIMBERS are distinguished from twiners by having some means of attachment, as tendrils or other special devices, while twiners rise by twisting their stems round their support. In a wider sense, the word is often used synonymously with "vines," including all plants that use other plants or other objects for support, by whatever mechanism or method. By "trailers," nurserymen commonly mean low-growing vines, and by "climbers," tall-growing vines. See *Vines*.

CLIMBING FERN: *Lygodium*. Climbing Fumitory: *Adiantum fungosa*. Climbing Hempweed: *Mikania scandens*. Climbing Lily: *Gloriosa superba*.

CLINOSTIGMA (Greek, *inclined stigma*). *Palmaeæ*, tribe *Arctecæ*. Low spineless palms with the habit and somewhat the appearance of small kentias; feather-leaved.

Trunks not over 8 ft., usually conspicuously ringed: lvs usually 3-4 ft. long, rarely more, and pinnate; lfts. scythe-shaped, or lanceolate, 2-parted or obliquely truncate at the apex, not revolute at the base; rachis scaly, convex beneath, grooved above. fls monœcious in the same spadix, sessile along its branches, the male usually 2 together, the female solitary; spadix long and usually much branched, in the male there are 3 imbricate outer segms. and 3 valvate inner segms. to the perianth, with 6 stamens surrounding an abortive ovary: fr. obliquely globular.—Species 3, one from

Austral., one from Samoa, and another from Fiji. Only the following is known in cult., and it is a rare palm. Its graceful lvs and convenient dwarf habit should commend it to the trade. For cult. see *Kentia*.

MOOREANUM, F. Muell (*Kéntia Mooreana*, F. Muell.). Dwarf palm, 3-4 ft high lvs 3-4 ft. long, segms. numerous, about 1 ft long, longitudinally plicate when young spadix at first closely sessile, very much branched when older. New S Wales, confined to Lord Howe's Isl.—This graceful and recent palm resembles *Howea Forsteriana* somewhat in habit of growth, but its arching lvs spread wider, and its sts are dark purplish, and its pinnæ tough and leathery. The palm is free and clean in growth.

N. TAYLOR.

CLINTONIA (after DeWitt Clinton, the famous Governor of New York and promoter of the Erie Canal). *Labiææ*. A small group of low-growing, herbaceous plants of North America and Asia, with a few tufted, broad shining leaves, and usually umbels of flowers.

Perianth-segms equal or nearly so; stamens 6, inserted at the base of the perianth-segms. ovary 2-3-celled with 2 to several ovules in each cavity fls on scapes; root-stocks slender fr a globose or oval berry. For *C. pulchella* and other species of the abandoned genus *Clintonia* of Hort., see *Downingia* a very different genus belonging to Campanulaceæ.

Clintonias grow in cool, moist woods, and fanciers can secure them from some dealers in native plants. It is difficult to tell the species apart by the leaves.

A. Scape bearing an umbel of fls.

B. Fls greenish yellow.

borealis, Raf. Height 1-2 ft fls 3-6, nodding, green, margined yellow. Labrador to Winnipeg and south to N. C. B M 1403 (as *Smilacina borealis*).—This is one of the choicer plants of cool, moist woods, known to plant lovers chiefly by its handsome umbels of blue berries found in autumn, which are borne above the large, dark green, shining lvs. The commonest species, but not easily grown below elevations of 1,000 ft.

BB. Fls white, with green spots.

umbellulata, Torr. Fls 10-20 or more, smaller than in *C. borealis*, erect or nearly so, white, with green or purplish spots. Alleghany Mts from N Y to Ga. B M 1155 (as *Smilacina borealis*).—This species has the smallest fls of the group, and is the only one that has but a single pair of ovules in each cell of the ovary.

BBB. Fls deep rose.

Andrewsiana, Torr. One to $1\frac{1}{2}$ ft. high, bearing 4 sessile, oblong, acute lvs, and 20 or more nearly erect fls which are in dense umbels. Calif, to S Ore, in deep, cool woods, in clayey soil rich in mold. B.M. 7092.—The showiest of the group. Cult to some extent.

AA. Scape bearing 1 white fl.

uniflora, Kunth. The only species in which the scape is shorter than the lvs fls nearly erect, rarely there are 2 fls. lvs. narrow, obovate-lanceolate, hairy. Calif. to Alaska.

WILHELM MILLER.
N. TAYLOR.†

CLITÓRIA (derivation recondit). *Leguminosæ*. BUTTERFLY-PEA. Glasshouse vines with pea-like flowers, and also hardy perennials.

A widespread and variable genus of 30 species allied to *Centrosema*, and characterized by the calyx-tube being cylindrical and longer than the lobes: standard narrowed at the base, not appendaged on the back; stamens in one group, the anthers all alike; style often bearded. The most important garden plant is *C. Ternatea*, a warmhouse annual twiner, reaching 15 ft., and requiring no special cult. It has very showy blue fls.

A. *Lfts. 5.*

Ternatæa, Linn. (*C. cærulea*, Hort. *Ternatæa vulgaris*, HBK.). *Lfts.* 5, oblong, obtuse, short-petioled; fls. 1 in. or more long, rich blue, with beautiful markings, especially on the standard. B.M. 1542 Gn 38.132. P.M. 7:147 and 13:79.—Name from Ternate, one of the Molucca Isls. and not from ternate, meaning 3-leafted.

1000. *Clivia miniata*.

Hardy in Cent. Fla., where it is usually a biennial. *C. alba*, Hort., is a white form. More or less double forms have been known for over a century.

AA. *Lfts. 3.*

mariæna, Linn. Hardy perennial, smooth, erect, or slightly twining, 1-3 ft. high; *lfts.* 3, obovate or ovate-lanceolate; fls. light blue, 2 in. long, on short peduncles; pod straight, few-seeded. Summer. Dry banks, N. Y. to Fla. and west to Mo. Also India and Burma.—Rarely sold by dealers in native plants.

arboræscens, Ait. St. shrubby, the rusty colored branches twining *lvs.* trifoliate, the *lfts* elliptical or oval; fls. racemose, showy, purple, the standard more than 2 in long. Trop. Amer. B.M. 3165.—An excellent warmhouse climber, grown chiefly in botanic gardens.

WILHELM MILLER.

N. TAYLOR †

CLIVIA (after a Duchess of Northumberland and member of the Clive family). Syn., *Imantophyllum*. *Amarylloideæ*. Tender bulbous plants with handsome evergreen foliage and showy, bright red or red and yellow flowers in large umbels.

Bulb imperfect, mostly of old lf.-bases; perianth funnelform, curved or straight, the segments much longer than the tube; ovules 5-6 in each cell; fr. a berry, differing in this from the capsular fr. of Nerine.—Three species from S. Afr. J. G. Baker, *Amarylloideæ*, p. 61.

Clivias make excellent house plants, but, like *amaryllis*, are too costly to be very popular. They have the advantage over *amaryllis* of having attractive foliage all the year round, and are more certain to bloom well. They have thick, fleshy roots, like an *agapanthus*. All the species are well worth growing, because of their handsome umbels of flowers, produced during the

spring and early summer months. *Clivia miniata* is the species most commonly grown. There are several distinct forms of this, with larger and deeper colored flowers. Established plants may be grown in the same pots for several years, if the plants are fed during the growing period with weak liquid manure. In potting, the soil given should be of a lasting nature, not easily soured, nor likely to become sodden. In arranging the drainage, place one large piece, concave side down, over the hole, and around this arrange several smaller pieces. Over these place one or two handfuls of pieces small enough to go through a No. 2 sieve. The best time to pot is after the flowers have been produced. The plants should then be kept for some time in a humid atmosphere to encourage growth, receiving an abundance of water after they are well started. After growth has been completed, they will winter safely in an ordinary greenhouse temperature (not under 40°), if kept rather dry at the root. For propagation, choose old plants which have become crowded in their pots, so that the entire plant can be pulled to pieces. After trimming the roots, put the growths in small pots and keep in heat, to encourage root action. *Clivias* are well suited for planting permanently in the front part of greenhouse borders. The soil for this purpose should be rich and well firmed about the roots. Withhold water as much as possible during the resting period, or the plants will produce leaves at the expense of the flowers. (G. W. Oliver)

A. *Fls. erect; perianth broadly funnel-shaped.*

miniata, Regel (*Imantophyllum miniatum*, Hook.). Fig 1000 *Lvs* 16-20, in a tuft, sword-shaped, tapering to a point, 1½ ft long, 1½-2 in broad; fls 12-20, in an umbel; perianth erect, bright scarlet, with a yellow throat, tube broadly funnel-shaped, longer than *C. nobilis*; segments about 2 in long, the inner ones broader than the outer; stamens shorter than the segments; style not exerted; berries ovoid, bright red, 1 in long. Natal. B.M. 4783 R.H. 1859, pp 126-7, 1869 250, and 1894, p. 572. F.S. 9.949, 23.2373 I.H. 26.343, 36.80; 37.102; 40:177.—*I. cyprianthiflorum*, Van Houtte (F.S. 18 1877), is a hybrid between this species and the next. It has a curved perianth, with the inner segments of the limb twice as broad as the outer; stamens longer than the corolla. R.H. 8 259 (desc.) Var *aurea*, Hort. Fls yellow with a deeper shade at base of the segments. Var *striata*, Hort. *Lvs* freely variegated.

AA. *Fls. pendulous, perianth narrowly funnel-shaped.*

nobilis, Lindl. (*Imantophyllum Aitoni*, Hook.). *Lvs.* about 12, strap-shaped, very obtuse, with a roughish edge. fls 40-60, in an umbel; perianth curved and drooping, tube narrowly funnel-shaped, shorter than in *C. miniata*; segments tipped with green, about 1 in long; stamens as long as the segments; style exerted. Cape Colony. B.M. 2856. L.B.C. 20:1906. Intro. to cult. 1828.—*I. cyprianthiflorum*, Van Houtte (F.S. 18:1877), said to be a hybrid between this and the above, shows little if any influence of *C. miniata*. It has the narrow-tubed, pendulous fls. and the greenish tinge of *C. nobilis*. R.H. 1894, p. 573.

C. Atterdens, Hook. Very much as in *C. nobilis* but with the corolla-lobes obviously spreading; stamens as long as the perianth-segments; anthers oblong, yellow. B.M. 4895.—A desirable plant. WILHELM MILLER.

Root-system

CLOVE PINK: The carnation, *Dianthus Caryophyllus*.

CLOVER. Species of *Trifolium* (Leguminosae), particularly those that are useful in agriculture. The word is also applied to species of related genera, as Medicago. The sweet clover is *Melilotus*. Bush and Japan clover are *Lespedeza*s. Prairie clover is a *Petalostemon*.

About 300 species of *Trifolium* have been described. These are widely dispersed in temperate climates. The flowers are papilionaceous but small, and are disposed in dense heads or spikes. The leaves are digitately or palmately 3-foliate. The common European red clover is *T. pratense*, Linn., now thoroughly naturalized in North America, but supposed not to be native here. It is valuable both for stock feed (as pasturage and hay), and also as a green manure. As a manure crop, to be plowed under, it is particularly useful because of its deep root-system and its power (in common with other leguminous plants) of fixing the nitrogen of the air by means of its roots. Fig. 1001 illustrates the root system. Fig. 1002 shows the root of a fifteen-months-old plant that grew in hard clay soil. It is 22 inches long, and some of the root was left in the ground. The mammoth red clover (*T. medium*, Linn.) is perhaps an offshoot of *T. pratense*. It is usually a larger plant, with zigzag stem, entire and spotted leaflets, and longer-stalked head. White clover, or shamrock, is *T. repens*, Linn., introduced from Europe, and supposed to be native to North America as well. Alsike clover, *T. hybridum*, Linn., is of

1002 The penetrating root of the red clover

1003. Crimson clover — *Trifolium incarnatum* ($\times \frac{1}{2}$)

Old World nativity (*incarnatum*, Linn.), Fig. 1003, an annual from southern Europe, is now much grown as a catch- or cover-crop in orchards. See *Cover-crops*. It is also highly ornamental, and is worthy the attention of the florist. For agricultural discussion of the clovers, see Vol II, *Cyclo Amer. Agric.* L. H. B.

CLOVES are the dried flower-buds (Fig. 1004) of a handsome tree of the myrtle family *Jambosa Caryophyllus* or *Eugenia caryophyllata*, better known as *Caryophyllus aromaticus*, a native of the Spice Islands, but now cultivated in the West Indies and elsewhere. See *Eugenia Caryophyllus*, the ancient name of the clove, means "nut-leaf." The carnation, or "clove pink," was named *Dianthus Caryophyllus* because of its clove-like odor, and it has become the type of the great order Caryophyllaceae, which, however, is far removed botanically from the Myrtaceae. The word "gallflower" is a corruption of caryophyllus, and, until Shakespeare's time and after, was applied to the carnation, but now-a-days it usually refers to certain cruciferous plants of the genera *Cheiranthus* and *Matthiola*.

The clove bark of pharmacy is secured from *Dicypellum caryophyllatum*, of Brazil, one of the Lauraceae. The word clove is used among gardeners for a small secondary bulb employed for propagating, specially for the little bulb that forms in a scale-axil of a larger bulb.

CLUB-MOSS *Lycopodium*

CLÛYTIA (after Cluyt, Dutch botanist of 16th century) *Euphorbiaceae*. Evergreen greenhouse shrubs from S. Afr., rarely cult., chiefly in botanical gardens. Habit often ericoid. lvs. alternate, small, entire; calyx clustered in the axils, staminate with petals; calyx imbricate; stamens about 5, ovules 3. Prop. by cuttings. *C. pulchella*, Linn., is a small shrub; lvs. ovate and somewhat acute, petioled, glabrous, entire; fls. axillary, small, white. B. M. 1945.

J. B. S. NORTON.

CLYTOSTOMA (Greek *klytos*, splendid or beauteous and *stoma* mouth, alluding to the beautiful flowers) *Bignoniaceae*. Ornamental vines, grown for their beautiful flowers.

Evergreen shrubs, climbing by leaf-tendrils; lvs. opposite, with 1 pair of short-stalked entire lfts., the rachis elongated into a slender simple tendril, sometimes wanting; fls. in 2's, axillary, or terminal or in panicles; calyx campanulate with 5 small or subulate teeth; corolla funnelform-campanulate with imbricate rounded lobes, stamens 4, with spreading anther-cells, disk short, ovary conical, warty, 2-celled, with

1004 Clove
1 Spray of leaves and flowers, 2 The opened flower, 3 An unopened bud, or clove

the ovules in 2 rows: caps. compressed, prickly, septoid, with numerous nearly orbicular winged seeds.—About 8 species in S. Amer., usually described under *Bignonia* in horticultural writings. Closely related to *Bignonia*, from which it differs chiefly in its simple

1005. *Cnicus benedictus*.

slender tendrils, the short disk, the small or subulate calyx-teeth and the prickly pod. Suited for cult. in subtropical or tropical regions only, or as a stove plant, in the N. For cult. and prop., see *Bignonia*.

callistegioides, Bur. & Schum. (*Bignonia callistegoides*, Cham. *B. speciosa*, Graham. *B. picta*, Lindl. *B. Lindleyi*, DC.) Large climber. lfts elliptic-oblong, acuminate, undulate, glabrous, lustrous, reticulate below, about 3 in. long. fls. on 2-fld. terminal peduncles; calyx campanulate, with subulate teeth, corolla pale purple, streaked, about 3 in. long, the tube yellowish streaked purplish, limb 2-3 in. broad, with the lobes spreading, broadly oval, obtuse and wavy, disk crenate. Spring and early summer. S. Brazil, Argentina. B.M. 3888. B.R. 28.45. H.U. 3.227. P.M. 10:125. F.S. 9.907.—Will stand a little frost, when grown in the open in the S.

purpureum, Rehd. (*Bignonia purpurea*, Lodd.) Large climber. lfts sometimes 3, ovate-oblong or obovate-oblong, short-acuminate, bright green above, paler below, entire, occasionally toothed, about 3 in. long. fls. on axillary 2-fld. peduncles or sometimes in clusters; calyx tubular-campanulate, with short triangular teeth, corolla mauve-colored with white eye, with a rather slender tube 1 in. long, lobes spreading, orbicular-obovate. Uruguay. B.M. 5800. G.C. III. 24:399.

ALFRED REHDER

CNICUS (Latin name of Safflower, early applied to thistles). *Compositæ*. BLESSED THISTLE, early applied to thistles allied to *Centaurea*, and distinguished from it botanically by its heads being quite sessile and surrounded just below by bristly leaves. Its habit in the garden is very different from the bachelor's button, being thistle-like, and more interesting than ornamental. A hardly annual low-growing herb, rough, branching and pilose. Once thought to counteract poison. Culture easy. Fit for wild gardens and rockeries.

benedictus, (Linn. *Carduus benedictus*, Authors. *Centaurea benedicta*, Linn. *Cardenia benedicta*, Adans.).

Fig. 1005 Height 2 ft. lvs. alternate, sinuate-pinnatifid, oblong, the lobes and teeth spiny heads terminal, yellow, 1 in. wide, the fls. exclusively tubular. Medit. regions and Caucasus. Sometimes cult., also seen in waste places of S. Atlantic states and Calif. as a weed adventive from Eu.

C. raphilips, Hemsl., S. Mex., has recently been cult. abroad. It is described as a handsome plant with deeply cut spiny-toothed lvs. about 2 ft. long, gray-tomentose beneath, st. colored, much branched fl. heads 3-3½ in. long, the involucre bracts scarlet and spine-tipped, fls. scarcely exerted, the filaments carmine. Under the above definition of *Cnicus*, this plant must fall in another genus. It has been placed in *Carduus* by E. L. Greene, as *C. raphilips*.

N. TAYLOR †

COBÆA (after Father Cobo, Spanish Jesuit of the seventeenth century, naturalist, and resident of America for many years). Syn. *Rosenbergia*. Sometimes incorrectly spelled Cobæa. *Polemoniaceæ*. Attractive climbers, one or two species commonly grown in the open and under glass for the large bell-shaped flowers.

Shrubby plants climbing by lf. tendrils, but known in cult. as herbs. lvs. alternate, pinnate calyx large, 5-parted, corolla bell-shaped, the limb 5-lobed caps 3-valved, angled. fls. solitary on long peduncles, bracted at the base.—A genus of about 10 Trop. American climbers (monographed by Brand in Engler's *Pflanzenreich*, hft. 27, 1907), of which *C. scandens*, a tender perennial plant, is amongst the dozen most popular vines commonly treated as annuals. This is the only genus of climbers in the order. Prop. by seeds which should be placed in moist earth, edge down. It is a rapid grower.

scandens, Cav. (*Rosenbergia scandens*, House). Figs 1006-1008 Height 10-20 ft. lfts in 2 or 3 pairs, the lowest close to the st., and more or less eared fls. bell-shaped, 1-1½ in. across, light violet or greenish purple, with protruding style and stamens tendrils

1006. *Cobæa scandens*. (×½)

branched. Mex. B.M. 851. F.S. 14:1467.—There is a white-flid form (*C. alba*, Hort.), and one with variegated lvs., var. *variegata*, Hort.—The terminal lft. is represented by a tendril (Fig. 1007). Sometimes there are indications of tendrils on other lfts. (Fig. 1008), making the plant an interesting one for students of morphology.

stipularis, Benth. (*Rosenbergia stipularis*, House). Resembles the preceding species but the sepals ovate, tapering to a broadly acuminate apex (the sepals of *C. scandens* being broadly ovate or suborbicular). Mex.

1007 Normal leaf of *Cobæa scandens*

macrostoma, Pav (Sometimes erroneously written *macrostema* and *macrostemma*). Sts. climbing 6-10 ft. lvs. alternate, of 3 pairs of obovate lfts. fls. solitary, on a 2-lyd long peduncle, the petals yellow-green, stamens at least $1\frac{1}{2}$ in longer than the corolla. Guatemala. B.M. 3780.

C. minor, Marten & Galleotti. A small vine of which little is known, but cult. in Amer. in botanic gardens and fanciers' collections. It has small fls. borne on stalks shorter than the lvs. Mex.—*C. Pringlei*, House (*Rosenbergia Pringlei*, House). A glabrous, high-twining vine fls. 6, the basal pair oblong-lanceolate, basally clasping, peduncles 4-5 in. long, calyx-lobes green, herbaceous, scarcely 1 in. long and half as broad, corolla pure white, 2 in. long, stamens exserted less than $\frac{1}{2}$ in. Mex.

WILHELM MILLER
N. TAYLOR †

COBNUT. *Corylus*

COBÚRGIA: *Stenomesson*

COCA. The leaves of *Erythroxylon Coca*, used in medicine. Sold chiefly as a fluid extract. Cocaine is the famous local anesthetic. See *Erythroxylon*.

COCCÍNIA (Latin, *scarlet*, referring to the ornamental gourds) *Cucurbitaceæ*. Tender perennial vines, usually with tuberous roots, grown for ornament mostly indoors.

Leaves angled or lobed, sometimes glandular: fls. white or yellowish, large, staminate and pistillate on different plants or sometimes on different branches of the same plant; calyx short, often campanulate. fr. a small, scarlet gourd, sometimes marbled, with an insipid pulp.—Twenty species from the tropics of Asia and Afr. A. Cogniaux in DC., Mon Phan 3:528. *C. cordifolia* is treated as a tender annual, requiring an early start and no special cult. The genus is sometimes referred to *Cephalandra*.

A *Tendrils simple male fls. solitary: lvs. small*

cordifolia, Cogn (*C. indica*, Wight & Arn.). Height about 10 ft., perfectly smooth: lvs. small, 1-2 in. long, glossy, ivy-like, short-petioled, obtusely 5-angled: fl. white, bell-shaped, the staminate solitary: fr. roundish at both ends, about 2 in. long, 1 in. thick. India.

AA *Tendrils bifid male fls. in racemes: lvs. large.*

palmata, Cogn (*Cephalandra palmata*, Lond.). Attaining 30 ft. lvs. large, 3-4 in. long and wide, long-

petioled, palmately 5-lobed: fls. yellowish: fr. ovate, acute. Natal.—Intro. by P. Henderson & Co., 1890. A rare greenhouse plant.

C. Dinteri, André, with palmate lvs. and handsome scarlet frs., may be in cult. S. Afr. R.H. 1900:268.

WILHELM MILLER.
N. TAYLOR †

COCÓLOBA (Greek, *lobed berry*, referring to the ends of the pear-shaped fruit). Sometimes spelled *Coccolobus*. Including *Campdenia*. *Polygonaceæ*. Tropical shrubs, trees or rarely tall woody climbers, grown for their fruits and usually large glossy leathery leaves.

Leaves alternate, always entire: fls. small, in axillary or terminal spike-like racemes, usually some shade of green or yellow-green; sepals 5, herbaceous; petals 0; stamens 8, exceeding the perianth: fr. berry-like, with a small stone, often edible.—About 125 species in the American tropics and reaching to Fla. *C. platyclada* is now referred to *Muehlenbeckia*, which see.

Coccoloba uvifera, the sea-grape or shore-grape of the West Indies, bears an edible fruit, and has particularly beautiful foliage. It is the most important of the genus and is offered by dealers in tropical plants. It will not stand the frost and its cultivation out-of-doors is limited to the frostless region of California and Florida. It can be easily grown in any greenhouse. North. All species are easily propagated by seeds, which are very plentiful with most of the species. Some species may be increased by cuttings of ripe wood, which root easily in sand under the usual conditions, in a frame or propagating-house. Layering may also be employed to increase the stock. The various species grow naturally in both clayey and sandy soils, preferring most rich earth, and a high temperature. *C. uvifera* frequents the seashore, and is found growing in sand and broken shells apparently lacking altogether in plant-food. Rich sandy soil of a light character seems to be best for all the species so far known in cultivation. Plants are readily transplanted from the open ground, but pot-grown plants are to be preferred. (E. N. Reasoner.)

uvifera, Linn. SEA-GRAPE. SHORE-GRAPE. UVADEL MAR. Fig. 1009. Tree, reaching 20 ft. or more, with many flexuous branches: lvs. large, often 5 in. long by 7 in. wide, broadly heart-shaped, wavy margined,

1008. Monstrous or abnormal leaf of *Cobæa*.

glossy, leathery, glabrous, the midrib red at the base; petioles short, with sheathing stipules at the base: racemes 6 in. long, erect in fl., nodding in fr., fls. $1\frac{1}{2}$ in. across, white, fragrant, petals 5, stamens 8; styles 3: berries 9 or more in a raceme, small, about $\frac{3}{4}$ in. long, pear-shaped, reddish purple, dotted green, sweetish acid nut roundish, with a short, sharp point on top, and vertical wrinkles. Sandy seashores of Trop. Amer. especially S. Fla. and W. Indies. B.M. 3130.—The wood is used in cabinet-work, and, when boiled, gives a red color.

floridana, Meissn. (*C. laurifolia*, Jacq.). PIGEON PLUM. Tree, 25-30 ft. lvs. $1\frac{1}{2}$ -3 in. long, 1-2 in. wide, ovate or elliptical, glabrous, narrowed at both ends, obtuse, margin slightly recurved; berries small, $\frac{1}{4}$ in. long, pear-shaped, edible, but not marketable. S. Fla., the Bahamas, and northern coast of S. Amer.

1009. *Coccoloba uvifera*. (X $\frac{1}{2}$)

pubescens, Linn (*C. grandifolia*, Jacq.). A high, sparingly branched tree. lvs. cordate-orbicular, 3-6 in. long, rusty-pubescent beneath, chiefly on the prominent veins. fls. racemose. fr. berry-like, about $\frac{3}{4}$ in. diam. Trop Amer April B M 3166

C. caracasana, Meissn., or a closely related species, has recently been intro to the trade by Franceschi, of Santa Barbara, Calif. It is described as having "larger fr. than other known species, like a good-sized plum." Venezuela.

WILHELM MILLER.

N. TAYLOR †

COCCOTHRINAX (a berry and *Thrinax*, in reference to the berry-like fruit) *Palmaeae*. Small or medium-sized palms, with fan-leaves.

Trees (or rarely stemless) with slender sts., clothed above with the persistent petiole-sheaths, lvs. terminal, pale beneath, thin and brittle, divided into narrow, acute, 2-parted obliquely folded lobes; petioles compressed, slightly rounded and ridged on the 2 surfaces, thin and smooth on the margins; spadix interfoliar, paniculate, shorter than the petioles; fls. perfect, minute, solitary, perianth cup-like, obscurely 6-lobed, deciduous, stamens 9, exserted; ovary superior, ovoid, 1-celled; fr. berry-like, subglobose, 1-seeded, in ripening becoming thick and juicy, shining black or purple-black; albumen channeled.—A genus of a few species, made from *Thrinax*; Fla. and S.

Gárberi, Sarg (*Thrinax Gárberi*, Chapm. *T. argentea* var *Gárberi*, Chapm.). SILVER-PALM. Stemless lvs. only 10-12 in across, fan-shaped, silvery beneath. An attractive dwarf palm, early showing its characteristic form, native on shore of Biscayne Bay, Fla; perhaps a depauperate form of *C. jucunda*, Sarg (*Thrinax argentea*, Chapm., not Roem & Sch.), which has lvs. 20-32 in across; it bears the fls on rigid spreading short pedicels, the perianth is white, anthers light yellow, and ovary orange. fr. $\frac{3}{4}$ in. or less diam, becoming succulent and bright violet and later almost black

and shining, ripening 6 months after the flowering; petiole slender, flexible, rounded on upper side and obscurely ribbed on lower side, extending as a thin undulate rachis that ends in a short obtuse point.

L. H. B

CÓCCULUS (diminutive of *kokkos*, berry, the fruit being berry-like) Syn. *Cébatha*, *Epibátium*. *Menispermaeae*. Shrubs grown for their handsome foliage and the ornamental red or black fruits

Twining or erect lvs. alternate, petioled, entire or lobed, with entire margin, deciduous or persistent, palmnerved fls inconspicuous, dioecious, in axillary panicles or racemes, sometimes terminal; sepals, petals and stamens 6; carpels 3-6, distinct, developing into berry-like, 1-seeded drupes; seed reniform.—About 12 species in N Amer., E and S Asia, Afr and Hawaii, chiefly in tropical and subtropical regions. Only a few species are cult, thriving in almost any somewhat moist soil, the evergreen kinds are sometimes grown in pots, in a sandy compost of peat and loam. Prop. by seeds or by cuttings of half-ripened wood in summer, under glass, with bottom heat.

"*Cocculus indicus*" is the trade name of the berries used by the Chinese in catching fish. The berries contain an acid poison, which intoxicates or stuns the fish until they can be caught. The berries are imported from the East Indies to adulterate porter, and "*Cocculus indicus*" is a trade name with druggists, not a botanical one, just as "*Cassia lignea*" is a trade name of a kind of cinnamon bark, derived, not from a cassia, but from a species of *Cinnamomum*. The name "*Cocculus indicus*" was given by Bauhin, but binomial nomenclature began later, with Linnaeus, in 1753. The plant which produces the berries is *Anamirta Cocculus*

carolinus, DC (*Cébatha carolina*, Brit. *Epibátium carolinum*, Brit.) CAROLINA MOONSEED. A rapid-growing, twining shrub, attaining 12 ft., with pubescent branches. lvs. long-petioled, usually ovate, sometimes cordate, obtuse, entire or 3-, rarely 5-lobed, pubescent, glabrous above at length. petals emarginate: fr. red, $\frac{1}{4}$ in diam. Along streams from Va and Ill to Fla and Texas.—Decorative in fall, with its bright red fr. Not hardy north of N Y

trilobus, DC. (*C. orbiculatus*, Schneid. *Cébatha orbiculata*, Kuntze. *C. Thunbergii*, DC.) Slender climber with pubescent branches; lvs. broadly ovate to oblong-ovate, truncate or subcordate at the base, obtuse, often emarginate, usually entire, pubescent on both sides; petals bifid at the apex fr. bluish black, about $\frac{1}{4}$ in thick, in short-stalked axillary clusters. Japan B M 8489. I T 6.231.—Quite hardy at the Arnold Arboretum, keeps its lvs. green until very late in autumn

C. diversifolius, Mig., not DC.—*Sinomenium acutum*—*C. heterophyllum*, Hemsl. & Wilson—*Sinomenium acutum*—*C. japonicus*, DC.—*Stephanus bernardifolia*—*C. laurifolia*, DC. Erect shrub, to 15 ft., glabrous lvs. evergreen, oblong, acute at both ends. Himalayas. Decorative, with its bright green, shining foliage. Only hardy in subtropical regions

ALFRED REHDER.

COCHLEARIA (Greek, *cochlear*, a spoon, referring to the leaves). *Cruciferae*. More or less fleshy seaside small herbs, including scurvy-grass and related things; scarcely cultivated.

Annual or perennial: lvs. simple. fls. small, white, yellowish or purplish, in racemes. fr. an inflated silicle, with very convex valves, the seeds several in each cell and usually 2-rowed.—About 15 species in Eu. and N. Amer. Formerly the horse-radish was referred here, but it is now placed by some in *Radicula*, by others in *Roripa*, and by still others in *Nasturtium*.

1010. *Cochlearia danica*.

officinalis, Linn. **SCURVY-GRASS**. Hardy biennial, 2-12 in. high, but cult. as an annual: root-lvs petioled, cordate; st-lvs oblong, more or less toothed and sometimes with a short-winged petiole. fls. early spring; calyx-lobes erect. Arctic regions.—Prop. by seed, which is small, oval, slightly angular, rough-skinned, reddish brown. The germinating power lasts 4 years. The green parts of the plant are strongly acrid, and have a tarry flavor. The seed is sown in a cool, shady position, where the plants are to stand. The lvs are rarely eaten as salad, but the plant is mostly grown for its anti-scorbutic properties. Not to be confounded with water-cress.

dánica, Linn. Fig. 1010. Annual, scarcely 6-8 in. high: lvs rounded, kidney-shaped, scarcely 1 in. long in large specimens, usually much smaller. North temperate and arctic regions. L B C. 15:1482.—It is covered in early summer with a profusion of small white fls. A valuable plant for ornament northward.

N. TAYLOR.†

COCHLIODA (Greek for *spiral*, in reference to the structure of the lip). *Orchidaceæ*. A small group of orchids found at high elevations in South America, little grown, requiring treatment given *Odontoglossum*.

Pseudobulbous. fls. bright rose-color or scarlet, in long racemes, sepals equal or the side ones more or less joined, petals all much alike, lip clawed, the blade spreading and the side lobes rounded and perhaps reflexed, the middle lobe narrow.—Some of the species are retained by various authors in *Odontoglossum* and *Mesopidmium*.

Noetziàna, Rolfe. Pseudobulbs ovate-oblong, compressed, about 2 in. long, monodiphyllous lvs linear: peduncles arcuate, fls. numerous, in graceful racemes, orange-scarlet, about 1 in. across, sepals oblong, petals rather ovate, labellum 3-lobed, disk yellow, otherwise similar in color to the petals. Andes. B M 7474. Gt. 43 1403. G C III 16 71. O R 12.309.

rosea, Hort. Plants similar to *C. Noetziàna*: fls. rose-color. Peru. B M 6084. J H 18 66.

vulcànica, Benth & Hook. Peduncles more or less erect. fls. larger than in the preceding, bright rose-color; labellum 3-lobed, provided with 4 ridges. Peru. B M. 6001.

C. brasiliensis, Rolfe. Pseudobulbs tufted, oblong lvs oblong-lanceolate. scapes erect or arching, with 6-13 greenish fls. Brazil.—*C. Flóran*, Rolfe. Natural hybrid between *C. Noetziàna* and *C. rosea*. Fls. cinnamon-red with yellow crest, sepals lanceolate, petals elliptic oblong.

OAKES AMES.

COCHLIOGLOSSA. *Orchidaceæ*. A garden hybrid between *Cochlioda Noetziàna* and *Odontoglossum secptrum* or *O. pratenis*, known as *Cochlioglossa moorlebeekensis*. Fls. star-shaped, the petals and sepals yellow with pale brown spots, lip has the characters of that of *Odontoglossum secptrum*, but a little longer and less attractive. Shows no marks of *Cochlioda Noetziàna*.

COCHLIOSTÈMA (Greek, *spiral stamens*). *Commelinaceæ*. Curious and gorgeous plants cultivated under glass.

Cochlostemas are epiphytes, with the habit of *Billbergia* and great axillary panicles of large fls. of peculiar structure and beauty. They are stemless herbs from Ecuador, with large, oblong-lanceolate lvs, sheathing at the base, and fls. which individually last only a short time, although a succession is produced for several weeks; sepals 3, oblong, obtuse, concave; petals 3, nearly equal, wider than the sepals, margined with long hairs; stamens 3, villous, 2 erect, linear, the third short, plumose; staminal column hooded, with incurved margins, inclosing 3 spirally twisted anthers; style slender, curved.—Gardeners recognize 2 species, although they are considered by some botanists as forms of one. Recorded as the most beautiful cultivated plants of the family.

These are handsome stove-flowering perennial plants, closely related to the *commelinas*, and are of comparatively easy culture, thriving well in ordinary stove temperature in a mixture of two parts loam, and one part fibrous peat, with a little well-decayed cow- or sheep-manure added when potting mature plants. They like a copious supply of water at the roots during the summer months, and at no season must they be allowed to become dry. Propagation is effected by division of the plants in early spring, or by seeds, to obtain which the flowers must be artificially fertilized.—They seed freely when fertilized at the proper time.

Only a few of the stronger or larger flowers should be allowed to bear seed. Sometimes a simple shaking of the flower-stalk will accomplish the necessary work of fertilizing, but it is safer to employ the regular method to insure thorough impregnation. The seeds ripen within six weeks' time, and they can be sown soon thereafter, in shallow pans of light, peaty soil, and placed in a warm, close atmosphere until germinated. As soon as the seedlings are large enough, they should be potted singly into thumb-pots, and shifted on as often as they require it, when they will flower in six to twelve months. The chief reason why cochlostemas are grown in America so little is, probably, that it is necessary to keep a much more humid atmosphere in stove-houses than in England, and this is very much against all stove-flowering plants, causing the season of blossoming to be very short (Edward J. Canning.)

A. Lvs. red beneath: panicle hairy; fls. very fragrant
odoratissimum, Lem. Lvs. lighter green above than in *C. Jacobianum*, and deep purplish red beneath, narrower, and with a similar margin. fls. very numerous; sepals more leaf-like, hairy, green, with a reddish tip. I. H. 6:217. R. H. 1869, p. 170.

AA. Lvs. green beneath: panicle not hairy; fls. less fragrant

Jacobianum, C. Koch and Lind. Height 1-3 ft. lvs. in a rosette, spreading or recurved, dilated and sheathing at the base, margined brown or purplish, 3-4 ft. long, 6 in. broad at the base, 4 in. broad at the middle. peduncles stout, white, tinged purple, 1 ft. long bracts large, opposite and whorled, 3-4 in. long, acuminate, concave. panicle-branches 4-6 in. long; fls. 2-2½ in. across, sepals purplish, petals violet-blue. Autumn. B M 5705. R. H. 1868. 71. G C 1868 323, desc. F S 18:1837-9.

WILHELM MILLER.

COCHLOSPERMUM: Marimbanæa.

COCKLE. In North America, a name for *Lychnis Githago*, or corn-cockle, a familiar handsome-flowered weed of wheat-fields. The name is also applied to the dandel, *Lolium temulentum*.

COCKLE-BUR: Xanthium, a weed.

COCKSCOMB: Celona.

COCKSFOOT GRASS: Barnyard Grass, Panicum Crus-Galli.

COCOA: Products of Theobroma Cacao.

COCOA PLUM: Chrysobalanus Icaeo.

COCO-GRASS: Cyperus rotundus.

COCONUT. Plate XXVII. Figs 1011, 1012, 1014, 1015. The coconut, *Cocos nucifera*, is the most important of cultivated palms. Its nearest relatives, whether or not regarded as in the same genus, are natives of tropical America. For this and for other reasons which have been presented by Cook, it must be believed that the coconut is a native of America, and that it was carried westward across the Pacific in prehistoric times. While the nut will float and retain its power of germination for a considerable time, its propagation from island to island in known cases has practically always been the deliberate work of men, and it is probable that men were

also responsible for its crossing the Pacific. It was a cultivated plant in Polynesia and Malaya, and in many places the chief crop at the time of the discovery of this part of the world by Europeans. But it reached Ceylon recently enough so that its introduction is a matter of fairly reliable legend. It is now grown in all tropical countries except the interior of continents. Its cultivation extends somewhat beyond the tropics, both north and south, but its growth at these extremes, in Florida, India and Madagascar, is not thrifty enough to give it any industrial importance. Within the last two decades, the rise in the price of oils and the discovery of new uses for coconut-oil have caused a tremendous increase in the area devoted to the plantation and cultivation of coconuts.

Climatic conditions favorable for the coconut.

The coconut makes on the climate the characteristic demands of a typically tropical plant. It thrives where the mean annual temperature is 72° F or higher, and where there are no great differences in temperature between seasons. Except where supply of ground water

1011. End of a mature coconut. The nut sprouts usually from the largest eye.

makes it independent of local rainfall, the coconut demands an annual rainfall of at least one meter (about 40 in.); and this precipitation should be well distributed through the year. In most of the best coconut countries, the rainfall is considerably more than one meter. The coconut can endure exceedingly drying conditions for short periods, and is accordingly adapted to the intense light of the seashore, to resisting strong winds, and to enduring salt water about its roots for short periods of time. Moreover, it will live through prolonged droughts. But long dry seasons cut down the crops; and the damage done by droughts lasts for as much as two or three years after the return of rain. A dry season of five or six months every other year will keep the crop at all times down to not more than 40 per cent of what it would be if the supply of water were constant. If there is an ample supply of soil-water, dryness of the atmosphere is favorable to the best production. Seacoasts usually have higher land back of them, and the ground-water from the higher country circulates through the soil toward the sea. Near the shore it comes near enough to the surface to be reached by the roots of the coconut. For this reason, coconuts thrive on the seashore under climatic conditions that prevent good development in the interior. This is the principal ground for the idea that coconuts thrive only near the sea. Around the bases of volcanoes in the interior, similar soil conditions are met with, and such localities are admirably adapted to this crop.

Propagation and cultivation.

The coconut is produced only by seed. Nuts for this purpose should of course be selected from conspicuously good trees. They are usually planted in seed-beds, although, on a small scale, there are various other local methods of handling them during germination. The best treatment is to take them from the seed-bed when the plumule is not more than 6 inches high, which will usually be after about six months. To avoid the expense of keeping the groves clean while the trees are small, it is common practice to leave the nuts for a longer time in the seed-beds, but the transplanting of older seedlings, even with the greatest practicable care, sets them back for several months. In the Jaffna district of northern Ceylon, the nuts are transplanted from the first seed-beds to others in which they have more room, and are not put in their permanent places until they are three or four years old.

In the first years after the coconuts are transplanted, it is good policy to raise catch-crops between the trees. But these crops should be so chosen that they will not compete with the coconut for light or water, and from the profit they pay, a return should be made to the soil of fertilizers at least sufficient to replace what they have removed. By the time the grove is four years old, the coconuts will shade the ground and it will no longer be possible to raise catch-crops on a large scale. Then, but not before this time, it is good practice to use the grove for pasture. The returns from live-stock should be at least sufficient to pay for keeping the plantation in good condition and cattle will themselves do a large part of the work in keeping down the other vegetation. Pasturing of other live-stock in coconut groves is in general not to be recommended. It is not customary anywhere in the tropics to give to coconut plantations such cultivation as is given to orchards in temperate countries. It has even been believed that any but the most shallow cultivation would be detrimental by destroying the roots near the surface, and that machine-cultivation was likely to be too expensive to be profitable, in view of the time that it would have to be kept up before the coconut begins to pay returns. Limited experience in the Philippines indicates that real cultivation produces very much the same results with coconuts as it does with other crops. Coconuts respond, as do other crops, to the application of manures containing potash, nitrogen, and phosphorus. So far as the very limited evidence shows, the demand for these three fertilizing elements is in the order given. With ordinarily good treatment, coconuts come into bearing in seven or eight years. Single trees of standard varieties will bear fruit in five years, while others will require ten. If the coconut is treated as a wild crop, which is by no means uncommon, and little or no attention is given it after the first three years, it will be ten or fifteen years, as a rule, before a full crop is produced and even then the crop will be an inferior one.

Pests.

With the increase in the industry in the tropical world, and with the increase in commerce, there have been created conditions favorable to the development and spread of pests. Twenty years ago, serious coconut pests were practically unknown, and only eight years ago, Prudhomme, in an excellent general treatment of the coconut industry, listed as serious pests only two or three insects and no other organisms. There are now known as serious pests various species of Rhynchophorus, known as palm weevils, *Oryctes*, called the rhinoceros beetle; a scale, *Aspidiotus destructor*, closely related to the San José scale, at least two fungi, and the organisms causing bud-rot. The latter have been determined in the West Indies to be *Bacillus Coli*, and in India to be a fungus, *Pythium palmivorum*. Besides these, there are a large number of minor or local pests, including weevils and other beetles, the

larvæ of moths and butterflies, insects of other groups, and fungi. Damage is also done in places by crustaceans, and by rats and other higher animals. Forests made up of one kind of tree practically do not exist in nature in the tropics, and when such forests are made, as has been done with the coconut, the prevention of devastation by pests will be accomplished only by greater care than is ordinarily demanded to protect the crops of temperate lands.

Varieties.

A very large number of varieties of coconuts is known in different parts of the tropics, but a careful comparative study of their merits has never been made on a large scale and with nuts from many different sources. The best experiment began less than a decade ago in Madagascar. In several localities in the Philippines, there are strains of very large nuts, of which, as a plantation average extending over years, 3,300 produce a ton of copra. In favorable seasons the production has been at the rate of a ton from 2,800 nuts. There are reports of similar large nuts from other countries, but no data as to their yield on a plantation scale. In the parts of the Philippines having the greatest coconut industry, it requires 5,600 to 6,000 nuts to produce a ton of copra, and the same figures apply to Ceylon and various other coconut countries. In still other places the nuts are so small that 7,000 are required to the ton. There are varieties characterized by shape and by color, but these characteristics seem not to be related to the yield either of copra or oil. The nuts of the Laccadive and Maldiva Islands are reputed to produce a particularly good fiber. Throughout the eastern tropics, coconuts are locally used to produce liquor. For this purpose, early maturing varieties that are likely also to produce very small nuts, but numerous clusters, are selected. There are varieties in Ceylon and the Philippines which bear at the age of four years, while the varieties in extensive cultivation and used for the production of copra can none of them be relied upon to produce a crop in less than seven years and not in less than ten years unless properly treated. A Philippine variety known as *Maikapunô* has the interior of the nuts completely filled with a soft, sweet tissue, used as a table delicacy. Such nuts sell locally for about 10 cents, while the ordinary nut is worth 2 or 3 cents.

Uses and products of the coconut.

The local uses of the coconut are almost unlimited. Besides being of practical utility in a very large number of ways to the people of the Malay-Polynesian region, it has, as a result of its practical importance, acquired a prominent place in the rites and superstitions of the people of this part of the world. Thus Murray tells of a tribe of Papuans, among whom it is not proper for a man to cut a person whom he has killed, this privilege being reserved for his associates, but a man may eat the heart of his own victim if he sits on one coconut and balances himself with his feet on two others while he prepares and devours it.

The products of great industrial importance are toddy and its derivatives, coir, and copra and its products.

Toddy is an usual English name of the fresh beverage obtained from the unopen flower-clusters. In the Philippines it is known as "tuba." The mode of securing it differs somewhat in the three countries in which it is secured on an industrial scale, the Philippines, Java and Ceylon. In all of them, the spathe is bent down gradually and the tip is then cut off. A thin slice is afterward cut off with a sharp knife, usually twice a day. After a few days of this treatment, the irritation results in a flow of sap from the cut surface. This sap falls into a jar or bamboo tube from which it is collected, as a rule twice a day, and a very thin slice is removed from the end at each time of collection.

This continues until the whole inflorescence has been removed by the series of slices. The amount of toddy collected depends on the vigor of the tree, on the weather, and on the skill of the workman. Under fairly favorable conditions, a good workman will secure a quart or more a day from one inflorescence. The technique of this business seems to be better developed in the Philippines than elsewhere, with the result that more toddy is secured in a given time from the tree. The toddy is used as a fresh beverage or as a source of alcohol, or less frequently of sugar, or still more rarely of vinegar; it is also a common source of yeast in the East Indies. The toddy, as it falls from the cut branch, contains about 16 per cent of sucrose. This inverts very rapidly if permitted to do so, and the invert sugar is in turn rapidly fermented to alcohol. In parts of the Philippines, the production of strong liquor in this way is a business of some importance. If sugar is to be produced, care is taken to keep the vessels clean and approximately sterile, and the inversion is often prevented by the use of tanbark from one of the mangroves, usually *Bruguiera*. If alcohol is the product desired, the same bamboo tubes are used over and over without cleaning. In the Philippines it is common practice to connect the trees used for this purpose with bridges of bamboo on which the collectors pass rapidly from tree to tree. In other countries each tree is climbed by itself.

(Nat size at this stage)

(Nat size.)

1012 Stages in the growth of a coconut.

Coir is produced for local use in many parts of the world, but as an article of commerce comes chiefly from Ceylon. This fiber was the old staple cordage material of the Polynesian region. As a fiber material, it is conspicuous for its elasticity, being able to stretch 20 or 25 per cent without exceeding the limit of elasticity. It is also remarkable for lightness, for resistance to decay, and for the short length of the individual cells. It is accordingly a valuable fiber for use in ropes subject to abrupt strains, for calking boats, and for a stuffing fiber. Its stiffness and durability make it especially serviceable for the manufacture of mats, and this is its chief commercial use.

Copra—The principal coconut product exported from most producing regions is copra, which is the dried meat or hard endosperm of the fruit. To produce the best copra, nuts should be thoroughly and uniformly ripe, and this condition is best guaranteed by permitting them to ripen on the trees until they fall, and then to collect and use them at frequent intervals. However, it is far more common practice to harvest them before they fall, going through the groves at regular intervals. This is most commonly done every three months. The nuts are cut down in various ways. The simplest method is the use of a long pole made of detachable joints of bamboo and bearing at the top a sharp and recurved knife. A nut-gatherer then goes from tree to tree and cuts down the nuts that are ready, without leaving the ground. This method is the local one used in certain parts of the Philippines.

Elsewhere in the Philippines and in many other places, the practice is to climb each tree, using notches cut at convenient heights for this purpose. If these notches are cut with sufficient care, it probably can be done without real damage to the tree, but in practice such care is not usually taken, and the notches are very often centers from which decay of the trunk begins. In other places the nut-gatherers climb the trees without notches. To do this easily, they usually bind their ankles together with a thong, or pass a rope around the hips and around the tree, or use both of these devices. The old story of the harvesting of coconuts by the use of monkeys is not altogether a myth. In the Sunda islands and in Sarawak, monkeys are sometimes trained for this purpose; and from Sarawak, these trained monkeys are occasionally exported to the Straits settlements. In some of the islands of the south seas, the entire nuts, husk and all, are split into halves with an axe, and in Ceylon a machine for this purpose has come into limited use. Elsewhere, the first step in the preparation of copra is the removal of the husks. This is usually done with the aid of a piece of iron, three cornered and moderately sharp, mounted on an erect stick and standing at about the height of the knee. This implement is in universal use in the Philippines, and elsewhere in the East, and has of late years come into use in the tropics of the New World. A machine to remove the husks has also been invented, but the most that is claimed for it is that a workman can husk a thousand nuts a day, and this is only the standard day's work for a nut-husker in the Philippines by the old method. After the removal of the husk, the nut is split into two halves by a sharp blow with a heavy knife. The water is allowed to run out on the ground.—Methods of drying copra fall under three heads: sun-drying, grill-drying, and kiln-drying. Centrifugal dryers have also been tried and are said to give good results. Sun-drying is the oldest method, and is a good one where the climate is such that the drying can be trusted to go on without interruption. Under favorable conditions it produces the finest grade of copra, Cochin sun-dried being the standard of excellence. Most Philippine copra is grill-dried. A hole is dug in the ground on which is placed a grating usually made of bamboo, and the whole protected by a roof. Coconut husks and shells are used for fuel. The heat and smoke rise directly from the fire to the coconuts. Sun-drying takes usually five to nine days; if more than this is required, the method is unsafe. Smoke-drying is finished as a rule in a single day or in parts of two days. Smoke-dried copra is unsuited for the manufacture of food products and accordingly sells at a lower price than the best copra. It is a good way of making poor copra, for if any copra is imperfectly dried or is even in part the product of unripe nuts, it ferments with a considerable loss of oil, and this fermentation is decidedly checked by smoking. Kilns for drying coconuts are of various patterns in different countries, and if properly handled always produce a high grade of copra. There is one kiln in the Philippines which handles more than three tons of copra at a charge, and dries it in six or eight hours. By all methods, it is customary to make two stages of the drying, one immediately after the nuts are opened, and the other after the meat has shrunk enough to be easily removed from the shells. The ultimate use of copra is the manufacture of oil, an industry which has been developed to the greatest extent in France. In all coconut countries there is a local business in manufacturing oil. This is done by various primitive methods, some of which produce a food or toilet product of the highest possible quality. In the manufacture of such oil, the utmost care is taken and the product is of purely local use. Oil for wider distribution is manufactured with less care, by methods characteristic of the different countries. To prepare oil for world com-

merce, such establishments have long been used in European countries, and to a less extent in the United States, have more recently been founded in the producing lands. The oil has a variety of uses. It was formerly consumed almost entirely in the manufacture of soap and candles. Principally during the last decade, methods of refining and separation have been developed, by which excellent butter-substitutes are made. As the butter produced in this way is palatable and most digestible, and is cheaper than real butter, these products have found a ready sale, with the result that there has been a great increase in the demand for good grades of copra and a consequent improvement in the general quality produced in most countries, and an increase in the price of all grades. It seems probable that the market will for some time continue to increase more rapidly than the supply.

Other products.—A well-known product is desiccated coconut. Among producing countries, Ceylon is the only one which has taken up the manufacture of this article. It is prepared directly from the fresh meat of ripe nuts. Very large numbers of coconuts are also put upon the market of temperate countries as "coconuts," usually after the removal of the husk. The United States is the chief market for these nuts and the export of them is accordingly a conspicuous feature of the business in lands situated where delivery in the United States is economically possible, that is in the West Indies and to a much less extent in the islands of the Pacific. An exportation of this kind is also assuming large proportions with Australia as a market. For all kinds of coconut produce, Ceylon long held first place and the business of producing coconuts, copra and oil, as well as coir, and desiccated coconut, has reached a better development in Ceylon than anywhere else. However, during the last few years, the Philippines have far outstripped Ceylon in the production of copra. The export from the Philippines in the year ending June 30, 1912, was more than 160,000 tons. In this year, copra was for the first time the foremost export of the islands, taking from abacá the place which it has held almost without interruption for the last fifty years.

E B COPELAND.

CÔCOS (Portuguese, *monkey*, from the nut, which suggests a monkey's face) *Palmæceæ*. This genus includes the coconut tree, *C. nucifera*, and a few pinnate palms cultivated for ornament in the North under glass, and in southern Florida and southern California as avenue and ornamental trees. See page 3567.

Low or tall palms, with slender or robust, ringed spineless trunks, often clothed with the bases of the lvs: lvs. terminal, pinnatisect, segms. ensiform or lanceolate, equidistant or in groups, 1- to many-nerved, entire at the apex, or with 1 lateral tooth, or more or less deeply lobed, the margins smooth, recurved at the base, rachis 3-sided, acute above, convex on the back; petiole concave above, smooth or spiny on the margins, sheath short, open, fibrous spadices erect, at length drooping, the branches erect or drooping, spathe 2, the lower one the shorter, split at the apex, the upper one fusiform or clavate, woody, furrowed on the back; bracts variable, fls white or yellow. fr. large or medium, ovoid or ellipsoidal, terete or obtusely 3-angled, often fibrous-coated as in the coconut.—Species 56 in Trop and Subtrop S Amer, 1 in the tropics around the world. The genus is allied to *Maximiliana* and *Attalea*, and distinguished by its male fls having lanceolate petals, 6 included stamens, and a 1-seeded fr. G C. II. 23 439

The coconut is the example most commonly cited of dispersal of seeds by water. Its buoyant, impervious husk is said to enable it to cross an ocean without losing its germinating power. Its structure is interesting and at first puzzling. Although it is a dry, indehiscent, one-seeded fruit, it seems very unlike an achene, as

for example, in the Composite. Structurally, it is more like a drupe, for the fibrous husk is formed from the outer part of the pericarp, and the hard shell inclosing the meat from the inner. In other words the husk is exocarp and the shell endocarp. The milk of the coconut is unsolidified endosperm. In the cereal grains it is the endosperm which affords most of the material used for human food. Only a part of the liquid matter of the coconut solidifies, and the milk is left in the center. The eyes of the coconut (Fig 1011) mark the positions of the micropyles, and germination takes place only through the larger one. Palm pistils are three-carpeled and each carpel in Cocos has one ovule. The marks of the three carpels are seen in Fig 1011, but only one ovule develops into a seed. Fig 1012 tells the story of the growth of a coconut. In *a*, the young nut is enveloped by three petals and three sepals. At *b*, the pericarp has far outgrown the sepals and petals. Sometimes the floral envelopes remain when the nut is picked. Coconuts, like many other fruits, often grow to a considerable size without pollination, and then perish.

Of the species cultivated for ornament, *C. Weddelliana* is by far the most important. It is sold in great quantities from 3- and 4-inch pots when the plants are 12 to 15 inches high. They are favorite house-plants, as their culture is easy, and they grow slowly and retain their beauty a long while. They are much used in fern-dishes. As a house-plant, *C. Weddelliana* is probably the most popular species of all the smaller palms. It is especially suitable for table decoration. In distinguishing tropical from subtropical regions, the coconut is an excellent guide. It flourishes best where frost is never known, although there are magnificent specimens at Miami and Palm Beach, Florida, both places having rare but sharp frosts. The oil extracted from the nuts is an important article of commerce. The fiber refuse is much used by florists and gardeners. Being open, spongy, very retentive of moisture, clean and easily handled, it is a favorite material in which to root bedding-plants and to start very small seeds, but it is not used for permanent potting. See U. S. Dept. Agric., Bull. of Div. of Ent. (new series) 38, 20-3, for a report of diseased coconuts. For culture of Cocos under glass, see *Palms*.

Cocos in Florida.—The species of the *C. australis* group (as known in the trade) are dry-land palms, the best and most beautiful palms adapted to poor sandy soils in Florida. In moist and rich ground they are subject to diseases, particularly to blight. On dry land, they thrive with great vigor, and although slow growers, they are strikingly beautiful specimens when only a few years old. They look best in groups of five or even a dozen planted together (about 12 to 15 feet apart). After they have formed trunks 5 to 10 feet high they are very impressive, particularly when the background consists of tall bamboos or dark evergreens such as *Magnolia grandiflora* or live-oaks. All the species of this group have leaves more or less glaucous, silvery white or bluish green. The leaflets are often very hard to the touch—very rigid. The petiole at its base is provided with short blunt spines. The roots are brown and quite numerous, but the root-system is very shallow, the trunks do not rest deep in the ground as is the case with the Sabal and Phoenix species, and for this reason they are easily blown over or they acquire a leaning disposition. In planting these palms, they should be set in a saucer-like cavity, which can be filled up gradually. Both young and old plants are easily transplanted in November and December, but it is always advisable to plant only young specimens. Few palms require so little care and fertilizer as these Cocos species. A good application of stable manure as a mulch when the rainy season begins helps them along wonderfully, or they may be fertilized with a combination consisting of equal parts of ammonia, phosphoric acid and potash. The flowers are always inclosed

in a club-like spathe varying in size from a large walking-stick to a baseball club. These spathes burst open with a crack and reveal the much-branched flower-spike, varying in color from a creamy white, yellowish, lavender-erimson to a deep violet. The fruits also vary in size and color. Some of them are not larger than a large pea, others as large as a plum, some are yellowish and others orange and red in color. (H. Nehrling.)

Cocos in California.—After passing through a severe test during the first week in January of the year 1913, the several species of Cocos palms are in a condition in which one may safely judge of their comparative hardness. In the Cocos palms found in local gardens are two very distinct groups. These two groups may each contain but one species having several varie-

1013. Cocos Weddelliana.

ties, or they may consist of several species as they are known "in the trade," and it is upon the latter basis they are here dealt with. (1) The dwarf group is commonly and widely represented by the one known as *C. australis* and the other and less-known kinds are catalogued as *C. Alphonssi*, *C. Bonnetii*, *C. campestris*, *C. Gaertneri*, and *C. Yalag*. Occasionally two others, *C. odorata* and *C. pulposa*, are listed. All those named are quite hardy and may safely be planted from Los Angeles to San Francisco without fear of losing them through freezing, though in places some may get "scorched" while young. With age all become quite hardy. (2) To a taller and more striking group, belong those of which *C. plumosa* is the best known and, unfortunately, most widely planted type. These are *C. botryophora*, *C. coronata*, *C. Dahl*, *C. flexuosa*, *C. plumosa*, and *C. Romanzoffiana*. Of these six four have proved quite tender and three quite hardy, the latter lot resistant to at least a half-dozen degrees more of cold than the former. The tender ones are: *C. botryophora*, *C. coronata*, *C. plumosa*, and *C. Romanzoffiana*. Those proving hardy over all of southern California in 1913 were *C. Dahl* and *C. flexuosa*, the latter the

only one at all common. To these may be added the true *C. australis*, not known here in the trade at all, a tall-growing species, and not the dwarf one commonly sold under this name. J Harrison Wright, of Riverside, has grown this novel species and assures the writer of its hardiness in his garden where *C. plumosa* succumbs in comparatively mild winters. These notes are based upon a close study of these species and varieties as observed during the past few winters in the gardens of Los Angeles and Pasadena in Southern California. (Ernest Braunton.)

A. Filaments present on the rachis.

1 *eriospatha*, Mart St 9-15 ft. high, 10-14 in. thick, capitately thickened with the persistent bases of the petioles. lvs ample, glaucous, finely pectinate, margins of the rachis with excurrent filaments, segms about 1 in. apart, the lower elongated, linear, 20-24 in. long, very long-acuminate, the upper narrowly linear, short, attenuate, 1 ft. long, 2 lines wide, all rigid, faintly nervose-strate spadix thick, branched but very compact. S Brazil—"The hardest of the genus and one of the hardest palms in S Calif. Fronds bluish fr. pulp tastes like apricots"—F. Franceschi, Santa Barbara. Some of the *C. australis* of the trade may belong here.

AA. Filaments absent.

B. Rachis abruptly contracted above the insertion of the lowest lfts.

2 *flexuosa*, Mart St 9-12 ft. high, 2-3½ in. diam., arcuate-ascending, naked just above the base, thence densely clothed with dead petiole bases. lvs lax, 3-6 ft. long, petiole flat above, arcuate, at first tomentose, later smooth; rachis abruptly narrowed above the insertion of the lowest lf-segm, thence linear-filiform at the apex, excurrent, segms 70-90 on each side, rigid in opposite groups, the middle 10-14 in. long, ½ in. wide, the upper 4 in. long, ¼ in. wide spadix long-peduncled and rather loose. Brazil—Cult in northern green-houses. Similar in habit to *S. plumosa*, but with more finely cut lvs, and in S. Eu. considered to stand more frost. Probably the *C. flexuosa* planted in this country is not the true species *C. flexuosa* of Martius, but of Hort., a hardy form of *C. Romanzoffiana*, Cham, which latter according to the late Barbosa-Rodriguez is a polymorphic species including, besides this *flexuosa* type, all our garden forms known as *C. plumosa*, Hook., *C. coronata*, Hort., not Mart., *C. botryophora*, Hort., *C. Dahl*, Griseb & Drude, and *C. australis*, Mart. The foregoing description has been drawn from Martius and not from cult. specimens. The true *C. flexuosa* of Martius is a slender-stemmed palm from tropical Brazil

The true *C. australis* of Martius is native in Paraguay; it is like *C. plumosa* in appearance but harder.

BB. Rachis not abruptly contracted.

C. Lfts flaccid.

D. Arrangement of lfts. equidistant.

3. *Weddelliana*, Wendl. (*Glazidva Martiana*, Glaz., to which genus Martius considers the species to belong). Fig. 1013. St. 4-7 ft. high, 1¼ in. diam., densely covered with persistent sheaths: lvs. equally pectinate-pinnatisect, 3-3¼ ft. long; petiole 8-20 in.; sheath coriaceous-fibrous, glabrous or tomentose, with slender brown hairs, at length evanescent; blade 2-3 ft.; segms. about 50 on each side, widely spreading, the middle 5 in. long, 2 lines wide, subequidistant, glaucous beneath; rachis filiform at the apex, brown-sealy; spadix equaling the lvs, stiff and erect Trop. Brazil. R H. 1879, p 434 I H. 22:220. A G 16 345 —The most important of small ornamental palms for the N.

1014. Coconut germinating.

DD. Arrangement of lfts. in groups of 2-4.

4 *plumosa*, Hook St. 30-36 ft. high, 10-12 in. thick, ringed at intervals of a foot, clothed near the apex with remnants of the dead petioles lvs. erect-spreading, 12-15 ft. long, recurving; petiole a third to half as long as the blade, segms linear-acuminate, sparse, solitary or mostly in groups of 2-4, 1½ ft. long, deflexed near the apex spadix usually 3 ft. long and much branched, the branchlets pendular Cent. Brazil. B M 5180 —The chief avenue palm of the genus. A quick grower, ultimately 50 ft. high in S. Fla. and Calif. The slender smooth boles and heads of graceful recurving lvs make this a very attractive tree.

CC. Lfts rigid

D. Form of lfts sword-shaped

5 *butyracea*, Lann Sts very tall, naked; lvs pinnate, lfts simple. spathe cylindrical-oblong, 4-6 ft.; spadix as long as the spathe, 4-6 ft., branches of the spadix about 1 ft., thickly clustered and somewhat pendulous Venezuela—Rare and perhaps confused with *Scheelea butyracea*. Little known, although long ago described.

6 *Romanzoffiana*, Cham. Sts 30-40 ft. high, somewhat fusiform above: lvs. about half as long as the caudex, the withered ones deflexed, pendent, the upper spreading, often arching; segms conduplicate at the base, ensiform: spadix about 6 ft. long, at first inclosed in a stout pendulous spathe which appears among the lowest lvs. S Brazil near the sea; according to recent characterizations, it comprises a wide variety of forms, as explained under No 2

1015. Coconuts.

DD. *Form of lfts. linear apex obtuse; petiole glaucous.*

7. *australis*, Mart. PINDO PALM. Height about 30 ft.: st erect, columnar, equal, strongly annular above; lvs. 9–12 ft. long, the sheath fibrous and glabrous; petiole naked; segms. linear, glaucous, rather rigid; fr as large as a pigeon's egg, outer pulp sweet, edible, seed only Paraguay. G.C. III 18.739. A.F. 5 515, 7:805. R.H. 1876, p 155—A good grower. Cult. under glass and outdoors in Fla. and Calif

8. *nucifera*, Linn. COCO PALM COCONUT TREE. Figs. 1014 (adapted from Cook), 1015. Caudex 40–100 ft. high, flexuous, thickened at the base; lvs 12–18 ft long; lfts. linear-lanceolate, 2–3 ft., coriaceous, flaccid; petiole 3–5 ft. stout. Seashores within the tropics and at Miami and Palm Beach, Fla. Indigenous to Cocos or Keeling Isls of the Indian Ocean, but recently thought to be native of Trop Amer. See O.F. Cook, Contr. U.S. Nat. Herb., 7:257–93 (1901); 14:271–342 (1910). R.H. 1895, p 457. Mn 2:171. GF 7:45—Produces the coconuts of commerce. Var. *aurea*, Hort., is a form remarkable for its orange-yellow sheaths, petioles and midribs. It is known in cult only in England

DDD. *Form of lfts narrowly lanceolate.*

E *Lvs long, 6–15 ft. in mature specimens.*

F. *Petiole spinose-serrate segms. of lf less numerous.*

9. *Yatay*, Mart. St 12–15 ft high, over 1 ft. diam, naked below, covered with dead sheaths above, lvs recurved, spreading 6–9 ft, sheath 1 ft long, fibrous at the mouth, petiole $1\frac{1}{2}$ ft long, spinose-serrate, the spines increasing in length towards the lower end of petiole, segms 50–60 on a side, crowded below, then equidistant, linear-lanceolate, the uppermost long-setaceous filiform, the middle ones $2\frac{1}{2}$ ft. long, 2–5 in wide, the upper 20 in long, $\frac{3}{4}$ in wide, all rigid, glaucous beneath. Spadix about $4\frac{1}{2}$ ft. long with at least 150 branches. Brazil, Argentina

FF. *Petiole not spinose-serrate segms. of lf very numerous*

10. *Dâtîl*, Drude & Griseb. St 30 ft high, 8–12 in diam, lvs 12–15 ft long, sheath about 16 in long, petiole $1\frac{1}{2}$ ft long, $1\frac{3}{8}$ in wide, $\frac{3}{8}$ in thick, segms. linear-acuminate, glaucous, densely crowded in groups of 3 or 4, 150–160 on each side, the lowest 2 ft., middle $2\frac{1}{4}$ ft and apical 1 ft, the uppermost filiform, all narrow, stiff and rigid, the dried lvs glaucous green or whitish spadix 3– $3\frac{1}{2}$ ft long with at least 300 spirally twisted branches. Argentina, isls and river banks.—The frs are edible, resembling those of the date palm Hardier in S. Calif. than *C. plumosa*, *C. flexuosa*, and *C. Romanzoffiana*

11. *coronata*, Hort., not Mart. Trunk at length 18–30 ft high, 8 in diam, erect, deeply ringed; lvs. erect-spreading, 6–9 ft long, short-petioled, arranged in a close, 5-ranked spiral, the long-persistent bases of the petioles forming a spiral-twisted column below the crown; lf segms in groups of 2 or 3, folded together from the base (conduplicate), linear-lanceolate, coriaceous, densely crowded, about 100 on each side; midrib 4-sided below, 3-sided above; spadix about $2\frac{1}{4}$ –3 ft. with not more than 60 branches. Brazil.

EE. *Lvs. shorter, 3– $4\frac{1}{2}$ ft. in mature specimens.*

F Apex of lfts. obtuse.

12. *campéstris*, Mart. St 8–10 ft. high, thickened, scaly; lvs. spreading-recurved, rigid, 3– $4\frac{1}{2}$ ft long; rachis elevated, triangular above, convex below; segms narrowly lanceolate, 30–40 on each side, obtuse at the apex and shortly cordate-acuminate; spadix about $2\frac{1}{2}$ ft long, with 10–14 branches. Brazil.—Hardier than *C. nucifera*, but scarcely known in cult in N. Amer. Perhaps hardly as far north as N. C.

FF. *Apex of lfts acuminate.*

13. *insignis*, Mart. (*Glazioda insignis*, Hort.) St. 3–6 ft high, $1\frac{1}{2}$ in diam; lvs $4\frac{1}{2}$ –6 ft. long, sheath densely brown-lanate; petiole shorter than or equaling the sheath, a fourth or fifth as long as the rachis, segms. equidistant, 50 on each side, narrowly lanceolate, obliquely acuminate and caudate, silvery glaucous beneath; spadix about 3 ft. long, with about 50 branches. Brazil

The following are trade names of rare or botanically little-known plants not sufficiently described. *C. Alphonse*—*C. Archævalatonia*, Barb., is described as somewhat like *C. Romanzoffiana* but taller and making larger crowns. It is a native of Uruguay—*C. Blumenau*=*C. eriopatha*—*C. Bonneti*—*C. Gartneri*=(?)—*C. Geriva*, Hort. G.C. III 27:293 figures *C. Geriva*, a remarkable *Cocos* (?) with 4 branches. Nothing further is known of this plant. It may be *C. Geriva*, Rodr.=*C. botryophora*, Mart.—*C. Maximiliana*, Hort.=(?)—*C. odorata*, Rodr. St short. lfts in 3's or 5's, linear-lanceolate, petioles spiny, fr yellowish green or pink, pulp scented. Brazil R.H. 1893, p 345—*C. pulchra*, is supposed to be very like *C. eriopatha*. This species is scarcely known in this country—*C. Yurumajna*=(?).

N TAYLOR †

CODIÆUM (probably from Greek for *head*, the colored leaves being used for crowning-wreaths, or from the Malayan name). *Euphorbiaceæ*. CROTON. VARIEGATED LAUREL. Tropical shrubs or trees grown for the variegated and interesting foliage, as greenhouse plants or for summer bedding outdoors

Leaves alternate, simple, somewhat thick and leathery, pinnately veined, glabrous; juice somewhat milky fls monocious, in slender axillary racemes; staminate fls with petals, calyx imbricate, stamens 20–30, erect in the bud, pistillate fls apetalous, ovary 3-celled, 3-ovuled—Six species of Malaya and Pacific Isls., not closely related to any other commonly cult. *Euphorbiaceæ*. Differs from the true crotons in the erect stems, glabrous foliage and more or less milky juice

The almost endless variety of codeiums (or crotons of gardens) are probably all from one botanical species, greatly varied by selection and crossing. Although a great many of these bear Latin binomials they intergrade so that it is often difficult to separate them or to make a reliable classification, however, they may be grouped conveniently as below. Totally different leaf forms and color variations often appear on the same plant. The latest botanical treatment is by Pax in Das Pflanzenreich, litt. 17, and is followed in this article.

The crotons are prized chiefly for the varied and brilliant markings of the leaves. The young leaves are usually green and yellow, changing later to red, although in some the markings remain yellow or with red only in the petiole. They are usually kept not over 2 to 3 feet high, but if given opportunity will grow into considerable trees in the greenhouse. They are good subjects for massing in the open and develop most brilliant colors in our bright hot summers, however, they will not stand frost

Codeiums (or crotons, as they are popularly known in America) are beautiful plants with many forms of handsome and odd foliage of the most brilliant coloring. The colors range from almost pure white to light and deep yellow, orange, pink, red and crimson, in the most charming combinations. In some cases one color predominates, as in *Carrirei* (yellow), *Czar Alexander III* (crimson), *Hawken* (light yellow). These varieties of distinct coloring make beautiful specimen plants for jardinières; and their beauty is enhanced when used in jardinières of appropriate color. As exhibition plants they are very effective, and may be grown to specimens 5 or 6 feet high, or even larger. In smaller sizes, codeiums are much used as table plants, for which purpose well-colored trees are rooted and grown on until they are from 12 to 15 inches high. The narrow-leaved varieties are most used for this purpose. Codeiums are very attractive in vases and window-boxes and for mantel and table decorations. They are also

very valuable as bedding plants. Planted in clumps or masses, the effect of the combination of rich colors is charming. They should be planted in any good, rich, not too heavy soil, and regularly syringed to keep down red spider. They color best when fully exposed to the sun, and should not be planted out until about the 10th of June in the neighborhood of New York and Philadelphia. If something is needed to make the beds look attractive early in the season, it is a good plan to plant pansies in April, to remain until it is time to plant the codeiums. Some of the tender varieties, such as Reedin, albicans, and a few others, are inclined to burn in the extremely hot weather, but nearly all the sorts do well bedded out. Among the very best for this purpose are Queen Victoria, Dayspring, Baron Rothschild, Andreanum, Lady Zetland, Carrièrei, Barryi, Hawkeri, fasciatum, anetumense — The house culture of codeiums is very simple. It is neces-

1016. *Codium variegatum* Baronne de Rothschild.
(An example of form *platyphyllum*.)

sary that a night temperature be maintained of 70° to 75°, and that the air be kept moist by frequent syringing. Cuttings of half-ripened wood may be easily rooted at any time from October until June, a bottom heat of 80° being just what they need. When very fine specimens are desired, root strong and shapely tops by making an incision in the stem and tying moss around the wounded part; it will be rooted ready to pot in about three weeks. By this method all the foliage may be retained, and a perfect plant will result. The more light the plant receives, the better will be the color, but with some kinds of glass it is necessary to shade lightly to prevent burning of the leaves. They may be grown finely in a house glazed with ground glass, which admits the light and does not require shading. It is well to syringe two or three times a week with tobacco water, to kill mealy bug and red spider. Little's Antipest, or any emulsion of coal-oil, is a good insecticide for codeiums. New varieties from seed, the result of crossing existing sorts, are continually being raised. Seed ripens freely under glass in North America, and there is no doubt that the list of about eighty choice varieties now in cultivation will be largely added to in the near future. (Robert Craig.)

variegatum, Blume, var. *pictum*, Muell. Arg.
(*C. medium*, Baill. *C. variegatum* var. *genuinum*,

Muell. Arg., in part *C. pictum*, Hook. *Crötön variegatus*, Linn. *Crötön pictus*, Lodd. *Phyllactrea Codæum*, Lour.). Lvs. ovate to linear, marked with various colors, entire, or lobed.—Cult. throughout the Old World tropics as well as in Eu. and Amer. The wild form with green lvs. is var. *molluccadum*, Muell. Arg. (*C. molluccanum*, Decne.). B M. 3051. L B C 9:870.

a. *Foliage plane or recurved, entire, not appendiculate.*

b. *Lvs. 2-3, rarely 4 times as long as broad, usually broadest above the middle. Form platyphyllum, Paz.*

c. *The lvs. with practically no red coloration.*

Hort. vars: aureo-maculatum, aureo-marmoratum, Baron Frank Seilliere, Barryi, Bergmanni, Bruce Findlay, Carrièrei, Delight, Exquisite, fasciatum, fucatum, Golden Queen, grande, Hawkeri, Henryanum, Hookeri, invictum, Jamesi, lacteum, magnolifolium, maximum, medium variegatum, Orvilla, ovalifolium, Princess Waldeck, superbiens, tournfordensis, Truffauti.

cc. *The lvs., at least when older, red colored.*

Hort. vars: Andreanum, acubæfolium, Austinianum, Baronne James de Rothschild (Fig 1016), B Compté, Beauty, Dayspring, Dormannianum, Hilleanum, Le Tzar, Magnificent, Marquis de Guadiaro, Me Lucien Linden, Mortii, Mrs Iceton, Nestor, Newmanni, Pennincki; pictum, Pilgrimi, Prince Henry, recurvifolium, Reidii, Regina, roseo-pictum, Stewartii, Williamsii

ccc *The lvs. broad, color not specified.*

Hort. vars Compté de Germiny, d'Haenei, Dr. Friedenthal, Hendersonii, Kreutzæanum, Makoyanum, marmoratum, Prince Royal, Sanderi, Seemannii, Sinai, Stroemeri, verum, Watsonii

bb. *Lvs. lanceolate to narrowly lanceolate, 5 or more times as long as wide. Form ambiguum, Paz.*

c. *The lvs. with practically no red coloration*

Hort. vars albo-lineatum, angustissimum, anetumense, bellulum, Burtonii, concinnum, Countess, Crown Prince, Davisii, Duvalii, eburneum, elongatum, emmens, Goednoughtii, irregulare, latimaculatum, maculatum, Monarch, Mooræanum, Mrs Swan, volutum, Weismanni, Wilsonii

cc. *The lvs., at least when older, red-colored.*

Hort. vars: albicans, amabile, Broomfieldii, Chalengerii, Chantrieri, chrysophyllum, Cooperi, Drouetii, Duvivieri, Flamingo, Hanburyanum, imperiale, immitabile, insigne, Jubilee, Lady Zetland, lancifolium, Macfarlanei, magnificum, Massæanum, multicolor, musæum, Nevillii, princeps, Queen Victoria, recurvatum, Sunshine, triumphans, triumphans Harwoodianum, Vervetii, Victory, Veitchii, Youngii

ccc *The lvs. medium width, lanceolate, color not specified.*

Hort. vars: Boucheanum, Eckhautei, Eclipse, Excelenz, Flambeau, Gaertnii, Grusonii, Imperator, Leopoldi, Margarete Daniel, marginatum, nerifolium, Obersteutnant Brode, Ohlendorffii, Pres (Chercau, Said Pascha, Spindlerianum, splendidum, undulatum.

bbb. *Lvs. linear, 1 cm (3/16 in) or less broad. Form tænosium, Muell. Arg.*

c. *The lvs. with practically no red coloration.*

Hort. vars: algburthiense, aureo-punctatum, Dodgsonæ (in part), elegantissimum, Elvira, gloriosum, Hermon, Johannis, Phillipsii, superbum, Van Oosterzeet.

cc. *The lvs. with red color, at least when old.*

Hort. vars: Brageanum, elegans, majesticum, Mrs. Dorman, nobile, Princess of Wales, Rodeckianum, ruberrimum, sceptre.

ccc *The lvs. narrow linear, color not specified.*

Hort. vars. Donai, Fascination, Grayii, Klissingii, lineare, pendulum.

AA. *Foliage lobed, or with margin crisped or spirally twisted, or with a hair-like or lf.-like apical appendage.*

B. *Lvs entire, with margin crisped, or the whole lf. spirally twisted, without appendage. Form crispum, Muell Arg*

Hort. vars.: caudatum tortile, Chelsonii, Cronstadii, Elysian, Eyrei, Katharina, Madam Seilliere, Rex, spirale (in part) (Fig. 1019), Warrenii.

BB. *Lvs more or less 3-lobed, at least constricted in the middle (panduriform) Form lobatum, Paz.*

c. *The lvs panduriform or indistinctly lobed.*

Hort. vars.: Bismarckii, irregulare, lyratum, montifontanense, multicolor, Princess Matilda, Russeli, Thomsonii

CC. *The lvs distinctly 3-lobed.*

Hort. vars.: Craign, Disraeli, Evansianum, Fred Sander, Goldiei, hastiferum, illustre, Lord Derby, maculatum Katonii, trilobum.

BBB *Lvs entire or nearly so, the midrib projecting, usually below the apex, as a horn-like appendage. Form cornutum, André.*

Hort. vars.: appendiculatum, chrysophyllum (in part), cornutum, excurrens, Mrs McLeod, paradoxum, Prince of Wales, spirale (Fig. 1019)

BBBB *Lvs constricted to the midrib, or with the apically projecting midrib, bearing a second or even third plane, or cucullate, lamina Form appendiculatum, Celak*

Hort. vars.: Dodgsonae, interruptum (Fig. 1018), elegans, irregulare, Lainii, Mrs McLeod (in part), multiflorum, mutabile, picturatum, Rodeckianum (in part), Sinitzianum.

The following varieties are in the American trade or frequently cultivated in this country. A great many variations in spelling of names occur, chiefly due to different formations to agree with either *roton* or *codæum*. Such slightly different forms of names have been omitted. The brief descriptive phrases do not include the most important characters given in the above classification. When yellow and red are both mentioned, the foliage is generally at first yellow-marked and later the yellow changing to red with ground-color green or dark red-green. The measurements are approximate, and of course, more or less unreliable and show respectively width and length of leaves in inches. It is intended here to account for the Latin-form names, that might be confused with tenable species-names, but practically all the prevailing vernacular names have been inserted.

1017
Codium Disraeli
(An example of form
lobatum.)

Agberth Gem (= following?)
Agurthiense. Yellow midrib and spots, $\frac{1}{4} \times 11$. A F. 16-255 Gng. 9 19

Albana. White variegated, crimson beneath, 3×18 .
Albo-ineatum. Yellow center changing to white, 1×12 . A F. 16 255 Gng. 9 19

Amabile ("often called variable"). Lvs often distorted and curved to one side, variegated with yellow and two distinct shades of green and red, $1\frac{1}{2} \times 11$

Andreanum. Yellow to red veins, $2\frac{1}{4} \times 9$. I.H. 22.201. A F. 23 241. Gng. 13.81. R.H. 1876, p. 234.

1018. Codium interruptum.
(An example of form appendiculatum.)

Angustissimum (*Angustifolium*). Yellow margin and ribs, $\frac{1}{4} \times 15$ G.C. 1871 612

Anisolumense. Yellow midrib and cross veins, 1×11

Aucubifolium. Yellow, red-blotched, $2\frac{1}{2} \times 8$ I.H. 19, p. 327.

Aureo-maculatum. Yellow-spotted, $1\frac{1}{2} \times 3\frac{1}{2}$

Aureum. Yellow-marked

Baron Adolphe Seilliere. Lvs large, veins pale yellow, soon white
Baronne James de Rothschild (Baron Rothschild, etc., Baron A. de Rothschild (?) (Fig. 1016). Yellow, red veins, etc. $2\frac{1}{2} \times 7$. A F. 23 242 R.H. 1879 450, 1898 180 F.E. 18 379 I.H. 26 365

Barrin. Yellow, changing to white, midrib, veins and dots, 2×7 .

B. Comple. Large, yellow, red blotches, $2\frac{1}{2} \times 7$

Beauty. Yellow to pink center, margin and mottling, ovate, 2×6

Bergmanni. Cream-yellow with green blotches I.H. 27 389

Bergfeldii. Various yellow marks, midrib red-tinted, 2×10

Burtonii. Yellow mottled, lanceolate, 3×15

Carreresi. Margin, midrib, dots and some veins yellow, oblong, $1\frac{1}{2} \times 11$ I.H. 27, p. 90, desc.

Caudatum tortile. Yellow variegated with some red, long, narrow, spiral lvs. R.H. 35 240 Gng. 11, p. 83 Gt. 33 9

Challenger (Challengeri?, Imperator?) Midribs creamy white changing to red

Chelsonii. Yellow, red midrib and mottling, $\frac{1}{4} \times 10$. A F. 16 255 Gng. 9 19

Chrysophyllum (perhaps two vars. under this name). Irregular, large, yellow, red blotch, 2×12

Compte de Germany. Lvs broad

Coopers. Yellow, red center and spots, $\frac{1}{4} \times 10$ Gng. 10, p. 139

Cornutum. Yellow midrib and dots, often wavy, spiral or even lobed, $\frac{1}{4} \times 4$ I.H. 19, p. 188

Countess (Countess Superior?) Yellow spotted, tapering, $\frac{3}{4} \times 14$

Cronstadii. Yellow variegated, tapering, spiral, $\frac{1}{2}$ in wide. A F. 16 255, 23 275 Gt. 31 369

Crown Prince. Yellow veins, 2×16

Czar Alexander III. See Le Tear

Darwin. White midrib and variegation, $\frac{1}{4} \times 12$

Daypring. Yellow, red-mottled, margin green, ovate, $1\frac{1}{2} \times 8$.

Delight. Yellow changing to white, with green margin, lanceolate, 2×8 .

Dorseti. Fig. 1017. Various lobed, yellow, red veins and spots, 3×12 Gng. 10, p. 141 F.M. 1879 207

Dodgsonae. Yellow midrib, margin and spots, often spiral, excurrent midrib often foliaceous, $\frac{3}{4} \times 12$

Dormannianum. Lvs small, bronze-red and yellow.

Earl of Derby. See Lord Derby

Earls Court

Edmontonense. Lvs narrow, brilliantly colored

Elegans (*Parvifolium*, see *Interruptum*) Yellow, red midrib and margin, $\frac{1}{4} \times 6$

Elegantissimum. Yellow center and dots, petiole red, rarely with apical seta, $\frac{1}{4} \times 14$ I.H. 29 469

Elyria. Yellow center and variegation, sometimes with apical seta and twisted, $\frac{3}{4} \times 10$

Elysian. Yellow midrib and dots, $\frac{3}{4} \times 14$, twisted

Evansianum. Yellow, red-veined and mottled, 3-lobed. Gng. W. 4 409.

Excelsior

Excurrens. Greenish yellow variegated, oblong, midrib projecting.

Eulerpe.
Pascatum Yellow veins, broad ovate. A.F. 23:241.
Plambeo Medium width, lanceolate.
Plamingo Irregular yellow central stripe, $1\frac{1}{2}\times 8$.
Glorium (Prince of Wales) Lvs long-narrow, variously yellow-marked, sometimes spiral and appendaged. Gng 9 19. Gn. 14, p. 543. A.F. 16, p. 255
Golden Ring
Golden Yellow veins, 3-lobed, 3×10 .
Grande Yellow veins and spots
Grays Resembling Majesticum
Hamburyanum Yellow, rose marks and blotches, $2\frac{1}{2}\times 15$. Gng. 7 324
Harwoodianum (Triumphans Harwoodianum). Yellow, crimson midrib
Haukeri Light yellow, green margins and tips, broad-lanceolate, 6 in long J.H. III. 61 129 G.Z. 23, p. 265
Henjantum Yellow-mottled, ovate, 3×9
Hernon Yellow midrib and spots, $\frac{1}{2}\times 10$
Hillenum Purplish green, crimson marks, oblong or spatulate, 3×9 I.H. 19, p. 326
Hookerianum (Hooker) Irregular yellow center and blotches, broad lance-ovate G.C. 1871 1067 Gn 3, p. 45 I.H. 19, p. 40. G. 7 137 F. 1871, p. 109
Ilustris Yellow markings, 3-lobed, midrib excurrent. G.Z. 28 2
Imperator See Challenger
Inimistabls Yellow, red midrib and veins all dark red, 1×6 .

1019. *Codium spirale*. (An example of forms *crispum* and *cornutum*)

Insignis Yellow midrib and veins, margin red, narrow-oblong
Interruptum Fig 1018 Yellow, red midrib, $\frac{1}{2}\times 12$ Sometimes distorted or spiral, midrib excurrent. I.H. 19, p. 170 F. 1872, p. 200 A.F. 16 1510 Journ. Bot. 19 220
Juncis Lemon-color, broad lf
Irregular Lf form irregular, often contracted below middle, midrib and spots yellow I.H. 19, p. 135
Jameis Irregular yellow blotch changing to white, 3×10
Johanne (Thomson) Center and margin yellow lvs long, narrow F. 1872, p. 161 Gng 9 19 I.H. 19, p. 169. F.S. 19, p. 12. Gt. 34 24 A.F. 13 1070
Katoni (Maculatum Katoni). Lvs. partly trilobed, yellow-spotted F. 1879, p. 27
Lady Zealand Yellow, red margin, midrib and veins, $\frac{1}{2}\times 11$
Laingi Lf base yellow, remainder green to dark red, spiral, midrib excurrent or appendaged
Le Tear Lf. broad, veins and most of lf. yellow, red. I.H. 35 70
Lord Derby (Earl of Derby?) Trilobed, base and center yellow, red, $\frac{1}{2}\times 8$.
MacFarlanei Yellow, red-blotched, 1×12
Maculatum Katoni See Katoni
Madam Seillere Lvs. lanceolate, spirally twisted, variegated. A.F. 13 1068
Magnoliolum A few yellow spots and veins, 3×6
Majesticum Yellow, red margin, midrib and mottling, linear, 15 in long G.Z. 18, p. 97 G. 2 163 F. 1870, p. 63. F.M. 1874 103
Makoyanum Broad lvs chocolate and carmine marking.
Marquis de Castellane
Maximum Border and veins yellow or yellow with green blotches, 12 in long. I.H. 14, p. 534, 19, p. 168. B.H. 19 65.

Memphis.
Montefortianense (Montfortiense?) Somewhat 3-lobed, veins yellow, red, $1\frac{1}{2}\times 6$
Mortis Midrib and veins yellow, light red, 3×10
Mrs. Chas Heine
Mrs. Craige Lippincott Lvs lance-ovate, veins colored. A.F. 23 274 Gng 13 68
Mrs. Dorman Midrib scarlet, margins green, linear, $\frac{1}{2}\times 12$. A.F. 16 255 Gng 9 19
Mrs. H. F. Watson Lvs large, variously marked with yellow and red.
Mrs. Icton Very dark red with rose mottling, $2\times 4\frac{1}{2}$
Mrs. Meland Constricted in middle, midrib yellow, red projecting, $\frac{1}{2}\times 10$.
Mrs. Swan Central yellow stripe and blotch, petioles red, 1×12
Mulcolor Like Irregular but with red coloration developed. I.H. 19, p. 120 F. 1872, p. 89
Musacum Yellow, red-veined and mottled, or with green blotches on colored ground, $1\frac{1}{2}\times 8$ R.H. 1882 240
Nectar Serrated central yellow, red blotch and spots, $2\frac{1}{2}\times 12$.
Nemilux Green-red mottling on yellow
Neumannii Lvs short, broad, dark crimson
Noble Lvs linear, yellow, red variegated. A.F. 16-255. Gng. 9 19 F. 1878, p. 133
Orilla Green mottling on yellow, $1\times 4\frac{1}{2}$
Ovalifolium Yellow variegated Gt. 24, p. 221 F. 1875 8
Pictum Lvs broad oblong-acuminate, less than 10 inches long, blotches of green and blackish on red B.M. 3051.
Picturatum Similar to Interruptum Gt. 25-375
Pilgrims Yellow-blotched, overspread with pink, 3×9
Princeps (mutable) Yellow, red midrib and margins, lvs. narrow, variable in form, sometimes appendaged F. 1879, p. 69. Gt. 13 621, desc.
Princeps Matilda Lvs subtrilobed, yellow, red blotch, base nearly white, petioles red
Princess of Wales Yellow midrib and mottling, changing to white, with pink reverse, linear, $\frac{1}{2}\times 12$ Gng 13 84 A.F. 23 275
Punctatum
Queen Victoria Yellow, red veins and mottling, $1\frac{1}{2}\times 10$ A.F. 23 241
Recurvifolium Lvs acuminate, recurved at the tip, yellow, red veins and blotches
Regina Lvs short and broad, yellow, crimson and brown colored F. 1879, p. 59
Reids Yellow, red variegation and veins, rose tints, 4×8 . A.F. 23 242
Rodeckianum Various mottled and marked with yellow and red, $\frac{1}{2}\times 12$, sometimes twisted and appendaged
Roseo-pictum Yellow, red, with green blotches between veins. I.H. 20 364, 43, p. 159
Ruberrimum Crimson marked with creamy white, linear
Rubro-lanceatum Yellow, with crimson tints, oblong-lanceolate, "1 in to $1\frac{1}{4}$ in long."
Rubro-striatum
Sespe Lvs linear, yellow spots, red midrib
Sinitianum Yellow spots changing to white, projecting midrib appendaged, $\frac{1}{2}\times 10$ Gt. 30 278 G.Z. 26 145 J.H. III 48 435.

J B S NORTON

CODLIN. Used in England to mean a small, green, half-wild, inferior apple. It is used in distinction to grafted or dessert fruit. It is about equivalent to the American popular use of the word "crab." The word is also used in England as the name of a particular variety or group of varieties, as Keswick Codlin. The word codlin is known in America only in connection with the apple-worm insect, the codlin-moth. Sometimes written *Codling*.

CODONANTHE (Greek for bellflower) *Gesneriaceæ*. A dozen or more trailing or scandent herbs or subshrubs of Brazil, Guiana, Cent. Amer., and W. Indies, 1 or 2 of which may be found in choice collections of stove plants. Plants with long branches, opposite entire and fleshy or thick mostly small lvs., and whitish fs borne singly in the axils; corolla with a declined or curved tube, the throat broad or open, and the limb with 5 rounded nearly equal lobes, exceeding the 5 narrow lobes of the calyx, stamens attached in corolla-tube, not exerted. fr berry-like. *C. gracilis*, Hanst., with creamy white spotted orange fs and lvs often blotched red beneath, is the species most likely to be seen. Cult. of Gesneria and similar things. L. H. B.

CODONOPSIS (Greek, bell-like, alluding to the shape of the flowers) *Campanulaceæ* Twining or decumbent perennials, more or less hardy in the open, with showy blue, whitish or greenish flowers.

Herbs, with tuberous rhizomes; lvs alternate or irregularly opposite, petiolate, mostly cremate fs axillary or terminal, stalked, calyx-tube hemispherical, the limb 5-parted and the lobes leafy; corolla-tube broadly tubular or bell-shaped, 5-parted (rarely 4- or 6-parted); stamens free, the filaments dilated at base; stigma 3-5-lobed; fr a dry or somewhat fleshy 3-5-

valved caps.—Eighteen or 20 species in Cent. and E. Asia. A few of the species may occur in choice border-collections; they need protection N.

ovata, Benth. Six to 12 in., decumbent and branches becoming erect; lvs ovate, small ($\frac{3}{4}$ in. or less long), both alternate and opposite, acute or obtuse, hairy, short-petioled; fs pale blue, speckled inside, $\frac{1}{4}$ in or less long, broadly bell-shaped, on long terminal peduncles Himalayas.—Offered in England; half-hardy to hardy

C. clematidea, Schr. Two to 3 ft., from mts. of Asia; one of the hardiest lvs ovate-acuminate, petioled fs white tinged blue. Much like *C. ovata*.—*C. concolorata*, Kurz. Sta thin and wiry fs, bright blue, 1 in across, numerous. Upper Burma—*C. lanceolata*, Benth. & Hook (Campanulaceæ lanceolata, Sieb. & Zucc.) Twining, 2-3 ft fs hanging, greenish white and purple-veined, 1-2 in long and 1 in wide, in a short simple raceme lvs alternate, oblong-lanceolate, nearly or quite entire. Burma. China. F. S. 9 927—*C. Tangchen*, Oliver Climbing, with long thickened rhizome, the sts slender and 2 ft or more long lvs ovate or broad-lanceolate, toothed fs solitary, stalked, bell-shaped, $\frac{1}{2}$ in long, greenish spotted and striped purple inside. China. R. M. 8109. Root used in China as a tonic—*C. virens*, F. S. 9 927—*C. convolvulacea* twining, slender lvs mostly opposite, ovate or oblong-uminate, sinuate-dentate fs solitary, very long-peduncled, rather small, rotate, and deeply parted, blue. W. China. F. S. 9 927—*C. urdifo*, Maxim Small climber, free-flowering fs, bell-shaped, whitish green, gray and violet. E. Asia. L. H. B.

CÆLIA (Greek, *kaulos*, hollow* referring to the pollen masses). *Orchidaceæ* Epiphytic orchids of minor importance, culture of Epidendrum.

1020 Celia Baueriana.

The cælias are divided into 2 strongly marked groups with widely different kinds of inf. *C. macrostachya* is a type of the first section, with long racemes of numerous small, horizontal fs, which are much exceeded by the long spreading bracts, and the base of the column short. *C. bella* is typical of the second section, with the fs few, larger, erect, in groups of about 3, longer than their bracts, and the base of the column produced to twice its own length, which gives the fs a tubular appearance—A half-dozen species in Cent. and S. Amer

A. Fls small, in a long raceme.

macrostachya, Lindl Pseudobulbs $2\frac{1}{2}$ in. long, almost round, with brown scales at the base. Lvs about 3, from the top of the pseudobulb, 1 ft or more long, lanceolate, arching, broader than in *C. bella*, and not channeled sepals red; petals white. Mex R. H. 1878 210 B M 4712. J. F. 4:423

Baueriana, Lindl Fig. 1020. Pseudobulbs 1-2 in long, 2-3-lvd. lvs 10-18 in long, linear, acute; racemes of numerous small white fragrant fs; ovary 3-winged, sepals ovate-lanceolate, the petals ovate-oblong; lip with the claw yellow, the blade triangular. W. Indies and Mex B R. 28 36.

AA. Fls. white, tipped purple, few, large

bella Reichb f. Pseudobulbs smaller and more constricted at the top; lvs. 6-10 in. long, narrower, chan-

neled above, arching, fls 2 in long, erect, 3 or 4 in number, with the mid-lobe of the lip orange-colored. Guatemala B M. 6628.

C. densiflora, Rolfe. Characterized by a dense-fl. raceme, wingless ovary and oblong mentum. Cent. Amer.

GEORGE V. NASH.†

1021 Details of *Cælogyne speciosa*

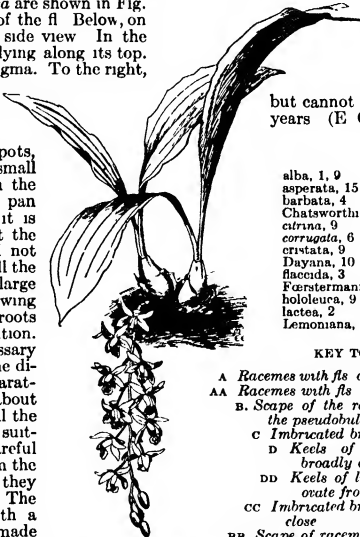

CÆLOGYNE (*hollow pustil*) *Orchidaceæ* Popular epiphytic warmhouse orchids of the eastern hemisphere

Pseudobulbs tufted or at intervals on the st. fls in racemes, opening simultaneously or in succession; sepals and petals similar, spreading or reflexed; lip 3-lobed, the lateral lobes erect, inclosing the slender column, the middle lobe flat or recurved, keeled, column slightly curved, winged above; pollinia 4.—Species about 115, distributed from N India to Ceylon, middle China, and in the islands of the Indian Ocean. The botanical details of *Cælogyne speciosa* are shown in Fig. 1021. At the top is a general view of the fl. Below, on the left, is the column, front and side view. In the center is the lip, with the column lying along its top. Below the lip, on the left, is the stigma. To the right, on the bottom row, are the pollinia, front and back view; and at the right center are separate pollen masses.

Cælogyne may be grown in pots, baskets or pans, using pots for small plants, and larger receptacles when the plants require them, but when a pan larger than 12-inch is necessary, it is best to use perforated ones so that the material may be well aerated and not become unsuitable for the roots. All the species are of rambling habit and large specimens may soon be had by growing on, provided the material at the roots is kept in a sweet healthy condition. When, however, it becomes necessary to divide a plant, this is best done directly after flowering, carefully separating the running shoots, cutting off about three of the last-made bulbs with all the roots attached, planting these in suitable-sized receptacles, being very careful to point the growing end away from the edge, or toward the center, so that they will not so readily outgrow again. The material to use is osmundine with a little sphagnum moss if it can be made to grow, packing all very firm about the roots so that too much water will not

be held about the roots. Place in the shady part of a warm house until root-action begins; but, during the hot summer months, the varieties of *C. cristata* may with great benefit be placed in a frame in a shady place outdoors, there to remain until danger of frost in October. Treated in this way, the plants will bloom much better. They should all be placed on inverted pots when outside to exclude vermin. When brought indoors the bulbs will be finishing up for bloom, and as they are terrestrial plants, weak manure-water should be given at every watering. A glance at the roots and their structure will show how they differ from the epiphytal orchids such as the cattleyas. Cælogyne, being evergreen, should never be quite dry at the roots, or shriveling will result, this always is the case after flowering or repotting; but, when growth commences, they soon plump up again. It is often desired to grow these plants in baskets. Space can then be made for them overhead in the cool-houses in winter, bringing a few at a time into warmth, thus having succession of bloom for three months for cutting, house or conservatory decoration, where they last a long time. There are more than 100 kinds of cælogyne, many of which are but of botanical interest. *C. pandurata*, *C. Dayana* and *C. Sanderriana* are warm-house plants and should be kept at a minimum temperature of 60° in winter. *C. nervosa*, *C. flaccida*, *C. nitida*, and *C. Massangeana* are coolhouse plants, often grown in collections, but *C. cristata* and its forms are the most valued, especially the variety *maxima* once so scarce, but now plentiful, this makes large bulbs and longer spikes of bloom. The Chatsworth variety, by some considered the same as *maxima*, *hololeuca* or *alba* as it is most often known in gardens, is a pure white form, perhaps the whitest of all orchids. This is inclined to ramble, owing to the length of rhizome between each bulb or growth, and needs attention in repotting frequently, it is also the latest to flower. *C. Lemoniana* has a pretty lemon-yellow blotch on the lip instead of the usual orange and is very pretty by

contrast with the other forms. When it is desired to increase the stock of plants, the back bulbs taken off at potting time may be planted similar to the other pieces and will grow on, but cannot be expected to bloom for two years (E. O. Orpet.)

1022. *Cælogyne Massangeana*. (X 1/4)

KEY TO THE SPECIES

- A Racemes with fls. opening in succession 1 *speciosa*
- AA Racemes with fls. opening all at once
- B. Scape of the raceme naked between the pseudobulb and lowest fl.-bract
- c Imbricated bracts below fls. none
- D Keels of lip extending into broadly ovate front lobe 2 *lactea*
- DD Keels of lip not extending into ovate front lobe
- cc Imbricated bracts below fls. several, close 3 *flaccida*
- BB Scape of raceme with 1 or few scales between pseudobulb and lowest fl.-bract 4 *barbata*

- c. *Lip with a large eye-like spot* 5. *nitida*
cc. *Lip with no eye-like spot*
d. *Keels of lip lacerated or fimbriated*.
E. *The scape arising from large lvs*
F *Fl-bracts persistent* 6 *nervosa*
FF *Fl-bracts deciduous* 7 *Sanderiana*
EE. *The scape without large lvs*
F. *Sepals about as long as broad, keels of the lip only slightly cut* 8 *Förstermannii*
FF. *Sepals about twice as long as broad, keels of lip strongly cut* 9 *cristata*
DD. *Keels of lip warty*
E *Peduncle, rachis and ovaries tomentose*
F. *The scape arising from large lvs* 10 *Dayana*
FF. *The scape without large lvs*
a. *The keels in middle lobe of lip papillose* 11 *tomentosa*
GG. *The keels in middle lip cut into tooth-like segments* 12 *Massangeana*
EE. *Peduncle, rachis and ovaries glabrous*
F. *Pseudobulbs elliptic to ovate-oblong, compressed*
a *Middle lobe of lip separated from lateral lobes by a distinct claw* 13 *pandurata*
GG. *Middle lobe of lip sessile* 14 *Mayeriana*
FF *Pseudobulbs fusiform, 4-angled*
a *Raceme many-fl'd, nodding* 15 *asperata*
GG *Raceme few-fl'd, erect* 16 *Parishii*

1 *speciosa*, Lindl (*C. salmonicolor*, Reichb.) Pseudobulbs ovoid, distinctly angled, 2-3 in long, 1-lvd.; lvs up to a foot long racemes with 1, 2 or 3 fls; sepals oblong, translucent, pale yellow-brown; petals pale yellow-brown, linear, reflexed; lateral lobes of lip erect, reticulated, with dull copper-brown on a bluish-salmon ground, mid-lobe roundish, partly broad-margined with white, disk with 2 fringed ridges and amber-brown markings. Java B.M. 4889 Gn 49, p 62 B.R. 33 23. C.O. 3. Var *alba*, Hort. A light-colored form.

2. *lactea*, Reichb. f. Pseudobulbs ovate, somewhat 4-sided, sulcate, 2-lvd, 3 in long lvs up to 10 in long, 2 in broad fls 6-12, sepals and petals spreading, cream-white, the sepals oblong-ovate, acuminate, the petals much narrower, linear-lanceolate, lip about as long as petals, the lateral lobes semi-ovate, truncate, the middle lobe about equaling one-half the whole length of the lip, triangular at the apex, acute, reflexed, keels 3, undulate, extending to the center of middle lobe Burma.

3. *fiacida*, Lindl. Pseudobulbs ovate, angulate, 2-3 in long; lvs. lanceolate, about 8-10 in long; raceme 7-12-fl'd, cream-white, the sepals oblong, the petals linear-oblong, fls $1\frac{1}{2}$ in. across; sepals and petals pendulous, lip with 3 ridges, the lateral lobes white, streaked red-brown inside, the middle lobe reflexed, acute, a bright yellow blotch on the disk. Nepal. B.M. 3318 B.R. 27-31. C.L.A. 6:166.

4 *barbata*, Griff. Pseudobulbs about 2 in. long, ovate. lvs broadly lanceolate, 10-12 in long; raceme 6-10-fl'd; sepals and petals white, the sepals ovate-oblong, the petals linear; mid-lobe of lip brownish inside, curiously fringed with brown; crests 3. Khasia hills

5 *nitida*, Hook. f (*C. ocellata*, Lindl). Pseudobulbs pyriform or nearly so: lvs up to 1 ft long, narrowly lanceolate. racemes erect, 5-8-fl'd; fls 2 in. across, white, the sepals oblong, the petals linear-oblong; lip with bright orange-yellow spots on each of the lateral

lobes and 2 smaller spots at the base of the mid-lobe, disk with 3 keels, the front lobe of lip with 5 Hmalayas, at an elevation of 7,000 ft. B.M. 3767 C.L.A. 1:55 Var. *maxima*, Reichb. Racemes longer; fls. larger. J.H. III 52 25

6 *nervosa*, A Rich (*C. corrugata*, Wight). Pseudobulbs ovate-pointed, $2\frac{1}{2}$ -3 in long lvs 6-12 in long; racemes 3-6-fl'd; fls white, 2-2 $\frac{1}{2}$ in across; sepals and petals nearly equal, oblong and acute, lip with the lateral lobes striped red inside, the middle lobe ovate, acuminate; disk yellow, with 3 white fringed keels. India B.M. 5601.

7 *Sanderiana*, Reichb. f Pseudobulbs ovate and wrinkled or costate, 2-3 in long lvs a foot long; fls about 6 in a pendulous raceme, 2-3 in. across, white; sepals lanceolate-acuminate, petals narrower; lip with the side lobes striped with brown inside and with a yellow blotch, the middle lobe oblong, acute, reflexed, undulate, disk bright yellow, with 6 fringed keels. India J.H. III. 44 75

8 *Förstermannii*, Reichb. f Pseudobulbs cylindric or fusiform lvs up to $1\frac{1}{2}$ ft long racemes many-fl'd; fls 2 in across, white, sepals and petals lanceolate; lip with 3 denticulate keels, the middle lobe elliptic, acute, disk marked with yellowish brown. India.

9 *cristata*, Lindl Fig 1023 Pseudobulbs $1\frac{1}{2}$ -2 in. long, ovoid-oblong, scattered on a scaly rhizome lvs. 8-12 in long racemes 5-9-fl'd, drooping, fls. white; sepals and petals lanceolate-oblong, undulate, acute, with 5 orange fringed keels, the lateral lobes slightly incurved, the mid-lobe transversely oval, denticulate. Nepal J.H. III 31 349 P.G. I 55 A.G. 14 331; 15 513 A.F. 4 497, 6 87, 9 1111, 13 1133, 16 1445. C.L.A. 6:163 F.E. 9 331 B.R. 27 57 G.C. III 47 40 O.R. 18-169 Gng. 2:393; 4 225 Var. *hololeuca*, Hort (var *alba*), has white fls, labellum without yellow. C.O. 1a Var *Lemoniana*, Hort (var *citrina*, Hort), has citron-yellow fringes. J.H. III 57 537 Var *Chatsworthii*, Hort, has large pseudobulbs and large fls of good substance Var. *maxima*, Hort, has very large fls—*C. cristata* is one of the best and most popular of orchids. It is one of the easiest to grow Can be grown with cattleyas

10 *Dayana*, Reichb. f. Pseudobulbs cylindric-fusiform, 5-10 in long lvs up to $2\frac{1}{2}$ ft. long, oblong-lanceolate racemes many-fl'd, pendulous, fls $2-2\frac{1}{2}$ in. across, sepals and petals pale yellow, margins reflexed, the petals much narrower than sepals, lip with 6 erect ridges fringed with brown, the lateral lobes brown, streaked with white inside, the middle lobe nearly quadrate, reflexed, apiculate. Borneo. G.C. III 15 695. A.F. 35 380

11. *tomentosa*, Lindl. Pseudobulbs elongated, ovoid, 2-3 in long lvs up to a foot long, 3-5-nerved racemes pendulous, tomentose; fls 15-20, $2-2\frac{1}{2}$ in. across; sepals

and petals pale orange-red, sepals lanceolate, petals linear-lanceolate; lip with lateral lobes oblong, rounded, streaked with red on inside, the middle lobe reniform or transverse-elliptic, sessile; keels 3, crenulate, lateral ones converging in the middle lobe and sometimes bearing 2 branches. Perak, Borneo, Sumatra.

12. *Massangeana*, Reichb. f. Fig. 1622. Pseudobulbs pyriform, 3-5 in. long; lvs elliptical, large, tapering toward the base, up to 20 in long racemes many-fl'd, pendulous, pubescent, fls. 2-3 in. across, sepals and petals pale yellow, the sepals oblong-lanceolate, the petals linear-oblong; lip with lateral lobes brownish within, lined or streaked with yellow, mid-lobe with a verrucose brown and yellow disk from which extend 3 denticulate keels. Assam B M 6979. C O 4

13. *pandurata*, Lindl. Pseudobulbs 3-4 in. long, oval-oblong, compressed, lvs 15-20 in long, cuneate-oblong, racemes many-fl'd, pendulous; fls up to 4 in across, sepals and petals green, linear-oblong, acute; lip fiddle-shaped, with black veins and stains on yellowish green ground, the mid-lobe crisped, black-warty; disk 2-keeled. Borneo B M 5084 F S 20.2139 J H. III 30 377. A F 6.633 C O 6. Gt. 49:1480.

14. *Mayeriana*, Reichb. f. Pseudobulbs ovate-oblong, about 2 in long, compressed, 2-lvd. lvs 8-10 in long, cuneate-obovate raceme 8-10-fl'd, erect or nodding, fls about 2½ in across, green, veined black-brown, sepals oblong, acuminate, the petals shorter and narrower, the margins reflexed; lip nearly as long as sepals, the lateral lobes concealing only the base of the column, the middle lobe sessile, oblong-elliptic, crisped, keels 3, papillose Singapore

15. *asperata*, Lindl (C. *Louii*, Paxt.) Large species (18-24 in. high). pseudobulbs ovate-oblong, 5-6 in long or more lvs up to 2½ ft long, lanceolate, acute raceme 7-10-fl'd, pendulous; fls 3 in. across, cream-colored, sepals and petals lanceolate, lip with the lateral lobes white, streaked red-brown inside, the middle lobe nearly orbicular, the crisped margin pale yellow streaked red-brown; disk with 2 or 3 orange-red warty ridges Borneo P. M. 16 227. G.C. III 46:34

16. *Pirishii*, Hook f. Like No. 12, but racemes not drooping, pseudobulb 4-angled, 4-6 in long lvs up to a foot long, lanceolate, acuminate, racemes 4-7-fl'd, erect, fls. about 2 in. across, pale yellow-green, sepals lanceolate, acuminate; petals linear-lanceolate, lip fiddle-shaped, black-spotted, the middle lobe apiculate, undulate; disk with 5 raised lines. Moulmein B M 5323

Burma. G.C. III 13:361.—C. *Velutina*, Rolfe. Racemes many-fl'd, pendulous, fls nearly globose, white, the sepals and petals much incurved, lip longer than sepals, the lateral lobes obtuse, the middle lobe ovate, revolute, the disk shorter than the lvs.—C. *Wendlandiana*, B. M. 7764.—C. *venusta*, Rolfe. Racemes many-fl'd, pendulous, fls pale yellow, the lip white, marked with yellow. S. W. China B. M. 8262.—C. *viridescens*, Rolfe. Resembling C. *Persiana*. Fls pale green with dark dots on the lip. Annam. GEORGE V. NASH.

COFFEA (from the Arabian name for the drink, itself conjecturally derived from Caffa, a district in southern Abyssinia). *Rubiaceæ* Woody plants, producing the coffee of commerce; as a horticultural subject, sometimes cultivated for the ornamental appearance; and also in collections of economic plants

Shrubs or small trees, natives of Trop Asia and Afr: lvs mostly opposite, rarely in whorls of 3, elliptical, acute, usually coriaceous and glossy: fls clustered in the axils, cream or cream-white and fragrant; calyx-limb 5-, rarely 4-, parted, the corolla salver-shaped, the corolla-tube cylindrical, the throat sometimes villous, stamens inserted in or below the throat of the corolla fr a berry; seeds 2, horny, which are the well-known coffee of commerce—From 25-40 species, in Trop. Afr. and Asia, the species not yet clearly defined, nor well understood horticulturally

Coffee-production is based mostly on C. *arabica* and C. *liberica*, both widely cultivated throughout the tropics, and in greenhouses northward. The coffee industry, one of the most important industries in the tropics, reaches the enormous figure of \$200,000,000 or sometimes a little more than this See the treatment in Vol II Cyclo. Amer Agri.

The coffee plant and its product. (T. B. McClelland)

The main source of coffee is *Coffea arabica*, an evergreen shrub, growing 10 to 15 feet high. The younger plants have one main trunk or stem, but from this others frequently develop later, which are similar in form and habit to the first. The lateral branches are opposite, horizontal and in pairs, very rarely in whorls of three. The pairs of branches are in whorls on the main stem. The leaves, which are opposite and borne in pairs, are 4 to 7 centimeters (about 1½ to 3 inches) broad by 10 to 20 centimeters (4 to 8 inches) long, the length being usually slightly more than two and a half times the breadth. They are elliptical, acuminate at tip and attenuate at base. There are eight to eleven pairs of main lateral veins. In the axils where the veins join the midrib are small pores, open below and slightly swollen above. The tip of the leaf is frequently curled and is rather abruptly contracted. The margin is entire and wavy. The leaves, which are perennial, are a dark glossy green, and though thin are firm in texture.

There are usually two or three large blossomings and several small ones extending over a period of several months. The pure white and delicately fragrant star-like flowers are borne on very short pedicels in one to four axillary clusters of one to four flowers each. These flower-clusters are subtended by two to four common calyxes. The tube of the corolla is 8 to 10 millimeters (about ¼ to ¾ inch) long. Its segments are about 7 millimeters (nearly ¼ inch) broad by 15 to 18 millimeters (¾ to ¾ inch) long. The style is 17 to 22 millimeters (¾ to nearly 1 inch) long. The stigma is two-branched, each branch being 5 millimeters (about ¼ inch) long. The linear anthers, corresponding in number to the petals, are 9 millimeters long and are supported on filaments 5 to 7 millimeters long. The size varies somewhat with favorable or unfavorable conditions. The short annular calyx with its denticulate limb is so small as almost to escape notice.

Under *Coffea arabica* are included a number of varieties quite distinct in growth and product from the other varieties of the same species, such as Maragogipe, Mocha, Pointed Bourbon (sometimes classified as C. *laurina*) and others.

Maragogipe coffee, as its name indicates, is of Brazilian origin, having been discovered in 1870 near the town from which its name is derived. On account of the large size of the bean it has commanded a fancy price on the market, but this variety is considered to be a small yielder. The flowers, fruits, and leaves are all larger than the ordinary Arabian coffee and the

leaves curl noticeably. Its flavor is not considered superior to that of the ordinary Arabian coffee.

Mocha coffee, with its shorter internodes and smaller flowers, fruits, and leaves is a distinct variety. The "beans" are much less oval and are more rounded and hold a high reputation for quality.

Normally two coffee "beans" or seeds are produced in each red cherry-like drupe. Some drupes, however, contain three beans and others only one. When only one is formed it is called "peaberry," and is oval in shape instead of being flat on one side and convex on the other as is the bean when two are produced. The peaberries are sorted out by machinery and are sold at a fancy price on account of being a little different in appearance from the other coffee, but any claim to superiority of flavor is without foundation. There is one variety of coffee that produces a number of beans in each drupe, and the corolla-segments may range up to ten. As the number of beans increases, the size and the attractiveness of appearance decrease, so that this is a very undesirable variation.

The fruits require six and one-half to seven months to mature. The ripening of the coffee, in relation to the blossoming, extends over several months. Where the West Indian or wet process for curing the coffee is followed, the ripe cherries are picked every fortnight. While fresh they are passed through a machine which pulps and separates the coffee in its parchment from the pulp. The former is then fermented and washed to remove a slimy covering. After thorough drying in the sun or in heated driers, the parchment coffee may be stored or it may have the thin brittle parchment or horn-skin and the silver-skin removed by special machinery. If desired it may be further polished and artificially colored. After being sized and having the better grades cleaned of inferior beans, it is ready for roasting. In some places where the dry or old preparation is followed the coffee is allowed to ripen and much of it to fall from the trees and lie on the ground until all can be collected in one picking. It is then dried in the sun without preliminary preparation.

Although coffee has been used as a beverage for hundreds of years by a few persons, as a world beverage it is comparatively modern. In 1825 the estimated production did not exceed 218,255,400 pounds. In 1906-1907 the production was estimated as 3,164,041,920 pounds, or an increase of 1,350 per cent in eighty-one years.

Brazil produces about three-fourths of the world's coffee crop. Then follow in order of importance Venezuela, Colombia, Guatemala, Mexico, Haiti, Salvador, Dutch East Indies, Porto Rico, British India, Costa Rica, Nicaragua, and other countries.

In Bulletin No. 79, Bureau of Statistics, United States Department of Agriculture, may be found a very extensive bibliography of coffee. In the Netherlands the per capita consumption is more than 15 pounds; in the United States under 11½ pounds, in Japan 003 pound.

A. Corolla 5-parted, sometimes 4-parted.

B. Segms. of corolla narrow: lvs. oblong, 4-5 in. long, 1½ in. wide.

arabica, Linn. COMMON OR ARABIAN COFFEE. Fig 1024 Lvs 3-6 in. long, rather thin, oblong, nearly 3 times as long as broad, more or less abruptly contracted near the apex to a point about ½ in. long; segms. of corolla over twice as long as wide; fr. a 2-seeded, deep crimson berry, but the "berries" or beans of commerce are the seeds. The commercial varieties of coffee are based largely on the size, shape, color and flavor of the seeds, and hence the fr. is very variable, but the typical fr. may be considered to be oval and ½ in. long. Indigenous in Abyssinia, Mozambique and Angola; supposed to have been intro. in early Mohammedan times from Abyssinia to Arabia, whence it became known to Europeans in the 16th century. This species furnished until recently the entire commercial product. B M. 1303 Gng 6.55—A variegated form, var *variegata*, Hort., is more showy than the type. It is offered by dealers in tropical plants. As coffee grows wild in Afr it is a small tree 10-15 ft. high, with the trunk 9-12 in. thick at the base. Often cult. under glass in the N. for its economic interest, and in S. Calif. it is a good outdoor ornamental shrub, esteemed for its shining lvs., fragrant white fls., and red berries.

BB. Segms. of corolla wide lvs. ovate.

bengalensis, Roxbg. BENGAL COFFEE Lvs ovate, barely twice as long as broad, acute, but not having a long, abrupt point fls. in 2's or 3's; segms. of corolla barely twice as long as wide. E. Indies, Malaya. B M. 4917—This has much showier fls. than *C. arabica*. A small shrub with glabrous, dichotomous branches. Mts. of N. E. India, whence it was brought to Calcutta and much cult. for a time. It is now neglected, the berries being of inferior quality and the plants not productive enough.

AA. Corolla 6-, 7-, or 8-parted.

B. Fls. in dense clusters or glumes: lvs. short-pointed.

liberica, Hiern. LIBERIAN COFFEE Lvs longer than in *C. arabica*, and wider above the middle, with a proportionately shorter and less abruptly contracted point: fls. 15 or more in a dense cluster, corolla-segms. usually 7. Trop. Afr. Trans. Linn. Soc. II 1 171 (1876). G C II. 6: 105. R H. 1890, pp 104-5—Said to be more robust and productive than *C. arabica*, with berries larger and of finer flavor. It is a more tropical plant than the common coffee, and can be grown at lower levels.

Zanguebarica, Lour. (*C. zanzibarensis*, Hort.). A glabrous, erect, closely branched shrub or small tree, to 6 ft., the branches ashy lvs. ovate or obovate, obtuse or shortly pointed, 2-4 in. long, ¾-1½ in. wide, the lateral veins about 6 pairs. fls. white, axillary, in dense clusters; corolla-lobes 6-7. berry red, turning black.

BB. Fls. solitary or in 3's lvs. long-pointed, 2½-5 in. long

stenophylla, Don Lvs 4-6 in. long, 1-1½ in. broad, narrower than in *C. arabica*, with a relatively longer and more tapering point corolla-segms. usually 9. W. Afr. B M 7475—This is said to yield berries of finer flavor than the Liberian coffee, and quite as freely, but the bush is longer in coming into bearing. This is a promising rival to the *C. arabica* of commerce. Seeds have been distributed by British botanical gardens, but are not known to be for sale at present in Amer. *C. madagascariensis*, Hort., and *C. robusta*, Hort., are names of uncertain status.

WILHELM MILLER.
N. TAYLOR.†

COFFEE. *Coffea*.

COFFEE BERRY. A name of *Glycine hispida*, which should be abandoned in favor of soybean. Various leguminous seeds are used as coffee substitutes and are so named, cf. *Cassia*, *Canavalia* and others.

COFFEE PEA. A western name for chick pea, *Cicer arretinum*, which is used as a substitute for coffee.

COFFEE-TREE *Gymnocladus*.

COHOSH: *Actea* The blue cohosh is *Caulophyllum*.

COHUNE: *Attalea Cohune*, it is a source of oil.

COIR: Fiber of coconut, which see.

CÔIX (an old Greek name). *Gramineæ*. Tall, broad-leaved, branched grasses with bead-like inflorescence, one of them grown in gardens

Plant loose-growing at the end of each peduncle is an indurated, globular, or oval, hollow bead, developed from a lf.-sheath; from an orifice at the tip projects the staminate spike pistillate fls inclosed in the bead, the styles projecting.—Species about 3, E Indies, the following widely distributed in all tropical countries.

Lácryma-Jôbi, Linn Jon's TEARS Fig 1025 Annual, 2-4 ft the beads or "tears," pearly white to lead-color, containing the seed, are about $\frac{1}{2}$ in long Dept Agric., Div. Agrost., 20 14.—Cult for ornament and as a curiosity The hard bony frs are used as beads and made into necklaces, to which are attributed marvelous properties. Var. *aurea zebrina*, has yellow-striped blades A S HITCHCOCK.

CÔLA (native name). *Sterculideæ* COLA Also called Kola, Korra, Gorra. One species is much grown in the tropics for the stimulating cola nut

The genus consists entirely of plants with unisexual or polygamous fls in axillary or terminal clusters calyx 4-5-cleft; petals none fr of 4-5 leathery or woody oblong carpels.—Probably about 40 species, of Trop. Afr trees chiefly interesting for the cola nuts, which are said to sustain the natives in great feats of endurance The tree grows on the east coast of Afr, but is very abundant on the west coast, and is now cult in the W Indies Within the tropics the trade in this nut is said to be immense It has become famous in the U S through many preparations for medicinal purposes and summer drinks The seeds are about the size and appearance of a horse-chestnut, and have a bitter taste Although repeatedly intro to Kew, England, the plant never flowered there until 1868

Colas require a rich, well-drained soil Those introduced into the West Indies and other parts of America, especially *C. acuminata*, thrive best on a sandy loam. The trees are grown from seeds, which are large and fleshy, keeping well for some weeks after ripening As the tree is difficult to transplant, the seeds may be planted singly in small pots, and the young trees kept growing thus until wanted for permanent planting. Propagation may also be effected by cuttings of ripe wood, which should be placed in bottom heat, and treated in the usual way. (E N. Reasoner)

acuminata, Schott & Endl. About 40 ft high in Afr, resembling an apple tree lvs alternate, petiole 1-3 in. long; blade 4-6 in long, 1-2 in broad, leathery, with prominent ribs below; older lvs entire, obovate, acute; younger lvs often once or twice cut near the base about half way to the midrib fls yellow, 15 or more in axillary and terminal panicles, about $\frac{1}{2}$ in. across, with a slender green tube and a showy yellow 6- or 5-cut limb, which is a part of the calyx. fr. 5-6 in. long. B.M. 5699 N. TAYLOR.†

CÔLAX (Greek, parasite). *Orchidideæ*. Epiphytic orchids, much like *Lycaste*.

Pseudobulbous: fls in an upright raceme, arising from the base of the new shoot, sepals and petals similar, the lateral sepal forming a distinct foot with the base of the column; lip 3-lobed, clawed, with a transverse hairy process; pollinia 4.—A Brazilian genus of 2 species.

jugdus, Lindl. (*Maxillaria jugdus*, Lindl. *Lycaste jugdus*, Benth.). Pseudobulbs ovoid, 2-3 in. long, 2-4-d.: lvs. 5-9 in. long, lanceolate: raceme 2-3-fl.; fls. 2-3 in across; sepals white, obtuse, oval-oblong; petals white, obovate-oblong, spotted and barred with violet-purple; lip white, shorter than petals, the side lobes streaked violet-purple, the middle lobe semi-circular, with numerous pubescent keels, streaked and blotched violet-purple B.M. 5661. I.H. 19:96

C. triperus, Rolfe. Ovary 3-winged, disk of lip bearing a broad fleshy callus Brazil GEORGE V. NASH.

CÔLCHICUM

(from Colchis, a country in Asia Minor, where the genus is most plentiful) *Liliaceæ*. MEADOW SAFFRON. AUTUMN CROCUS. Autumn flowering, rarely spring-flowering, bulbous plants with crocus-like blossoms

Leaves either all radical, or radical and cauline, sometimes ciliate, appearing in early spring and usually dying down by June: fls various colored, very beautiful; perianth tubular, varying from purple to white (there is 1 yellow-fld sort), the limb 6-parted; stamens 6, inserted on the perianth, ovary 3-celled, many-ovuled caps ovate-oblong in most of the species, the seeds globose.—A difficult genus, very much confused botanically, but horticulturally well known and popular They are narcotic poisons J G Baker, Jour Linn Soc 17 1880 G B Mallett, in Flora and Sylva, 1 108, 1903, has an excellent horticultural account of the genus

Colchicums are most charming and interesting plants of easy culture The bloom comes in August and September, at a season when the herbaceous beds begin to lose their freshness, and, although individual flowers are fugacious, others follow in quick succession, thus prolonging the time of flowering Opening, as they do, without foliage, some help is required from the greenery of other plants; for this purpose any low-growing, not too dense kind, may be used, such as the dwarf artemisias, sedums, or *Phlox subulata*. Colchicums are most effective in masses, which can be established by thick planting, or as the result of many years' growth. They can be grown in rockwork, in beds, or in grass which is not too thick nor too often mown; they will thrive in partial shade, but succeed best in an open sunny border They should be planted in August or early September, in deep well-enriched soil, a light sandy loam, with the tip of the long bulbs 2 to 3 inches below the surface; some protection should be given in winter. They remain in good condition for many years, and should not be disturbed unless they show signs of deterioration, fewer flowers and poor foliage. Then

1025.
Coix Lacryma-Jobi.
($\times \frac{1}{2}$)

they should be lifted and separated, just after the leaves die, end of June or early July. This is the usual method of propagation, but they can also be increased from seeds, sown just after ripening, June to July, the seedlings bloom when three to five years old. The bulbs are obtainable from the Dutch growers at moderate prices, and they must be imported early; otherwise they are apt to bloom in the cases *C. autumnale*, with rosy purple flowers, is a well-known and the most commonly cultivated species. There are numerous varieties, of which the best are the white, the double white and the double purple. Belonging to this same group and not differing much except in size and shading of the flower, are *C. byzantinum*, *C. montanum*, and *C. umbrosum*. *C. speciosum*, a native of the Caucasus, is the finest in every way of the genus. The flowers are much larger and of better shape, and the color, a rosy pink, is much more delicate; the habit of growth is robust, and the plant is most easily handled. *C. Parkinsonii* is distinct from the above varieties inasmuch as the flowers are tessellated, purple and white, giving a curious checker-board appearance which is unique, the leaves are much smaller and are wavy. *C. agrippinum*, *C. Bivonæ*, *C. ciliatum* and *C. Subhorpii*, are other species having checkered flowers more or less similar to *C. Parkinsonii*. *C. Bulbocodanum* = *Bulbocodanum vernum* Monograph by J. G. Baker in Jour. Linn Soc., vol 17 (1880) (B. M. Watson)

A. Blooming in spring lvs appearing with the fls.

B. Color rosy lilac size of anthers small.

C. Anthers oblong, purple.

1. *montanum*, Linn (*C. Bertoloni*, Stev.) An important and variable species, with many synonyms and variations Baker makes 7 forms. Corm ovoid, $\frac{1}{2}$ –1 in. thick, the tunics brown, membranaceous, the inner ones produced to a point 2–4 in. above the neck. lvs 2–3, rarely 4–6, linear or lanceolate, about 2–3 in long at the time of flowering, finally 6–9 in long fls 1–4, in spring and autumn Oct–June Medit region, from Spain to Persia B M 6143 — It appears in early spring with the snowdrops and crocuses

2. *crociflorum*, Regel, not Sims nor Schott & Kotschy Corm ovate-oblong lvs all radical, sheathing at the base, a few sometimes on the st, flat and linear, margins minutely and usually distantly toothed. corolla white, with violet-purple stripes, especially within, the tube about 2 in long, the limb scarcely 1–1½ in. long; style exceeding the stamens. Feb., March. Cent. Asia.

cc. Anthers linear, yellow.

3. *Stevenii*, Kunth Corm narrower than in No 1, about $\frac{1}{2}$ –¾ in. thick: lvs. at length 4–5 in. long: fls. Oct–Jan. Syria, Arabia, Persia — Less popular than No. 1.

BB. Color yellow* size of anthers large.

4. *luteum*, Baker. This is the only yellow-fl'd form in the genus, all the others ranging from purple to white. Although it belongs to the Medit. group, with lvs. and fls. produced at the same time and in spring, it is a native of W. India at an elevation of 7,000–8,000 ft. Corm tunics dark brown, sometimes almost black. lvs. 3 or 4, wider and less tapering than in No. 1, at the time of flowering 3–4 in. long, finally 6–7 in. long. B.M. 6153.—Very desirable.

AA. Blooming in autumn: lvs. appearing after the fls.

B. Perianth tessellated or checkered.

C. Tessellation distinct.

D. Lvs spreading or prostrate.

5. *variegatum*, Linn Lvs 2–3, lanceolate, about 6 in. long, 12–15 lines wide, lying flat on the ground; margins wavy fls 2–3 from each spathe, 4 in across, rose-color with a white tube. lvs of the Levant and Asia Minor. B M 1028 Variable The plant known as *C. chionense* is apparently a form of it. Corm size of walnut.

6. *Parkinsonii*, Hook f (B M. 6090) (*C. tessellatum*, Authors), is the best of all the tessellated forms, the tessellation being more sharply defined and more delicate

than the type. It is a smaller plant, and has shorter and more strongly undulated lvs, which he closer to the ground. Of this plant Parkinson said in his "Paradise Terrestrius," 1629 "This most beautiful saffron flower riseth up with his flowers in the Autumne, as the others before specified doe, although not of so large a size, yet farre more pleasant and delightfull in the thicke, deep blew, or purple coloured beautiful spots therein, which make it excell all others whatsoever the leaves rise up in the Spring, being smaller then the former, for the most part 3 in number, and of a paler or fresher green color, lying close upon the ground, broad at the bottome, a little pointed at the end, and twining or folding themselves in and out at the edges, as if they were undented. I have not seen any seede it hath borne. the root is like unto the others of this kinde, but small and long, and not so great it flowereth later for the most part then any of the other, even not until November, and is very hard to be preserved with us, in that for the most part the route waxyth lesse and lesse every year, our cold Country being so contrary unto his natural, that it will scarce shew his flower, yet when it flow-croth any thing early, that it may have any comfort of a warm Sunne, it is the glory of all these kinds "

DD Lvs ascending

E. Margin of lvs wavy.

7. *agrippinum*, Baker (*C. tessellatum*, Hort). Corms a trifle thicker than in No. 5 lvs 3–4, 6–9 in. long, 12–15 lines wide, margin wavy fls 2–4 from each spathe FS 11.1153 — This is a marked form of *C. variegatum*, of garden origin, which has similar fls., but a more robust habit and more nearly erect lvs.

EE. Margin of lvs flat, not wavy.

8. *Bivonæ*, Guss Lvs 6–9, nearly 1 ft. long, 9–15 lines wide, rather hooded at the apex, margin flat, not wavy fls 1–6 from each spathe, rose-purple faintly checkered with a darker color, 4–6 in. long. Medit. region. Var. *superbum*, Hort , an excellent form, is advertised in English catalogues. F S R. 1.108.

1026. Colchicum autumnale. (X¾)

cc. *Tessellation less distinct.*

9. *Sibthorpii*, Baker. Easily distinguished from Nos. 5, 7, and 8 by the much broader segms. of the perianth, and by the lvs., which are nearly erect, obtuse, and not at all wavy: lvs. 5-6, dull green, finally 1 ft. or more long, $1\frac{1}{2}$ - $2\frac{1}{2}$ in. wide, narrowed gradually to the base: spathe striped with green, and tinged with lilac at the tip. fls. 1-5 from each spathe; perianth-tube often 6 in. long. Mts. of Greece. B.M. 7181. F.S.R. 1:108. —A large, cup-shaped fl., showing no open spaces between the broad, overlapping segms. Very handsome.

bb. *Perianth not tessellated.*c. *Size of fls. large, 3 in. or more across.*d. *Lvs. broad, 3-4 in. wide.*e. *Number of fls. 1-4.*

10. *speciosum*, Stev. Corm 2 in. thick, the largest of the genus: st 1 ft. high: lvs. 4-5, 12-15 in. long, 3-4 in. wide, narrowed from the middle to the base, shining green: fls. 1-4 from each spathe, violet, with a white eye, but varying almost to pure pink, often 6 in. across. Caucasus. B.M. 6078 F.S. 23385 F.M. 1876:235. Gn 11:80 —Commonly considered the finest species of the genus; blooms Sept. and Oct. Var. *maximum*, Hort. Plant $7\frac{1}{2}$ in. high.

ee. *Number of fls. 12-20.*

11. *byzantinum*, Ker-Gawl. Closely allied to the above, but with wider lvs., smaller and paler fls., and broad, short anthers: st. 6 in. high. lvs. 5-6, oblong, dark green, striate, 9-12 in. long, 3-4 in. wide: fls. smaller than in No. 10, usually 3-4 in. across, lilac-purple, and often 12-20 from each spathe. Transylvania and Constantinople. B.M. 1122. —Corm large, depressed. *C. calicum*, Hort., has rosy fls., somewhat tessellated. G.C. III. 23:35.

dd. *Lvs. narrow, 1-2 in. wide.*

12. *Bornmülleri*, Freyn. Lvs. elliptic-lanceolate, 3-4 in. long, 1-2 in. broad: fls. 8 in. long and 5 in. across, the limb pale rose or lilac-rose at first, subsequently deeper purple, the corolla-tube white. Asia Minor. Early spring.—One of the rarest and finest of the group, suitable for the rock-garden.

13. *autumnale*, Linn Fig 1026; 442, p. 433. St. 3-4 in. high: lvs. 3-4, rarely 5-6, 9-12 in. long, $1\frac{1}{2}$ -2 in. wide: fls. 1-4, rarely 5-6, from each spathe, purple, with a white variety, about 4 in. across; perianth veined E. and N. Afr. B.M. 2673 (as *C. crociflorum*). —Possibly the commonest in the American trade. It has beautiful double forms in purple and pure white. F.S. 19:1936.

14. *Decaisnei*, Boiss. Corm ovate, membranaceous: lower lvs. broadly lanceolate, the upper ones narrower and acutish, entire, 1- $1\frac{1}{2}$ in. broad: fls. pale-rose, or flesh-colored, the tube elongate-elliptic, the stamens a little shorter than the perianth; anthers yellow, linear; style only slightly exceeding the stamens. N. Afr. and the eastern Medit. region. Nov.-Jan.—Planted in masses with *C. crociflorum* for rock-gardens, it is very effective.

cc. *Size of fls. small, about 2 in. across.*d. *Number of fls. from each spathe more than 1 or 2.*e. *Perianth-segms. acute.*

15. *Troëddii*, Kotschy. Corm medium-sized: lvs. 3-4, 6-12 in. long, 9-12 lines wide, dark green above: fls. 4-5 or even 12, lilac-purple, about 2 in. across; perianth segms. lanceolate-acute. Cyprus. B.M. 6901 shows a pure white variety.

16. *fasciculäre*, Boiss. Corm oblong: lvs. 5-7, broadly lanceolate, channeled, the apex acutish, frequently ciliate, about 1 in. wide: fls. many, in clusters,

the corolla $2\frac{1}{2}$ in. long, white, 6-10-nerved; stamens equalling the corolla, but slightly exceeded by the style branches. Feb. Syria.

ee. *Perianth-segms. obtuse.*

17. *umbrösum*, Stev. Corm small: lvs. 4-5, 6-9 in. long, 9-12 lines wide: fls. 1-5 from each spathe, lilac, about 2 in. across, perianth-segms. oblanceolate, obtuse, with 8-12 veins. Caucasus.

dd. *Number of fls. from each spathe 1 or 2.*

18. *alpinum*, DC. (*C. montanum*, All. not Linn.). Lvs. 2, rarely 3, nearly erect or spreading, 4-8 in. long, 3-6 lines wide, obtuse, channeled, shining green, narrowed from the middle to the base: fls. 1 or 2 from each spathe, about 2 in. across, lilac; segms. oblanceolate, obtuse, 3-4 lines wide, with 10-15 veins. Mts. of France and Switzerland.

C. granatum, Hort. A plant with magnificent pink fls.—Is not certainly referable to any species. The name appears in several catalogues, but is unknown in botanical literature. See F.S.R. 1:108—*C. hydrophilum*, Hort. An early spring-flowering species, bulb size of a walnut lvs. and fls. appearing together, the fls. bright clear rose and taller than the lvs., the latter growing after the fls. are gone and attaining a length of 6 in. fls. in clusters of 3-15, stamens half as long as the segms. Taurus Mts. G.C. III. 29:102—*C. sicchanum*, Hort. A late autumn-flowering species with rich reddish purple fls. Asia Minor—*C. verruculosum*, Hort. Similar to some of the forms of *C. speciosum*, but earlier in flowering.

WILHELM MÜLLER,
N. TAYLOR.†

COLDFRAME. An unheated covered frame (see *Frame*) used (1) for the starting of plants in spring in advance of settled weather but not so early as in a hotbed; (2) for receiving plants from a hotbed or greenhouse, holding them as an intermediate station until they may go in the field, (3) carrying hardy plants over winter, as spinach, lettuce, (4) providing a general store-place for hardy or semi-hardy stuff from greenhouse and garden; (5) affording a propagating-bed in spring and summer for seeds or cuttings. Usually the coldframe is topped with glass, as is the hotbed, but prepared paper or cloth is sometimes used. Coldframes are usually of temporary construction. L. H. B.

COLD-STORAGE, REFRIGERATION, RETARDING. Dealers in bulbs, cut-flowers, nursery stock, fruits and vegetables employ cold-storage to retard the growth of bulbs and plants, or to preserve cut-flowers and produce, by using specially constructed sheds, refrigerators, ice-boxes, or the public cold-storage warehouses. The nursery stock thus stored can be packed and shipped from the cold to warmer parts of the country in good season for planting, when it would be impossible to dig and ship such stock without the storage system. Sheds for the storage of nursery stock have earthen floors, are ventilated and lighted from the ridge-and-furrow roof and heated to exclude frost, the maximum temperature being 35° to 40°. Large trees are stood upright, the smaller stock usually laid lengthwise in compartments. The roots are covered with sphagnum, or a mixture of sphagnum and excelsior or cedar shingleton, the shingleton or excelsior alone will not make good covering for this purpose. See *Nursery*.

The roots and bulbs commonly placed in cold-storage are those used by florists for forcing, such as lily bulbs, lily-of-the-valley pips, and the like. By placing these in cold-storage, growers can secure a continuous succession of bloom throughout the year. Lily bulbs are stored in the original cases packed in soil, the cases being cleated to provide circulation of air, and held at 34°. The *multiflorum* and *formosum* varieties of *Lilium longiflorum* can be held in storage three to four months, and the *giganteum* type of this lily ten to eleven months, *L. auratum* four months, *L. speciosum* and varieties eight months. The sizes (circumference) of storage lily bulbs and number of bulbs to the case are as follows:

L. longiflorum and its varieties *multiflorum*, *formosum* and *giganteum*, 6- to 8-inch, 400, 7- to 9-inch, 300, 9- to 11-inch, 200, in *L. longiflorum giganteum* there is an 8- to 10-inch size which runs 225 to the case; *L. auratum* 8- to 9-inch, 160, 9- to 11-inch, 100, 11- to 13-inch, 75; *L. speciosum*, 8- to 9-inch, 200, 9- to 11-inch, 100, 11- to 13-inch, 75. Lily-of-the-valley pips are packed in a mixture of sphagnum and sand, one-fourth of the latter being used to three-fourths of the moss and held at 28°. These are packed 500, 1,000 and 2,000 to the case and

1027. Coleus cutting.

can be kept in storage eleven months. Canna roots, dahlias and gladioli should be held at 35° to 40°. Cut-flowers, such as roses, carnations, orchids, violets, and lilies, used by florists, are preserved for varying periods in ice-boxes or refrigerators, the usual temperature being 35° to 40°. Peonies cut when the buds show color, leaves removed from the lower part of the stem, wrapped in paper, and the lower bare portions of the stems placed in water, will keep several weeks at a temperature of 32° to 33°. *Lalium candidum* in bud can be treated the same way.

Fruits and vegetables are stored at 33° to 35°. Warehousemen say that cold-storage merchandise keeps best and is easiest to handle in packages containing about a bushel. See *Storage*.

MICHAEL BARKER

COLE. A generic name, little known in North America, for plants of the cabbage tribe, cole-oil is secured from species of *Brassica*.

COLEA (Sir G. Lowry Cole, Governor of Mauritius). *Bignoniacea* (Glabrous evergreen trees or shrubs of Madagascar, Mauritius and the Seychelles, members of which may occur in collections of warmhouse (or stove) plants. Lvs opposite or verticillate, pinnate, with many entire lfts. fls medium-sized, yellow, white or rose-color in lax or dense cymes or fascicles, corolla funnel-form, somewhat bilabiate, with 5 rounded spreading lobes, perfect stamens 4, didynamous. Probably 15 species, but little known in cult. They thrive in a fibrous earth and prop by means of mature shoots in sand over bottom-heat.

COLEUS (Greek for *sheath*, referring to the monadelphous stamens) *Labiata*. Common window-garden and greenhouse showy-leaved herbs, and a few less known species grown for the handsome flowers.

Herbs or small shrubs, annual or perennial, upright. Lvs opposite, dentate or serrate, petioled or sessile, st 4-angled fls mostly blue or lilac, in terminal spike-like racemes, small and middle-sized and usually bluish, the 5-toothed calyx deflexed in fr; corolla bilabiate, the lower lobes longer and concave, and inclosing the essential organs, stamens 4, didynamous and declinate, the filaments united into a tube, the anther-cells confluent, ovary 4-parted, subtended by a gland-like disk, the style 2-lobed. Probably 150 species, in the tropics of the eastern hemisphere, being especially abundant in Afr, E India and adjacent isls. Some species produce tubers that are eaten in the same way as potatoes.

The common coleuses are of the most easy culture. They root readily from short cuttings, cut either to a joint or in the middle of an internode (Fig 1027). Few conservatory plants are more ready to root than this. They may be rooted at any time of the year when new wood is to be secured. Formerly coleuses were much used for bedding, but the introduction of better plants for this purpose has lessened their popularity. They require a long season, they are likely to burn in the hot summers of the interior country; they have a weedy habit. However, they withstand hearing and therefore are useful for carpet-bedding. The leading variety for this purpose is still the old Golden Boder, whose golden yellow foliage is used as filling for fancy designs. Coleus plants make excellent specimens for the window-garden and conservatory. Best results are secured when new plants are started from cuttings each spring. They also grow readily from seeds, many interesting leaf-forms and colors arising. The old plants become leggy, lose their leaves, and lack brightness of color. They are very subject to mealy-bug. They are also liable to root-gall (the work of a nematode worm), as shown in Fig 1028. When plants are thus affected, take cuttings and burn the old plants, and either bake or freeze the earth in which they grew.

A. Common garden coleus, with red, purple, yellow, green and variegated foliage.

1028. A coleus attacked by root-galls.

Blümer, Benth (*C. Verschaffeltii*, Lem. *C. scutellarioides* var. *Blümeri*, Miq.) This species, founded on cult. plants in Java, is probably to be regarded, as now understood, as an assemblage or combination of species. The horticultural forms are perhaps derived in part (as suggested by Briquet and by Koorders) from *C. laciniatus*, *C. bicolor*, and others, and perhaps they are to be considered also in connection with *C. atropurpureus*, Benth, of Malaysia, and its relatives. The entire garden material needs to be worked over in

comparison with authentic native oriental specimens. Portraits of *C. Blümeri* of botanical interest are B M 4754. I H 27 3-7, 35 46, 39 164. F. S. 22 228778. A soft perennial herb or sub-shrub, growing 2-3 ft high, little branched lvs ovate, narrowed or broad at base and long-acuminate, sharply and nearly regularly toothed, variously colored with yellow, dull red and purplish. An extreme form of this is var. *Verschaffeltii*, Lem, Fig 1030, which is more robust and branchy, the lvs more brilliantly colored, acute but not acuminate, truncate or even cordate at base, and irregularly cut-dentate, with rounded teeth, giving the margin a crispy effect (I. H. 8.293). In some forms, the lvs are lacinate.

1029. A good young coleus plant.

AA. *Other species of Coleus, now and then in cult. (Still other species may be expected to appear in the trade.)*

thyrsoides, Baker. Tender shrub, 2-3 ft. high: sts. pubescent: lvs. cordate-acuminate, coarsely crenate, lower ones 7 in. long. fls. bright blue, in racemes which contain as many as 18 forking cymes with about 10 fls. in each Cent. Afr. B M. 7672—Considered to have much merit for cult., either under glass, or in the open far S. Winter.

shirénis, Baker. Perennial herb, densely pubescent, 3 ft., much like the above in habit: sts. angular, pale green turning to brown: lvs. glandular, pungently aromatic, broadly ovate, acuminate, membranous, 2-3 in. long, deeply crenate, pubescent beneath but scabrous above: fls. dark blue (also described as light blue), in large erect terminal panicles. Cent Afr. B M 8024—Winter.

Mahónii, Baker. Shrub, to 2 ft., pubescent, the branchlets slender: lvs. petioled, ovate, acute, 2-3 in. long, crenate, membranous, pale and finely pubescent beneath and green and nearly glabrous above: fls. small, purple with golden anthers, in a large graceful panicle. Cent Afr.—Winter

Pénzigii, Damm. Soft perennial herb, white-hairy: lvs. ovate, membranous, narrowed abruptly at base, crenate; petiole winged: fls. bright lilac (also described as ashy blue) in a long and lax racemose panicle, the whorls being about 8-fid. Nile Land. L. H. B

COLIC-ROOT: *Aletia farinosa*.

COLLÀBIUM (*neck and lip*, referring to a peculiarity of the fl.). *Orchidaceæ*. Two terrestrial orchids, of Java and Borneo, rarely cult., requiring the treatment given *Catasetum*. Lf. single, plicate fls. or clusters racemose, on a tall scape; lateral petals attached to the foot or base of the incurved column, lip at its base encircling the column (whence the generic name); pollinia 2 *C. nebulosum*, Blume Sts. fleshy, about 2 in. long. lf. broadly ovate, acuminate, the petiole rounded: scape about 2 ft., erect, fls. numerous in scattered clusters or whorls, spurred, about $\frac{1}{2}$ in long, the lip 3-lobed, white and a little fringed, the sepals and

1030. *Coleus Blumei* var. *Verschaffeltii*.

petals greenish with reddish margins. Java. *C. simplex*, Reichb. Lf. oblong, acute, wavy, green with darker blotches: fls. racemose at the apex of the scape; lip white; sepals and petals greenish yellow with purple and brown blotches. Borneo.

COLLARDS. A kind of kale. Probably several somewhat different plants pass as collards, the characteristic being that they produce tufts or rosettes of leaves that are removed and used as greens. Usually referred to *Brassica oleracea* var. *acephala*. See *Brassica*.

In the South, a form of the plant known as Georgia collards is much grown for domestic use and the southern market. The plant grows 2 to 4 feet high and forms no head, but the central leaves often form a kind of loose rosette.

These tender leaves are eaten as a pot-herb, as all other kales are. Fig. 1031, shows a Georgia collard, with a heavy crown. The seeds of collard may be started in a frame under glass, or in a seed-bed in the open. As far south as the orange-belt, they are usually started in February and March, in order that the plants may mature before the dry, hot weather. Farther north they are started in July or August and the plants are ready for use before cold weather. Transplant to rows $3\frac{1}{2}$ to 4 feet apart, and 3 feet apart in the row. Till as for cabbage.

Young cabbage plants are sometimes eaten as "greens," under the name of collards, and cabbage seeds are sown for this specific purpose. In the North, where heading cabbages can be raised, collards of whatever kind are not greatly prized. L. H. B.

COLLETTIA (Philibert Collet, 1643-1718, French botanist). *Rhamnaceæ*. Odd spiny shrubs grown under glass, and in the open in California and other warm regions.

Leaves small and simple (or wanting), opposite branches short, often flattened, arranged in opposite pairs, thickened, spiny (sometimes called lvs.) fls. small, perfect, yellowish or white, nodding on 1-fid. pedicels, single or fascicled in the axils or beneath the flattened divaricate spines; calyx bell-shaped or tubular, 4-5-parted, petals 4-6 or 0, inserted on the calyx, stamens 4-6, disk joined to calyx-tube, inconspicuous or the margin rolled-in, ovary 3-lobed and 3-celled, standing in the disk, the stigma 3-lobed fr. a coriaceous dry drupe-like caps—About a dozen species in S. Amer., mostly in the tropical parts. The collettias are said to start readily from cuttings of half-ripened wood, as well as from seeds. They are to be grown as single or detached specimens, because of their oddity.

cruciata, Gill. & Hook (*C. hórda*, Hort.). Very curious shrub, 3-4 ft., with elliptic flattened very decurrent branches: lvs. few, elliptic, entire: fls. small, white, a few together at the base of the spines, borne profusely in spring S. Brazil, Uruguay. B M. 5033.

spinosa, Lam. Shrub, to 10 ft., with strong awl-shaped very sharp spines lvs. elliptic, small, sessile, serrate, mostly vanishing at blooming time fls. larger, urn-shaped, borne singly or nearly so beneath the spines. S. Brazil, Uruguay.

ulicina, Gill. & Hook. Smaller, 3-4 ft.: spines as in *C. spinosa*, but more numerous, thicker, and hairy: fls. cylindrical, in clusters near tops of the branches. Andes of Chile.

Ephédra, Vent. Small stiff bush: branches erect, spiny: lvs. wanting: fls. (in very early spring) sessile at

1031. Collards.

the nodes, spikeate-glomerate, calyx top-shaped, the lobes spreading. Peru, Chile. L.B.C. 19.1830.—Reported as cult. in Calif L. H. B.

COLLIGUAYA (Chilean name) *Euphorbiaceae*. Small trees of the Chilean region, scarcely in cult., although the fragrant wood of some species is used. Seeds of this and related genera which have springing movements, due to contained insect larvae, are sometimes known as "jumping beans." Juice milky; fls monocious, apetalous, calyx umbriate or none in staminate fls; stamens 1-5, ovary 2-4-celled, cells 1-ovuled. The following may be expected in botanical collections, although probably not in the trade: *C. odorifera*, Molina. Lvs serrate, ovate to oblong. *C. brasiliensis*, Klotzsch. Lvs serrulate, linear-lanceolate. *C. integririma*, Gill. & Hook. Lvs linear, entire.

J B S NORRIS.

COLLINSIA (after Zaccheus Collins, American philanthropist and promoter of science, Philadelphia, 1764-1831) *Scrophulariaceae*. Hardy flower-garden annuals mostly from California and western North America.

Leaves simple, verticillate in 3's, or opposite, fls in the axils, solitary or in whorls, racemose in some species, calyx bell-shaped, corolla deeply bi-labiate, stamens 4, the fifth rudimentary and glandular.—About 25 species. They are not far removed botanically from Pentstemon and Chelone. From the former, the genus differs in having the fifth sterile stamen reduced to a mere gland.

The collinsias are free-flowering and of the easiest culture. They may be sown outdoors in the fall in well-drained soil, and will bloom earlier than if sown in

spring. Their flowers borne in midsummer range in color from white through lilac and rose to violet, with clear, bright blue also, at least on one lip of the flower. There is no yellow.

A. Fl.-stalks very short, giving the clusters a dense appearance.

B. Corolla strongly declined; throat as wide as long.

bicolor, Benth. Fig. 1032. Height 1-2 ft. hairy, glabrous, or sticky; sts weak and bending; lvs more or less toothed, and oblong or lanceolate, sessile, finely toothed, opposite or in 3's, fls typically purple and white, with 5 or 6 well-marked color varieties. Var **alba**, Hort. (Fig. 1033), has pure white fls., or the lower lip greenish or yellowish. Var **multicolor**, Voss (*C. multicolor*, Lindl. & Paxt.), has variegated fls., the same fl being white, lilac, rose or violet on either lip or both. Var. **multicolor marmorata**, has the lower lip white, suffused lilac, and upper lip light lilac, spotted and striped carmine. Calif., below 2,000 ft. B. M. 3488 P. M. 3 195. B. R. 1734.—This is the most widely distributed and variable species, and the one on which the genus was founded. Calif., mostly in moist ground.

BB. Corolla less strongly declined, throat much longer than broad.

bartsiaefolia, Benth. Height 1½ ft., the st. usually stiff and simple; sticky and somewhat glandular, rarely

hairy lvs from ovate-oblong to linear: fl-whorls 2-5, purplish or whitish seeds not wrinkled. Calif.

AA. Fl.-stalks ½ in. long or more, giving the clusters a looser look.

vérna, Nutt. Height about 6 in. lvs ovate or oblong or the lowest rounded and slender-stalked, and the upper ovate-lanceolate and partly clasping, whorls about 6-fl; fl-stalks longer than the fls; throat of the corolla as long as the calyx-lobes, lower lip bright blue, upper lip white or purplish; seeds thick, not flattened, oblong, arched. Moist woods, W. N. Y. and Pa. to Wis and Ky. B. M. 4927.

grandiflora, Douglas. Height 4-12 in. lvs thickish, the lowest roundish and stalked; whorls 3-9-fl, fl-stalks about as long as the fls; lower lip deep blue or violet; upper lip white or purple; throat of the corolla sac-like, as broad as long, or as long as the upper lip; seeds roundish, smooth. Shady hills of Calif. B. R. 1107.

WILHELM MILLER.
N. TAYLOR †

COLLINSÖNIA (after Peter Collinson, English botanist, correspondent of Linnaeus and John Bartram) *Labiateae*. HORSE-BALM HORSE-VEED. STONE-ROOT. Native perennial herbs.

Plants of small importance horticulturally, with large, odorous, ovate, serrate, mostly long-stalked lvs, thick roots, and simple or pinnate, naked, terminal racemes of yellow or whitish fls.—Three species in E. N. Amer., one of which is sometimes offered by dealers in native plants, but is not especially ornamental. They are of simple cult.

canadensis, Linn. **CITRONELLA**. Height 2-4 ft. lvs. 4-9 in. long, broadly ovate to oblong; racemes pinnate; calyx in fl 1 line, in fr 4 or 5 lines long, corolla light yellow, lemon-scented, ½ in. long. Rich woods, Canada to Wis., Kans., and south to Fla. L. H. B.

COLLÖMIA (Greek for *glue*, alluding to the mucilaginous character of the wetted seeds) *Polemoniaceae*. In Asa Gray's late treatment, Collomia is included with Gilia, although at first kept distinct by him (Proc. Amer. Acad. Arts & Sci. XVII, 223), and this disposition is followed here, particularly since none of the species seems to be known in the trade as Collomia. Engler & Prantl keep the genus distinct, however, ascribing to it eighteen species from western North America and Chile. Such as are cultivated will be found in this Cyclopaedia under Gilia. The Collomias are annual, biennial and perennial.

COLOCASIA (old Greek substantive name) *Araceae*. Perennial herbs with cordate-peltate leaves, which are often handsomely colored in cultivation, grown under glass, and one of the forms much used for planting out when large-leaved tropical effects are desired; also grown for the edible tubers.

Plants tuberous or with an erect caudex: lf-blades peltate, ovate or sagittate-cordate, basal lobes rounded; blade of spathe 2-5 times longer than tube; spadix shorter than spathe, terminating in a club-shaped or subulate appendage destitute of stamens. Differs from Alocasia and Caladium in floral characters.—Species 5. Tropics.

Colocasias includes the plants known as *Caladium esculentum*, which are much grown for subtropical bedding. *C. odorata* (which is an Alocasia) has very large,

1033. *Collinsia bicolor*
var. *alba* (×½)

1032. *Collinsia bicolor*.

thick stems, which may be wintered over safely without leaves, or at most with one or two, the stems, to save space, being placed close together in boxes. *C. esculenta* rests during the winter and is kept under a greenhouse bench or anywhere out of the reach of frost or damp. All of the tall-growing colocasias are of the easiest culture. As they are very rank-growing plants they are not much grown in greenhouses, but are chiefly planted out-of-doors for summer display. They do best in damp rich soil. The dwarf species and forms are suited for pot growth, but little is seen of them except in public gardens. Consult *Caladium* for further treatment. (G W Oliver.)

1034. *Colocasia antiquorum* var. *esculenta*. (*Caladium esculentum*).

Colocasias furnish the much-cultivated taro of the Pacific tropics, this edible product being the large starchy roots. From it is made the poi of Hawaii. In Japan and other countries the tubers of colocasias are much cultivated, and are handled and eaten much as we use potatoes (see Georgeson, A G 13 81). The young leaves of some kinds are boiled and eaten. The dasheen is of the same group. It has been recently introduced from tropical America, and is receiving considerable attention for cultivation in the South. The tubers may also be forced for the tender shoots Cf Bull. 164 Bur. Plant Ind U S Dept Agric (1910), and subsequent publications of Off. Foreign Seed and Pl Intro.

antiquorum, Schott. Lvs. peltate-ovate, basal lobes half as long as the apical one, connate two-thirds to three-fourths their length, separated by a broad, triangular, obtusish sinus. India B M. 7364.

Var. *euchlora*, Schott (*C. euchlora*, C Koch). Petioles violet, blade black-green, with violet margins.

Var. *Fontanesii*, Schott (*Alocasia violacea*, Hort. *Caladium violaceum*, Hort. *C. albo-violaceum*, Hort?). Petioles violet, blade dull green, with violet margins B M 7732—Multiplies rapidly by whip-like runners and grows well in shallow water.

Var. *illustris*, Engler (*C. illustris*, Hort.). BLACK CALADIUM. Petioles violet, blade more oblong-ovate, with black-green spots between the primary veins. F.M., 1874 107—Very beautiful in masses, but its have offensive odor.

Var. *esculenta*, Schott (*Caladium esculentum*, Vent. *Colocasia esculenta*, Schott). ELEPHANT'S EAR. Fig. 1034 Spadix with an appendage half as long as the staminate infl.: lvs. bright green, often 3 ft. or more long, nearly as wide. Hawaii and Fiji G. 2:62, 571, 7:44.

Var. *affinis*, Schott. Blade thin, membranaceous, rounded-ovate or ovate, the apical lobe scarcely a fourth or a third longer than wide; basal lobes connate nearly their entire length, bright green above, glaucous beneath; blade only 4-6 in long Himalaya—Not hardy in Cent. Fla.

Var. *Jenningsii*, Engler (*Alocasia Jenningsii*, Vetch). Petiole purplish, with transverse purple lines;

blade cordate, emarginate, with large, oblong or triangular black-green or black-violet spots between the primary lateral veins. I H. 16:535. F.S. 17. 1818-19. —Not hardy in Cent. Fla.

Var. *neo-guineensis*, André. Remarkable for its tufted habit, the shortness of the lf-stalks, its short-stalked infl., and the beautiful green tone of its smooth and shiny lvs., spotted with creamy white. New Guinea I H 27 380.

Märchall, Engler (*Alocasia Märchallii*, Hort. A hybrid, Bull). Hybrid, probably of *C. affinis* and *C. antiquorum*. Larger in all parts than *C. affinis*, the petioles pale green, very slightly emarginate, with large, confluent spots.

C. bataviensis = *Alocasia bataviensis* (?) — *C. Caracasana*, Engler = *Xanthosoma* — *C. jardniana*, Hort = (?) — *C. Majaffa*, Hort = *Xanthosoma* — *C. marginata*, Hort = *Caladium bicolor* — *C. monorhiza*, Hort = (?) — *C. odorata* Brongn = *Alocasia odorata*, Koch. Tree-like, the st or caudex 3-6 ft and 6 in diam. lvs. green, cordate, stalked, bearing peduncles in pairs in their axils. E Ama B M 3935 — *C. odorata*, Hort = *Alocasia macrocarpa*.

GEORGE V. NASH †

COLOCYNTH: *Citrullus*

COLOR IN FLOWERS. The range of simple color among flowers is not very extensive. There are singular and almost unaccountable intervals in that range where color is conspicuously absent in every genus. Indeed, there is no such thing as a pure green flower, nor a pure blue one, neither is there any flower to match the remarkable blue-green or green-blue so familiar in the plumage of certain birds, this has no existence at all in the vegetable world. The range of color, therefore, among flowers is strictly circumscribed. A simple color is a hue not complicated with any other tint or shade or hue. Roughly described, the hues comprise yellow, gold-yellow, orange, scarlet, red, crimson, magenta, purple, violet, and ultramarine, these together with blue, peacock-blue, green, and yellow-green (hues which do not appear in the floral world) compose a circle of color from which all tints and shades are derived. Fig 1035. In other words, the admixture of white with a hue produces a tint, and the admixture of black, a shade. Fig 1036. A reduction of the range of hues given above to its simplest terms would comprise only yellow, orange, red, purple, blue, and green, six primary colors. Fig 1037. Although pioneer investigators of the nature of color

1035. The intermediate hues.

resolved these six hues into three—yellow, red, and blue,—the restriction was made at the cost of absolute purity in the other three hues which they chose to name secondary colors. There is no possible way of producing absolutely pure orange, violet, or green, by a combination of pigments.

The generic character of flower-colors is comprehended in the hues just named, although such names are of little consequence so long as identification is without question. Unfortunately scientists and artists have not yet established a standard nomenclature of color, and as a consequence the name of a particular hue is largely determined by a consensus of public opinion, which, very naturally, is not always correct.

WITH BLACK	WITH WHITE	CLEAR COLOR
OLD GOLD	SULPHUR	YELLOW
OCHRE	STRAWY.	COLD Y.
BURNT ORANGE	SALMON	ORANGE
TERRA COTTA	SHRIMP R.	SCARLET
CARDINAL	PINK	RED
MAROON	C. PINK	CRIMSON
PLUM	P. LILAC	MAGENTA
DARK B. PLUM	LILAC	PURPLE
LOGWOOD VIOLET	B. LILAC	VIOLET
INDIGO	V. BLUE	ULTRAMARINE

1036. Color phases in flowers.

505, violet at 430, ultramarine at 455, and blue at 480. These numbers indicate the wave-lengths of the respective hues, with the micron (one-millionth part of an inch) as the unit. This identification of color, however satisfactory from a scientific point of view, is both intangible and impracticable in every other respect. The flower-petal or the artist's pigment matched with the spectrum is the only proper medium through which to convey an adequate knowledge of a given hue to the layman, and it must be remembered that everyone is hypothetically the layman who is not directly associated with the particular science or art under consideration. The colors of certain flower-petals as matched with the spectrum lines are as follows.

Yellow (580).—*Eurotheria biennis*, *Brassica nigra*, *Ranunculus acris*, *Helianthus decapetalus*, a single dandelion ray.
Gold-yellow (590).—*Rudbeckia hirta*, golden calendula.

Gold-yellow (585).—*Kerria japonica*.
Gold-orange (600).—Golden eschscholtzia.
Gold-orange (615).—*Crocus susianus*.
Orange (635).—*Tropaeolum majus* (deepest orange hue), the common type.

Scarlet (645).—Mme. Crozy canna, scarlet geranium and tropaeolum, berry of *Cornus canadensis*.

Red (680).—Red azalea, red carnation, tube of *Rhododendron nudiflorum*.

Red (690).—Red gladiolus.

Crimson.—Crimson peony, American Beauty rose (dilute).

Magenta.—Magenta cineraria, *Polygala sanguinea*.

Purple.—Purple cineraria, *Mimulus ringens*.

Violet (425).—*Viola cucullata* and *Campanula rotundifolia* (light).

Violet (430).—*Verbena erinoides*.

Ultramarine violet (440).—*Centaurea Cyanus*, the bluest phase (light).

Ultramarine blue (455).—*Scilla sibirica* (light).

Ultramarine blue (435).—*Gentiana Andrewsii*, (bluest tip of petal).

Blue (475).—*Myosotis palustris*, bluest phase (pale).

Such a list is manifestly imperfect; to state the case accurately, few flowers are "on the line," three of the colors have no numbered lines, and many of the plant species or varieties are not and can not be explicitly cited. For example, the red carnation must be a red and not a scarlet-red variety, and its coloring should match that of the *Rhododendron nudiflorum* tube; the same rule applies to the red gladiolus. It is equally the case that many flowers show only a modification or a dilution of the hue they are chosen to represent; the blue of the forget-me-not at best is extremely dilute.

A list of artists' pigments is more to the point. It has the great advantage of nomenclatorial fixity and it does not include hues subject to change. The representative colors are

Lemon, zinc, ultramarine, pale cadmium, and light malori yellows

Medium cadmium and malori gold-yellows.

Cadmium orange and deep malori orange-yellow.

Orange mineral.

Scarlet-vermilion.

Carmine or alizarin lake (no single pigment is exactly normal red), these incline to scarlet.

Crimson lake

Magenta, a mixture of crimson and mauve lakes in nearly equal parts

Mauve lake: a true purple.

Violet ultramarine

Gumme's French ultramarine.

Cobalt blue

Emerald-green.

The color harmonies.

If the simple colors, yellow, orange, red, purple, blue, and green, are arranged in a circle (Fig. 1037), those lying opposite each other harmonize by reason of absolute contrast. Blue and orange, for example, are complementary colors and theoretically they balance each other. It by no means follows, however, that a mass of orange nasturtiums and blue forget-me-nots must therefore look well together; the very massing of such hues would make that impossible in spite of the fact that the misty grayish character of a clump of blue forget-me-nots is the reverse of aggressive. But the orange of the nasturtium is obtrusive to the last degree, and its environment should be as colorless as possible—even to the point of dull gray or white.

If these six simple colors in the circle are again separated by intermediate hues (Fig. 1035), so about three of the latter lie between the six original colors, the result will be a circle of twenty-four divisions, having the effect of a rainbow. This will perfectly illustrate the principle of color harmony and color discord. Besides the opposing colors which harmonize by contrast, there are neighboring colors which harmonize by analogy.

For example, any four or five colors lying side by side in the circle are bound together harmoniously by reason of their near relationship. Therefore, all these four or five colors may be combined—and nature does combine them—with esthetic results. But skip over four of the colors and attempt a combination of the first and sixth, and the result will prove to be a discord, the bond of relationship is broken, and the eye is disturbed by the aggressiveness of two colors between which there is evidently no bond of sympathy. It

1037. Harmony by contrast.

would be safe to say, therefore, that the circle demonstrates the fact that its colors situated at right angles with each other are discordant, and those lying nearly parallel with each other are harmonious.

This is the theoretical side of color harmony. The practical side is scarcely different, it simply modifies the theory. Brilliant blue and orange, which are theoretically harmonious, are scarcely as agreeable in each other's company as the rule would imply. The trouble, however, lies with the brilliancy. The golden calendula and the deep purple aster in association are violent and aggressive. Remove the one and the other and substitute pale-tinted flowers of these hues and the result will be harmonious.

Flower families are very likely to sustain harmonies of analogy. Hyacinths, sweet peas, and nasturtiums

1038 The circle of 360° in colors.

represent groups with very nearly related hues or tints. There is a predominating influence of crimson-pink among sweet peas, of lilac among hyacinths, and of orange among nasturtiums, yet the influence at times (in a particular variety) is wholly wanting and is replaced by an analogous tint or hue. It would be a rather nice bit of color adjustment which would result in a harmony superior to that of a careless grouping together of flowers gathered at random from any one of these three genera.

But the theory that analogous colors harmonize is correct only when not carried to excess. Attempts to force deep-hued flowers into harmony often lead to contrary results. A range of color from crimson to ultramarine depends for its harmony upon the careful grading of intermediate hues. Such colors, in full force, might do violence to each other. It is tempting the hardness of a diamond to pound it with a hammer. It is taxing crimson too heavily to expect it to show its beauty in the presence of strong violet! The effort should rather be to merge the individualities of the crimson and the purple flowers into a group and effect a play of color between the two.

The theory that colors at right angles on the wheel are discordant is also subject to some modification. Relatively the right-angled colors must be crude and strong to affect the eye objectionably. Yellow and red in the rose is an agreeable color-combination. Yellow and red dahlias crowded together are certainly harsh and unneighborly.

A country bouquet of asters, marigolds, fuchsias and dahlias is bad, because the country garden is not a part of it. Atmosphere, space, and a stretch of green foliage make a world of difference.

It is wisest to try the effect of one color upon another before allowing two or three strong hues to wage war

with each other. It will be found quickly that white is a peacemaker, and green is an invaluable mediator. With these colors at command, the chances of discord are reduced to a minimum. Everything also depends upon simplicity in color-combinations. It is questionable whether a combination of more than two colors can be ever esthetically a success. The adjustment of many colors needs the hand of an expert.

The restriction of color in flowers.

The very strict limitation of range in flower-colors demands careful study if it would be thoroughly understood. Augustin Pyramus de Candolle divided flower-colors into two classes, which he named xanthic (red, scarlet, orange, gold-orange, yellow, and green-yellow), and cyanic (green-blue, blue, ultramarine-violet, violet, purple, and red). Further, he explained, flowers of the yellow (xanthic) series could pass into red or white but never into blue, and those of the blue (cyanic) series could pass into red or white but never into yellow. The theory is correct but it requires both modification and revision. Gold-orange must evidently displace yellow, and ultramarine-violet displace blue as series names; furthermore, the passage into red should not exceed scarlet-red in the xanthic series, or crimson-red in the cyanic series. Pure red logically should be the zero point between the two divisions, and not be included in either unless connected by analogous hues.

Gold-orange and ultramarine-violet are respectively the type-colors of the two series because each occupies a median position with equal influence on either hand. Red, occupying the median position between the two series, should and does exercise an equal influence on both, a casual glance at the chromatic scale demonstrates the fact. Neither the xanthic nor the cyanic series can exclusively claim the respective yellow and blue in absolute purity, for the cogent reason that among flowers yellow is associated with both these divisions, and a true blue scarcely appears at all. Further, if pure red is the zero point between the two series, then the consistent red of the xanthic order is scarlet-red, and that of the cyanic order is crimson-red; a pure red or pure yellow flower, therefore, consistently belongs to either order according to its xanthic or cyanic congeners.

The best proofs of the above statements are to be found among the flowers themselves. Asters belong to the cyanic group, but there is no blue aster. Tropaeolums belong to the xanthic group, but there is no pure yellow nasturtium, there are, however, ultramarine-violet asters and gold-yellow nasturtiums. There is a pure yellow, a golden orange, but no white marigold (Tagetes); the species is xanthic. The family Cruciferae is cyanic; it includes pure yellow, deeper yellow, and magenta flowers. The genus Hyacinthus is cyanic; it includes no blue flower, but many which are purple, violet, cyanic red, and modified yellow. *Viola tricolor* is cyanic; it includes a strong yellow along with intense purple and violet-ultramarine flowers. The genus Zinnia is xanthic; it includes no true yellow flower but many which range through all reds into cyanic crimson. The genus Rosa is cyanic; its flowers range from pure red to magenta-crimson, develop a strong, modified yellow, fuse yellow with crimson, but never approach the xanthic gold-orange. The genus Chrysanthemum is xanthic; its flowers include all yellows, skip pure orange and scarlet, and range from scarlet-red to cyanic red-crimson.

Species belonging to the cyanic group invariably produce white flowers which have an albino origin. Species of the xanthic order produce white flowers which are not albinos but which invariably displace flowers of some strong, pure xanthic hue. For example, geraniums are white, red, scarlet, and pink, but never gold-orange or golden yellow. Carnations are white, red, and cardinal-red, but never scarlet, or orange. Chrysanthemums

XXIX. Cranberry-picking in a New Jersey bog.

mums are yellow, white, and pink, but never orange or scarlet. Dahlias are scarlet, red, crimson-red, and even pure yellow, but never pure gold-orange, or orange.

It is perfectly evident from the foregoing examples that the range in a given genus, or species, is limited to what may be termed the swing of a pendulum upon the chromatic scale (Fig. 1038). The swing may extend over a quarter of the dial, rarely it does more. If it happens that two colors are developed, like violet and yellow, it will still be found that there is but one pendulum-swing and not two. Violet will be associated with contiguous hues, but yellow will be developed quite alone.

This, it is reasonable to believe, is direct evidence of a dual or treble origin of color in a flower group. Yellow cannot be evolved from violet, or vice versa. Necessarily, if white appears in a xanthic group, it must have evolved alone and independent of any color-range in that group. Undoubtedly the range of contiguous colors itself has evolved from a median hue which has spread out, fanlike, in graded variations within strict limits. Naturally, such statements conflict with the old theory that all flowers were originally yellow, but they are not inimical to the idea that the earlier ones might have been yellow, and later ones magenta, violent ultramarine, scarlet, and gold-orange. It is important to keep in mind the fact that a steamboat is not evolved from a locomotive.

It is further evident that yellow belongs quite as little to the xanthic as it does to the cyanic series, or, to put it more strongly, it belongs to neither. Its origin, independent of any "range," was undoubtedly the elimination of blue from chlorophyll. Hence, it is not surprising to find it in some modified form associated with both series, and in the cyanic series isolated. The flora of the northeastern United States is essentially cyanic. Twenty-one per cent is yellow, 21 per cent magenta and 22 per cent white, the remainder is 8 per cent xanthic and 28 per cent cyanic—the last mostly pink and light violet. The record is significant and points directly either to an arrested color development, or to a depauperate color condition in an inclement region, the former seems the more likely. An aggregation of cyanic-flowered plants are found in the north temperate zone, and of xanthic-flowered plants in the torrid zone.

Color activity.

Color results from a play of light upon a surface which rejects or absorbs certain rays. It is a significant fact that the red end of the spectrum comprehends those hues which are produced by the calorific rays of the sun, and the violet end those hues which are produced by the actinic rays. It is not surprising therefore that the coloring of vegetation is intense, and that xanthic flowers predominate under the equator. A separation of cyanic and xanthic flowers follows almost identically the thermal lines which band the great continents of the northern hemisphere, cyanic color prevailing north, and xanthic color south of the line marking 80° F. In a word, xanthic flowers belong to a very warm, and cyanic flowers to a temperate or cold climate. That they should become mixed in a narrow zone between the extremes is only natural; the rule, therefore, is in no way compromised thereby. That yellow, too, should appear in both cyanic and xanthic groups is not at all surprising. In the spectrum it holds a median position between the red and the violet ends; it is neither a hot nor a cold color, and has consequently evolved from its primitive condition as a constituent of the green in chlorophyll under any and all temperatures. That is the only way to account for its isolation when connected with cyanic groups.

It would appear, then, that magenta, violet, and ultramarines, together with gold-orange, orange, and red, are primitive colors quite as well as yellow and

white. In what order they appeared upon the earth in the petals of flowers, it would be difficult to determine, but it is reasonable to think they appeared as original colors, in weak, perhaps, but absolute purity. Otherwise, the remarkable limitation of color-range must be accounted for by a less logical theory. Upset this limitation, and attempts to produce a blue rose, yellow aster, white nasturtium, or green carnation, should prove successful. Recognize the limitation, and the futility of such attempts becomes at once apparent, and the possibility of improving existing "strains" of color is limitless. At some time or other in the distant past the law of limitations fixed the range of flower-colors; no new law of elasticity has since developed to remove the boundaries and thus aid the floriculturist in his ambition to produce what would prove to be a mere novelty. See *Standards of Color*.

F. SCHUYLER MATHEWS.

COLTSFOOT *Tussilago Farfara*. Sweet coltsfoot is *Petasantes*, formerly called *Nardus*.

COLUMBINE *Aquilegia*.

COLQUHOUNIA (after Sir Robert Colquhoun). *Labnata*. Tender plants with dense whorls of gaping fls. an inch long or more, colored scarlet and yellow.

Erect or twining shrubs, woolly in all parts when young. lvs. large, crenate, whorls few-fld., axillary or crowded into a terminal spike or raceme, corolla-tube incurved, the throat inflated.—Two Asian species. Prop. by cuttings of growing tips, in sandy soil, under glass in summer.

coccinea, Wall. Tall climber, with very long branches, 8–10 ft. lvs stalked, ovate-acuminate, 3–5 in long, crenate, dark green above, roughish, typically with scarcely any wooliness except when young. corolla twice as long as the calyx. B. M. 4514 — *C. tomentosa*, Houll., is probably identical. The dense wooliness is perhaps temporary. R. H. 1873 130 shows a handsome terminal spike in addition to axillary clusters, containing about 20 fls.—Apparently not advertised, but probably as worthy as the next.

vestita, Wall. Very similar to *C. coccinea*, except that it is a low-growing, erect plant, and more densely and permanently woolly on the st., calyx and under side of lvs., which are elliptic or elliptic-ovate and cordate.—Cult. outdoors at Santa Barbara, Calif., where it may be used for the wild garden as it is perfectly hardy. Not of much horticultural value.

N. TAYLOR †

COLUMNEA (after Columna or Colonna, Italian writer on plants, sixteenth century) *Gesneriaceae*. Tropical American shrubs and climbers, sometimes grown under glass in choice collections.

Flowers widely gaping, showy, often 2 in. long; lvs. opposite, nearly equal or widely unlike; fls. solitary or numerous, axillary, stalked or not, without bracts or with bracts in an involucre; corollas scarlet, carmine or yellowish.—A group of 100

species of which half a dozen mostly red- or orange-fl. are cult. abroad and may be known to a few fanciers at home, but are not advertised by the dealers. They are warmhouse evergreens requiring the treatment of *Trichosporum* (*Æschynanthus*).

Schiedeana, Schlecht. The best known species. It has handsome scarlet fls. 2 in. long, sometimes variegated with yellow. It is an herbaceous climber from Mex. B.M. 4045. P.M. 9:31.

gloriosa, Sprague. Fig. 1039. An epiphytic perennial herb: lvs. ovate or ovate-oblong: fls. axillary, solitary, scarlet and yellow. Costa Rica. B. M. 8378.

C glabra, Oerst. var. *major* Fls. scarlet; stamens white. Costa Rica—*C. magnifica*, Klotzsch & Hanst. Corolla bright scarlet; tube inflated about the middle. Costa Rica G.C. III. 43:86—*C. Orstediana*, Klotzsch. Epiphytic undershrub or herb fls. scarlet. Costa Rica. B.M. 8344. N. TAYLOR.†

COLUTEA (*Koloutea*, ancient Greek name). *Leguminosæ*. **BLADDER SENNA**. Shrubs grown chiefly for their attractive yellow or brownish red flowers and the ornamental bladder-like pods

Deciduous, with alternate, odd-pinnate lvs.: lfts. many, rather small, stipules small: fls. papilionaceous, in axillary, few-fl. long-peduncled racemes, yellow to brownish red; calyx campanulate, 5-toothed; standard suborbicular with 2 swellings above the claw; 9 stamens connate, 1 free pod inflated, bladder-like, many-seeded—About 15 species in the Medit. region to Abyssinia and Himalayas. Ornamental free-flowering plants of rapid growth, with pale green or glaucous foliage and yellow or brownish red fls. during summer, followed by large, usually reddish-colored and decorative pods. They grow in almost any soil, but prefer a tolerably dry and sunny position; not quite hardy N., the hardest being *C. arborescens*—Prop. by seeds sown in spring or by cuttings of mature wood inserted in fall in sandy soil; rarer species and varieties are sometimes grafted on *C. arborescens* in spring under glass.

a. Fls. yellow: pod closed at the apex

arborescens, Linn. Fig. 1040. Shrub, to 15 ft.: lfts. 9–13, elliptic, dull green, mucronulate, usually slightly pubescent beneath, $\frac{1}{2}$ –1 in. long; fls. 3–8, about $\frac{3}{4}$ in. long; wings nearly as long as the keel, flat. June–Sept. S. Eu., N. Afr., N. B.M. 81.—Lvs. have cathartic properties. Var. *crispa*, Kirchn. Dwarf, with crisped lvs. Var. *bullata*, Rehd. (*C. bullata*, Hort.). Dwarf and compact: lfts. 5–7, obovate or nearly orbicular and somewhat bullate.

cilicica, Boiss. (*C. longilata*, Koehne. *C. melanocalyx*, Hort., not Boiss.). Shrub: lfts. bluish green, usually 11, oval or broadly ovate, rounded or truncate and mucronulate at the apex, $\frac{1}{2}$ – $\frac{3}{4}$ in. long; fls. bright yellow, 3–6, about $\frac{3}{4}$ in. long; wings longer than the keel. June–Aug. Asia Minor. G.C. III. 16:155.

AA. Fls. orange-yellow or brownish red, wings shorter than the keel.

media, Willd. Shrub, to 10 ft.: lfts. 7–13, obovate, grayish green or glaucous, $\frac{1}{2}$ – $\frac{3}{4}$ in. long, nearly gla-

brous: fls. 3–6, orange or reddish yellow, the standard with brownish markings, pod closed at the apex. June–Sept.—Probably hybrid of garden origin between *C. arborescens* and the following, often cult. under the names of the following species.

orientalis, Mill. (*C. cruenta*, Ait.). Shrub, to 6 ft.: lfts. 7–11, obovate, glaucous, thickish, $\frac{1}{2}$ – $\frac{1}{2}$ in. long, nearly glabrous fls. 3–5, reddish yellow or brownish red, pod open at the apex. June–Sept. S. E. Eu., Orient.—Often cult. under the name of *C. halepica* or *C. istria*

C. brevialata, Lange. Shrub, to 4 ft. lfts. usually 11, oval, $\frac{1}{2}$ – $\frac{3}{4}$ in. long fls. 2–6, yellow, wings much shorter than keel. S. France—*C. gracilis*, Freyn & Sintenis. lfts. usually 11, obovate, $\frac{1}{2}$ – $\frac{1}{2}$ in. long fls. 2–5, yellow, with the wings almost as long as the keel. Turkistan—*C. istria*, Mill. (*C. halepica*, Lam. *C. Paeckoni* Ait.) To 4 ft. lfts. glaucous, small and numerous fls. yellow, nearly 1 in. long, wing longer than the keel—*C. nepalensis*, Hook. Similar to *C. arborescens* racemes drooping. B.M. 2622. B.R. 1727. Tender.

ALFRED REIDER

COLVILLEA (after Sir Charles Colville, governor of Mauritius). *Leguminosæ*. **SHOWY**-flowered tropical tree, a worthy rival of the royal poinciana, which is closely allied, but easily distinguished, especially by its round and full, not flat, legume

Colvillea has drooping racemes, $1\frac{1}{2}$ ft. long, densely crowded with perhaps 200 fls. of curious shape and of a splendid scarlet, the fls. open at the st. end of the pendent dense raceme, and display masses of long showy yellow stamens, the unopened fls. are about the size and shape of a filbert, and these are gradually smaller towards the end of the raceme—Only 1 species, characterized by its large, oblique, colored calyx, having 4 segms., the standard being the smallest instead of the largest part, wings very long, narrow, erect, obovate, pod 2-valved. Supposed to be a native of E. Afr. but discovered in 1824 by Bojer on the west coast of Madagascar, where a single tree was cult. by the natives. It flowered there in April or May. Its cult. is similar to that of *caesalpinia*. Prop. in the S. only by seeds. Not common in cult. outside of botanic gardens and fanciers' collections

racemosa, Bojer. Tree, 40–50 ft. high, with the general aspect of *Poinciana regia* but with a thicker trunk and ampler foliage. Branches very long and spreading: lvs. about 3 ft. long, alternate, remote, twice pinnate, with 20–30 pairs of pinnae which are opposite, 4 in. long, and have 20–28 pairs of lfts., each $\frac{1}{2}$ in. long; keel very small, almost covered by the wings; free stamens 10, 3 inserted below the standard, 2 under the wings, 1 under the keel, and 4 under the ovary. B.M. 3325–6.

WILHELM MILLER.

COMANDRA (name alludes to the hairs in the fl.). *Santalacææ*. Perhaps a half-dozen leafy herbs or subshrubs, one in Eu., and the others in N. Amer., more or less parasitically attached to the roots of other plants, one or two of which may be of interest to horticulturists. Lvs. alternate, almost sessile: fls. whitish or greenish, small, perfect, in terminal cymes or umbellate panicles; calyx 4–5-cleft, lined or constricted

1040 *Colutea arborescens*. (× $\frac{1}{2}$)

above the ovary, and the tube sometimes conspicuously continued to a neck or top on the fr.; petals wanting; stamens of same number as calyx-lobes, the anthers connected by hairs to the calyx-lobes. fr. nut-like or drupe-like. *C. umbellata*, Nutt. (Fig. 1041), 6-18 in.

high, in dry mostly open ground in the eastern states, as an attractive plant when allowed to spread naturally in patches in waste places rootstock not showing above ground (*C. Richardiana*, Fern., has a superficial rootstock). lvs thin, oblong, pale beneath: fls. whitish

L. H. B.

COMARÉLLA: Potentilla

COMAROSTAPHYLIS: Arctostaphylos

COMARUM (an old Greek name). *Rosaceae*. One species allied to Potentilla, and often referred to that genus but differing in the lateral style unknown in Potentilla. *C. palustre*, Linn (*Potentilla palustris*, Scop.)

1041 *Comandra umbellata*. (× 1/2)

Scop.), the marsh cinquefoil, is a decumbent herb growing in swales in the northern states (also in the Old World), with pinnate, 5-7-foliate lvs (lfts dentate), and solitary or cymose purple fls 1/2 in across petals shorter than the calyx-lobes, acute, stamens numerous. An old and interesting but not showy plant, sometimes planted in bogs. Mn 3' 97 —The fr. somewhat resembles a strawberry, but is spongy instead of juicy. In some parts of Scotland, it is said to be called cowberry and is rubbed on the inside of milk-pails to thicken the milk. *C. Salesovii*, Bunge (*Potentilla Salesoviana* Steph.), of the Himalayan region and Thibet, 11,000-14,000 ft altitude, is a suffrutescent silky-hairy plant worthy of cult, but little known in gardens: lvs. pinnate; lfts. 7-9, oblong, obtuse, crenate-serrate; fls white, in an ample paniculate cyme. Probably better placed in Potentilla. B.M. 7258.

N. TAYLOR.†

COMBRÉTUM (old Latin name). *Combretaceae*. Tropical shrubs and trees, many of which are climbers by means of the persistent leaf-stalks.

Leaves mostly opposite, in some species verticillate in 3's or 4's, entire fls in spikes or racemes, polygamous; calyx bell-shaped; petals usually 4, stamens usually 8 fr winged and indehiscent, 1-seeded. —A genus of 250 species from Asia, Afr. and Amer., particularly S. Afr. The combretums are warehouse plants, little known in this country. Prop by cuttings of firm wood. One climbing species is in the American trade *C. coccineum*, Lam (*C. purpureum*, Vahl. *Poterea coccinea*, DC.), from Madagascar. Lvs

oblong-lanceolate, acuminate, evergreen, fls. small, brilliant red, the long-exserted stamens forming the chief feature of beauty; the handsome loose spikes often in panicles; parts of the fl. in 10's. B.M. 2102 L.B.C. 6 563 —Handsome. *C. butyraceum* yields a butter-like substance, used by the Kafir as food. *C. sanduicam* in recent years has attained some prominence as a reputed anti-opium remedy.

N. TAYLOR.†

COMFREY: Symphytum

COMMELINA (bears the name of early Dutch botanists). Also written Commelyna. *Commelinaceae*. DAY-FLOWER. Perennial or annual herbs, of which a very few are cultivated in the open or under glass for their interesting flowers.

Upright, spreading or procumbent, usually more or less succulent, often rooting at the joints. lvs alternate, sessile or short-petioled, clasping the st. a lf subtending the sessile fl-cluster and forming a clasping folded spathe: fls. opening for a day, mostly blue (varying to white and rose), irregular; outer perianth parts (calyx) 3, colored, 2 of them somewhat united, inner parts (petals) 3, one of them small and 2 broad and with long claws, stamens usually 6, but only 3 of them fertile, filaments not hairy fr. a 2-3-celled caps on a recurved pedicel. —Nearly or quite 100 species, in warm regions around the globe, a few of them reaching cool-temperate climates. The cult. species are perennials. The hothouse species appear not to be offered in this country or to be much cult. Allied to Tradescantia and Zebrina.

Commelinas are mostly of easy culture, thriving well in any light rich soil. The evergreen stove and greenhouse species are readily propagated in March or April by cuttings inserted in an ordinary propagating-bed and kept close for a few days, while the tuberous-rooted half-hardy herbaceous species may be propagated either by division of the tubers or by seeds sown in a frame early in April and afterwards transplanting the seedlings in the herbaceous border. In the fall, they should be lifted and the tubers stored away in the same manner as dahlias. Of the tuberous-rooted species, *C. caelestis* is perhaps the best, its bright blue flowers being very effective, especially when planted in masses (Edward J. Canning.)

A Plant hardy in the open

nudiflora, Linn (*C. Sellowii*, Walp. *C. Sellowiana*, Schlecht.). Creeping, rooting at the joints, glabrous or practically so lvs lanceolate to ovate-lanceolate, acute or acuminate, the lf-sheaths often ciliate; spathe lf acute or acuminate, broad at base, petioled fls few in each cluster, 1/2 in or less across, blue; caps 3-celled and 5-seeded. N. J. southward and widely dispersed in the parts of the world. —Some times offered as an outdoor plant. A rose-colored form is reported.

communis, Linn. Much like the last and often confused with it more erect and less rooting at joints fls larger, caps 2-celled and 4-seeded. N. Y. southward, and widely distributed; perhaps an intro. from Asia.

1042. *Commelina caelestis*. (× 1/2)

AA. *Plant tender or only half-hardy.*

tuberösa, Linn. Diffuse and branching, from a tuberous root: lvs. narrow-lanceolate, 2-3 in. long; spathe-lf. cordate-ovate to lanceolate, conduplicate, more or less hairy; sheaths pubescent. fls. rich blue. Mts. of Mex.—The plant sold under this name is recommended as a free-flowering border plant in England, the tubers to be lifted in autumn and stored in dry sand for the winter.

cælestis, Willd. Fig. 1042. Erect, root more or less tuberous, 10-18 in. high, branching, with clasping, long, broad-lanceolate pointed lvs. and blue fls (2-10 together) on elongating axillary pubescent peduncles; spathe-lf. ovate, folded; sheaths ciliate. Mts. of Mex.—Runs into several forms. Var. **alba**, Hort., has white fls. Var. **variegata**, Hort., has fls. blue and white. *C. cælestis* is a half-hardy plant, in the N. requiring protection of a greenhouse, although it may be planted out. Prop. by seed, cuttings and tubers.

L. H. B.

COMPARÉTTIA (Andreas Comparetti, 1746-1811, Italian botanist). *Orchidaceæ*. A small group of graceful epiphytes.

Pseudobulbs, 1-3-lvd.: racemes simple or branched; fls. small, lateral sepals united in a single piece, lengthened at the base into a conspicuous horn, lateral petals converging; labellum large, produced into a double spur, which is hidden in the horn made by the sepals; column free, semi-terete, erect, pollinia 2—Four species, Mex. to Brazil. Grown on blocks or in baskets in a light intermediate or warmhouse.

coccinea, Lindl. Pseudobulbs small, bearing lanceolate, coriaceous lvs., purple beneath; racemes several-flid; fls. 1 in. across; petals and sepals light yellow, margined orange-red, labellum large, broader than long, crimson. Brazil. B. R. 24'68. I. H. 13:472.

falcatà, Poepp et Endl. (*C. rosea*, Lindl.). Similar in habit to *C. coccinea*: fls. 1 in. across, deep crimson; labellum broad; racemes pendent. Peru. B. M. 4980. A. F. 6:609. Lind. 4:163. F. S. 2:109.

macropléctron, Reichb. f. Fls. 10 or more, 2 in. across, dorsal sepal whitish, often spotted with purple; midlobe of labellum cleft, suborbicular, magenta-rose, dotted at the angled base; spurs conspicuous. Colombia. B. M. 6679. Var. **punctatissima**, Hort., has the fls. copiously rose-spotted. C. O. 1. GEORGE V. NASH.†

COMPASS PLANT: *Silphium*.

COMPOST. Mixed and rotted vegetable matter, particularly manure and litter, used as a fertilizer and amendment.

The mixture of bulky fertilizing materials known as compost, while of little importance to the general farmer, plays an important part in garden practices. Many of the garden crops must be made in a very short time, or are of delicate feeding habits. Their food, therefore, must be easily assimilable. It is good practice to pile all coarse manures, sods, weeds, or any rubbish available for the purpose, in big flat heaps (Fig. 1043), to ferment and rot before being applied to the garden soil. If desired, chemical manures, especially superphosphate (dissolved bone or South Carolina rock) and potash (muriate or kainit), may be added to make the compost the richer. By spading or forking the heaps over a few times at reasonable intervals, a homogeneous mass is easily obtained, which can be applied in greatest liberality without fear, or more sparingly, in accordance with the needs of the particular crop. Of equal, if not still greater importance, is the compost heap which gives soil for greenhouse benches, flats, hotbeds and coldframes. This compost is principally made of sods shaved off a rich pasture or meadow and piled in alternate layers with stable manure, more of the latter being used for forcing succulent crops, and

less in growing plants which should be short and stocky, like cabbage or tomato plants. Garden litter may be added to the pile, as leaves and trimmings. All compost heaps, during dry weather, need frequent and thorough moistening with water, or, better, with liquid manure. Turn several times during the year, to ensure thorough rotting of the materials. T. GREINER.

COMPTERIS. The only published reference to this generic name and species is in G. C. III. 29: May 21, 1901, suppl. 2, where its introduction to cultivation by L. Linden is noted. The name *Comptenis* may be a corruption, or the plant may have been a young form of some known form. The description below is quoted from *The Gardeners' Chronicle*.

C. Brazzaiana, Hort. Intro in Eu about 1900, as a remarkably distinct large fern with long bipinnate fronds narrow at base and broad across the middle and tapering to a narrow point, barren pinnae oval or oblong and simple; fertile pinnae distinctly lobed.

R. C. BENEDICT

COMPTÔNIA (Henry Compton, Bishop of London, patron of horticulture, died 1713) *Myricææ*. A small native shrub, useful for covering banks and to grow on sterile sandy and stony soil.

1043. A compost heap.

The genus is allied to *Myrica*, and by some not regarded as sufficiently different in botanical characters to justify separate generic rank. Branching brown-twigged bush, diœcious or monoœcious, with globular fertile catkins, the 1-celled ovary surrounded by 8 linear persistent scales or bractlets lvs. long-oblong, pinnatifid, fr. a bur-like axillary head of few small nuts. The only species is *C. asplenifolia*, Gärtn. (*C. peregrina*, Coulter. *Myrica asplenifolia*, Linn.) SWEET FERN. In dry, sterile soil in the E. and N. U. S., also in the trade. It is an attractive undershrub (1-3 ft.) with fern-like, scented foliage and brownish heads of imperfect fls.; roots long and cord-like. Staminate catkins 1 in. or less long, slender, in clusters at the ends of the bractlets. L. H. B.

CONÁNDRON (*cone-shaped anther*) *Gesneriææ*. Almost stemless herb with radical glabrous rugose lvs. Differs from *Streptocarpus*, its nearest horticultural relative, in having a straight, not twisted pod. For cult. see *Streptocarpus*. It should be grown in shade and is hardy only south of N. C.

C. ramondioides, Sieb. & Zucc., of Japanese mountains, is the only species. It is an interesting little tuberous-rooted herb, with oblong, rugose, irregularly toothed root-lvs. and scapes bearing 6-12 white or purple, dodecatheon-like fls.: cymes nodding or drooping pubescent; corolla 1 in. diam.: seeds very minute.

B M 6484.—This is one of several groups of rare and widely scattered herbs, of which *Ramondia*, *Haberlea*, *Wulfenia*, *Didymocarpus*, *Shortia* and *Shizocodon* are examples. Conandron is adapted to growing in shady rockeries. Scapes less than 1 ft. high. Little known in cult., but is in the trade. N. TAYLOR †

CONE-FLOWER: *Rudbeckia*. **Purple Cone-Flower:** *Echinacea*.

CONGÈA (from an East Indian vernacular name). *Verbenaceae*. A few species of climbing shrubs in Burma and the Malayan peninsula. Lvs opposite and entire; fls in peduncled capitate cymes which are combined in large terminal panicles, the bracts at the base of the cyme-peduncles large and often showy; calyx funnel-form, 5-toothed; corolla-tube slender, seldom much exceeding the calyx, usually hairy in the throat, 2-lipped, the upper lip of 2 narrow upright lobes and the lower of 3 shorter broader lobes, stamens 4, exserted, ovary incompletely 2-celled fr a small roundish nearly dry drupe. *C. tomentosa*, Roxb., is grown in India and is said to be suitable for growing in a stove or warm conservatory in Britain a strong climber, conspicuous for the pink and changing tints of the large elliptic persistent bracts in the loose woody terminal panicles lvs 3 in long, ovate-acute, soft-hairy beneath: corolla white, calyx hairy. Burma G C. III 54 399 — Evergreen until retained for several weeks. Allied to *Petrera volubilis*

CONIFERS *Arborsculturæ*

CONIOGRÁMME (Greek, *dust-line*) Formerly *Dictyogramma Polypodiaceæ*. A few Japanese and Pacific island ferns, with naked sori, which follow the course of the free or reticulated veins. The species are sometimes referred to *Gymnogramma*. Strong-growing indoor-ferns, useful for specimen plants

japónica, Diels. Lvs simply pinnate or bipinnate at the base, 1½–2 ft high, the pinnæ 6–12 in long and an inch wide, sori extending from the midrib to the edge. Japan and Formosa—Also known as *Gymnogramma japonica*. An interesting fern of rather strong growth, and very distinct in appearance. Grows best in a moderate temperature—for example, 55–60°—and requires an open and well-drained soil of peaty character. R C BENEDICT †

CONIUM (Greek name) *Umbelliferae*. Two weedy biennial plants, widely distributed. *C. maculatum*, Linn., is the poison hemlock, “by which,” as Gray writes, “criminals and philosophers were put to death at Athens.” It is a rank, much-branched European herb which has run wild in E. N. Amer., and which has been offered in the trade as a border plant. It is biennial, rank-smelling, and poisonous, and is scarcely worth cult. although the finely cut dark foliage is highly ornamental. It grows from 2–4 ft high, and has large umbels of small white fls. See *Poisonous Plants*.

In North America the word hemlock is used for the hemlock spruce, *Tsuga*.

CONOCÉPHALUS (Greek, *cone head*). One of the liverworts (*Marchantiaceæ*), with broad flat forking evergreen thallus, growing on moist banks, like a moss. *C. conicus*, Dumort., is sometimes offered by collectors as a cover for rockeries, but can scarcely be said to be a cultivated plant.

CONOCLINIUM: *Eupatorium*.

CONOPHÁLLUS (name refers to the cone-shaped inflorescence) *Ardeææ*. A name proposed by Schott for certain aroids, but now made a section of *Amorphophallus*. *C. Kónjac*, Koch, is *Amorphophallus* *Ruvers* var. *Konyac*, Engler. The great tuber is much grown in Japan for the making of flour (see *Georgeson*, A.G 13:79). *Amorphophallus* *Ruvers* is figured on p.

276, Vol I.; also in R.H 1871, p. 573; and in B.M. 6195 (as *Protenophallus Ruvers*). Konjak is offered by importers of Japanese plants.

CONSERVATORY. Primarily a glasshouse in which plants that have been brought to perfection—usually in other greenhouses—are to be placed for display or to be kept in condition.

The conservatory should be as near the residence as possible; if not an architectural unit of the house, it may be connected by a corridor or pergola. The size of a conservatory depends of course upon the requirements or taste of the family, some are as small as 6 by 10 feet, while others are as large as 35 by 75. The aspect or side of the dwelling best suited to a conservatory is on the east, and preferably against a gable, so that sliding snow from the roof of the dwelling will not give trouble. If this is not convenient, the glass roof of the conservatory must be protected with snow-guards. A lean-to house is subject to great fluctuations if placed against the south side.

Since much attention has been given to the building of conservatories within the past few years, they can now be made attractive in architectural design, and at the same time supply the best possible conditions for the well-being of the plants. A curvilinear roof is usually more attractive and is better for the plants than a flat roof, but abundant ventilation must be provided. The roof glass should be ground or frosted, as plants remain in flower much longer under a subdued light than when exposed to direct sunlight. Even ground glass is not sufficient in summer, some shading being required, roller shades are hard to adjust and not altogether practicable, whitewash applied to the glass outside is unsightly and damages the painted wooden strips in which the glass is laid. The following has been found to be an excellent shading mixture: Sixteen ounces white lead, thirty-eight ounces turpentine, two ounces linseed oil, apply to the glass outside with an ordinary paint-brush. The advantages of this mixture are that it is not unsightly, is easily applied, and wears off as winter comes on.

The heating of a conservatory is an important matter, since even night temperatures must be maintained as in other greenhouses. This can easily be arranged if the dwelling is heated by hot water, which is the best for any conservatory, but with steam or hot air it is more difficult, if possible when these methods of heating the dwelling are used, a separate small hot-water system should be installed for the conservatory. The temperature at which conservatories are to be kept depends upon the plants grown in them. Palms, ferns, orchids and ornamental-leaved plants generally require a night temperature of about 60°. Flowering plants, such as chrysanthemums, azaleas, primulas and bulbs, do better in a temperature of 45° to 50° at night with a rise of 15° to 20° for both classes of plants by day before opening the ventilators, and these, in winter especially, must be opened with caution, admitting the outside air very sparingly.

The floor of a conservatory may be of tiles and the interior may be arranged with rugs and easy chairs in the center with the plants arranged on tables around the outside or over the heating-pipes. The catalogues of the principal greenhouse builders show some very artistic arrangements, both inside and outside.

A conservatory is often a part of a commercial greenhouse establishment, being in effect the display house or room into which interesting and perfected plants are brought for inspection; and in large cities conservatories are often attached to florists' stores, not only as a display house but because plants will keep in much better health and condition for a much longer time than in the ordinary conditions of the florist's store; but commonly the word is used as above to designate an adjunct to a home.

EDWARD J. CANNING.

CONVALLARIA (old name *Lilium convallium*, derived from *convallis*, a valley) *Liliaceae*. **LILY-OF-THE-VALLEY**. A dainty herb, much prized for its erect racemes of white delicately-scented flowers; perennial.

Leaves radical, from a horizontal rootstock, producing upright parts or pups (Fig. 1044) fls. white (sometimes pink-tinted), small and short-bell-shaped, with short blunt recurved lobes, nodding, in a short, radical, raceme (Fig. 1045), the stamens 6 included, style 1 (Fig. 1046) fr. a globular small few-seeded red berry. —Commonly considered to be only one species, native in Asia, Eu., and in the higher mts., Va. to S. C.; of several similar races or types.

Lily-of-the-valley is much prized for its delicate, sweet-scented flowers. The rhizome and roots are sold in drug-stores they are poisonous in large doses; in small doses used as a heart tonic. The plant is popularly supposed to be the one referred to in the Sermon on the Mount, but this is not to be determined. It is essentially a shade-loving plant. The species is *C. majalis*, Linn. Lvs oblong or oval, thick and persisting till autumn, forming a dense sod, plane, with more or less bloom-racemes 5-10 in high berry ¼ in diam. R. H. 1886 84 Gn 47, p. 179; 52 182 and p. 319 (the latter in fruit). A. F. 13.402 Gng. 5.56-7. F. R. 2 4. G. C. III. 23: 149 (var. *grandiflora*). Lowe, 42 (var. *variegata*).

The plant is hardy, and is easily grown in partially shaded places and moderately rich ground. Old beds are liable to run out. The roots and runners become crowded, and few good flower-stems are produced. It is best to replant the beds every few years with vigorous fresh clumps, which have been grown for the purpose in some out-of-the-way place. Five or six strong pups, with their side growths, planted close together, will form a good clump in two years if not allowed to spread too much. The mats of clean foliage make attractive carpets under trees and in other shady places. If the bed is made rich and top-dressed every fall, it may give good results for four or five years; and plants in such beds thrive in full sunshine. One form has prettily striped foliage, very ornamental in the early part of the season. Lilies-of-the-valley bloom early in spring. They run wild in many old yards, in cemeteries, and along shady road-sides. There are double-flowered forms; also one (var. *prolificans*) with racemes 2 feet long (J. B. Keller).

For culture as a florist's flower, see *Lily-of-the-valley*.

Recent studies of this genus by E. L. Greene, have distinguished 3 other species: *C. japonica*, Greene, representing the Japanese form of the plant, rootstock very short and stout. Lvs 2 only, sub-ovate, elliptic, cuspidately acute, bright green with no trace of bloom on either surface, peduncle short, about equaling the bases of the lvs., raceme few-fl'd., the bracts small, ovate-lanceolate, perianth widely opening, broadly bell-shaped or almost saucer-shaped, stamens large, very short, the very obtuse anthers longer than the filaments. —*C. globosa*, Greene. Herbage light green, without trace of bloom lvs. with a more fibrous and less fleshy anatomy than those of *C. majalis*, and of shorter duration, disappearing by the end of summer, perianth urn-shaped (not bell-shaped), stamens inserted about the middle of the perianth, extending horizontally (rather than vertically, as in *C. majalis*). Probably N. C., but described from plants growing in a wild garden in Washington, D. C., later-blooming than *C. majalis*. —*C. maydickii*, Greene. Differs from *C. majalis* in its very large light green lvs., which have no trace of bloom and an excessively fibrous

anatomy which makes the growing lf. to look plicate, more than twice larger than *C. majalis*, later-blooming, perianth broadly bell-shaped, filaments very short, nearly hypogynous, erect, anthers large, oblong, obtuse, cordate at base S. E. Pa., and southward.

L. H. B.

CONVOLVULUS (Latin, *convolvere*, to entwine). *Convolvulaceae*. Includes *Calystegia*. **BINDWEED**. Annual and perennial herbs, grown mostly in the open, some are twiners.

Sometimes suffrutescent, twining, trailing, erect or ascending, with filiform, creeping rootstocks. Lvs petiolate, entire, toothed or lobed, generally cordate or sagittate; fls. axillary, solitary or loosely cymose, mostly opening only in early morning, corolla campanulate or funnel-form, the limb plaited, 5-angled, 5-lobed or entire. —A genus of about 175 species, widely distributed in temperate and tropical regions. Convolvulus and *Calystegia* are no longer kept separate. As *Convolvulus Sepium* is the type of both genera, they are therefore synonymous. When the fls of *C. occidentalis* are borne singly, the calyx bracts are broad and *Calystegia*-like, when borne in clusters the bracts are greatly reduced.

The species thrive in a variety of soils without especial care. The greenhouse species do best in a soil with considerable fiber. The hardy perennials are usually propagated by dividing the roots, otherwise by cuttings or seeds, the tender species preferably by cuttings. *C. triolan* is the most important of the hardy annuals. It may also be started in the greenhouse, and makes an excellent plant for the hanging-basket. All are vigorous growers, and may become troublesome weeds in some places if not kept within bounds. *C. japonicus* and *C. Sepium* should be used with caution. This is the chief reason why the hardy perennials are not often found in well-kept gardens, except along wire fences or lattice screens, where the turf is laid up close so as to allow only a narrow border for the roots. The double-flowered form of *C. japonicus* is seen to best advantage in half-wild places, or on rocky banks, where shrubs make but a stunted growth. Here it will grow luxuriantly, forming graceful festoons from branch to branch, and covering the ground with a pretty mantle of green (J. B. Keller).

C. purpureus, the common morning-glory, and many related species are to be found under Ipomoea.

1045 Raceme of Lily-of-the-valley. (Natural size)

1044. Lily-of-the-valley pup.

1046 Section of flower of Lily-of-the-valley, laid open to show the parts. (X2)

A. Calyx with 2 membranaceous bracts at the base; peduncles usually 1-fld. (*Calystegia*.)

B. St. prostrate, 8 in. to 2 ft. high; peduncle usually shorter than the lvs.

1. *californicus*, Choisy (*C. villosus*, Gray. *Calystegia villosa*, Kellogg) Plant densely white-villose throughout; st. prostrate, scarcely twining; lvs. slender-

1047.
Convolvulus
japonicus.
($\times \frac{1}{2}$)

petioled, reniform-hastate to sagittate, the upper acuminate, 1 in. or less long, the basal lobes often coarsely toothed; bracts oval or ovate, completely inclosing the calyx; fls. cream-yellow, 1 in. long. Calif.—Perennial.

2. *malacophyllus*, Greene Similar to the preceding but foliage velvety or plushy pubescent. Calif.—Perennial. Other closely related Californian species are *C. saricola*, Eastw., *C. deltoideus*, Greene, *C. Berryi*, Eastw. and *C. atriplicifolius*, House.

BB St. twining or trailing, 3-10 ft. high; peduncle exceeding the lvs.

3. *japonicus*, Thunb. (*Calystegia pubescens*, Lindl.). CALIFORNIA ROSE Fig 1047 Hardy perennial herbaceous twiner; growth very vigorous, often 20 ft. whole plant more or less densely and minutely pubescent. lvs. hastate, lanceolate, obtuse or broadly acute, with angular or rounded lobes at the base, variable, occasionally without lobes, rarely sharp lanceolate. fls. bright pink, 1-2 in. broad, produced freely during the summer months and remaining expanded for several days. Japan and E. Asia. The double form is now naturalized from S. E. N. Y. to D. C. and Mo. P. M. 13.243. F. S. 2:172. B. R. 32:42.—The double form is completely sterile, with narrow wavy petals, irregularly arranged, the outer somewhat lacerate. A valuable decorative plant for covering stumps and walls. In rich soil the roots spread rapidly, and will smother out all other plants unless confined in tubs. The *Calystegia pubescens* of Lindley has been wrongly referred to *Ipomoea hederacea*, but the two plants are very different, the former being perennial and the latter annual. Soc. Journ. Hort. Soc. 1:70 (1846). The plant is commonly confounded with *C. Sepium*.

4. *occidentalis*, Gray. Hardy perennial, herbaceous or with suffrutescent base; st. twining, several feet high, glabrous or minutely pubescent; lvs. from angulate-cordate, with a deep and narrow sinus, to lanceolate-hastate, the posterior lobes often 1-2-toothed; peduncle 1-fld. or prolikerously 2-3-fld.; bracts ovate or lanceolate, usually completely inclosing the calyx, variable; corolla white or pinkish, 1-2 in. long; stigmas linear. Dry hills, Calif.—Listed as early as 1881.

An admirable plant for rockeries. Several related species are native also to Calif. *C. cyclostegus*, House, *C. Binghamii*, Greene, *C. polymorphus*, Greene, *C. Greenei*, House, *C. druidis*, Greene, *C. purpuratus*, Greene, *C. illecebrosus*, House, *C. gracilentus*, Greene, and *C. longipes*, Wats.

5. *Sepium*, Linn. (*Calystegia Sepium*, R. Br.) RUTLAND BEAUTY. Fig 1048 Perennial trailer, 3-10 ft. long, glabrous or minutely pubescent; lvs. round-cordate to deltoid-hastate, the basal lobes divaricate, entire or angulate; fls. white, rose or pink, with white stripes. F. S. 8.826. B. M. 732. A. G. 12:638. Gn. 50.514.—A very variable species. Cosmopolitan in temperate regions. An insidious weed in moist soil. The native forms have been called *C. interior*, House, Rocky Mt. region; and *C. americanus*, Greene, in the eastern states, but are difficult to distinguish. Var. *repens*, Gray (*C. repens*, Linn.) Pubescent. sts. trailing or sprawling; the basal lobes of the lvs. obtuse or rounded. Coastal region from Que. to Fla.

AA Calyx without bracts; peduncle 1-6-fld. (*Eucnolvolvulus*.)

B. St. prostrate, trailing, glabrous or minutely pubescent.

6. *mauritanicus*, Boiss. Strong perennial roots. st. herbaceous, slender, prostrate, rarely branched, minutely villose; lvs. alternate, round-ovate, obtuse, short-petioled; fls. blue to violet-purple, with a lighter throat, 1-2 in. across, very handsome. Afr. B. M. 5243. F. S. 21:2183. Gn. 39:52.—A free bloomer through the summer. On dry banks each plant forms a dense tuft which throws up many graceful shoots. Not hardy north of Philadelphia.

7. *Scammonia*, Linn. Hardy perennial trailer, deceduous; st. angular, glabrous; lvs. cordate-sagittate, gray-green, the lobes entire or dentate; sepals glabrous, ovate, obtuse; corolla white, creamy or light pink. Asia Minor.—The large tap-roots supply the resinous cathartic drug scammony.

BB St. erect or ascending, silky.

8. *Cneorum*, Linn. St. shrubby, half-hardy, 1-4 ft. high; lvs. persistent, lanceolate or spatulate, silky gray; infl. a loose panicle, 1-6-fld.; fls. white or tinged with pink, borne freely during the summer. S. Eu.—Valuable as a pot-plant for greenhouse or window decoration, or trained to a warm wall. Confused with *C. oleifolius*.

9. *oleifolius*, Desr. Tender perennial; lvs. linear-lanceolate, acute, slightly villose; fls. bright pink, borne freely in loose, umbellate panicles in the summer. Greece. B. M. 259 (as *C. linearis*).—Many plants now passing as *C. oleifolius* are *C. Cneorum*. The latter may be distinguished by its broader, blunter, silvery-villose lvs., lighter-colored blossoms, and taller growth.

10. *tricolor*, Linn. (*C. minor*, Hort.) Fig. 1049. Hardy annual st. trailing, ascending 6-12 in., angulate, densely covered with long brown-

1048. *Convolvulus Sepium*. ($\times \frac{1}{2}$)

ish hounds: lvs. linear-oblong or subsupatulate, obtuse or rounded at the apex, usually pubescent but sometimes glabrous, the margin ciliate towards the base. peduncle 3-4d., exceeding the lvs., sepals ovate, lanceolate, villose, acute, limb of the corolla azure-blue, throat yellow, margined with white. S. Eu. B.M. 27.—One of the best annuals for the home border. Each plant covers a ground space of 2 ft. and blooms continuously throughout the summer. Fls. remain open all day during pleasant weather. There are many variously striped and spotted forms of this popular annual, none of which surpasses the type in beauty. A variety with pure white fls is attractive. Other well-marked horticultural forms are Var *vittatus*, prettily striped with blue and white F.S. 3-298 R.H. 1848 121. Var *compactus*, dwarf, and valuable for pot culture Gt. 47, p. 635 A 5-petaled form is also recorded. F.S. 8, p. 116, desc.

11. *adureus superbus*, Hort. A tender perennial, but may be treated as an annual, since it flowers the first season from seed; st trailing or twining, 4-5 ft. long; fls. golden.—Valuable as a greenhouse climber and for hanging-baskets. Not sufficiently described for identification.

C. althaeoides, Linn (C. italicus, Roem. & Schult.) St. prostrate, twining or climbing, if it finds support; upper lvs. pedately, lower ovate-cordate, crenate, silvery fls. pink. May-Aug. Medit. region B.M. 359 F.S. 10 1021 (as var. *argyræus*) R.H. 1864 111.—*C. umbilicus*, House, native from Mont. to New Mex. and S. Calif., is a close relative to *C. arvensis*—*C. arvensis*, Linn. Slender perennial trailer, 1-3 ft. long, glabrous or nearly so; lvs. ovate-sagittate or hastate, variable fls. white or pink. Eu. and E. Asia. Naturalized in old fields through the Atlantic states and Calif. A troublesome weed in cult. grounds.—*C. canariensis*, Linn. Greenhouse evergreen lvs. oblong-cordate, acute, villose fls. violet-purple, peduncle 1-6-ft. Canary Is. B.M. 1228—*C. dahuricus*, Herb. (Calystegia dahuricus, Fisch.) Highly deciduous twiner, 3-6 ft. lvs. oblong-cordate, shortly acute fls. pink or rose-violet. June, July N. Eu. B.M. 2609 F.S. 10 1075—*C. erubescens*, Sims (C. acaulis, Choisy) Tender biennial lvs. oblong, hastate, the basal lobes toothed; fls. small, 5-lobed, rose-pink. Austral. B.M. 1067—*C. macrostegus*, Greene. The plants in the trade under the name may be referred to *C. occidentalis*—*C. major*, Hort., not Gilib.—*Ipomoea purpurea*—*C. ocellatus*, Hook. Stove evergreen limb of corolla white, 5-angled, throat reddish purple. lvs. sessile, linear, acute, 1-veined, villose. S. Afr. B.M. 4065—*C. scoparius*, Linn.—*C. Soldanella*, Linn. Sts. prostrate lvs. reniform fls. pink or rose-colored. Sandy shores, Wash. to Calif., also in Eu. and Asia.

1049. *Convolvulus tricolor*. (X 5/8)

S. W. FLETCHER.
H. D. HOUSE.†

COÖKIA: *Claucaena*.

COONTIE: *Zamia integrifolia*.

COOPÈRIA (after Joseph Cooper, English gardener). *Amaryllidaceæ*. Tender bulbous plants with the habit of Zephyranthes but night-blooming.

Flowers fragrant, solitary, 2 in. or more across, waxy-white, tinged red outside, and more or less green within; the perianth subtended by a bract-like spathe, somewhat as in Iris; anthers erect in distinction to versatile in Zephyranthes. lvs. appearing with the fls. in summer, long, narrow, flat and twisted.—Only 2 or 3 species from Texas to New Mex. and Mex., usually growing in dry places. The bulbs should be taken up in autumn and stored during the winter in dry soil. Cult. easy and like zephyranthes.

A. Neck of bulb short: perianth-tube $3\frac{1}{2}$ in. long or more.

Drummondii, Herb. EVENING STAR. Bulb roundish, 1 in. thick, with a short neck; lvs. narrowly linear, erect, 1 ft. long; peduncle slender, fragile, hollow, $\frac{1}{2}$ -1 ft. long, spathe $1\frac{1}{2}$ -2 in. long, 2-valved at the tip; perianth tube 3-5 in. long; limb $\frac{3}{4}$ -1 in. long, white, tinged with red outside; segments oblong, cuspidate. Prairies, of wide range. Var. *chlorosolen*, Baker, has a perianth-tube stouter and tinged with green: limb

longer and less wheel-shaped: lvs. a little broader. B.M. 3482.

AA. Neck of bulb long: perianth-tube less than $2\frac{1}{2}$ in. long.

pedunculata, Herb. GIANT PRAIRIE LILY. More robust than *C. Drummondii*: bulb with a longer neck, 2-3 in. long; lvs. about 6, 1 ft. long, $\frac{1}{4}$ in. broad; peduncle about 1 ft. long, spathe 1-2-valved at the tip, perianth-tube shorter, $1\frac{1}{2}$ in. long, limb nearly as long as the tube, tinged red outside. B.M. 3727. R.H. 1853 401.—The best species. Fls. larger, of purer color, and remaining open a day or two longer.

N. TAYLOR.†

COPAÍFERA (from *copaba*, Brazilian name of the balsam derived from some of these trees). Syn *Copaba Leguminosæ*. Sixteen or more spineless trees of Trop. Amer., and Afr., with abruptly punctate lvs., small mostly white, not papilionaceous fls. in panicles, interesting because several of them produce an oleo-resin known as copaba. They are not in cult., except now and then in collections of economic plants.

COPERNÍCIA (from *Copernicus*) *Palmææ*, tribe *Coryphææ*. Tall fan-palms with their trunks frequently thickened above the base.

Leaves flabellate, the petiole often with small spines; the small young lvs. usually undivided, the older much cut palmately. Spadix very much branched, the fls. single upon it or in small clusters; calyx tubular, more or less deeply 3-toothed fr. globose or ovoid, 1-seeded.—Species about 8, all confined to Trop. Amer. *C. cerifera* is a valuable economic plant, the wood being among the hardest known, and the lvs. being the source of a valuable wax. For cult., see *Corypha* G.C. II. 24 362 Beccari, *Le Palme Americane*, tribe *Coryphææ*, 1907.

cerifera, Mart. CARNAUBA PALM. St. 30-35 ft., with a small swelling near the base; lvs. 3-4 ft. wide, nearly round; rachis none; petiole convex below, concave above, the margins with rather thick spines; spadix erect or spreading, 5-6 ft. long and thrice branched; fls. in clusters on the spathe. Trop. S. Amer.—Not well known in the trade; see *Livistona*.

C. australis, Becc., a recently described species, said to be more hardy than *C. cerifera*, has been cult. at Riverside, Calif. Taller, 60-80 ft., inf. densely woolly tomentose.

N. TAYLOR.

COPRA: material from the coconut, which see (p. 811)

COPRÓSMÁ (Greek name referring to the fetid odor of the plants). *Rubiacææ*. Shrubs or small trees, often trailing, of New Zealand, Australia and Polynesia, sometimes planted for the pretty fruit or variegated leaves.

Leaves opposite, mostly small, stalked or almost sessile: fls. small, solitary or fascicled, white or greenish, dioecious, corolla-limb 4-5-lobed, the lobes revolute, stamens 4-5. fr. an ovoid or globose usually 2-celled drupe.—About 60 species mostly in New Zealand, extending to Borneo, Hawaii and Juan Fernandez.

Coprosmas are greenhouse plants in the North, but they are rarely cultivated. Propagated by hardened cuttings. The soil which is found among kalmia roots, mixed with good loam and sand, if necessary, will suit these plants. Cuttings should be rooted in moderate heat in spring, before growth begins. If placed under a handlight or propagating-frame, care must be taken to prevent damping, to which the cuttings are liable. (G. W. Oliver.)

Baüeri, Endl. (*C. Baueriana*, Hook. f.) Shrub or small tree, in exposed and rocky places in its native habitat sometimes not more than 1-3 ft high and with branches nearly prostrate, in better conditions often a round-topped tree 20-25 ft. high; lvs, thick, shining green, 1-3 in long, wide-ovate or oblong, obtuse or notched at the apex, the margins usually revolute; male fls. in dense heads on short axillary peduncles; females 3-6, the heads with short peduncles; calyx very small; corolla of female fls tubular, 4-lobed. New Zeal.—In cult. there are two forms, both with variegated lvs; one has lvs broadly blotched creamy yellow, at times the green disappearing altogether (var *variegata* or *pectinata*); the other (*C. Stöckii*, Hort.) has lvs blotched yellow-green on a deeper ground. *C. Baueri* is a favorite in S Calif., and probably the only one grown there; thrives near the sea.

acerdosa, A. Cunn. Low and spreading, much branched, with minute lvs., small white fls., and pretty sky-blue drupes or berries. New Zeal.—Once catalogued in Calif.

Pétriel, Cheesem. Prostrate and creeping, forming mats, the branches to 1½ ft long lvs 1 in or less long, linear-oblong or -obovate, rigid and thickish fls. solitary, on the ends of short erect branchlets, the males 4-toothed and without calyx, the females smaller, irregularly toothed and calyculate. Drupe ½-½ in diam., mostly purplish. New Zeal.—Mentioned abroad for cultivation. L. H. B.

CÓPTIS (Greek, *to cut*, from the cut leaves) *Ranunculaceae*. Hardy perennial herbs of the cooler parts of the northern hemisphere, sometimes planted in bogs and moist places.

Low, stemless plants, with slender rootstocks; lvs radical, compound or divided, lasting over winter; fls. white or yellow, scapose, sepals 5-7, petal-like, petals 5-6, small, linear, hood-like; stamens numerous; carpels stalked, few, becoming an umbel of follicles.—Eight species, only one of which is used in American gardens.

The bitter roots yield the tonic medicine known as "gold thread," also a yellow dye. The plants should have peaty soil, with a little sand, and prefer shade, in damp situations. They are rather hardy. The roots withstand severe winters, being native of the cooler parts of the northern hemisphere. If the plants are given some protection in winter, as in a cold pit or by a dressing of litter, the leaves remain green and fresh. The plants are valuable in hardy borders because of the leaves and also the flowers.

The plants are very easily propagated in either early spring or late fall, the former being preferred. Seeds may be sown when ripe, before they become old, and will grow readily in moist but well-drained soil. They should be only

slightly covered with soil but the surface should be kept moist by a close covering with leaves or paper, and partial shade is preferred. The seedlings may be transplanted at any time after the leaves are large, by keeping plenty of soil about the roots.

1050. *Corallorhiza multiflora*. (X ½)

trifolia, Salisb. No st.; rootstock yellow; lvs compound, long-petioled, lfts broadly obovate, cuneate, obtuse, the teeth mucronate. fl-st. slender; sepals white, with yellow base; petals small, club-shaped; follicles 3-7, spreading, equaled by their stalk; seeds black. May-July. Adirondacks and westward. L.B.C. 2. 173.—Neat and pretty, with shining lvs.

K. C. Davis.

CORAL BERRY: *Symphoricarpos vulgaris*

CORAL DROPS: *Besleria elyagis*

CORALLORHIZA (Greek for coral-root). *Orchidaceae*. CORAL-ROOT. Low orchids, growing in woods and parasitic on roots, destitute of green foliage, the plant usually brownish or yellowish and inconspicuous.

Flowers small, somewhat 2-lipped, usually obscurely spurred at the base, sepals and petals nearly alike; lip small, slightly adherent to the base of the column; pollinia 4.—Species few, in N Amer., Eu. and Asia. The coral-roots have little merit as garden plants, although very interesting to the student. They may be grown in rich, shady borders. Two species have been offered by dealers in native plants. *C. multiflora*, Nutt (Fig 1050), is purplish, 1½ ft or less high, 10-30-fl, lip deeply 3-lobed. Grows in dry woods in northern states. *C. Mertensiana*, Bong., scape many-fl, 8-15 in high, the lip entire and broadly oblong occurs in Brit Col and north to Alaska. *C. odontorrhiza*, Nutt., provides what is known as crawley-root, said to be used for its diaphoretic and febrifuge properties. It is a slender plant, in woods S, but extending north as far as Canada, light brown or purplish, 6-7 in tall lip nearly or quite entire, white spotted with crimson. L. H. B.

CORAL-PLANT: *Jatropha*.

CORAL-ROOT: *Corallorhiza*.

CORAL-TREE: *Erythrina*.

CÓRCHORUS (name refers to some reputed virtue, as an eye remedy, of one of the species) *Tiliaceae*. Shrubs or herbs of the tropics, two of which supply jute.

The jute plants are *C. capsularis* Linn and *C. oleratus*, Linn. The latter differs from the *C. capsularis* in having an elongated, not semi-globose, pod. B.M. 2810. They are annual plants, natives of Asia but cult throughout the tropics, growing 10-12 ft high, with a straight st as thick as the little finger and branched only at the top. Fls. small, yellow, with 4-5 glandless petals and a slender caps., or sometimes the caps is globose. The young shoots of both are used as pot herbs. *C. oleratus* is much grown for this purpose in Egypt, and is known as Jews' mallow. Jute is made from the fibrous bark of these and other species of *Corchorus*. It is released from the sts by retting in stagnant pools. See Cyclo. Amer. Agric., Vol. II, pp 282, 507.

C. Balducci, Fedde, has very recently been mentioned in foreign horticultural literature. It is described as a perennial, woody at the base lvs linear-elliptic, pilose above and white-tomentose beneath fls. solitary, axillary and minute. Italian Somaliland.

The *corchorus* of trade lists is likely to be *Kerria*.

CÓRDIA (an early German botanist, Valerius Cordus, born 1515) *Boraginaceae*. Warm-climate trees, shrubs or almost herbaceous, sometimes planted.

Leaves mostly alternate, petioled, entire or dentate. fls in dense heads or clusters or scirpoid cymes, perfect or polygamous, the corolla usually white or orange; calyx tubular or campanulate, toothed or lobed; corolla tubular, funnelform or salverform, lobed, the parts and the stamens 4 or more; style 4-lobed. fr a drupe which is 4-loculed and usually 4-seeded.—Species about 230 in tropical and subtropical regions, mostly

in the western hemisphere. Some of them are vines; some are herbaceous above the base. Species confused.

The cordias are greenhouse plants with showy flowers of easy culture. Grown in the open in the extreme South. Propagated by cuttings of firm wood and by seeds.

1051. *Cordia Greggii* var. *Palmeri*. (×3½)

Sebestëna, Linn. (*C. speciosa*, Willd.) **GEIGER TREE** Tall evergreen shrub or small tree, hairy, with rough, ovate, entire or undulate stalked lvs fls 1-2 in. long, orange or scarlet, stalked, in large open terminal clusters, the cumpled corolla-lobes and stamens 5-12. drupe inclosed in the hazel-like husk formed by the persistent calyx Keys of Fla. and south B M 794.

Grégu, Torr Much-branched shrub, to 8 ft lvs less than 1 in long, pale, obovate, obtuse, dentate, rugose, long-cuneate at the base fls more than 1 in. across, white, in few-fld contracted capitate clusters but becoming looser as flowering proceeds; corolla-lobes obtuse, stamens 5 or 6, scarcely half the length of the corolla Mex Var *Palmeri*, Wats (Fig 1051, adapted from G F 2 233) has more broadly funnel-form corolla, the limb 1½ in broad lvs somewhat larger, ovate-oblong and abruptly cuneate at the base, acute or obtuse at the apex Mex.—Deserving of planting in the southwest country, if hardy

Other cordias are likely to come into cult. in the southern country. Some of them yield drugs, many of them produce useful timber, and some have edible frs. There are numbers of species in Porto Rico and others of the W Indies—*C. Francisci*, Tenore Tall lvs dark green fls white S Amer—*C. Maza*, Linn., from Trop. Asia and Austral., is one of the best woods for kindling fire by friction, and is useful in many other ways L H B.

CORDYLINÉ (*club-like*, referring to the fleshy roots). *Liliacée*. DRACENA. DRACENA. PALM. Greenhouse plants closely related to DRACENA, planted in the open in California and similar climates

Stems tall, often woody and palm-like, bearing large crowded lvs., to the striking variegation of which the group owes its value fls panicle, stamens 6, pedicels articulated; perianth 6-parted; ovary 3-celled, fr a berry.—Cult for the ornamental foliage. The horticultural forms and names have become very numerous.

The various species are in the trade under DRACENA, which see for a key to the species of both genera combined. From DRACENA, *Cordyliné* differs in the ovary containing several ovules in each cell, and the solitary pedicels being provided with a 3-bracted involucre. In the following paragraphs, the initial D. indicates that the plant in question is known in the trade as a DRACENA, and C. that it is known as a *Cordyliné* (see DRACENA). For a monograph, see Baker, Journ. Linn. Soc 14: 538 (1875).

Of cordylines or dracenas, propagation is usually effected by cutting the ripened stems or trunks, from which all leaves have been removed, into pieces from 2 to 4 inches long These are laid either in very light soil or in sand in the propagating-bed, where they receive a bottom heat of about 80°, being barely covered with sand or moss (Fig 1052) The eyes soon start into growth, and, as soon as they have developed about six leaves, these shoots are cut off with a small heel and again placed in the propagating-bed until rooted, after which they are potted off into small pots in light soil, kept close until they become established They are then shifted on into larger pots as soon as well rooted. They delight in a mixture of three parts good turfy loam and one part well-decayed cow-manure, with a liberal sprinkling of sharp sand A warm, moist atmosphere suits them best while growing, but towards fall the finished plants must be gradually exposed to full sunshine and a dry atmosphere, which develops their high colors The kinds enumerated below are such as are mainly grown in large quantities for decorative purposes, and are sold principally during the winter months, especially during the holiday season, when plants with bright-colored foliage are always in strong demand *C. anabitis*—A strong-growing form with broad green foliage, which is prettily variegated with white and deep rose One of the hardest varieties, either for decorations in winter or for outdoor work, vases, and the like in summer *D. fragrans*—An African species with broad, massive, deep green foliage which makes noble decorative plants, being frequently grown into specimens from 6 to 8 feet high Its foliage is of heavy texture, making it a useful plant for the dry atmosphere of a living-room Two handsomely variegated forms of the above are *D. Lindeni* and *D. Massangana*, both very desirable varieties *C. terminalis*—This is the most popular species, and is grown in immense quantities The foliage on well-matured plants is of an intense rich crimson marked with lighter shadings *C. australis* (commonly called *C. indivisa*)—Used principally as an outdoor decorative plant in summer, being extensively used for furnishing vases, window-boxes, and the like It succeeds best when planted out in the open border during summer, potted in the fall and stored during winter in a cool greenhouse It is propagated almost exclusively from seed, which germinates freely if sown during the early spring months in sandy soil, in a temperature of 60°

to 65°, growing them on during the first season in small pots. These, if planted in the open border the second season, make

1052. Stem-cutting of *Cordyliné*.

fine plants for 6- or 7-inch pots. There are a number of varieties of *C. australis*, among them several handsomely variegated bronze-colored forms, which, however, are but little distributed yet. Among the principal varieties and species besides the above which are grown in a commercial way are: *Baptisia*, *Shepherdia*, *stricta grandis*, *Youngii*, *Goldieana*, *Lord Wolseley*, *Desmetiana*, *Sanderiana*, *Godseffiana*, and *Mandæana*. (J. D. Eisele.)

A. Foliage of sessile, thick, sword-shaped lvs.

B. Lvs. glaucous beneath, broad.

1 *indivisa*, Kunth. Arborescent, 10-20 ft. high: lvs. dark green, densely crowded, 2-6 ft. long, 4-6 in. broad at the middle, 1½-2 in. at the base, rigid, very coriaceous, midrib stout, colored red and white, veins on each side of it 40-50 pumice nodding, bracteoles lanceolate, 3-4 lines long, membranous, perianth 3-4 lines long, white, tube very short, campanulate, segms. equal, sharply recurved berries ½ in. diam., blue, ovules 5-6 in each cell. New Zeal. Gn 49, p. 86. Lowe, 52 — Coolhouse, valuable for vases. Rare in cult. See *C. australis*, No. 4.

BB Lvs. green on both sides, narrower.

2 *stricta*, Endl. (*D. congesta*, Hort.) Slender, 6-12 ft. high. lvs. less crowded than in the next, acuminate, 1-2 ft. long, 9-15 lines wide, base 3-6 lines wide, scarcely costate, veins scarcely oblique, margins obscurely dentate pumice terminal and lateral, erect or cernuous, pedicels ½-1 line long, lower bracteoles lanceolate, perianth lilac, 3-4 lines long, campanulate, interior segms. longer than the outer, ovules 6-10 in each cell. Austral. B.M. 2575. G.C. III 17 207 — Coolhouse, vases, and the like. Var. *grândis*, Hort. Large, highly colored. Var. *discolor*, Hort. Like var. *grandis*, but with foliage dark bronzy purple.

3 *austrâlis*, Hook. (*D. indivisa*, Hort. *D. calocoma*, Weud.) Fig 1053, 359, Vol. I. Arborescent, 15-40 ft. high. lvs. densely rosulate, 1½-3 ft. long, 1½-2½ in. wide, base 6-12 lines wide, acuminate, green; midrib firm, indistinct, nerves on each side of it 12-20, scarcely oblique pumice drooping or erect, terminal, ample; pedicels very short; bracteoles deltoid, ½ line long; perianth white, 3-4 lines long, tube short, campanulate, segms. nearly equal, recurved berry white or bluish-white, mature seeds often solitary. New Zeal. B.M. 5636. G.C. III 23-153. Gn 47, p. 312, 48, p. 197. I.H. 35 40 (as var. *Doucetiana*), 37 114 (as var. *Dalderiana*), 40 190 (as *C. lineata* var. *purpurascens*) S.H. 1, p. 487 — Coolhouse, vases. Var. *aurea-striata*, Hort., variegated with a number of longitudinal yellow stripes. Var. *atropurpurea*, Hort. Base of lf. and under side of midrib purple. Var. *lineata*, Hort. Lvs. broader, the sheathing base stained with purple. Var. *Veitchii*, Hort. (*D. Veitchii*, Hort.) Base of lf. and under side of midrib bright crimson. *C. Hookeri*, Hort., was a garden form of this species — Much of the *C. indivisa* of the American trade has been, in the past, *C. australis*. Known as "cabbage tree" to residents of New Zealand.

AA. Foliage of petioled lvs.

B. Lvs. oblanceolate; petioles broad.

4. *rubra*, Hugel. Slender, 10-15 ft. high: lvs. contiguous, ascending, 12-15 in. long, 18-21 lines wide above the middle, thick, dull green both sides, distinctly costate, veins oblique, petiole broad, deeply grooved, 4-6 in. long pumice lateral, nodding, pedicels very short, bracteoles small, deltoid; perianth lilac, 4½-5 lines long, inner segms. longer than the outer, ovules 6-8. Country unknown — Coolhouse, vases. *D. Bradniti*, Hort., was a garden form of this species. R.H. 1897, pp. 514, 515. G.C. III 22 285. G.W. 12, p. 230.

BB Lvs. lanceolate; petioles narrow, nearly terete.

5. *Haageana*, Koch. (*C. Murchisonæ*, F. Muell.) Slender and small lvs. contiguous, ascending, oblong-falcate, 4-8 in. long, 2-2½ in. wide at the middle, acute, base rounded or deltoid, thick, dull green

1053. Cordyline australis—C. indivisa of the trade.

throughout, distinctly costate, veins slender, oblique; petiole 3-4 in. long, deeply channelled pumice lateral, pedicels 1½-2 lines long, perianth 4-½ lines long, tinged with lilac, ovules 6-8 in each cell. Austral.

6 *terminalis*, Kunth. Low and slender, 3-8 ft. high. lvs. contiguous ascending, green or rarely colored, 12-30 in. long, 2-5 in. wide, elliptical or elliptic-lanceolate, acute, thickish, distinctly costate, veins frequently unequal, strongly oblique, petiole 4-6 in. long, deeply channelled, pedicels very short or none, bracteoles deltoid, membranous, perianth 5-6 lines long, white, lilac, or reddish, segms. short, ovules 6-10 in each cell. Berry large, red. E. Indies. A.G. 16 361. B.R. 1749. Var. *cannæfolia*, Baker (*D.* and *C. cannæfolia*, Hort.) Lvs. oblanceolate, 12-15 in. by 2-2½ in. perianth 2 lines long, segms. twice the length of tube. Var. *ferrea*, Baker (*D.* and *C. ferrea*, Hort.) Lvs. narrow, oblanceolate, 2-2½ in. broad, dull purple or variegated, petiole short fls. much as in the typical form, but redder and often smaller. B.M. 2053 — *C. Guilfoylei* is a form with lvs. tapering both ways, recurved, striped with red, pink or white; white on lower part of lf. and margin of petiole. I.H. 19, p. 249. Var. *Ti*, Baker (*D. braziliensis*, Schult. *C. Eschscholziana*, Mart.) Robust lvs. large, mostly oblong, 4-6 in. wide pumice large, lower branches compound, perianth 6 lines long, lilac; segms. as long as the tube — *D. imperialis*, Hort., is a form with lvs. arching or erect, thick, deep metallic green, rayed all over with bright crimson or pink, handsome. *D. regina*, Hort.

belongs here. The varieties of this species in cult. are almost innumerable. Names that have been used for those in the American trade, usually considered as horticultural species, though many of these names are now no longer used, are as follows: *C. amabilis*. Lvs. broad, shining deep green, in age becoming spotted and suffused with rose and white. *C. amboynensis*. Lvs. oblong-lanceolate, recurved, deep bronze-green, edged with rose-carmine below; petioles tinged with purple. *C. anerilensis*. Lvs. very broad, deep bronze-red, with some white. *C. Baptistii*. Fig. 1054. Lvs. broad, recurved, deep green, with some pink and yellow stripes sts also variegated. I H 26 334. *C. Bausesi*. Lvs. broad, dark green, with some white. *C. bella*. Lvs. small, purplish, marked with red. *C. Cantrellii*. Lvs. dark metallic crimson, young ones bright carmine. *C. Cooperi*. Lvs. deep wine-red, gracefully recurved; common in cult. *C. Fraseri*. Lvs. somewhat erect, broad, oblong, abruptly acute, blackish purple with bloom, margin below with a deep rosy lake stripe extending down the petiole. *C. Gladstonei*. Lvs. broad, brilliant crimson. *C. hybrida*. Lvs. broad, variegated, deep green, margined with rose, in age deep rose, creamy white in young lvs. *C. jardiniere* (*C. terminalis alba* × *C. Gualfayleri*). Lvs. very small and compact, narrow, green broadly margined with white. *C. metallica*.

Lvs. erect-arching, oblong, when young uniform rich coppery purple, in age dark purple-bronze, petioles same. F M 1872 24. *C. nigro-rubra*. Lvs. narrow, linear-lanceolate, dark brown with rosy crimson centers, young often entirely rose. *C. norwoodiensis*. Lvs. striped with yellow, green and crimson, list color principally confined to the margin; petioles brilliant. *C. Robinsoniana*. Lvs. long lanceolate-acuminate, arched, light green, striped with bronze-green and brownish crimson. I H 26 342. *C. Schödin*. Lvs. broad, variegated. F E 7. 961. *C. Scottii*. Lvs. broad, arching, deep green, crimson edged, said to be a hybrid. *C. Youngii*. Lvs. broad, spreading, when young bright green streaked with deep red and tinged with rose, in age bright bronze. *C. Youngi* var. *rosea*, Hort. Green, tinged with pink, white or carmine. *C. Youngi* var. *alba*, Hort. Variegated with white instead of red. Crosses with *C. Scottii* are known as *C. stricta*, *C. albo-lineata*, Mrs. George Pullman, Mrs. Terry, with *C. norwoodiensis*, as Little Gem.

C. angulata, Hort. (*C. terminalis* var.) Lvs. narrow, arching, dull dark green above, purplish beneath. A slender form—*C. angustifolia*, Kunth—*C. stricta*—*C. aurantiaca*, Hort. (?)—*C. Balmoranda*, Hort. Lvs. bronzy with white and pinkish stripes—*C. Banksii*, Hook. Lvs. very long, linear-lanceolate, 3-5 ft. long, 2-3 in. wide, petioled, green, glaucous beneath, veins conspicuous. G C III 18 613—*C. Berkeleyi*, Hort. (?)—*C. Casuarina*, Hort. (?)—*C. (Wilsoni)*, Hort. CORĒMA (Greek, a broom, in allusion to its bushy habit) *Empetraceæ* BROOM CROWBERRY. Two species of low heath-like shrubs from E. N. Amer. and S. W. Eu. and the Atlantic Isls., of which the American spe-

cies is rarely cult. in botanical collections. Closely allied to *Empetrum* and differing chiefly in the apetalous fls. arranged in terminal heads, and in their upright bushy habit. Cult. and prop. like *Empetrum*. *C. Cónradii*, Torr., is a much-branched shrub, to 2 ft. high, with crowded linear lvs. about 1/4 in. long fls. inconspicuous, in terminal heads, the staminate with long exerted purple stamens; fr. a small berry-like drupe, usually with 3 nutlets. H 1. 6:531. Hardy.

N.—*C. album*, D. Don, has obtuse lvs. with revolute edges and resinous dots. fls. pink fr. white to purple. S W Eu., Azores. ALFRED REENDER

1054. *Cordyline terminalis* var. *Baptistii*.

COREÓPSIS (Greek, signifying bug-like, from the fruit) Including *Calliopsis*, *Compsoptis*. TERNSTED Annual or perennial herbs, flowering in summer or autumn, nearly all natives of eastern North America, some of them popular as flower-garden subjects.

Leaves opposite or rarely alternate, heads pedunculate and radiate, the broad involucre with bracts of 2 distinct series, the outer narrower or shorter and more herbaceous, the inner broad triangular-ovate or oblong, thin, yellowish green or purplish, and striate; receptacle chaffy, rays very showy, yellow, parted or rarely rose, neutral, disk-lvs. yellow, dark or brown; pappus of 2 weak bristles or scales, or a low crown or none. achenes often winged.—The genus differs from *Bulens* only in the reduced or obsolete, not stiff-awned pappus, and in segments not serrate. Many of the species are in the trade under the name *Calliopsis*. Other genera with this peculiar involucre are *Hudagoia*, *Dahlia*, *Thelopsis*, *Cosmos*, and *Leptosyne*. All the kinds are of easiest cult. The perennials are hardy border plants. The annuals are raised in any garden soil, and bloom freely with little care. They are all showy plants, of 50-70 species.

K M WIEGAND.

CORIANDER is the seed-like fruit of *Coriandrum sativum*, Linn., an umbelliferous annual of southern Europe. The plant grows 1 to 3 feet high, glabrous, strong-smelling, with leaves divided into almost thread-like divisions, and small white flowers. The plant is easily grown in garden soil. It occasionally becomes spontaneous about old yards. The seeds (fruits) are used as seasoning and flavoring in pastries, confections and liquors, although they are less known in this country than caraway. The plant is sometimes grown in American gardens with sweet herbs and other things

CORIANDRUM. Coriander

CORIARIA (*corium*, skin, leather, a shrub used for tanning leather was described as *fruter corarius*, by Phny) *Coriariaceæ*. Shrubs or perennial herbs grown chiefly for their ornamental fruits

Leaves deciduous, entire, 3-9-nerved, opposite and distichous: fls polygamous-monoecious in slender racemes, small, petals and sepals 5, stamens 10 fr berry-like, consisting of 5 1-seeded nutlets inclosed by the enlarged and colored petals—About 8 species in Himalayas and E Asia, Medit region, N Zeal and S. Amer Ornamental shrubs or herbs, with slender arching branches imitating pinnate lvs., and with very showy yellow, red or black fr. The lvs of some species are used for tanning leather, the frs are poisonous in some species, edible in others. *C. japonica* has proved hardly with slight protection in Mass., and *C. terminalis* seems to be of the same hardness, the other species are more tender. They grow in almost any good garden soil, and prefer sunny position. Prop. readily by seeds and greenwood cuttings in summer under glass; also by suckers and layers.

japonica, Gray. Fig 1057. Shrub, 2-3, sometimes to 10 ft branches quadrangular lvs nearly sessile, ovate or ovate-lanceolate, 3-nerved, smooth, 2-4 in long fls. in axillary racemes from the branches of last year fr. becoming bright red in summer, changing to violet-

black when ripe Japan B M 7509 G F 10 343 (adapted in Fig 1037). S I F 2:58 R H 1913, p 79.

terminalis, Hensl Herbaceous or suffrutescent, 2-3 ft branches quadrangular lvs nearly sessile, broad-ly ovate-lanceolate, 5-9-nerved, scabrous on the beneath, 1-3 in fls in terminal racemes on the current year fr black Sikkim, W China. **xanthocarpa**, Rehd & Wilson. ALFRED REIDER

CORIS (ancient name, transferred) *Primulacée*. Two low thyme-like herbs of S Eu, sometimes planted in rock-gardens, but apparently not in the trade Lvs small, alternate, linear, spreading or recurved, the margin revolute fls lilac or rose-purple, in terminal densely-fl'd racemes *C. monspeliensis*, Lam., of the Medit region, is 6 in high, much branching and spreading, the sts thickly covered with the little narrow lvs

CORK-TREE. *Quercus*.

CORMUS *Sorbus*

CORN, MAIZE (SWEET and POP). A tender annual cultivated for its grain, which is used both for human and live-stock food, and for the herbage which is used as forage. As a horticultural crop, it is grown primarily for the unripe grain or for pop-corn.

The word maize, Spanish *maiz*, is derived from the name Mahiz, which Columbus adopted for this cereal from the Haytiens. Maize has not yet been found truly wild. Its close relationship to a native Mexican grass called teosinte, *Euchlana mexicana*, is indicated by the known fertile hybrids between this species and maize as pointed out by Harshberger. Teosinte and the only other species which show close botanical relationship to maize are indigenous to Mexico. In fact the evidence all shows that maize is of American origin, although its original form has not yet been discovered, nor has its evolution from other types been completely traced. DeCandolle concludes that maize is not a native of the Old World but is of American origin, and that it was introduced into the Old World shortly after the discovery of the New, and then was rapidly disseminated.

Very early in the exploration and settlement of the New World, the whites learned from the natives the use of maize as food. Several of the Indian names for preparations of food from this cereal were adopted or adapted by the settlers and passed into the English language,—as for example hominy, samp, and succotash. In the English-speaking colonies, maize was grown as a field crop under the name Indian corn, but later the tendency was to drop the word Indian so that this cereal is now known in American agriculture and commerce by the simple word corn. The word corn has thus come to have a specific meaning on this continent which does not attach to it in the British Isles.

Corn now holds first rank among the agricultural products of the United States, both in the area

devoted to its cultivation and in the value of the annual crop. The types known in garden culture in this country are the sweet corns and the pop-corns, the other types, which are more strictly agricultural, may be designated as field corns. Sweet corn and pop-corn are also grown as field crops in comparatively limited areas, the sweet corn either as a truck crop or for canning, and the pop-corn to supply the demand for this product in our domestic markets. Only the types of sweet corn and pop-corn will receive attention in this article.

Botanical classification

Zea almost uniformly has been considered by botanists as a monotypic genus, its one species being *Zea Mays*. But *Z. Mays* is an extremely variable species, including groups which are separated by definite characteristics. As a working classification, that proposed by Sturtevant is the best which has yet appeared. He describes seven "agricultural species." These are *Zea tunicata*, the pod corns, *Z. ovata*, the pop-corns (Fig. 1058), *Z. indurata*, the flint corns, *Z. indentata*, the dent corns, *Z. amylacea*, the soft corns, *Z. saccharata*, the sweet or suga corns (Figs 1058, 1059, 1060), *Z. amylacea-saccharata*, the starchy sweet corns *Z. camma*, Wats., is a hybrid form, as shown by Harshberger. *Z. Mays*, Lam., belongs to the natural order of grasses or Gramineae. Culms 1 or more, solid, erect, 1½-15 ft tall, or more, terminated by a panicle of staminate fls (the tassels) internodes grooved on one side branches ear-bearing or obsolete lvs long, broad, channeled, tapering to the pendulous tips, with short hyaline ligules and open embracing sheaths fls monocious, awless, usually proterandrous, staminate fls in clusters of 2-4, often overlapping, 1 fl usually pedicelled, the other sessile or all sessile, glumes herbaceous, palea membranaceous, anthers 3, linear. The ear contains the pistillate fls on a hard, thickened, cylindrical spike or spadix (cob), which is inclosed in many spathaceous bracts (husks), spikelets closely sessile, in longitudinal rows, paired in alveoli with hard, corneous margin, fls 2 on a spikelet the lower abortive, glumes membranaceous; style single, filiform, very long (silks), ovary usually sessile ear variable in length and size, often distichous, grain variable in shape and size. The color ranges from white through light and dark shades of yellow, red and purple to nearly black.

1058. Kernels of corn on the cob—sweet corn behind, pop-corn in front ($\times \frac{1}{2}$)

Sweet corn (*Zea saccharata*, Sturt.) Figs 1058-1060. This is a well-defined species-group, characterized by horny, more or less crinkled, wrinkled or shriveled kernels, having a semi-transparent or translucent appearance. Sturtevant, in 1599, lists sixty-one distinct varieties. He gives the first variety of sweet corn recorded in American cultivation as being introduced into the region about Plymouth, Massachusetts, from the Indians of the Susquehanna in 1779. Schenck, in 1854, knew two varieties. It appears, therefore, that the distribution of sweet corn into cultivation made little progress prior to the last half of the nineteenth century, green field corn having largely occupied its place prior to that period.

Sweet corn is preeminently a garden vegetable, although the large kinds are sometimes grown for silage or stover. As a garden vegetable, it is used when it has reached the "roasting ear" stage, the kernel then being well filled and plump but soft, and "in the milk." The kernel is the only part used for human food. When sweet corn is used as a fresh vegetable, it is often cooked and served on the cob. Dried sweet corn, though never an important article of commerce, was formerly much used, especially by the rural population. It is gradually being generally abandoned for canned corn, for other cereal preparations or for other vegetables, but recently desiccated corn has been put upon the market and is finding sale in certain districts, particularly in the South and in mining and lumber camps. It is practically unknown outside North America.

In the last quarter of the last century, canned sweet corn came to be an important article of domestic commerce in the United States and Canada. The total pack for the United States and Canada for the year 1898 was 4,398,563 cases, each containing two dozen two-pound tins. The following statement shows the number of cases packed for the United States for the five-year period from 1907 to 1911.

1907	6,653,744
1908	6,779,000
1909	5,787,000
1910	10,063,000
1911	14,301,000

Comparatively little of this corn was sent abroad, most of it being consumed in the States, Canada, and Alaska. In 1911 Iowa took first rank in the output of canned corn with a pack of 2,774,000 cases, which was nearly 20 per cent of the total output of the United States for that year. Illinois, New York, Maryland, Maine, Ohio, and Indiana followed in the order named. These seven states packed about 88 per cent of the total output of this country in 1911. These figures are the best obtainable and give a general idea of the progress and distribution of the corn-canning industry. Maine produces as good canned corn as is put on the market and grows the crop largely in localities having too short a season to mature the seed.

Sweet corn is commonly grown for canneries under contract, the canning company supplying the seed and guaranteeing it to be good and true to name, while the farmer agrees to grow a certain specified acreage and deliver the whole crop to the cannery at a stipulated price. In Iowa the price now paid the grower is about \$7 per ton of good ears. A yield of three to four tons to the acre is considered good. The ears are snapped from the stalks with the husks on and hauled in deep wagon-boxes to the canneries. The stalks, when preserved either as ensilage or as stover, make excellent fodder. The overripe and inferior ears, being unmarketable, are left on the stalks and thereby materially increase their value as a stock food. The stover keeps best in loose shocks, as it is liable to mold when closely packed in large stacks or bays.

As a field crop, sweet corn is grown most extensively

on medium heavy loams that are well supplied with humus or organic matter. It luxuriates in rich warm soils. The crop rotation should be planned so as to use the coarse manures with the corn, which is a gross feeder. On the more fertile lands of the central corn-belt, nitrogenous manures may not always be used to advantage with corn, but in the eastern and southern states, where the soil has lost more of its original fertility, stable manure may often be used profitably with this crop at the rate of 8 or 10 cords to the acre, or possibly more.

In the northern part of the corn-belt in the central and western states, that is to say north of the Ohio and Missouri rivers, deep fall plowing of corn land is generally favored, but in experiments at the Illinois and Indiana experiment stations, the depth of plowing has had little influence on the crop. In sections of the eastern states, shallow plowing late in spring is favored, especially if the land be in sod. In warmer, drier regions, as in parts of Nebraska and Kansas, listing has been much practised on stubble ground. The listing plow, having a double mold-board, throws the soil into alternate furrows and ridges, the furrows being 8 or 9

1059 Early Marbled sweet corn

inches deeper than the tops of the ridges. The corn is planted in the bottom of the furrow, either by means of a one-horse corn-drill or by a corn-drill attachment to the lister plow, consisting of a subsoil plow through the hollow leg of which the corn is dropped.

Great care should be used to secure seed-corn having high vitality as a precaution against the rotting or weak germination of the seed in the soil, should the season be cold and wet after planting. Select the seed-corns early before any hard frosts have come. At this time the large, early, and well-matured ears can be distinguished from the rest of the crop, as the husks about the early-maturing ears will have started to turn brown. Early maturity is a vital point to consider in selecting seed-corns and this quality should never be sacrificed for the size of late unmaturing ears. In selecting seed for a field crop, seek systematically for stalks having little or no growth of stools and bearing single, large, and early-maturing ears. For garden use, seed from more productive stalks is desirable, even though the ears be smaller. The seed-corns should be dried at once by artificial heat so that the seed may better withstand unfavorable conditions of temperature or moisture. In many localities so-called kiln-dried seed is much in favor.

In the North, sweet corn should be planted as early as can be done without involving great risk of loss from frosts or from rotting of seed in the soil. In New York, field-planting is generally done from May 10 to May 20; in central Minnesota from May 10 to May 30. The ground having been plowed and prepared so as to make a seed-bed of fine, loose soil 3 inches deep, the seed should be planted to a depth of 1 to 3 inches. The drier and looser the soil, the greater should be the depth of planting. In planting small fields, the ground may be marked in check-rows so that the hills planted

at the intersection of the rows will stand about 3 feet 4 inches to 3 feet 6 inches apart each way, and the corn planted by a hand-planter, which each time it is thrust into the ground drops from four to five kernels, which is usually the number desired. Three feet apart is too close to allow the cultivators to work easily. For large fields, the check-row type of planter should be used. These planters drop and cover the seed in hills at uniform distances apart, planting two rows at one trip across the field. Two types of furrow-openers are now used on corn-planters, these are the runner furrow-openers and the disc furrow-openers. The former are less satisfactory on sod land or in fields covered with trash, as the runners will often ride out and leave the seed uncovered. It is better to use the disc furrow-opener on such land, besides opening the furrow better, it also pulverizes the soil about the seed. Field corn is often planted in drills by planters adapted to this purpose, but sweet corn should be in hills so that the surface of the ground may be kept loose and entirely free from weeds.

Till for the purpose of retaining soil-moisture as well as to kill weeds. This requires frequent shallow cultivation, pulverizing the surface of the soil so that it will act as a mulch to retard the evaporation of soil-moisture. Tillage should begin as soon as the planting is done, using the slanting-tooth harrow and the weeder types of implements until the corn is nearly 6 inches high, providing that the weeds are small and the ground is in friable condition. After this time the spring-tooth cultivators or the two-horse cultivators, having preferably three or four shovels on a side, are generally used, depending somewhat upon the kind of soil to be cultivated. This type of two-horse cultivator is preferable to the double-shovel type which was formerly much used. The two-horse revolving disc cultivator is sometimes used in damp, weedy ground. One great objection to this type is that too much earth is thrown toward the corn and the middles between the rows are usually left either untouched or bare of the loose soil which is needed for a mulch. For the later cultivations the two-horse surface cultivator is coming more and more into general use.

Till at intervals of seven to ten days. At first the cultivator may run from 2 inches deep near the plant to 4 inches deep midway between the rows. Each successive cultivation should gradually increase in depth towards the middle between the rows, throw $\frac{1}{2}$ inch or more of earth towards the corn and cover the weeds. At the last cultivation the cultivator may be kept a little farther from the corn. It should leave the soil pulverized to a depth of 2 to 3 inches over the entire field. The earlier cultivation may be deepened, if necessary, to kill weeds, even though some corn roots are severed, but cutting the roots by deep cultivation near the plants late in the season is to be especially avoided. Till the soil until the corn gets so large as to prevent the use of a two-horse cultivator. Occasionally a later cultivation, with a one-horse cultivator, may be necessary if heavy rains leave the surface soil hard and start the weeds. Often catch-crops for late pasturage, cover-crops or crops of winter wheat or rye are sown in the cornfield and cultivated in with the last cultivation. The seed is covered deeply by cultivating it in because the weather is apt to be dry at this period. The lower part of the furrow-slice is thus left compact, furnishing a compact seed-bed, in which small grains delight.

The cultivation of sweet corn in the garden should follow the general lines indicated for field culture, but stable manure and commercial fertilizers may be used more liberally. Except on very fertile soils, it is well to put a small amount of a complete commercial fertilizer in each hill and mix it well with the soil before planting the corn. A fertilizer which has a large amount of nitrogen in quickly available form should be chosen

for this purpose. Dwarf early-maturing varieties may be planted, for early use, as soon as the ground is sufficiently dry and warm. A little later, when the ground is warmer, the second-early main crop and late varieties may be planted. Later successional plantings insure a supply of green corn till frost kills the plants.

Corn is not grown commercially as a forcing crop. Attempts to force it in winter have not given encouraging results, but it may be successfully forced in spring, following any of the crops of vegetables which are grown under glass, providing the houses are piped so as to maintain the minimum night temperature at 65° F. Provide good drainage. Give a liberal application of stable manure and thoroughly mix it with the soil. In the latitude of New York the planting may be made as early as the first of March. As soon as the first leaf has unfolded, the temperature may be allowed to run high in the sun, if the air is kept moist by wetting the floors and walls. The glass need not be shaded. Keep night temperature close to 65° F., not lower and not much higher. After the silk appears, jar the stalks every two or three days, when the atmosphere is dry, and thus insure abundant pollination. Early maturing varieties, like Cory, give edible corn in about sixty days when thus treated. Corn may be forced in the same house with tomatoes, eggplant, and other vegetables which require similar range of temperature.

Varities of sweet corn.

Some of the desirable varieties for the garden, the market, and for canning are listed below. These varieties are named to show the range of variation and to indicate the leading groups or types, rather than to recommend these particular kinds. New varieties are continually supplanting the old.

For the home garden—Extra-early Golden Bantam, an extra-early sort, has recently become very popular, on account of its productiveness, good flavor, and desirable size for table use, and because the kernels separate very easily from the cob, many plant it in succession so as to cover the entire season with this variety alone. Peep o' Day and Minnesota are other good extra-early varieties. Second-early Early Crosby, Early Evergreen. Medium or standard season Hickox Improved, Stowell Evergreen, White Evergreen. Late Black Mexican, Country Gentleman.

For market—Extra-early Cory (red cob), White Cob Cory, and Extra-early Adams, which, though not a sweet corn, is largely grown for early use. This last-named variety is recommended in the South because of its comparative freedom from the attacks of the ear worm. Second-early Shaker, Crosby, Early Champion; Early Adams also is extensively grown for market, though not a true sugar corn. Midseason and Late. Stowell Evergreen, Country Gentleman, Late Mammoth, Egyptian.

For canning—Stowell Evergreen is the standard variety for canning factories everywhere. Country Gentleman is also grown to a considerable extent for fancy canned corn. Other varieties that are used for canning include Early Evergreen, White Evergreen, Egyptian, Potter Excelsior, and Hickox Improved.

Diseases and pests of sweet corn

The most widespread and destructive disease of corn in the United States is the smut produced by the parasitic smut-fungus, *Ustilago Zeæ*. The sorghum-head smut, *Ustilago Reihana*, also attacks maize. Smut causes most injury when it attacks the ears. The grains are transformed into a mass of dark-colored smut spores, and become exceedingly swollen and distorted out of all semblance to their normal outlines. Infection may take place at any growing point of the plant from early till late in the season, hence treatment of seed corn by fungicides is of no value as a

remedy for corn smut. The destruction of smutted parts of the plants, and taking especial care that the smut does not become mixed with manure which is used for the corn crop, are measures which may be expected to lessen the prevalence of the disease. No remedy is known.

Another disease of sweet corn in the United States is the bacterial blight caused by *Pseudomonas Stewartii*. It has been found in New York, New Jersey, and Michi-

1000 Golden Bantam sweet corn

gan, but thus far has been seriously destructive only on Long Island on early dwarf varieties of sweet corn. It is characterized by wilting and complete drying of the whole plant, as if affected by drought, except that the leaves do not roll up. The fibro-vascular bundles become distinctly yellow, and are very noticeable when the stalk is cut open. The disease attacks the plant at any period of growth, but is most destructive about the time the silk appears. No remedy is known.

These two diseases are of the most economic importance in the United States. Two others of somewhat minor importance which deserve mention are rust and leaf blight. The leaf-blight fungus causes round, brownish, dead spots on the foliage. The maize rust, *Puccinia sorghii*, is found principally where rainfall is abundant. It is rather common throughout the corn-belt. The fungus is similar in nature to that which causes the rust of small grains. It cannot be controlled economically.

Over 2000 species of insects are known to be injurious to corn, either to some part of the growing plant or to the stored product. The corn-ear worm, known South as the cotton-boll worm, is especially injurious to sweet corn. It burrows in tender green corn, ruining the ear for either canning or market purposes. It is known to do serious damage as far north as western New York and central Iowa. Recent experiments in dust-spraying promise well. Spraying is done weekly, beginning when silks appear, using equal weight powdered lead arsenate and lime. Shallow fall plowing to kill pupae is a partial remedy. Wire-worms, northern corn-root worms, white grubs, and certain other grass insects attack corn plants. One of the best preventive measures is to plan the rotation so that corn does not immediately follow any cereal or grass crop.

Pop-corn (*Zea everta*, Sturt.) Fig 1058 Pop-corn is characterized by the excessive proportion of the corneous endosperm and the small size of the kernel and ear. The kernel split laterally shows the chit and corneous matter enveloping, and in some cases a fine, starchy line. The small size of the kernel and the property of popping makes identification certain. This species-group extends throughout North and South America and has claims for prehistoric culture.

The preparation of the ground recommended for sweet corn holds for pop-corn. Tillage should be started early in the spring to conserve as much of the soil-moisture as possible, thus protecting the crop against possible injury from drought later in the season.

On good clean ground the pop-corn is very often drilled, dropping the kernels 6 to 8 inches apart in the row. More often, however, it is check-rowed with the rows 3 feet 4 inches apart and from four to six kernels in the hill. The ordinary corn-planters are

used with special plates for pop-corn planting. For dwarf varieties of pop-corn such as the Tom Thumb, when planted in home gardens and tilled by hand, the hills may be as near together as 2½ feet.

Pop-corn is much slower in germinating than field corn and the plant is not so vigorous a grower. Shallow cultivation is recommended just as for other corns, especially for the later cultivations, since deep cultivating cuts too many roots.

Pop-corn is planted earlier than field corn. It should be planted deep enough to reach the moist soil, usually 1½ to 2 inches, but in a dry season it may need to go 3 inches deep.

The White Rice, which is grown more extensively for market than any other variety, mixes with field corns readily. The resulting hybrid types have larger ears and larger, smoother kernels and give heavier yields than do the pure pop-corns. These hybrid types

were for a time quite in favor with the commercial growers because of their greater yield. Now they are being discriminated against by the buyers because of their inferior popping qualities, and the tendency among the growers is to get back to the pure types, even though they give smaller yields.

Pop-corn matures earlier than field corn. For this reason in many sections of the country it is regarded as a surer crop. In the region about Odebolt, Iowa, where pop-corn is grown more extensively than in any other district in the world, harvesting sometimes begins as early as the middle of September, but more often it is delayed till the first of October or later to let the corn dry on the stalk. There are two methods of harvesting. One is to snap the corn and pile it in the crib, then shuck it during the winter. However, this is not generally practised because it makes more work and takes more crib room. The other and common method is to pick and shuck the ears from the standing stalks directly into the wagon, the same as with field corn.

On account of the heavy expense of hand-picking, some are now using the harvesting apparatus called the corn-picker and husker. Opinions differ as to the economy of using this picker. The rows should be long and the corn should stand up well to justify its use. For hand-picking the price per bushel usually ranges from 10 to 12 cents. A good hand can pick about forty bushels in a ten-hour day if the corn is good.

It is very important that the pop-corn be thoroughly dried. After it is picked it is placed in the crib which usually has ventilators through the center. These extend along the middle of the floor, are slatted to admit air, and are about 1½ feet wide by 2½ feet high. The corn is usually left in the crib through the winter season. Sometimes it is marketed on the cob. Formerly it was a common practice to ship it on the cob in sacks, but now it is generally held over winter in the crib, shelled the next spring and shipped in two-bushel sacks. It is usually marketed from June to September.

It is ready to use for popping just as soon as it is dry enough. It can be popped immediately after it is gathered if the season is dry and the corn is allowed to dry sufficiently in the field. Usually it is left on the stalk till it is so dry that it shells some when thrown into the wagon.

Various companies make a practice of contracting for a certain number of acres of pop-corn at a certain price in the spring of the year, so that the farmer may know just what price he will get for his corn in the fall or at some stated time at which it is to be delivered. The contracting firm does not as a rule supply the seed but does specify the grade of the corn and objects to the coarse hybrid types.

The prices for corn in the ear are ruling from 1 cent to 2 cents a pound; for shelled corn from 1½ cents

to 3 cents a pound. Pop-corn is considered a very profitable crop and less likely to fail than field corn because it matures earlier. A good return to the acre would be twenty to twenty-five bushels of ear corn, worth from \$20 to \$50, averaging about \$30. Field corn in the same region averages about fifty-five bushels, worth usually from \$20 to \$25 an acre.

Varieties.

In 1899, Sturtevant described twenty-five varieties of pop-corn. Tracy, in his "American Varieties of Vegetables for the Years 1901 and 1902," enumerated fifty-four varieties. The rice pop-corns are generally used for commercial plantings. White Rice is now the leading commercial variety of pop-corn, since it gives the greatest yield and also brings the highest price on the market. In the noted region about Odebolt, Iowa, this variety is grown almost exclusively. The following list includes the leading varieties:

White Rice—Ear 4 to 8 inches long. This vigorous, late variety is widely cultivated. With other rice corns, it is characterized by deep, tapering, beaked kernels.

White Pearl—Ear 4 to 8 inches long. Matures somewhat earlier than Rice and later than Dwarf Golden. Kernels round and silvery white.

Dwarf Golden—Ear 1 to 3 inches long. An early-maturing sort, with broad, golden yellow kernels. A favorite garden variety.

Golden Tom Thumb—Ear 2 to 2½ inches long. An ornamental variety for home gardens. The stalks only grow to a height of about 20 inches. The kernels are bright and golden yellow.

Other kinds of pop-corn worthy of mention are Golden Queen, Silver Lace, and California Yellow.

S. A. BEACH.

CORN COCKLE: *Lychnis Githago*.

CORNEL, CORNELIAN CHERRY: *Cornus mas*.

CORNFLOWER: *Centaurea Cyanus*.

CORN POPPY of Europe is the weed of the grain fields from which some of the garden poppies have been raised, *Papaver Rhæas*.

CORN-SALAD (*Valerianella olitoria*, Poll.). *Valerianaceæ*. A spring and summer salad and pot-herb plant.

Annual mature plant 4-6 in. tall, forking; radical lvs. tufted (the parts used), oblong and obtuse, narrowed at the base, entire or few-toothed, st-lvs narrow, often clasping fls very small, in small terminal cymes, whitish fr (seed) nearly globular, gray, not crested. S. Eu. *V. cricoides*, Desv. of S. Eu and N. Afr. is sometimes cult as salad lvs longer and lighter-colored fr (seed) flattened, pale brown, crested. Known also as lamb's lettuce, fetticus, and vetticost.

Sow the seed of corn-salad in early spring, at the time of the first sowing of lettuce, and make successional plantings as often as desired. For very early salads the seeds are planted in September, and the young plants are covered with a light mulch and wintered exactly as spinach is often managed. Sow in drills a foot or 18 inches apart and cover lightly. Work the ground thoroughly, and give an abundance of water. The leaves may be blanched, but are usually eaten green. It matures in sixty to sixty-five days during good spring weather. Only one variety is offered by most American seedsmen, but several sorts are known to European gardeners. It is sometimes used for a pot-herb, being served like spinach, but is chiefly valuable for salads. It is rather tasteless, and is not so popular as cress or lettuce on that account, but persons who prefer a very mild salad, or who would rather taste the salad dressing, will doubtless fancy corn-salad.

It is best served in mixture with other herbs, as lettuce, water-cress or white mustard. It is easy to grow. There are no special enemies.

F. A. WAUGH.

CORNUS (ancient Latin name of *Cornus mas*). *Cornaceæ*. Dogwood. Woody plants (one or two infrequently cultivated herbs), grown for their attractive flowers and fruits, some species also for the winter effect of their brightly colored branches.

Shrubs or trees, rarely herbs. lvs. opposite, rarely alternate or whorled, deciduous, entire; fls small, 4-merous, usually white, in terminal cymes (Fig. 1061) or heads; calyx-teeth minute, petals valvate, style simple, filiform or cylindric; ovary inferior, 2-celled; fr a drupe with a 2-celled stone—About 40 species in the temperate regions of the northern hemisphere and one in Peru. Monograph by Wangerin in Engler, *Pflanzenreich*, hft. 41, pp. 43-92, quoted below as Wang.

The dogwoods are hardly ornamental shrubs with handsome foliage, often assuming a brilliant fall coloring, and with attractive flowers and fruits. Nearly all are very desirable for planting in shrubberies. They grow nearly as well in shady places under large trees as in sunny exposed situations, and thrive in almost any soil. One of the most beautiful in bloom is *C. florida*, with extremely showy flowers in spring. *C. racemosa* is one of the best for shrubberies, blooming profusely in June. The red-branched species, as *C. alba*, *C. amomum*, *C. Baileyi*, *C. sanguinea* are very attractive in winter. Propagated by seeds, which usually do not germinate until the second year. The species with willow-like soft wood, as *C. alba* and its allies, grow readily from cuttings of mature wood, while the others are sometimes increased by layers. They are often grown in this country from nearly ripened cuttings.

1061 *Cornus* winter shoots, showing the opposite buds and terminal flower-clusters—*Cornus Baileyi*.

1062. Cutting of *Cornus*.

(Fig 1062), handled in frames in summer. Horticultural varieties of other species are mostly budded in summer on seedlings of the type, or grafted in early spring in the propagating-house.

Various species of *Cornus* have many interesting uses. Our native *C. florida*, which in flower is the showiest

1063. *Cornus alternifolia*.

member of the genus, furnishes a useful substitute for quinine. The bark of all parts contains the same substances found in cinchona, but in different proportions. It is inferior in effectiveness and more difficult to secure in large quantities. It is sometimes possible to ward off fevers by merely chewing the twigs. The powdered bark makes a good tooth-powder, and the fresh twigs can be used for the same purpose. The bark mixed with sulfate of iron makes a good black ink. The bark of the roots yields a scarlet dye. The wood, being hard, heavy, and close-grained, is good for tool handles. The cornelian cherry has pulpy fruits resembling cornelian in color and about the size and shape of olives, for which they can be substituted. The ripe fruits are soft and rather sweet. The name dogwood comes from the fact that a decoction of the bark of *C. sanguinea* was used in England to wash mangy dogs. The small red berries of *C. suecica* (not in the trade) are eaten by the Esquimaux.

A. Plants, shrubs or trees.

B. Fls. in cymes or panicles without involucre. (*Svida*.)

c. Foliage alternate: fls. in umbel-like cymes, cream-colored.

1. *alternifolia*, Linn. (*Svida alternifolia*, Small).

Fig 1063. Shrub or small tree, to 25 ft.: lvs. slender-

petioled, elliptic or ovate, usually cuneate, acuminate, nearly glabrous above, pale or whitish beneath and appressed pubescent, 3-5 in long: cymes $1\frac{1}{2}$ -2 $\frac{1}{2}$ in. wide. fr. dark blue, globular, $\frac{1}{8}$ in. across, on red peduncles May, June. New Bruns. to Ga and Ala, west to Minn. S S 5.216. Em 463. Wang 51—Of very distinct habit, the branches being arranged in irregular whorls, forming flat, horizontally spreading tiers, as in the picture. A variety which shows this habit more distinctly than the common form is var *umbraculifera*, Dieck. Var *argentea*, Temple & Beard, is a form with white-marked foliage. Var *ochroleuca*, Rehd., has yellowish frs.

2 *controversa*, Hemsl. (*C. brachypoda*, Koch, not C A Mey. *C. macrophylla*, Koehne, not Wall.). Tree, to 60 ft., lvs. slender-petioled, broadly ovate or elliptic-ovate, usually rounded at the base, abruptly acuminate, whitish and slightly hairy beneath, 3-5 in long cymes 3-4 in wide. fr. bluish black. June. Himalayas to Japan. B M 8261. S I F. 1 77. R B 30 63—With the habit of the former, but of more vigorous growth, not hardy N. Var *variegata*, Rehd. (*C. macrophylla variegata*, Barbier). Lvs. edged white. Gng 3 67; 16:291 J H. III. 28.129, 47.147.

cc Foliage opposite.

d Fr. white or blue.

E. The fls. in umbel-like flat cymes.

F. Color of fr. white or bluish white

g. Under side of lvs. with appressed hairs, glaucous.

3. *stolonifera*, Michx. (*C. alba*, Wang.) RED-OSIER Dogwood. Fig. 1064. Shrub, to 8 ft., usually with dark blood-red branches and prostrate st., stoloniferous: lvs. obtuse at the base, ovate or oblong-lanceolate, acuminate, 2-5 in long cymes dense, 1-2 in wide, disk usually red. fr. white, globose, with the stone broader than high. May, June. From Brit N Amer to Ill and Calif. G C II 8:679—Habit bush-like, as in Fig 1064. Var *flaviramea*, Spaeth. Branches yellow. There are also varieties with variegated lvs. Var. *nitida*, Schneid. (*C. alba* var *nitida*, Koehne). Branches green lvs. glossy above. Var *coloradensis*, Schneid. (*C. alba* var *C. coloradensis*, Koehne). Branches brownish red, strongly recurved fr. bluish white. Colo. Var. *pendula*, Ell. Low shrub with pendulous branches.

4 *alba*, Linn. (*C. latifolia*, Mill.) Shrub, to 10 ft., with usually erect st. and bright blood-red branches, mostly with glaucous bloom when young. lvs. obtuse at the base, ovate or elliptic, somewhat bullate or rugose above, acute, $1\frac{1}{2}$ -3 $\frac{1}{2}$ in long cymes dense, small; disk

1064. *Cornus stolonifera*.

yellow: fr. ovoid, bluish white, sometimes whitish; stone usually higher than broad, flat. Siberia, N. China. Var. *argenteo-marginata*, Rehd. (*C. alba* var. *elephantissima variegata*, Hort.). Lvs. edged white. Var. *Spaethii*, Spaeth. Lvs. broadly edged yellow. Gn 64, p. 378; 69, p. 343. Var. *Gouachaultii*, Rehd. (*C. sibirica* *Gouachaultii*, Carr.) Lvs. variegated with yellowish white and pink. Var. *sibirica*, Lodd. Branches bright coral-red. C. L. A. 21, No 4-29. Gn 54-249. Var. *Kesselringii*, Rehd. (*C. sibirica* var. *Kesselringii*, Wolf). Branches very dark purple, nearly purplish black. There are also some other varieties with variegated lvs.

GG Under side of lvs. with woolly hairs

5. *Baileyi*, Coult. & Evans. Fig. 1065. Erect shrub, with reddish branches: lvs. ovate to lanceolate, acute or acuminate, white beneath, with woolly and with appressed hairs, 2-5 in. long; fls. in small rather compact woolly cymes: stone of the white fr. much broader than high, compressed and flat-topped. Pa to Minn and Wyo. G F 3 465 (adapted in Fig. 1065).—A very handsome species of upright growth, with dark red branches, blooming nearly all summer, and of a distinct grayish hue due to the slightly upward curled lvs. The full color of foliage and winter color of twigs are unequaled. Well adapted for sandy soil. Early observed on dunes, S. Haven, Mich., but brought to the attention of systematists from specimens collected in extreme N. E. Minn. in 1886.

6. *asperifolia*, Michx. Shrub, 8-15 ft. branches reddish brown. lvs. slender-petioled, elliptic to ovate, acuminate, rough above, pale and woolly-pubescent beneath, 1-4 in. long; cymes rather loose, rough-pubescent fr. globose, white, stone nearly globose, slightly furrowed. Ont. to Fla., west to Texas. G F 10 105.

FF. Color of fr. blue or bluish, sometimes partly white or greenish white

G Lvs. densely woolly-pubescent beneath.

7. *rugosa*, Lam. (*C. crenata*, L'Her.) Shrub, 3-10 ft. the young branches green, blotched purple, older ones purplish. lvs. orbicular or broadly ovate, acute or short-acuminate, slightly pubescent above, pale and densely pubescent beneath, 2-6 in. long; cymes rather dense fr. light blue or greenish white. May, June. Em 464. Wang 61.—Bark has medicinal properties.

GG Lvs. pubescent only on the veins or nearly glabrous beneath

8. *Amomum*, Mill. (*C. sericea*, Linn. *C. caryoclea*, Lam.) Shrub, 3-10 ft., with purple branches: lvs. usually rounded at the base, elliptic-ovate or elliptic, dark green and nearly glabrous above, pale green beneath, usually with brownish hairs on the veins, 2-4 in. long; cyme compact: fr. blue or sometimes partly white. June, July. Mass. to Ga., west to N. Y. and Tenn. Em 466.—Bark has medicinal properties. Var. *variegata*, Hort. Lvs. variegated with yellowish white.

9. *obliqua*, Raf. (*C. Párpura*, Koehne). Shrub, similar to the preceding, usually broader and more loosely branched. branches purple to yellowish red: lvs. usually narrowed at the base, elliptic-ovate to oblong, dark green and glabrous above, glaucous beneath, on the veins usually with whitish or brownish hairs, 2-3½ in. long; cyme compact: fr. blue or partly white. May, June in the S., July in the N. Que. to Minn. and Kans. south to Pa., Ill. and Mo. S. T. S. 1:39. R. H. 1888:444 (as *C. stolonifera*)

EE The fls. in broad panicles: fr. white or pale blue.

10. *racemosa*, Lam. (*C. candidissima*, Marsh., not Mill. *C. paniculata*, L'Her. *C. oblongata*, Hort.) Shrub 6-15 ft., with gray branches: lvs. cuneate, ovate-lanceolate or lanceolate, acuminate, appressed-pubes-

cent. or nearly smooth, whitish beneath, 1½-4 in. long; petals white, lanceolate: fr. white. May, June. Maine to N. C., west to Minn., and Neb. Wang. 58 (as *C. femina*).—Flower-flowering, very handsome when in bloom, and with its white frs. on red peduncles in fall.

11. *femina*, Mill. (*C. stricta*, Lam. *C. fastigiata*, Michx.). Shrub, to 15 ft., with purplish branches: lvs. ovate or ovate-lanceolate, sparingly and minutely appressed-pubescent, green on both sides, 1½-3 in. long; petals white, ovate-lanceolate fr. pale blue. April, May. Va. to Ga. and Fla.—Tender N. Closely allied to the former, and perhaps only variety.

DD. Fr. black (green in a var. of No. 16).

E Fls. in broad panicles.

12. *brachypoda*, C. A. Mey. (*C. ignota*, Shiras. *C. macrophylla*, Hemsl., not Wall. *C. Thelycrinus*, Lebas. *C. Thelycrina*, Hort.) Shrub or small tree branches yellowish or reddish brown. lvs. slender-petioled, elliptic-ovate to elliptic-oblong, abruptly acuminate, rounded or broadly cuneate at the base, dark green

1065. *Cornus Baileyi* (Spray $\times \frac{1}{3}$)

above and nearly glabrous, glaucous beneath and sparingly appressed hairy, with 6-8 pairs of veins, 2½-6 in. long; panicle rather loose, 3-6 in. across, style below the stigma abruptly enlarged into a disk fr. bluish black. Aug. Japan, Cent. China S. T. S. 1 41. S. I. F. 1:77. R. H. 1875, p. 395. F. 1876, p. 123.—One of the handsomest dogwoods on account of its large lvs. and large panicles of white fls.; not quite hardy N.

13. *Wilsoniana*, Wang. Tree, to 40 ft. branches brownish lvs. elliptic, narrowed at the base, acuminate, above sparingly, beneath more densely appressed-pubescent, green or glaucescent beneath, with 3-4 pairs of veins, 2-4 in. long; panicle 2½-4 in. across, style cylindric, scarcely enlarged below the stigma. fr. bluish black. Cent. China. Wang 66.—Very handsome, similar to the preceding, but harder. Page 3567.

EE Fls. in umbel-like cymes: lvs. green beneath.

F Lvs. with appressed hairs beneath.

14. *paucinervis*, Hance (*C. quinquevirus*, Franch.). Shrub 4-6 ft.: young branches quadrangular, usually reddish brown: lvs. short-petioled, of firm texture, oblong-obovate to elliptic-lanceolate, acute, cuneate at the base; dark green above, paler beneath with appressed hairs, with 3-4 pairs of veins, 1½-3½ in. long; cymes long peduncled; style thickened below the apex:

fr. black. June. Cent. China. G C. III. 50:95. G.M. 54:593 Gt. 1896, p. 285. Wang. 72.—Handsome shrub nearly half-evergreen, but not hardy N. P. 3567

15. *pumila*, Koehne (*C. mds* var. *nana*, Dipp). Dense shrub, to 6 ft. branchlets terete, glabrous. lvs. crowded, broadly ovate to oblong-ovate, short-acuminate, abruptly contracted at the base, dark green and nearly glabrous above, paler and appressed-hairy beneath, $1\frac{1}{2}$ – $3\frac{1}{2}$ in long cymes long-peduncled, 2–3 in broad; style thickened below the apex fr. black July. Origin unknown — Handsome with its dense dark green foliage, particularly when dotted with the white fl.-clusters; has proved hardy at the Arnold Arboretum.

FF. Lvs. with woolly hairs beneath; branches purple

16 *sanguinea*, Linn Shrub, to 12 ft., with purple or dark blood-red branches lvs broad-elliptic or ovate, rounded or narrowed at the base, usually pubescent on both sides, pale green beneath, $1\frac{1}{2}$ – $3\frac{1}{2}$ in long fls greenish white, in dense cymes fr. black May, June Eu, Orient Var. *variegata*, Dipp Lvs variegated with yellowish white. G W 9, p. 247 Var. *viridissima*, Dieck With green branches and green fr.

BB. Fls. in dense heads or umbels, with an involucre.

c Color of fls yellow; involucre yellowish, not exceeding the fls (*Macrocarpum*)

17 *mas*, Linn (*C. midsula*, Hort) CORNELIAN CHERRY Fig 1066 Shrub or small tree, to 20 ft lvs ovate or elliptic, acute, appressed-pubescent, and green on both sides, $1\frac{1}{2}$ –4 in long; fls in sessile opposite umbels, before the lvs; pedicels not exceeding the involucre fr. oblong, scarlet, $\frac{3}{4}$ in long; edible March, April S Eu, Orient Mn 5 192 G C II 9:399. H W 3, p. 61 — Handsome shrub of dense growth with glossy foliage, very attractive in early spring with its yellow fls., and again in fall with its shining scarlet frs. CORRÊA (after Jose Francisco Correa de Serra, Portuguese author, 1750-1823) *Rutaceæ* Tender Australian shrubs, rarely cultivated under glass.

1070.
Coronilla varia.
($\times \frac{1}{2}$)

Shrubs, usually with dense, minute, stellate hairs lvs. opposite, stalked, entire, and with transparent dots: fls. rather large, showy, red, white yellow or green, usually pendulous, solitary or 2 or 3 together; petals and sepals each 4; stamens 8; carpels 4, nearly distinct. —Seven species. *C. speciosa* is probably the

best and most variable species. It is a native of barren sandy plains, and belongs to the large and much-neglected class of Australian shrubs

speciosa, Ait (*C. cardinalis*, F. Muell). Tender shrub, 2-3 ft high: branches slender, brown, opposite, covered with minute rusty hairs: lvs opposite, about 1 in long, elliptic, about a fourth as wide as long, wrinkled, dark green above, whitish below, margin entire, recurved: peduncles opposite, axillary, longer than the lvs, 1-fld, with a pair of leafy bracts, fls $\frac{1}{2}$ in. long, pendent, tubular, bright scarlet, with a very short limb of 4 spreading, greenish yellow segments, calyx small, cup-shaped, with 4 almost obsolete teeth; stamens 8, exerted, about $\frac{1}{4}$ in. B M 4912 —There are several varieties

1071 *Correa alba*.
($\times \frac{1}{2}$)

alba, Andr Fig 1071 A compact and much-branched shrub, 3-4 ft, the branches rusty-tomentose: lvs variable, orbicular to obovate or elliptic, very blunt, $\frac{1}{2}$ –1 in long fls white or pink, 2 or 3 together, not over $\frac{1}{2}$ in long, and not so showy as preceding B.R. 515. —Offered in S. Calif.

WILHELM MILLER
N TAYLOR †

CORTADERIA (from *Cortadero*, the native name in Argentina). *Graminææ* PAMPAS-GRASS. Large reed-like perennials with numerous long, narrow blades and a large striking plume-like inflorescence. Species six, South America. See *Gynnerium*.

argentea, Stapf (*Gynnerium argenteum*, Nees). PAMPAS-GRASS. Culms numerous, in large thick tussocks, 3-10 ft high, excluding the panicle. lvs. mostly basal, the upper sheaths gradually elongated, blades firm, long and slender, very scabrous on the margins, $\frac{1}{2}$ – $\frac{1}{4}$ in. wide, tapering to a slender point. panicle large, compact, 1-3 ft., silvery white or in cult. varieties tinged with purple, diacious; spikelets 2-3-fld., the pistillate silky with long hairs, the staminate naked; glumes white and papery, long and slender; lemmas bearing a long slender awn A.G. 14:323. Lambeyi folius variegatus*, Hort. G.C. III. 25:335, appears to be a form of *C. argentea*.

Quilla, Stapf (*Gynnerium Quilla*, Nees. *G. jubatum*, Lem. *G. arcuato-nebulosum*, Hort.). Differs from pampas-grass in the rather laxer, more graceful plume, with longer, more flexuous, nodding branches, somewhat smaller spikelets, and more delicate glumes, and in the longer, very slender stamodes of the pistillate fls.: plume lavender-colored, 1-2 ft. long, the spikelets 3-5-fld. B M 7607. G.C. III 26:102. Gn 15, p 179; 55, p. 93. R. H. 1885, p 200; 1899:52, 53. —Grows in a dense tuft; perennial, but with biennial culms; the plant has been killed by a temperature of 3° F. Intro by Lemoine, of

Nancy, France. Probable synonyms are *Gyneryum roseum Rendleri* and *G. argenteum carminatum Rendleri*. F.S. 20:2075. Not so well known as *C. argentea*.

A. S. Hitchcock.

CORTUSA (named by the herbalist Matthioli after his friend Cortusus, professor of botany at Padua). *Primulaceae*. Scapose, perennial, pubescent herbs with long-stalked, cordate-ovate lvs and purple umbellate fls. *C. Matthioli*, Linn., from the Swiss Alps, has long been a choice and delicate but not very popular plant, suited for shady parts of the rockery. It was long considered the only species of the genus. It is an herbaceous perennial, about 6 in high, pubescent, rhizomatous, with a few long-stalked, cordate, 7-9-lobed, dentate lvs, and a slender scape bearing an umbel of about 7 small, rosy purple, drooping fls, which appear in early spring. B.M. 987 J.B.C. 10 956. It has some resemblance to *Primula cortusoides*. The genus has possibly 4 species, and is distinguished from *Primula* and *Androsace* by its stamens attached to the base of the corolla, and its long-acuminate anthers. Its culture is similar to that of the hardy primulas, but it needs winter protection in the northern states. Prop. by division of the roots.

CORYANTHES (Greek, *korys*, helmet, and *anthos*, flower, referring to the shape of the lip) *Orchidaceae*. Epiphytic orchids requiring warmhouse conditions.

Pseudobulbous lvs plicate, lanceolate fls in racemes; sepals spreading, dilated, flexuose, conduplicate, lateral ones largest, distinct at the base, petals small, erect; lip large, tridentate, basal portion forming a hood, continued into the column, distal portion bucket- or pouch-like; column pointing downward, elongated, terete, bicornute at the base, apex recurved, pollinia 2, compressed, caudicle linear, arcuate. The bucket part of the lip is provided with a spout-like structure, by means of which the bucket overflows when about half full of a secretion which drops from a pair of glands near the base of the column. The fls of the species known are not lasting, the sepals being of such delicate texture that although at first they fully expand, they soon collapse and become unsightly. Although much interest attaches to the species of *Coryanthes*, the genus is not generally cult, since the fls last too short a time and are not particularly brilliant. This complex genus, which is closely related to *Stanhopea*, is represented by several interesting species inhabiting Trop. Amer. For cult see *Stanhopea*.

macrantha, Hook. Fls. few, in drooping racemes; ground-color rich yellow dotted with red; hood and part of bucket brownish red. Caracas P.M. 5.31. B.R. 1841. B.M. 7692 G.C. III 28 355. O.R. 3 41.

maculata, Hook. Fls. in a drooping raceme; sepals and petals dull, pale yellow, bucket blotched on the inside with dull red. B.M. 3102; 3747. B.R. 1793. F.S. 8.755 (as *C. Albertina*). A.F. 30:325 C.O. 1. Var. **punctata**, Hort., has the petals and sepals bright yellow, speckled with red, the hood yellow, blotched with reddish orange, the pouch pale, speckled and spotted with red. Demerara. *C. Cobbii* is an unsupported form of this.

C. Balfouriana, Hort. Similar in habit to a *stanhopea*, with a long pendulous scape bearing 2 or 3 large and curiously shaped fls. Peru. — *C. leucodonta*, Rolfe. Sepals yellowish green, marked with brownish purple, the petals white, marked with light purple, the lip white with the bucket marbled with light rosy purple. Peru. Lind 7 203. — *C. Mastersiana*, Lehm. Raceme erect, fls 2 or 3, yellowish, tinged and spotted with copper-red. Colombia. G.C. III 29 19. — *C. Sanderi*, Hort. A very large-fl. plant allied to *C. macrantha*. — *C. speciosa*, Hook. Raceme of 2 or 3 fls; sepals and petals pale yellow, lip brown-red, the stalk brownish yellow. Brazil. G.C. III 30 106. B.M. 2755 (as *Gongora*). C.O. 2.

GEORGE V. NASH.†

CORYDALIS (Greek, *lark*, the spur of the flower resembling a lark's spur). *Fumariaceae*. Hardy plants allied to the Dutchman's breeches.

Erect or prostrate herbs, usually perennially rooted,

but often annuals. lvs. lobed and finely dissected in nearly all the species; fls. racemose, often yellow, less frequently blue, purple or rose; petals 4, spurred as in the Dutchman's breeches; stamens 6, in 2 groups. — Ninety species, natives of the north temperate regions. They are all of easy cult. They prefer full sunlight but will grow in half-shade. Prop. by division or seed.

ophiocarpa, 8.

solida, 1.
thalictrofolia, 5.
tomentosa, 12.
Wilsonii, 6.

A. Fls. chiefly purple or rose, sometimes tipped yellow.

B. Plant perennial: root tuberous: st.-lvs. few.

1 **bulbosa**, DC. (*C. solida*, Swartz). Erect, 6 in. high: lvs 3-4, stalked, bipinnately cut, segms. wedge-shaped or oblong; root solid: fls large, purplish. Spring. Eu.

2 **Allenii**, Fedde. A perennial caulescent herb, with glaucescent foliage: lvs usually alternate with finely divided segms, the whole lf. not over 10 in long. fls. showy, rose-colored, pendulous, on a terminal dense-fl. raceme that is usually about the height of the lvs. N. W. N. Amer. — Perhaps not hardy in the northeastern states.

BB Plant annual: root fibrous: st.-lvs many.

3 **glauca**, Pursh. Annual, 1-2 ft. high, very glaucous: lobes of the lvs. mostly spatulate racemes short, panicked at the naked summit of the branches; fls barely ½ in. long, rose or purple with yellow tips, spur short and round caps slender, linear; seeds with minute, transverse wrinkles. Summer. Rocky or sterile ground, Nova Scotia to Rocky Mts., and even Arctic coast, south to Texas. B.M. 179 (as *Fumaria*). — Not advertised for sale, but probably worth cult.

AA Fls. chiefly yellow.

B. Foliage not tomentose.

c. Plant perennial: root tuberous or woody: st.-lvs. few or none.

D The fls. at least 1 in. long.

4 **nobilis**, Pers. Fig 1072 Perennial, erect: lvs. bipinnately cut, segms. wedge-shaped and lobed at the apex: fls white, tipped with yellow, and a dark purple spot; spur 1 in long. Spring. Siberia. B.M. 1953 (as *Fumaria nobilis*). G.C. II. 19:725.

5. **thalictrofolia**, Franch. not Jameson. Rhizome woody, elongated. lvs large, long-petiolate, rigid, but spreading, the pinnae of the finely dissected lvs. petiolulate. fls yellow, in large spreading racemes, which are opposite the lvs; sepals persistent, ovate. — A very showy species from China, the foliage strongly resembling *Thalictrum*.

6. **Wilsonii**, N. E. Br. A glabrous, often glaucescent perennial, with a rosette of radical much-dissected lvs. about 5 in long: fls. in an erect raceme 7 in high, which is usually leafless; corolla deep canary-yellow, about 1 in long, the blunt spur about ½ in. long. G.C. III.

1072. *Corydalis nobilis*.

35:306.—Useful for the Alpine garden and more profuse bloomer than *C. tomentosa*, its nearest relative. China.

DD. The fls. not over $\frac{1}{2}$ in. long.

7. *cheilanthisfolia*, Hemsl. A small low perennial with radical, fern-like, much-dissected, erect lvs about 8 in. long; scape usually taller than the lvs., bearing numerous fls. not over $\frac{1}{2}$ in. long, yellow. China. May.—Suitable for most places in the alpine garden. Probably unknown in U. S. as it is a rare plant in nature.

CC. Plant annual or biennial: root fibrous: st.-lvs. numerous.

D. Height of plants 2 ft. or more.

8. *ophiocarpa*, Hook. f. & Thoms. Root fibrous, the st. 2-3 ft. and branched, lvs. pinnatisect, 4-8 in. long, and glaucous beneath; fls. yellow, in many-fl'd, lax racemes which are opposite the lvs; sepals orbicular, finely toothed and finfricate. Moist valleys of the Himalayas.

DD. Height of plants usually less than 1 ft.

E. Raceme spike-like; fls. almost sessile.

9. *curvisiliqua*, Engelm. Probably a biennial: commonly more robust than *C. aurea*, ascending or erect, 1 ft. high or less, fls. golden yellow, over $\frac{1}{2}$ in. long, in a spike-like raceme; spur as long as the body, commonly ascending caps quadrangular, $1\frac{1}{2}$ in. long; seeds turgid to lens-shaped, with acute margins densely and minutely netted. Woods in Texas.

EE. Raceme not spike-like; fls. pedicellate.

10. *aurea*, Willd. Annual, 6 in high, commonly low and spreading fls. golden yellow, about $\frac{1}{2}$ in. long, on rather slender pedicels in a short raceme, spur barely half the length of the body, somewhat decurved caps. spreading or pendulous, about 1 in. long, seeds 10-12, turgid, obtuse at margin, the shining surface obscurely netted. Rocky banks of Lower Canada and N. New England, northwest to latitude 64°, west to Brit. Col. and Ore, south to Texas, Ariz. and Mex.; not Japan.—The western forms have the spur almost as long as the body of the corolla and pass into

Var. *occidentalis*, Engelm. More erect and tufted, from a stouter and sometimes more enduring root. fls. larger; spur commonly ascending caps thicker, seeds less turgid, acutish at margins. Colo., New Mex., W. Texas, Ariz.

11. *lutea*, DC. Erect or spreading, 6-8 in. high, annual, or forming a tufted stock of several years' duration: lvs. delicate, pale green, much divided; segms. ovate or wedge-shaped, and 2-3-lobed, fls. pale yellow, about $\frac{1}{2}$ in. long, in short racemes; spur short: pod $\frac{1}{4}$ or $\frac{1}{2}$ in. long. Stony places of S. Eu., and runs wild in Eu.

BB. *Foliage tomentose.*

12. *tomentosa*, N. E. Br. A low rock-loving perennial, with a rosette of radical lvs. 4-7 in. long, oblong in outline and tomentose, the tomentum whitish pink, pinnæ finely dissected: racemes erect, 5-7 in. tall; corolla about $\frac{3}{4}$ in. long, light canary-yellow, the spur very blunt and about $\frac{1}{2}$ in. long. China.—A good plant for the rock-garden.

C. angustifolia, DC. is a little-known perennial with bi-ternately divided lvs and flesh-colored fls. = *Fumaria angustifolia*, Bieb. G C III 35 307.—*C. edna*, Schweigg. & Kort (probably a form of *C. tuberosa*, DC.) is somewhat larger than *C. bulbosa*, with pretty fls. varying into purplish and white. Eu.—*C. ochroleuca* Koch. One ft. high, blooming June-Sept. fls. yellow-white, the spur yellow caps. linear petiole winged. Italy.—*C. Scutleri*, Hook., grows 3 ft., and is cult. in some European gardens. W. Amer.

N. TAYLOR.†

CORYLOPSIS (*Corylus* and *opsis*, likeness, in foliage resembling the hazel). *Hamamelidaceae*. Woody plants, grown chiefly for their yellow fragrant flowers appearing in early spring and for the handsome foliage.

Deciduous shrubs, rarely trees: lvs. alternate, strongly veined, dentate: fls. in nodding racemes with large bracts at the base, appearing before the lvs, yellow; calyx-lobes short; petals clawed, 5, stamens 5, alternating with entire or 2-3-parted short stamodes; styles 2, ovary half-superior, rarely entirely superior. fr. a 2-celled, dehiscent, 2-beaked caps., with 2 shining black seeds.—About 12 species in E. Asia and Himalayas.

These are low ornamental shrubs, with slender branches and pale bluish green distinct foliage; all are very attractive in early spring, when covered with numerous nodding spikes of yellow, fragrant flowers. Not hardy north of New York, except in sheltered positions. They grow best in peaty and sandy soil. Propagated by seeds sown in spring, best with slight bottom heat, and by cuttings of half-ripened wood in summer under glass, also by layers, rooting readily in moderately moist, peaty soil.

A. Fls. in many-fl'd racemes.

B. Petals obovate to oblong-obovate.

C. Young branchlets and lvs. beneath pubescent, at least on the veins.

spicata, Sieb. & Zucc. Shrub, to 4 ft. lvs. oblique and rounded or cordate at the base, roundish ovate or obovate, sinuate-dentate, glaucous beneath and pubescent, 2-3 in. long; racemes 7-10-fl'd., 1-2 in. long, their bracts ovate; fls. bright yellow; stamens slightly longer than the obovate petals; calyx hairy. Japan. S Z 19. B M 5458. F S 20 2135. R H 1869, p 230, 1878, p 198; 1907, p. 403. G C II 15 510, III 25 210. Gn 33, p 441. S I F. 2 26.—This species has larger and handsomer foliage and fls. of a deeper yellow, in longer racemes, but *C. pauciflora* flowers more profusely and is somewhat harder.

sinensis, Hemsl. Shrub, 6-15 ft.: lvs. obovate to oblong-obovate, abruptly acuminate, obliquely subcordate or cordate at the base, sinuate-dentulate, pubescent at least on the veins and grayish green beneath, 2-4 in. long; racemes about 2 in. long, their bracts nearly orbicular; petals orbicular-obovate, slightly longer than style and stamens, calyx hairy. Cent. China. G C III 39 18. Var. *glandulifera*, Rehd. & Wilson (*C. glandulifera*, Hemsl.) Young branchlets and petioles with scattered glandular bristles: calyx glabrous. H I. 29.2819.

CC. Young branchlets glabrous, lvs. glabrous or only with a few silky hairs on the veins beneath when young.

Veitchiana, Bean. Shrub, 3-6 ft. lvs. short-petioled, elliptic, abruptly acuminate, subcordate at the base, sinuate-dentulate, glaucous beneath, 3-4 in. long; racemes 1-2 in. long, petals obovate, slightly shorter than the stamens; calyx hairy, nectaries 2-parted. Cent. China. B M. 8349. Gn. 76, p. 184.

BB. Petals with the blade as broad as or broader than long.

Willmotii, Rehd. & Wilson. Shrub, to 12 ft. lvs. oval to obovate, cordate or truncate at the base, sinuate-dentulate, glaucous beneath, 1-3½ in. long; racemes 2-3 in. long, petals suborbicular, calyx glabrous, nectaries 2-parted, slightly shorter than the sepals. Cent. China. G M 55 191 (as *C. multiflora*).

platypetala, Rehd. & Wilson. Shrub, 3-8 ft. young branchlets with scattered glandular bistles lvs. on glandular petioles, ovate or broadly ovate, cordate or subcordate at base, sinuate-dentulate, on both sides sparingly silky-hairy when young, soon glabrous 2-4 in. long, racemes 1-2 in. long, petals hatchet-shaped, ½ in. broad, nectaries emarginate at the apex; stamens and styles much shorter than petals; calyx glabrous. Cent. China. Var. *levis*, Rehd. & Wilson. Branchlets and petioles without any glands. W. China.—Less showy than most other species.

AA. *Fls. in 2-3-fld racemes.*

pauciflora, Sieb & Zucc. Low, much-branched shrub, 2-3 ft. lvs. obliquely cordate, ovate, sinuate-dentate, ciliate, pubescent and glaucous beneath, 1-2 in. long; racemes 2-3-fld., $\frac{1}{2}$ - $\frac{3}{4}$ in. long, fls. light yellow; petals obovate, about as long as stamens and style. Japan, S Z 20. G.F. 5 342. Gt 48.1467. B.M. 7736. G.W. 15, p 101 J H III. 48 381 S I F 2 26.

C. Griffithii, Hemsl. (*C. himalayana*, Hook. not Griff.). Shrub or small tree, to 20 ft. young branchlets and lvs. beneath densely pubescent lvs. subcordate racemes 1-2 $\frac{1}{2}$ in. long, stamens and styles much shorter than the obovate petals. Himalayas B.M. 6779

ALFRED REHDER.

CORYLUS (ancient Greek name). *Betulaceae*. HAZEL, FILBERT COBNUt. Woody plants grown for their handsome rather large foliage and some species for their edible nuts.

Deciduous shrubs, rarely trees: lvs. alternate, stipulate, petioled, serrate and usually more or less pubescent fls. monocious, appearing before the lvs.; staminate in fall, pendulous catkins, formed the previous year, and remaining naked during the winter (Fig 1073), each bract bearing 4 divided stamens; pistillate included in a small, scaly bud with only the red styles protruding (Fig 1074) fr a nut, included or surrounded by a leafy involucre, usually in clusters at the end of short branches.—Fifteen species in N Amer., Eu and Asia, all mentioned below. Monograph by Winkler in Engler, Pflanzenreich, hft 19, pp 44-56 (1904), quoted below as Winkl.

Numerous varieties are cultivated in Europe for their edible nuts. They are also valuable for planting shrubberies, and thrive in almost any soil. The foliage of some species turns bright yellow or red in autumn. Propagated by seeds sown in fall, or stratified and sown in spring, the varieties usually by suckers, or by layers, put down in fall or spring, they will be rooted the following fall. Budding in summer is sometimes practiced for growing standard trees, and grafting in spring in the greenhouse for scarce varieties. They may also be increased by cuttings of mature wood taken off in fall, kept during the winter in sand or moss in a cellar and planted in spring in a warm and sandy soil. Illustrated monograph of the cultivated varieties by Franz Goechke, Die Haselnuss (1887). See, also, bulletin on Nut-

1073. Winter catkins of filbert

culture by the U. S. Dept of Agric. For the culture of the nuts, see articles *Filberts* and *Hazels*.

A. Husk or involucre consisting of 2 distinct bracts (sometimes partly connate).

B. Involucre densely spiny: lvs. nearly glabrous.

1. **ferox**, Wall. Tree, to 30 ft.: young branchlets silky-hairy: lvs. oblong to obovate-oblong, usually rounded at the base, acuminate, doubly serrate, glabrous except on the veins beneath, with 12-14 pairs of veins, 3-5 in. long; involucre tomentose, forming a spiny bur about $1\frac{1}{2}$ in. across, longer than the small nuts. Himalayas. Winkl. 45. Var. *thibetica*, Franch.

(*C. thibetica*, Batal.). Lvs. broadly ovate to obovate: involucre glabrescent. Cent. and W. China. R.H. 1910.204.

BB. Involucre not spiny.

c. Bracts of the involucre deeply divided into linear lobes, much longer than the nut tree.

2. **Colurna**, Linn. Tree, to 70 ft.: petioles $\frac{3}{4}$ -2 in. long, usually glabrescent lvs. deeply cordate, roundish ovate to obovate, slightly lobed and doubly crenate-serrate, at length nearly glabrous above, pubescent beneath, 3-5 in. long fls. 3-10, clustered involucre open at the apex, usually densely beset with glandular hairs nut roundish ovate, $\frac{3}{4}$ in. long. From S Eu to Transcaspiia G.C. III 40 256 (Gn. 31, pp 260-1 ff W 2, p 29 G.W. 14, p 642 Gng 16 163—Ornamental tree, with regular pyramidal head, not quite hardy N. Rarely cult for the fr under name of filbert or of Constantinople or Constantinople nut. Var. *glandulifera*, DC. Petioles and peduncles glandular-setose: lobes of the involucre less acute and more dentate.

3. **chinensis**, Franch. (*C. Colurna* var. *chinensis*, Burk.) Tree, to 120 ft. petioles $\frac{1}{2}$ -1 in. long, pubescent and setulose lvs. ovate to ovate-oblong, cordate and very oblique at the base, glabrous above, pubescent on the veins beneath, doubly serrate, 4-7 in. long; fr 4-6, clustered, involucre constricted above the nuts, with recurved and more or less forked lobes, finely pubescent, not glandular. W. China. Winkl 49 and 50.

cc Bracts of the involucre divided into lanceolate or triangular lobes shrubs

d. The involucre not or only slightly longer than the nut, open or spreading, at the apex

E. Lobes of bracts serrate or dentate.

4. **Avellana**, Linn. Shrub, to 15 ft.: lvs. slightly cordate, roundish oval or broadly obovate, doubly serrate and often slightly lobed, at length nearly glabrous above, pubescent on the veins beneath: involucre shorter than the nut, deeply and irregularly incised, nut roundish ovate, $\frac{1}{2}$ - $\frac{3}{4}$ in. high Eu, N Afr, W Asia. II W 2 16, p 28 Var. *atropurpurea*, Kirchn. (var. *fusco-rubra*, Goechke). Lvs. purple Var. *abrea*, Kirchn. Lvs. yellow Var. *laciniata*, Kirchn. (var. *heterophylla*, Loud.) Lvs. laciniately incised or lobed Var. *pendula*, Goechke. With pendulous branches G.W. 2, p. 13 There are also many varieties cult. for their fr

5. **pontica**, Koch. Shrub lvs. cordate, roundish ovate or broad-oval, doubly serrate, pubescent beneath involucre finely pubescent, with few glandular hairs at the base, campanulate, somewhat longer than the nut, with large spreading lobes nut large, broad-ovate W Asia F.S. 21 2223-4 (as *C. Colurna*)—From this species the cobnuts seem to have originated; also the Spanish nuts are probably mostly cross-breeds between this species and *C. Avellana* or *C. maxima*, or between the two latter species.

EE. Lobes of the bracts entire or sparingly dentate, triangular.

6. **heterophylla**, Fisch. Shrub, to 12 ft.: petioles about $\frac{3}{4}$ in. long: lvs. orbicular-obovate, cordate at the base, nearly truncate at the apex and with a very short point, merely serrate, pubescent on the veins beneath, 2-4 in. long involucre somewhat longer than the nuts, striate, glandular-setose near the base Japan to W. China S I F 1 20—Several varieties apparently not yet in cult occur in China: var. *Crista-Galli*, Burkell, var. *setchuenensis*, Franch., and var. *yunnanensis*, Franch.

1074. Pistillate flowers of *Corylus rostrata*. (Natural size)

DD. The involucre about twice as long as the nut, usually tightly enclosing the nut

7. *americana*, Walt. Shrub, 3-8 ft.: young branchlets pubescent and glandular bristly lvs slightly cordate or rounded at the base, broadly ovate or oval, irregularly serrate, sparingly pubescent above, finely tomentose beneath, 3-6 in. long. involucre compressed, exceeding the nut, the 2 bracts sometimes more or less connate, with rather short, irregular, toothed lobes: nut roundish ovate, about $\frac{1}{2}$ in. high From Canada to Fla west to Ont and Dak Var. *calyculata*, Winkl. (*C. calyculata*, Dipp.) Involucre with 2 very large bracts at the base

AA. Husk or involucre tubular, narrowed above the nut and forming an elongated beak.

B Involucre finely pubescent outside with rather wide gradually narrowed beak

8. *máxima*, Mill. (*C. tubulosa*, Willd.) Shrub, sometimes small tree, to 30 ft. lvs cordate, roundish-ovate, slightly lobed and doubly serrate, 3-6 in long involucre finely pubescent outside nut oblong, large, kernel with thin red or white skin S Eu HW 2, p 30. Winkl 49. Var *purpurea*, Rehd (*C. Avellana purpurea*, Loud. *C. máxima* var *atropurpurea*, Dochnahl). Lvs deep purplish red darker than in *C. Avellana atropurpurea* F.E 21 325 —Many varieties, with large nuts, known as filberts or Lambert's filberts The cult. forms are partly hybrids with *C. Avellana*

BB. Involucre densely beset with bristly hairs, and usually rather abruptly constricted into a narrow beak c. *Petioles usually longer than $\frac{1}{2}$ in.*

9. *mandshurica*, Maxim (*C. rostrata* var *mandshurica*, Regel). Shrub, to 15 ft. young branchlets pubescent: lvs suborbicular to elliptic or obovate,

doubly serrate and slightly sinuately lobed, pubescent beneath, 3-5 in long. involucre thickly beset with brown spreading bristles, about 2 in. long, about 3 times as long as the nut, divided at the apex into narrow entire segms. Manchuria, Korea. Winkl 49.

10. *Sieboldiana*, Blume (*C. rostrata* var. *Sieboldiana*, Maxim.). Shrub, to 15 ft.: lvs. elliptic to oblong or obovate, usually rounded at the base, doubly serrate and slightly lobed, 2-4 in; the young lvs. often with a purple blotch in the middle: involucre with less stiff bristles, about $1\frac{1}{2}$ in. long, 2 or sometimes 3 times as

long as the nut, narrowed toward the apex. Japan. S.I F. 1:20.

cc. *Petioles shorter than $\frac{1}{2}$ in.*

11. *rostrata*, Ait. Fig. 1075. Shrub, 2-6 ft.: branchlets pubescent or glabrous, not bristly: lvs. rounded or slightly cordate at the base, oval or obovate, densely serrate and sometimes slightly lobed, nearly glabrous at length, except sparingly pubescent on the veins beneath, $2\frac{1}{2}$ -4 in long: involucre densely beset with bristly hairs, beak long and narrow: nut ovoid, $\frac{1}{2}$ in long E N Amer, west to Minn and Colo. (G F 8.345 (adapted in Fig 1075).

12. *californica*, Rose (*C. rostrata* var *californica*, DC.). Allied to *C. rostrata* Shrub, to 20 ft. lvs more villous beneath involucre with a short beak, which is often flaring and sometimes torn Calif to Wash

C. colchica, Alboff Low shrub, to 3 ft. lvs ovate or obovate, densely doubly serrate, sparingly pilose involucre connate, with a short lacerated beak, pubescent Caucasus Winkl 53. Not in cult. — *C. colurnoides*, Schneid. (*C. intermedia*, Loud., not Fingerh. *C. Colurna* × *C. Avellana*) Similar to *C. Colurna* small tree or large shrub bark dark involucre shorter, scarcely glandular Garden origin — *C. Parqueti*, Schneid. (*C. mandshurica* var *Parqueti*, Barkl.) Tree to 45 ft. lvs narrow-obovate to oblong involucre soft-pubescent, sometimes only slightly so W China — *C. Jacquemontii*, Deene (*C. Colurna* var *lacera*, DC.) Allied to *C. chinensis* Tree lvs ovate, lobed toward the apex, less pubescent, 5-8 in long involucre pubescent, not constricted, lobes not or rarely forked, often dentate Himalayas

ALFRED REHDER.

CORYNOCARPUS (Greek, club-fruit, alluding to the shape). *Anacardiaceae*; by Engler made the sole representative of *Corynocarpaceae*. A very few New Zealand and Polynesian evergreen trees, one of which is intro in Calif Glabrous lvs large, alternate, simple and entire, without stipules. fls perfect, small, whitish green, odorless, in terminal or subterminal panicles; calyx-lobes petal-like, unequal, 2 exterior smaller; petals much like the calyx-lobes, stamens 5, opposite the petals and shorter, stammodia 5, petal-like fr drupaceous, narrowly ovoid, 1-seeded, the pulp said to be edible, seed very bitter, poisonous *C. laevigata*, Forst New Zealand LAUREL Attractive leafy tree, 30-40 ft, the trunk sometimes more than 2 ft diam: lvs to 8 in long, elliptic-oblong or oblong-ovate, with a short stout petiole, margins slightly recurved, suggesting those of *Magnolia grandiflora* fls very small, greenish or whitish, short-pedicelled, in a terminal branched panicle, petals concave, little exceeding the calyx-lobes drupe $1\frac{1}{2}$ in or less long, orange-colored, fleshy, plum-like N Zeal., in lowlands not far from the sea. B.M. 4379. — *C. similis*, Hemsl, and *C. dissimilis*, Hemsl, from New Hebrides and New Caledonia respectively, are not listed among cult. plants

L. H B

CORYNOPHALLUS: *Hydrome*.

CORYNOSTYLIS (Greek, describing the club-shaped style) *Violaceae* A monotypic genus of woody climbers, with alternate lvs. and terminal racemes of long-stalked violet-like fls *C. Hybanthus*, Mart & Zucc. (*Calyptron Aubletii*, Ging. *Corynostylis Aubletii*, Hort.), native of Trop Amer. The lvs are 2-5 in long, ovate, or orbicular, bright green, serrate: fls. white, in axillary showy racemes which are contiguous along the st, long-spurred, 2 or 3 times as large as a violet, the spur half-twisted F.S 21 2213 B.M 5960. — A handsome, vigorous warmhouse climber, and cult. in the open in S. Calif Prop by cuttings and seeds

CORYPHA (Greek for summit or top,—where the leaves grow) *Palmaceae*, tribe *Corypheae*. Tall fan-leaved palms with a spineless stout trunk

Leaves terminal, large, orbicular, flabellately divided to the middle into numerous linear-lanceolate segms.; segms. induplicate in the bud; rachis none; ligule small; petiole long, stout, concave above, spiny on the

XXX. Chrysanthemum.—Two of the florist's types.

margins; sheaths split; spadix solitary, erect, paniculately much branched; spathes many, tubular, sheathing the peduncle and branches; fls. green, the plant dying after once flowering and fruiting frs. as large as a cherry, with a fleshy pericarp.—Species 6, Trop. Asia and Malay Archipelago G. C. II. 24:362. These fan-palms are cult. the same as *Chamaerops* and *Livistona*. They are warmhouse plants, prop. by seeds. Large fans, umbrellas and tents are made of the talipot palm by the natives of Ceylon. Coryphas are but little grown commercially, the growth of young plants being slow. Good loam well enriched with stable manure, a night temperature of 65° and abundant moisture, are the chief requisites in their cult., with a moderately shaded house during the summer.

elata, Roxbg (*C. Gebanga*, Blume). Fig 1076. Trunk straight, 60–70 ft high, 2 ft. diam., spirally ridged, lvs. lunate, 8–10 ft diam; segms 80–100, separated nearly to the middle, ensiform, obtuse or bifid, petioles 6–12 ft., with black margins and curved spines spadix about one-fourth the length of the trunk, but narrow. Bengal and Burma.

umbraculifera, Linn. TALIPOT PALM. Trunk ringed, 60–80 ft. lvs sub-lunate, 6 ft. long by 13 ft wide, palmately pinnatifid, folded lengthwise above the middle, segms obtusely bifid; petiole 7 ft., the spines along its margins often in pairs spadix sometimes 20 ft long, with spreading branches. Malabar coast and Ceylon A F 12:313 Gng 5: 213.—Lvs. used as a substitute for paper

C. australis, R. Br.—*Livistona*—*C. macrophylla*, Hort = (?)—*C. minor*, Jacq.—*esulata*—*C. Wogani*, Hort, is a dwarf round-lyd plant A G 15:307

N TAYLOR †

CORYSANTHES (*helmet-flower*, Greek) *Orchidaceae* Not to be confounded with *Coryanthus*. Fifteen or more terrestrial orchids of Austral, New Zealand and Malaysia, little cult. Dwarf, delicate, tuberous-rooted or fleshy-rooted herbs, bearing a solitary broad lf and a large solitary fl: upper sepal large, helmet-shaped, lateral sepals free, linear or filiform, petals (sometimes wanting) smaller than lateral sepals and similar to them, lp large, tubular at base, the margins enclosing the column, the upper part extended into a broad reflexed limb; pollinia 4. *C. picta*, Lindl., Malaya, is 3–4 in high upper part of fl deep purple and yellow, and lower part with four long awl-like segms and a bract at base of ovary. *C. limbata*, Hook f., Java, is mostly even lower, with fl purple and white, the ovate-cordate lf with reticulating white veins. B M 5357.

CORYTHOLOMA (referring to the helmet-shape). *Gesneriaceae*. By some referred to *Gesnera*: a half-hundred or more leafy-stemmed tuberous herbs of Trop. S. Amer., with mostly rod or speckled tubular fls in terminal umbels or racemes, or solitary or few in the axils. lp of corolla erect, concave, disk 5-glandular; stamens didynamous. It is doubtful whether any of the species are in the trade. *C. macropodum*, Sprague, recently mentioned, is a glandular-hirsute herb, 6–9 in high, from a subglobose tuber. lvs 3–5 in. across, suborbicular: fls. in solitary axillary cymes, 5–7 fld., cinnabar-red, the corolla-tube about 1 in long and nearly cylindric, the limb only slightly 2-lipped, the 3 lower lobes blotched purple. S. Brazil. B. M. 8228.—A handsome little plant. These plants are probably to be handled after the manner of gloxinias and similar things.

COSMÁNTHUS: *Phacelia*.

CÓSMEA: *Cosmos*.

COSMIDIUM: *Thelaspisma*.

COSMOPHYLLUM: *Podachnium*.

CÓSMOS (from the Greek word with a root idea of orderliness; hence an ornament or beautiful thing). Syn., *Cósmea* *Compositae*. Annual or perennial herbs, now popular as flower-garden subjects.

Often tall, usually glabrous: lvs. opposite, pinnately cut in the garden kinds fls typically shades of rose, crimson and purple, with one yellow species, and white horticultural varieties, long peduncled, solitary or in a loose corymbose panicle: achenes glabrous: chaff of the receptacle

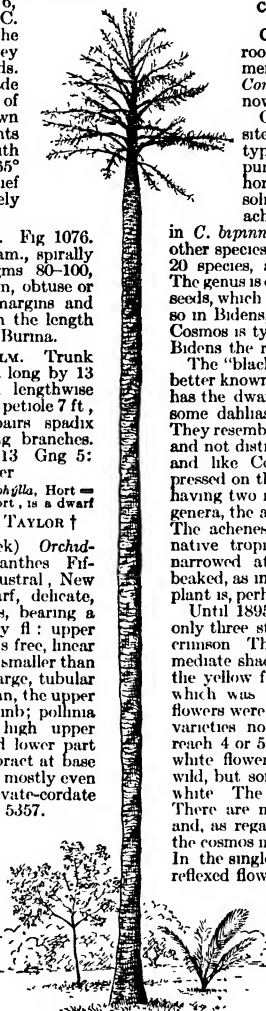

in *C. bipinnatus* with a long and slender apex, in other species with a blunt and short apex.—Perhaps 20 species, all Trop. American, mostly Mexican. The genus is distinguished from *Bidens* chiefly by the seeds, which are beaked in *Cosmos* but not distinctly so in *Bidens*, and by the color of the rays, which in *Cosmos* is typically some form of crimson, while in *Bidens* the rays are yellow or white.

The "black cosmos" (*C. diversifolius*) is, perhaps, better known to the trade as a *Bidens* or *Dahlia*. It has the dwarf habit and dark red early flowers of some dahlias, but the achenes are very puzzling. They resemble those of *Bidens* in being four-angled, and not distinctly beaked. They are unlike *Bidens*, and like *Cosmos*, in being not distinctly compressed on the back. They resemble both genera in having two rigid persistent awns, but, unlike these genera, the awns have no retrorse barbs or prickles. The achenes are linear, as in *Cosmos* and all our native tropical species of *Bidens*, but, although narrowed at the apex, they are not distinctly beaked, as in most species of the genus *Cosmos*. The plant is, perhaps, nearest to *Bidens*.

Until 1895 there were in the two leading species only three strongly marked colors, white, pink and crimson. These and the less clearly defined intermediate shades have come from *C. bipinnatus*; and the yellow forms have come from *C. sulphureus*, which was introduced in 1896. At first cosmos flowers were only an inch or two across. The best varieties now average 3 inches, and sometimes reach 4 or 5 without thinning or disbudding. Pure white flowers of cosmos are rarely if ever found wild, but some of the cultivated varieties are clear white. The group is lacking in bright deep reds. There are no full double forms of cosmos as yet, and, as regards strongly marked types of doubling, the cosmos may be decades behind the China asters. In the single forms, flat, incurved, or cupping, and reflexed flowers are to be looked for. Stellate forms are now offered; and also dwarfs, and other variants.

It is a mistake to grow cosmos in too rich soil, as one gets too vigorous growth and too few flowers, which are also late. A sandy soil is to be preferred as being earlier, and not too rich. It is well to pinch out the leading shoots of young plants in order to make them bushy and symmetrical, instead of tall and straggling. In the East, for best results it is still necessary

to sow seed indoors in April and transplant outdoors as soon as danger of frost is past. Seed sown in the open ground often fails to produce flowers in some northern localities before frost. The early frost kills the typical species, but some of the new strains are said to resist a degree or two of frost.

1076. *Corypha elata*, having spent itself in blooming.

A. Rays white, pink or crimson: disk yellow.

bipinnatus, Cav. Fig. 1077. Glabrous annual, 7-10 ft. high. lvs. bipinnately cut, lobes linear, remote, entire: involucrel scales ovate-lanceolate, acuminate: fls. white, pink or crimson seeds smooth, with an abrupt beak much shorter than the body Mex B.M. 1535. Gn. 41:10. R.H. 1892.372.—The older and commoner species. *C. hybridus*, Hort., is presumably a trade name for mixed varieties of *C. bipinnatus*, but see G.F. 1:474 for note.

AA. Rays yellow: disk yellow.

sulphureus, Cav. Fig. 1078. Pubescent, 4-7 ft. high, much branched: lvs. often 1 ft. or more long, 2- or 3-pinnately cut, lobes lanceolate, mucronate, with rachis and midrib ciliate or hispid; pinnæ alternate, entire or 2-3-toothed peduncles 7-10 in long, naked: outer involucrel bracts 8, linear, acuminate, green, 2 lines long, inner ones 8, oblong, obtuse, scarious, 5 lines long, fls. 2-3 in. across, pale, pure or golden yellow; rays 8, broadly obovate, strongly 3-toothed at the apex, ribbed beneath, anthers of the disk exerted, black, with orange tips: seeds linear, 1 in long, including the slender beak Mex G F 8 485 (adapted in Fig. 1078).—Intro. 1896; parent of the yellow forms.

AAA. Rays dark red, disk red.

diversifolius, Otto (*Bidens atrosanguinea*, Ortg. *B. dahlioides*, Wats. *Dahlia Zimapanum*, Roetzl) BLACK Cosmos Tender annual, 12-16 in high, with tubers more slender, and requiring more care in winter than those of common dahlias. lvs. pinnately parted; lfts. 5-7, entire or slightly serrate, the terminal lfts. largest: peduncles each bearing 1 head 6 in. or more above foliage, rays dark velvety red, sometimes tinged dark purple Mex B M 5227 Gt 1861 347. F C 2:47. J.H. III 33:403 Var *superba*, Hort., is sold —Prop. almost exclusively by seeds. WILHELM MILLER.†

COSSIGNIA (Jos Fr Charpentier de Cossigny, 1730-1789, French naturalist) *Sapindaceæ*. Shrubs or little trees of about 3 species, sometimes mentioned for cult. in warmhouses *C. pinnata*, Comm., of Mauri-

tius, has white fls. in terminal paniced corymbs, and odd-pinnate lvs., with 3-5 oblong and entire lfts.

COST-ACCOUNTING. The keeping of profit-and-loss records, and the drawing of conclusions from them for the improvement of the business.

In recent years, the application of cost-accounting and efficiency methods to farming operations has opened practically a new approach to the discussion of agricultural problems and is forcing a reorganization in practices and in the sub-divisions of the business. Careful and extended studies have not yet been made of the efficiency principles in most horticultural occupations, but the suggestions drawn from orchard records may show the nature and scope of the work.

Annual inventory.

There is no single account that is more important than the annual inventory. This inventory should list the land and each important building separately. The total value of these items should equal the value of the farm. It should list each cow, horse and important piece of machinery separately. All the cash, notes, mortgages and accounts due the farmer should be recorded with his property. A separate list should be made of all notes, mortgages or accounts due to others. The difference between these and the value of property owned gives the net worth of the farmer. A comparison of the net worth at the beginning and end of the year shows the gain or loss for the year unless money or property has been added to the business from some other sources or taken from it.

Cost-accounts.

But an inventory does not show on which enterprises gains or losses have occurred. Usually a business is made up of both profitable and unprofitable enterprises, or of enterprises that are unequally profitable. In order to know how to develop the business to the best advantage, it is important to know which enterprises pay best for the use of land and labor. Cost accounts also have very many uses aside from determining the relative profitability of different enterprises. If all the time spent, labor costs, and other costs, and the receipts are known, it is often possible to see ways of changing the management of a crop so as to increase profits.

In order to keep a complete cost-account with any crop, it is necessary to know all the labor of men, teams and machinery for the crop, to know all receipts and expenses caused by the cropping, and to keep track of any outlays contributed to the crop from the farm or other enterprises, also whatever this crop contributes to other enterprises.

A work-report of the time of man and horse should be kept in an ordinary account-book. At the end of the year, the total time is charged to each crop-account in the ledger. The ledger should have wide pages, so that there may be room for full descriptions. The left-hand page is used for charges, and the right-hand page for credits.

Each evening one should record any cash spent during the day under the proper crop or enterprise. The number of hours that have been spent on each enterprise for both man and horse labor are also recorded in the form shown on the next page. For convenience, the horse time is reduced to terms of one horse. A three-horse team working 10 hours is put down as 30 hours. If one desires, he may keep an account with only one enterprise. It is better to keep accounts with all the enterprises on the farm, so that one may study each part of his business and the business as a whole.

The best method of discussing the subject is to show an account as kept by a farmer. The following account with a 3-acre apple orchard was kept by a New York farmer in 1912.—

1077 *Cosmos bipinnatus*.

			\$340 42

This mere keeping of cost-accounts is not the end. The accounts must be studied. The following are a few of the facts that the farmer used in the preceding records and the suggestions derived from them:

Total crop	Bus	Total crop	Bus
Baldwin	421	Brought forward	611
Greening	93	Wagener	21
Hubbardston	30	Spitzenberg	6
Spy	23	Fall Pippin	3
King	22		
Snow	22		611
Carried forward	611	Drops and culls	105

From the foregoing records he was able to determine the yields per tree of different varieties.
Yields per acre good apples, 214 bushels.
Yield per acre culls and drops, 33 bushels.
Per cent of culls and drops, 14
Total receipts, good apples, less cost of barrels, \$233 07.
Average price per bushel, good apples, without barrels, 36 cents
Hours of man-labor, per acre, 164.
Hours of horse-labor, per acre, 65.
Profit, per acre, \$17
Profit, per hour, of man-labor, 10 cts.
Cost per bushel, good apples, without barrels, 28 cents.
Profit, per bushel, 8 cents.

It will be seen that the cost of barrels was very high owing to buying late in the season. Ten cents a barrel extra cost is more than equal to the profit on a bushel of apples, or one-third the entire profit. Usually the profit on an enterprise can be greatly changed by small changes in cost.

The profit per acre is in addition to pay for use of land. If all the profit is expressed in terms of land, the orchard paid \$27 per acre rent, or gave a profit of \$14 per acre.

If the profit is all expressed in terms of labor, the orchard paid 28 cents per hour for time spent on it, or gave a profit of 10 cents per hour.

Records similar to those given above may be kept with each crop or enterprise on the farm. If this is done, an account is kept with horses from which the cost of an hour of horse-labor is determined. At the end of the year, the labor on each crop for the year is charged at this rate. Similarly, the cost of man-labor is found and charged. The cost of machinery-labor is charged in proportion to the hours that horses worked for the enterprise. This is how the costs per hour given above were determined. But if a complete set of accounts is not kept, the charge for labor of men and horses is placed at the usual rate of pay for such work in the region, including the cost of board. References.

COSTMARY: The rayless form of *Chrysanthemum Balsamita*, known as var. *lancoletoides*

CÓSTUS (old classical name). *Zingiberaceæ* SPIRAL FLAG. Perennial thick-rooted tropical herbs, cultivated under glass for their flowing-limbed showy flowers, which are in terminal bracteate spikes

Stems short or tall and leafy (plant rarely acaulescent), roots often tuberous; fls. golden yellow, red, saffron-colored or white; corolla tubular, cleft, not showy; 1 stammodium, enlarged and bell-shaped, usually with a crispy limb, and forming the showy part of the fl (called the lip), cleft down the back; ovary 3-loculed; filaments petaloid. — About 100 species, widely distributed in the tropics. More or less fleshy plants, prized in warm-houses, and grown in the open in S Fla and other warm regions. Monogr. by Schumann in Engler's Pflanzenreich hft. 20 (1904)

This interesting genus of tropical herbs thrives in any rich moist soil, but luxuriates in that of a gravelly or sandy character, when under partial shade. The plants are readily propagated by cutting the canes, or stalks, into short pieces of an inch or two in length, and planting in sifted peat, or fine moss and sand, covering but lightly. The roots may also be divided, but this is a slow means of propagation. Specimen plants require rather high temperature to bring out the rich colors of the leaves, which in some species are prettily marked with a purplish

tint, and are usually arranged spirally on the ascending stem. This gives rise to the name "spiral flag." (E. N. Reasoner.)

speciosus, Smith. Somewhat woody at base, 4-10 ft., stout, erect. lvs. oblong or oblanceolate, acuminate, nearly 1 ft long, silky beneath. bracts red; fl. large, with a flowing white limb and yellowish center, 3-4 in. across, not lasting. E. Indies. I.H. 43:56. Gn. 47:166

igneus, N E Br One to 2 ft lvs. oblong or elliptic-lanceolate, 4-6 in. long. bracts not colored nor conspicuous. fls. clustered, orange-red. Brazil. I.H. 31:511. B.M. 6821 J.H. III 28:11.

Few species of *Costus* are offered in this country, but others may occur in special collections — *C. Friderichsenii*, Petersen 8 ft or more lvs. sessile, lanceolate, acuminate, 1½ ft or less long. fls. very large, bright yellow in thick terminal spikes. Ct. 52 15-21 Cent Amer (?) — *C. macduthus*, Gagnep. 5-6 ft lvs. spirally placed, lanceolate fls. very small with red tube and orange-red yellow-tipped lobes, the lip tubular and purple, in cone-like spikes 3 in long. Martinique — *C. muscivus*, Hort. lvs. obliquely lanceolate, 4-5 in long, dark green, marked and tessellated with silvery gray. W. Afr. — *C. zebrius* is very likely the same as last. L H B

CÓTINUS (ancient Greek name of a tree with red wood). *Anacardiaceæ*. SMOKE-TREE CHITTAWOOD Woody plants, grown chiefly for the attractive feathery fruiting panicles and for the handsome foliage turning brilliant colors in autumn

Deciduous shrubs or trees with a strong-smelling juice: lvs. slender-petioled, entire, without stipules fls. dioecious or polygamous, small, greenish or yellowish, in large and loose terminal panicles, the pedicels of the numerous sterile fls. lengthen after the fls. have dropped and become clothed with spreading hairs, petals 5, twice as long as the pointed calyx-lobes, the 5 stamens shorter than the petals, inserted between the lobes of the disk; ovary superior with 3 short styles fr. a small compressed oblique-obovate dry drupelet with the style on one side — Two species, one in N Amer and one in S Eu to Cent Asia. Formerly usually included under *Rhus*, which differs chiefly in its usually compound and more or less serrate lvs., the globose fr. with terminal style, the absence of plumose pedicels and in the milky juice. Often planted, particularly the European species, for its loose feathery panicles which give almost the effect of a dense cloud of smoke, from which the shrub derives its name. The panicles of the American species are much less showy, but the autumnal coloring is more brilliant. Both species hardy as far north as Mass., the American being somewhat more tender. They prefer a sunny, and in the N., a somewhat sheltered position and well-drained soil, and are adapted for planting in dry and rocky ground. Prop. by seeds; also by root-cuttings and layers.

Cogggria, Scop (*C. Cótinus*, Sarg. *C. Coccigrea*, Koch *Rhus Cótinus*, Linn.) SMOKE-TREE Fig. 1079. Spreading, rather dense shrub, to 15 ft: lvs. slender-petioled, oval or ob-

1079. *Cotinus*
Cogggria.
($\times \frac{1}{4}$)

ovate, abruptly narrowed at the base, rounded at the apex, glabrous, $1\frac{1}{2}$ - $3\frac{1}{2}$ in long, panicles to 8 in long, densely plumose, usually purplish: frs few, about $\frac{7}{8}$ in long June, July, fr. Aug., Sept. S Eu to Cent. China and Himalayas Gn 34, p. 162, 54, p. 505, 71, p. 552. Cng. 5:118 M D G 1902 217 G C III. 29 92 H W 3, p. 32 Var *atropurpurea*, Dipp. Panicles with dark purple hairs. Var. *péndula*, Dipp.

1080 *Cotoneaster horizontalis*

Branches pendulous Var *pubescens*, Engler Lvs, at least beneath, and often also the young branches, pubescent

americanus, Nutt (*C. cotinoides*, Brit *Rhus cotinoides*, Nutt) Upright shrub or small tree, to 35 ft lvs gradually narrowed at the base, obovate to elliptic-obovate, rounded at the apex, silky beneath when young, at maturity glabrous or nearly so, 4-6 in long, panicles 5-6 in long, with short and rather inconspicuous pale purple or brownish hairs June, July Ala to W Texas and E Tenn SS 3.98, 99 —The autumnal tints orange and scarlet, as in the preceding species, but more brilliant

ALFRED REHDER

COTONEÁSTER (*cotoneum*, quince, and *aster*, similar the leaves of some species resemble those of the quince) *Rosaceæ*, subfamily *Pomeæ* Shrubs, rarely small trees, chiefly grown for their ornamental red or black fruits and some species also for their foliage which turns brilliant colors in autumn

Leaves alternate, deciduous or persistent, short-petioled, entire, stipulate fls solitary or in cymes, terminal, on short lateral branchlets, white or pinkish: petals 5, stamens about 20 fr a black or red pomaceous drupe, with 2-5 stones —About 40 species, in the temperate regions of Eu and Asia, also in N Afr, but none in Japan

Cotoneasters are ornamental shrubs, many of them with decorative fruits remaining usually through the whole winter, while only a few, like the hardy *C. hupehensis* and *C. multiflora* and the tender *C. frigida*, and also *C. racemiflora* and *C. salicifolia*, are conspicuous with abundant white flowers. Of the species with decorative red fruits, *C. tomentosa*, *C. racemiflora* and *C. integririma* are quite hardy, and *C. Simonsii*, *C. acuminata*, *C. rotundifolia*, *C. microphylla* and others are hardy at least as far north as New York, while *C. frigida* and its allies are the most tender. The foliage of some of the species assumes brilliant colors in autumn; dark crimson in *C. Simonsii*, *C. horizontalis*, *C. divaricata* and *C. Dielsiana*; scarlet and orange in *C. foveolata*, bright yellow in *C. Zabelii*. The half-evergreen *C. horizontalis* and *C. adpressa*, and the evergreen *C. Dammeri* and *C. microphylla*, with its allied species, are well adapted for rockeries on account of their low, spreading or prostrate habit. Cotoneasters thrive in any good, well-drained garden soil, but dislike very moist and shady positions. Propagation is effected by seeds, sown in fall or stratified; the evergreen species grow readily from cuttings of half-ripened wood in August under glass; increased also by layers, put down in fall, or by grafting on *C. vulgaris*, hawthorn, mountain ash or quince.

A. Petals upright, small, usually pinkish; cymes usually few-fl or nodding, if many-fl (Orthopetalum.)

B Fr. red.

c Under side of lvs glabrous or only pubescent.

D Habit prostrate

1 *adpressa*, Bois (*C. horizontalis* var *adpressa* Schneid.) Prostrate shrub, with creeping and often rooting its irregularly branched lvs oval, acutish, wavy at the margin, nearly glabrous, $\frac{1}{2}$ - $\frac{3}{4}$ in long, fls 1-2, pinkish fr subglobose, usually with 2 stones. June fr Aug. Sept. W China VF 116 —Hardy at the Arnold Arboretum

2 *horizontalis*, Decne Fig 1080 Low shrub; branches almost horizontal and densely distichously branched lvs round-oval, acute at both ends, glabrous above, sparingly scotely hairy beneath, $\frac{1}{2}$ - $\frac{3}{4}$ in long; fls erect, 1-2, pink. fr ovoid, bright red, usually with 3 stones, smaller than in the preceding species June; fr Sept., Oct China RH 1885, p 136; 1889-348, fig 1 G C III 32 91 Gn 66, p 107 Var *perpusilla*, Schneid Lvs less than $\frac{1}{2}$ in long fr $\frac{1}{4}$ in across — Like the preceding species, one of the most effective fruiting shrubs for rockeries

DD Habit upright

E Lvs small, not exceeding 1 in, nearly glabrous beneath

3 *Simonsii*, Baker (*C. acuminata* var *Simonsii* Decne.) Shrub, with spreading branches, to 4 ft lvs roundish oval, acute, glabrous above, $\frac{1}{2}$ -1 in long, semi-persistent cymes 2-5-fl, fls white, slightly pinkish, calyx appressed-pubescent fr bright red, usually with 3-4 stones June, July Himalayas Refug Bot 1 55 B M 8010 (excl fls) as *C. rotundifolia*. One of the best red-fruited species, often under the name *C. Simonsii* or *C. Symonsii*

4 *divaricata*, Rehd & Wilson Upright shrub, to 6 ft lvs deciduous, oval or broadly oval, acute or obtusish, broadly cuneate at the base, lustrous above, $\frac{1}{2}$ - $\frac{3}{4}$ in long fls usually 3, pink, calyx appressed-pubescent fr ovoid, nearly sessile, bright red, $\frac{1}{4}$ in long, usually with 2 stones June, fr Sept Cent and W China —Very handsome when studded with its bright red frs, hardy at the Arnold Arboretum.

EE Lvs larger, $1\frac{1}{2}$ -3 in. long, deciduous

5 *acuminata*, Lindl Erect shrub, to 6 ft.: lvs. oblong to ovate-oblong, acute or acuminate, appressed-hairy on both sides, dull above to light green beneath: cymes 2-5-fl, nodding; fls white or slightly pinkish; calyx pubescent fr deep scarlet, turbinate, with 2-3 stones June; fr. Sept., Oct. Himalayas. I. B. C. 10 919 (as *Mespilus*). R. H. 1889:348, fig. 5 (as *C. nepalensis*)

6 *bullata*, Bois Spreading shrub, to 6 ft lvs. ovate, acuminate, rounded or broadly cuneate at the base, rugose and finally nearly glabrous above, reticulate, pale grayish green and pubescent beneath fls pinkish, few, calyx glabrous fr. red, subglobose, with 4-5

stones. May, June; fr. Sept., Oct. W. China. V.F. 119. Var. *floribunda*, Rehd. & Wilson (*C. moupinensis floribunda*, Stapf) Cymes many-fl'd; calyx slightly pubescent. B.M. 8284. Var. *macrophylla*, Rehd. & Wilson. Lvs. elliptic to lanceolate-oblong, narrowed at the base, often nearly glabrous, 2-6 in. long; cymes many-fl'd.—The varieties are much handsomer than the type.

cc. Under side of lvs. whitish or grayish tomentose; young branchlets densely pubescent

D. Lvs. $\frac{3}{4}$ – $2\frac{1}{2}$ in. long, rounded at base.

7. *integerrima*, Medikus (*C. vulgaris*, Lindl.). Shrub, to 4 ft.: lvs. ovate or oval, acute or obtuse and mucronulate, glabrous and dark green above, whitish and at length greenish tomentose beneath, $\frac{3}{4}$ –2 in. long; cymes nodding, 2–4-fl'd; fls. pale pinkish; calyx glabrous outside fr. globular, bright red May, June; fr. Aug. Eu., W. Asia, Siberia. H.W. 3, p. 73, figs. a–v.

8. *tomentosa*, Lindl. Shrub, to 6 ft.: lvs. broadly oval, obtuse, dull green above and pubescent when young, whitish tomentose beneath, 1– $2\frac{1}{2}$ in. long, fls. 3–12, white, calyx tomentose outside fr. bright brick-red June, fr. Sept., Oct. Eu., W. Asia. H.W. 3, p. 73, figs. k–o G.O.H. 105—Sometimes cult. as *C. speciosa*, Hort.

DD. Lvs. about 1 in. or less long, slightly pubescent above

E. Apex of lvs. mostly obtuse, base rounded

9. *Zabelii*, Schneid. Shrub, to 6 ft. with slender spreading branches: lvs. oval to ovate, dull green and loosely pubescent above, grayish or yellowish tomentose below, on young plants sometimes more glabrescent and acutish; $\frac{3}{4}$ – $1\frac{1}{2}$ in. long, fls. 5–9 in loose corymbs, pinkish; calyx villous outside, with obtuse teeth: fr. ovoid, red, about $\frac{1}{2}$ in. long, with 2 stones. May; fr. in Sept., Oct. Cent. China.

EE. Apex of lvs. mostly acute, base often cuneate.

10. *Dielsiana*, Pritz (*C. applandica*, Duthie) Shrub, to 6 ft. with slender spreading and arching branches: lvs. deciduous, firm, ovate or elliptic, acutish, rounded or broadly cuneate at base, yellowish gray tomentose beneath, $\frac{1}{2}$ –1 in. long; fls. few, short-stalked; calyx pubescent: fr. 1–3, subglobose, $\frac{1}{2}$ in. across, red, with 3–4 stones. June; fr. Sept., Oct. Cent. China. Var. *major*, Rehd. & Wilson. Lvs. larger and broader fr. larger Var. *elegans*, Rehd. & Wilson. Lvs. smaller, sub-persistent, finally nearly glabrous and somewhat shining above: fr. pendulous, coral-red. W. China

11. *Franchetii*, Bois Upright densely branched shrub with spreading branches lvs. thickish, elliptic or ovate, acute or acuminate, usually cuneate at base,

yellowish white tomentose beneath, $\frac{3}{4}$ – $1\frac{1}{2}$ in. long; fls. 6–15, in short and dense corymbs, pinkish, small; calyx pubescent outside, with acute teeth: fr. orange-red, ovoid, over $\frac{1}{2}$ in. long, with usually 3 stones. June; fr. Sept., Oct. W. China. R.H. 1902, p. 379; 1907: 256. V.F. 118.

BB. Fr. black or nearly black.

C. Lvs. acute or acuminate, pubescent or nearly glabrous beneath.

D. Upper surface of lvs. glabrous and somewhat lustrous: calyx slightly pubescent or glabrous

12. *lúcida*, Schlecht (*C. acutifolia*, Lindl. *C. sinensis*, Hort.) Upright, rather dense shrub, to 12 ft.: lvs. elliptic or elliptic-ovate, acute, usually cuneate at the base, slightly pubescent beneath, 1– $1\frac{1}{2}$ in. long, fls. 3–6, in nodding corymbs fr. purplish black, subglobose, with 3–4 stones. May, June, fr. Sept. Alta Mts G.W. 5, p. 247 (as *C. acutifolia*)—Foliage dark green, remaining green until very late in autumn.

DD. Upper surface of lvs. pubescent, at least when young, dull green: calyx pubescent

13. *acutifolia*, Turcz (*C. pekinensis*, Zabel *C. acutifolia* var. *pekinensis*, Koehne) Shrub, to 12 ft., with spreading slender branches lvs. elliptic-ovate to oblong-ovate, acute or acuminate, usually rounded at base, slightly appressed-pilose beneath, becoming nearly glabrous, $1\frac{1}{2}$ –2 in. long fls. 2–5, nodding fr. ovoid, black, to $\frac{1}{2}$ in. long, with usually 2 stones. May, June, fr. Sept., Oct. N. China Var. *villosula*, Rehd. & Wilson Lvs. more densely villous beneath, somewhat larger calyx densely villous fr. thinly pubescent. Cent and W. China.

14. *foveolata*, Rehd. & Wilson Shrub, to 10 ft. with spreading branches lvs. elliptic to elliptic-ovate, rarely ovate-oblong, acute or acuminate, soon glabrous above, pubescent beneath, chiefly on the veins, finally nearly glabrous, 2–3 in. long fls. 3–6, pinkish, calyx pubescent: fr. black, subglobose, $\frac{1}{2}$ in. across, with 3–4 stones. June; fr. Sept. Cent. China—The foliage turns bright scarlet and orange in autumn

cc. Lvs. obtuse or acutish, tomentose beneath.

15. *melanocarpa*, Lodd. (*C. nigra*, Wahlb.) Shrub with spreading branches, to 6 ft. lvs. oval or ovate, usually rounded at base, dark green and sparingly pubescent above, grayish white tomentose beneath, 1–3 in. long, fls. 3–8, calyx glabrous fr. black, globose, with 2–3 stones. May, June fr. Aug. N and E. Eu. to Siberia L.B.C. 16 1531 Var. *laxiflora*, Koehne (*C. laxiflora*, Jacq.). Corymbs 12- to many-fl'd, elongated, pendulous B.R. 14:1305 Var. *commixta*, Schneid. (*C. laxiflora*, Hook.) Lvs. acutish, 2 in. long corymbs 8–15-fl'd. B.M. 3519.

AA. Petals spreading, white, roundish: fr. red. (*Chaenopetalum*)

B. Fls. in many-fl'd. corymbs upright shrubs.

C. Lvs. broadly ovate or oval, obtuse or acute, $\frac{1}{2}$ – $1\frac{1}{2}$ in. long, deciduous

D. The lvs. glabrous beneath at maturity.

16. *multiflora*, Bunge (*C. reftera*, Carr.) Shrub, to 6 ft. with usually slender, arching branches: lvs. broad-ovate, usually acute, slightly tomentose at first beneath, soon becoming glabrous: cymes very numerous, 6–20-fl'd; calyx and peduncles glabrous. fr. red, $\frac{1}{2}$ in. across. May Spain, W. Asia to Himalayas

and China R H. 1892, p. 327; 1893, p. 29. G W. 6, p. 62 M D G. 1914: 7.—Very decorative in bloom, and hardy, but less free fruiting. Var. *calocarpa*, Rehd. & Wilson. Lvs. larger and narrower, slightly hairy below: fr. larger, nearly $\frac{1}{2}$ in. across, freely produced. W. China.

DD. The lvs. tomentose beneath.

17. *hupehensis*, Rehd. & Wilson. Fig. 1081. Shrub, to 5 ft., with slender spreading branches, villous while young, lvs. ovate to elliptic, obtuse or acutish, mucronulate, rarely emarginate, above finally glabrous, thinly grayish tomentose beneath, $\frac{1}{2}$ –1 in. long. corymbs very numerous, with 6–12 or more white fls.; peduncle and calyx villous; anthers yellow: fr. red, subglobose, about $\frac{1}{2}$ in. across, with 2 stones May Cent and W. China. M D G. 1914: 6 (as *C. acutifolia* var.)—One of the handsomest species in bloom; hardy as far north as Mass

18. *racemiflora*, Koch (*C. nummularia*, Fisch & Mey. *C. Fontanisti*, Spach). Shrub, to 4 ft., with erect or spreading branches, rarely prostrate: lvs. roundish or broad-ovate, obtuse or acute, whitish or grayish tomentose beneath, glabrous above, cymes very short-peduncled, 3–12-fld., peduncle and calyx tomentose: fr. red May, June. From N Afr and W. Asia to Himalayas and Turkestan. R H. 1867 31—Very decorative and hardy Var. *seongrica*, Schneid. Lvs oval, usually obtusish, less pubescent Var. *microcarpa*, Rehd & Wilson Similar to the preceding, but fr. ovoid, smaller Var. *orbicularis*, Wenz. (*C. Wheeleri*, Hort.) Low and divaricate: lvs. roundish or obovate, $\frac{1}{2}$ – $\frac{3}{4}$ in. long: cymes 3–6-fld.

cc Lvs elliptic to oblong, acute at both ends, subcoriaceous.

D Length of lvs $\frac{1}{2}$ – $\frac{1}{2}$ in : corymbs 1 in. across or less.

19. *pannosa*, Franch Half-evergreen shrub, to 6 ft : lvs elliptic to ovate-oblong, mucronate at the apex, glabrous above, densely grayish white-tomentose beneath calyx tomentose: fr. red, globose-ovoid, $\frac{1}{2}$ in long with 2 stones S W China R H 1907: 256. G 25 408 Gn 67, p 118 J. 12 120—Very handsome, but tender

DD Length of lvs $1\frac{1}{2}$ –4 in : corymbs 1–2 in. across

20. *salicifolia*, Franch Half-evergreen shrub, to 15 ft young branchlets floccose-tomentose. lvs elliptic-oblong to ovate-lanceolate, acute or acuminate, rugose and glabrous above, floccose-tomentose beneath, $1\frac{1}{2}$ –3 in long fls white in dense corymbs 1–2 in across: fr. subglobose, bright red, $\frac{1}{2}$ in. across, with 2–3 stones. June, fr Oct, Nov W China Var *rugosa*, Rehd. & Wilson (*C. rugosa*, Pritz) Lvs broader and shorter, elliptic-oblong, dull green above, more woolly-tomentose beneath fr. larger, usually with 2 stones. Cent. China Var *floccosa*, Rehd & Wilson Lvs oblong to oblong-lanceolate, floccose-tomentose beneath while young, later becoming partly glabrous and glaucous, bright green and lustrous above, fr. larger, usually with 3 stones W China—This species is very handsome, particularly in autumn when studded with its clusters of bright red berries. The var. *floccosa* which has been advertised as var. *glaciola* (misspelled for *floccosa*) seems to be the hardiest and most desirable.

21. *frigida*, Wall Large half-evergreen shrub, to 20 ft lvs oblong, acute at both ends, glabrous above, tomentose beneath when young, 2–4 in. long: cymes long-peduncled, very many-fld., pubescent: fr. scarlet. April, May. Himalayas. R R 15 1229, L B C. 16: 1512.—One of the most beautiful in fl. and fr., but not hardy N.

BB. Fls. 1–3: low prostrate or trailing shrubs: lvs. persistent.

c. Lvs green beneath.

22. *Dammeri*, Schneid. (*C. humifusa*, Duthie). Prostrate shrub with trailing often rooting branches: lvs. elliptic, usually cuneate at the base, obtusish and

usually mucronulate, glabrous or nearly so, about 1 in. long fls. usually solitary, calyx sparingly pubescent or nearly glabrous: fr. bright red. May, June; fr. Oct., Nov. Cent. China. Var. *radicans*, Schneid. Lvs. often obovate, slender-petioled: fls. 1–2, on peduncles about $\frac{1}{2}$ in. long.

cc. Lvs. glaucous or whitish tomentose beneath.

23. *rotundifolia*, Wall (*C. microphylla* Uva-ursi, Lindl. *C. prostrata*, Baker) Low or prostrate shrub: lvs. nearly orbicular or broadly oval, dark green above and somewhat pubescent, loosely pubescent beneath or glabrescent and glaucous, $\frac{1}{2}$ – $\frac{1}{2}$ in long: fls. 1–3, about $\frac{1}{2}$ in across: fr. bright red, subglobose, more than $\frac{1}{2}$ in. across Himalayas May, June, fr Sept B R 14: 1187 Var *lanata*, Schneid (*C. buxifolia*, Baker, not Wall *C. Wheeleri*, Hort.) Lvs elliptic to elliptic-obovate, tomentose beneath: fr. $\frac{1}{2}$ in across Refug Bot 1: 52 (fls. in bud). Gn 55 186 R H 1889, 348, fig 4

24. *microphylla*, Wall Low, prostrate shrub, densely branched lvs. cuneate-oblong or obovate, acute, shining above, densely pubescent beneath, $\frac{1}{2}$ in. long fls. usually solitary; calyx pubescent fr. bright red May, June Himalayas. B R 13 1114 L B C 14: 1374. R H. 1889: 348, fig 3 G C II 12 333, 18 681 Gn. 4, p. 165 Var *thymifolia*, Kochne (*C. thymifolia*, Baker). Very dwarf lvs. linear-oblong, smaller fls. and fr. smaller R H 1889, 348, fig 2 G C II. 12: 333; 18 681. Refug Bot 1 50 Var. *glaciola*, Hook. (*C. congesta*, Baker) Lvs. glabrous beneath, oval: fls. smaller, often pinkish. Refug Bot. 1: 51

C. affinis, Lindl Allied to *C. frigida*. Lvs. broad-elliptic fr. dark brown, globose Himalayas L B C 16 1522—*C. ambigua*, Rehd & Wilson Related to *C. acutifolia* Shrub, to 6 ft lvs elliptic-ovate to rhombic-ovate, villous beneath fls. 5–10, calyx slightly pubescent or nearly glabrous: fr. ovoid, black W China—*C. amana*, Wilson Related to *C. Franchetii* Dense shrub, to 5 ft lvs ovate or elliptic, usually $\frac{1}{2}$ in long corymbs 6–10-fld., sepals acuminate fr. globose, orange-red Yunnan G C III. 51 2—*C. angustifolia*, Franch Lvs. elliptic, angustifolia *C. angulata*, Rehd & Wilson Related to *C. Simonsii* Shrub, to 6 ft lvs orbicular to roundish ovate, apiculate, bright green and lustrous, nearly glabrous, $\frac{1}{2}$ – $\frac{1}{2}$ in long fr. nearly sessile, globose, bright red China—*C. arborescens*, Zabel *C. Lindleyi*, Rehd & Wilson—*C. bacularis*, Wall Related to *C. frigida* Lvs. smaller, usually glabrous beneath at length fr. dark brown Himalayas—*C. buxifolia*, Wall Related to *C. rotundifolia* Lvs. elliptic, slightly pubescent above at first, grayish tomentose beneath, fls. 2–4, $\frac{1}{2}$ in. across fr. red India Wright, len 3 992 Tender—*C. disticha*, Lange Related to *C. Simonsii* Half-evergreen, upright shrub, to 4 ft lvs suborbicular to broadly obovate, apiculate, sparingly pubescent above, nearly glabrous beneath, $\frac{1}{2}$ in or less long fls. 1–2, calyx glabrous or nearly so fr. scarlet Himalayas—*C. Harmsiana*, Wilson Related to *C. salicifolia* Shrub, to 6 ft lvs elliptic-oblong, sometimes oval, 1–2 in long, densely villous beneath corymbs $\frac{1}{2}$ in across S W China—*C. Henriciana*, Rehd & Wilson (*C. rugosa* var. *Henriciana*, Rehd) Related to *C. salicifolia* Shrub, to 12 ft lvs thinner, elliptic-oblong to oblong-lanceolate, 2–3 $\frac{1}{2}$ in long, and about 1 in broad, pubescent and only slightly pubescent above, densely grayish pubescent beneath corymbs many-fld., at length 1–2 in across: fr. reddish brown, fr. red ovoid, $\frac{1}{2}$ in across with 2–3 stones Cent. China. G C III 46 339 (not good) M D G 1914 15—*C. spaldii*, Wolf Related to *C. melanocarpa* Shrub, to 5 ft lvs ovate or obovate, greenish white beneath, pubescent, 1–2 in long, 8–13, pinkish, calyx pubescent at the base fr. dark reddish brown, nearly black, E Turkestan Yearb For Inst., Peterburg, 15 240—*C. Lindleyi*, Steud (*C. arborescens*, Zabel) Similar to *C. racemiflora* but fr. black Himalayas—*C. mucronata*, Franch Related to *C. foeniculata* Shrub, to 15 ft lvs elliptic to ovate, 1–2 in long, thickly rugose above, pubescent beneath, at least on the veins, 2–5 in long, corymbs many-fld., fls. white or pinkish, calyx sparingly pubescent fr. black, with 4–5 stones W China—*C. nitens*, Rehd & Wilson Related to *C. divaricata* Lvs. broadly oval or elliptic, ovate, glabrous and lustrous above, $\frac{1}{2}$ – $\frac{1}{2}$ in long fr. ovoid, purplish black, stalked, pendulous W China—*C. obscura*, Rehd & Wilson, Related to *C. acuminata* Shrub, to 10 ft lvs elliptic-ovate, finally glabrous above, yellowish gray-tomentose beneath, 2–3 in long fr. dull brownish red, ovoid, $\frac{1}{2}$ in long, usually with 3 stones. W China—*C. Pyracantha*, Spach—*Pyracantha coccinea*—*C. rosea*, Edgew Related to *C. integririma* Shrub, with slender upright branches lvs. elliptic to ovate-oblong, nearly glabrous, grayish, 1–1 $\frac{1}{2}$ in long fls. 4–9, pinkish with slightly spreading petals fr. subglobose, dull red Himalayas—*C. Silvestris*, Pampanini Allied to *C. integririma* Lvs. elliptic-ovate, densely hairy and cream-colored beneath, 1–2 in long calyx pubescent outside fr. orange-ovoid, 3 in long China—*C. Bungei* Allied to *P. vulgaris* Lvs. oval to oval-oblong, glabrous when older. fls. solitary. fr. red Altai Mts.

ALFRED REHDER.

COTTON belongs to the genus *Gossypium* (name used by Pliny), of the *Malvaceæ*. The species are now much confused, but it is generally agreed that the sea island cotton is of the species *G. barbadense*, Linn. The upland cotton is probably derived chiefly or wholly from *G. hirsutum*, Linn. The former is native in the West Indies. The nativity of the latter is in dispute, but it is probably Asian. The cotton flower is malvaceous-like, with a subtending involucre of three large heart-shaped bracts. The carpels or cells of the pod are three to five. These carpels break open, and the cotton covering of the seeds makes a globular mass,—the cotton boll (Fig. 1082). Cotton is not a horticultural

1082. A cotton boll.

crop, and is therefore not considered in this work. The reader will find "The Cotton Plant" (published by the Dept. of Agric., Bull. 33), a useful monograph. Consult Cyclo. Amer. Agric., Vol. II, p 247.

COTTONWOOD: species of *Populus*.

COTŪLA (Greek, *small cup*, the bases of the clasping leaves forming a hollow or basin) *Compósitæ*. Small diffuse or much-branched strong-smelling annual or perennial yellow-flowered herbs, a few of the perennials sometimes used as carpeters in rock-gardens.

Leaves alternate, toothed, lobed or pinnatisect; heads pedunculate, hemispherical or bell-shaped, many-fld. and discoid; outer or marginal florets nearly or quite apetalous, usually pistillate and fertile; disk-florets 4-toothed, fertile or male; torus naked; pappus not evident. achene glabrous, compressed.—About 50 or 60 species, largely in the southern hemisphere.

dioica, Hook. f. (*Leptanella dioica*, Hook. f.). Sts. glabrous or slightly hairy, 1 ft. or less long, creeping; lvs. solitary or tufted, not thick or stiff, stalked, 2 in. or less long, linear-obovate to spatulate, obtuse, serrate to pinnatifid or even pinnate; heads on axillary naked peduncles that are longer or shorter than the lvs., unisexual, the males $\frac{1}{2}$ in. or less diam, and the females a little larger achene obovoid, curved. New Zealand.—Very variable. A compact dwarf carpeter.

Muelleri, Kirk (*C. potentilliana*, Hort? *Leptanella potentilliana*, Muell.) Sts. long and rather stout, creeping and rooting, the branches ascending and somewhat villous towards the tips. lvs. 2-5 in. long, stalk and all, linear-obovate, deeply pinnatifid, glandular-dotted; heads on peduncles that usually are shorter than the lvs., bisexual, about $\frac{1}{2}$ in. diam.; achene club-shaped and 4-angled. New Zealand.

C. lanata, Hook. f. (*Leptanella lanata*, Hook. f.) Stout and woolly: lvs. rather fleshy, pinnate or pinnatifid florets glandular. New Zealand.—*C. lobata*, Linn.—*Lidbeckia*—*C. plumosa*, Hook. f. (*Leptanella plumosa*, Hook. f.) Stout, soft-woolly lvs. 3-4 times pinnatisect, florets not glandular. New Zealand.—*C. squida*, Hook. f. (*Leptanella squida*, Hook. f.) Allied to *C. lanata*, with lvs. deeply pinnatifid and segms. incised. New Zealand.

L. H. B.

COTYLEDON (a name used by Pliny, meaning a *canty*, having reference to the concave or cup-like leaves of some kinds), *Crassulacæ*. Succulent herbs or shrubs, rarely annual, grown mostly for their oddity, but some of them making good winter bloomers in pots and some used for summer bedding because of the stiff thick foliage, some are half-hardy North.

Habit very various, rosulate or erect, sometimes of a scandent tendency; branches and lvs. thick and fleshy; lvs. opposite or alternate, petiolate or sessile; calyx 5-parted, as long as or shorter than the corolla-tube; corolla tubular, cylindrical or urn-shaped, sometimes 5-angled, the parts or petals 5, erect or spreading, connate to the middle, longer than the usually 10 stamens; ovary of 5 free carpels, each with a narrow scale at base; fls. erect or pendent, sometimes showy, in terminal racemes or cymes. Differs from Sedum in the connate petals.—Species about 100, in Calif to Texas, and Mex., Afr., Asia and Eu. See I H 10 76 for an account of many of the species. Some of the species make dense rosettes of stiff lvs. on the ground and send up a small bracted scape; they remind one of the house-leek (*Semperivum tectorum* and related species).

As above defined, Cotyledon comprises the broad group habitually known under that name. Recently, however, Britton and Rose have revised the group, excluding Cotyledon from America, reinstating Echeveria and Pachyphytum for some of the American species and making new genera for others, as Dudleya, Oliveranthus, Urbina, Stylophyllum. For the convenience of the gardener, the cult. species are here brought together under Cotyledon, and they are also listed at other places under their new generic names.

Cotyledons are little known in this country except among fanciers and for carpet-bedding. Culturally, there are two groups,—the greenhouse kinds and the bedding kinds. The greenhouse kinds are well represented by *C. gubbiiflora*. It is attractive both in foliage and flower. It may be expected to begin bloom in January or February. Its period of bloom is short, after which it may be propagated. The top of the main shoot (or of strong side shoots) may be cut off with 2 or 3 inches of stem, and stood in pots so that the cut end will rest on moss in the bottom and the leaves on the rim of the pot, using no earth; fine roots will soon form and the young plant may then be repotted into dryish soil. The old stems of this and similar tall kinds may be placed rather close together in shallow boxes, when it is desired to propagate them, and kept in a warm dry place, where they will form small growths along the stems; these, when large enough, may be put into boxes of dry sand, and potted in thumb- or 3-inch pots when they have made a sufficient quantity of roots. This species should be kept in a warmhouse in winter, where it is rather dry and not exposed to drip. *C. fulgens* is a good greenhouse species, producing showy waxy red flowers in winter; also *C. coccinea*. For this purpose the large plants should be lifted from the beds and carefully potted, as they make a much finer growth in the open ground than when grown in pots.—When it is desired to increase the low-growing carpet-bedding kinds on a larger scale, the plants should be lifted before the ground gets too wet and cold. They may either be boxed in dry soil and kept in a cool dry house, or placed thickly together in a frame, taking care that no drip is allowed on the plants, and giving no water. The most convenient time for propagation by leaves is during the months of November and December, when the fall work of rooting soft-wooded plants is over. Leaves rooted at this time will make plants large enough for planting out the following season. They will take from three to four weeks to root, according to the kind. The leaves must be taken from the plant as follows. Grasp each leaf between the thumb and forefinger, give a gentle twist first to one side then to the other until the leaf comes off, taking care that the dormant bud in the

axil of the leaf accompanies it, otherwise the leaf will rot but a plant will not form from it. Make a depression about 2 inches deep in the center and 4 inches wide across the sand-bed, in this lay two rows of leaves with their bases touching each at the bottom of the depression; give no water until the small roots make their appearance, and only slightly afterwards. When the little plants are large enough they should be boxed, using sandy loam, and kept in a temperature of not less than 60° F. at night. For summer bedding purposes the following have been employed very successfully, being lower growers: *C. atropurpurea*, *C. fulgens*, *C. coccinea*, *C. fascicularis*, *C. gibbiflora* var. *metallina*, *C. Pachyphytum*, *C. Peacockii*, *C. Purpurea*, *C. roseata*, *C. secunda*, *C. secunda* var. *glauca*, *C. mexicana*. (G. W. Oliver.)

Other species of *Cotyledon* occur in collections of succulent plants, but the following probably represent those of commerce in this country.

A. Plants of the Old World, of various habit corolla-tube elongated, usually much longer than the calyx. (*Cotyledon* and *Umbilicus*)

B. Lvs crowded in a rosette (rosulate) at the base of the plant low, more or less stemless species of the houseleek or hen-and-chickens type, used in rock-gardens and for carpet-bedding.

c. Fls yellow or milk-white

1 *Aizoon*, Schoenl (*Umbilicus Aizoon*, Fenzl). Plant small, minutely pubescent, the st very short; lvs densely rosulate, linguulate, obtuse, ciliate, those on the st oblong-obtuse fls golden yellow, on very short pedicels, calyx spreading, corolla-parts lanceolate-acuminate and keeled. Asia Minor.

cc. Fls red or greenish

2 *Bárbeyi*, Schweinf. Whole plant hoary-white, tuft and branching lvs thick, fleshy, shovel-shaped: fls olive-green and red, 1 in long, in a close panicle. Blooms freely in spring and summer Abyssinia. Gt. 45, p. 465.—An exquisite plant for carpet-bedding.

BB. Lvs variously scattered along the st, or sometimes in rosettes or clusters at the ends of the branches mostly branching plants, grown in greenhouses, window-gardens, and sometimes used in summer bedding-out but not in carpet-bedding designs.

c. Fls white or ochroleucous.

3 *reticulata*, Thunb. Sts much branched, fleshy; lvs few at the ends of the branches cylindrical, acute, erect, fleshy, soft, smooth, $\frac{1}{2}$ in. or less long; fls. $\frac{1}{2}$ in. or less long, whitish, in an erect, dichotomous panicle. Cape. G. C III 21-282. The wiry fl-stalks remain on the plant and give it the appearance of being inclosed in a network. Odd.

4 *chrysántha*, Hort. (*Umbilicus chrysanthus*, Boiss.). Plant pubescent, glandular above, the st short; lvs. rosulate, short, oblong-spatulate, obtuse, those on the st elliptic and somewhat acute. fls large, ochroleucous (milk-white or yellow-

Sempervivum, 7.	Umbilicus, 5

ish), red-striped on the back of the oblong-lanceolate keeled lobes or parts of the corolla. Perennial. Asia Minor.

cc. Fls. yellow or greenish.

5 *Umbilicus*, Linn. (*Umbilicus pendulius*, DC.). PENNYWORT. NAEVLEWORT Perennial, 6-12 in high in flower, simple or slightly branched, leafy at base: radical and lower lvs fleshy, orbicular, crenate, more or less peltate: fls yellowish green, pendulous, in a raceme, calyx very small, corolla cylindrical, $\frac{1}{4}$ in. long but somewhat enlarging, with 5 short teeth.—On rocks and walls, W. Eu. Adaptable in rock-gardens.

ccc. Fls. red or purple.

6 *fasciculáris*, Soland Smooth, 1-2 ft. high, thick-stemmed, branched. lvs pale greenish white with a yellowish margin, glaucous, few, sessile, cuneate-obovate, thick, flattened, slightly concave, cuspidate: panicle branches long, scorpioid, fls. large, 1 in. long, pendent, calyx-lobes short, broadly ovate-acute; corolla-tube much longer than the calyx, with a greenish tube and reddish revolute limb. S. Afr. B. M. 5602. J. H. III 29 443

7 *Sempervivum*, Bieb (*Umbilicus Sempervivum*, DC.) HOUSELEEK COTYLEDON Plant green, glandular radical lvs. spatulate, obtuse, attenuate-cuneate at base, the margin denticulate, st-lvs oblong, fls purplish and papillose on the outside, on second branches in a corymbose panicle, corolla three longer than calyx, parted to the middle, the parts lanceolate-acuminate and somewhat recurved. Perennial.—Not to be confounded with *Sempervivum tectorum*.

8 *orbiculáta*, Linn Erect, 2-4 ft high lvs opposite, flat, obovate-spatulate, obtuse, mucronate, glaucous and mealy, with red margins fls. large, reddish, paniced. Fls. June-Sept S. Afr. B. M. 321 R. H.

1857, p. 347.—Grows well from cuttings. Variable, and has several named forms as var *elata*, *oblonga*, *ramosa*, *rotundifolia*

9 *hispánica*, Linn (*Psoralea hispánica*, DC.) Annual or biennial, branched, 6 in high, erect: lvs small, nearly cylindrical, oblong, few, sessile fls erect, in cymes, reddish, corolla trumpet-shaped, lobes spreading. Spain, Morocco R. H. 1895, p. 472

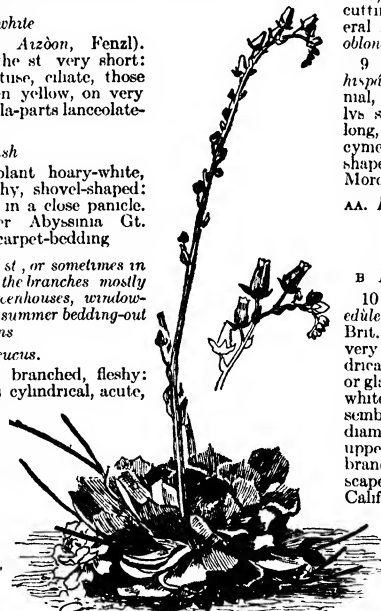

AA. Plants of the New World. corolla-tube usually short, perhaps always shorter than the calyx

B. Lvs urete. (*Stylophyllum*)

10 *edulis*, Brewer (*Sedum edule*, Nutt. *Stylophyllum edule*, Brit. & Rose) Sts caespitose, very short and thick lvs cylindrical, 3-4 in long, erect, whitish or glaucous green, not mealy: fls white, tinged with green, resembling those of *Sedum*, $\frac{1}{2}$ in diam, short-pedicelled, along the upper sides of the flexuous branches of the cymose panicle, scape 1 ft. high. San Diego, Calif.—Young lvs. eaten by Indians.

BB. Lvs linear or nearly so.

11. *mexicana*, Hemsl. Plant glabrous, 3-4 in high, erect, the branches woody: lvs. few, alternate,

1083. *Cotyledon secunda* (Detail $\times \frac{1}{2}$)

crowded on sterile shoots, somewhat fleshy, linear or linear-spatulate, obtuse, $\frac{1}{4}$ – $\frac{1}{2}$ in. long; fls. few short-pedicelled, cymose; sepals free, linear, obtuse; petals plane and strongly coherent, forming a tube, $\frac{1}{4}$ in.; or less long, the lobes ovate, acute, erect. S. Mex.—One of the dozen known species of *Altamiranoa* (see p. 237, Vol. I), in that genus becoming *A. mexicana*, Rose.

BBB. Lvs. broader, flat, often very fleshy.

c. Calyx minute. (*Urbina*)

12 *agavoides*, Baker (*Echeveria agavoides*, Lem. *Urbina agavoides*, Brit & Rose) Small and compact; lvs densely rosulate, stiff, acuminate and very sharp-pointed, pale gray-green on both sides, papillose fls 4–6, orange, on long pedicels, sepals several times shorter than the corolla. Mex.—Useful for carpet-beddings.

cc. Calyx evident or prominent.

D. Petals always appendaged at insertion of stamens. (*Pachyphytum*)

13 *Pachyphytum*, Baker (*Pachyphytum bracteosum*, Klotsch) SILVER-BRACT. Somewhat shrubby, very succulent, pale glaucous blue throughout, lvs. clothing upper part of st., more or less rosulate, large and thick, spreading, obovate, obtuse or obtuse-pointed, the scars from the fallen lvs orbicular. fls in spikes 4–6 in long on lateral peduncles, corolla red, immersed in the large calyx which is about 1 in. long, stamens 5 large and 5 small Mex B M 4951—A singular plant, blooming in summer 1 ft.

DD Petals not appendaged

E. Corolla strongly 5-angled (*Echeveria*.)

F Color of plant (or of lvs) dark purple

14. *atropurpurea*, Baker (*Echeveria sanguinea*, Morr.). St short and stout lvs in rosette at top of st., dark purple and glaucous, obovate-spatulate fls bright red, in a long raceme terminating the erect st., corolla 5-angled, white toward base Mex. See p. 1086.

FF. Color green, or ordinarily glaucous (except var. of No. 19)

G. St wanting or nearly so (acaulescent species).

15 *Peacockii*, Baker (*Echeveria Peacockii*, Crouch). Acaulescent lvs about 50 in a dense rosette 6 in across and standing 4 in. high, obovate-spatulate, mucronate, reddish toward tip, glaucous. st. 12–21 in., with small lf-like bracts: fls. bright red, in a scirpoid spike, calyx-lobes linear, unequal, corolla about $\frac{1}{2}$ in long, the parts lanceolate-acute. Mex (?)—Interesting for its glaucous coloring and waxy coating of the lvs. Named for Mr Peacock, of Hammersmith, England, in whose collection it flowered See p. 1086

16. *secunda*, Baker (*Echeveria secunda*, Booth) Fig 1083 Stemless lvs in a rosette, crowded, cuneiform, mucronate, glaucous, curving upward fls in a 1-sided, recurved spike, reddish yellow; peduncle long, 6–12 in high. June–Aug. Mex B R 26 57—Probably the most common species in gardens. Distinguished by its pale green red-tipped rosettes, several forms Half-hardy E. *glauca*, Baker (E. *secunda* var *glauca*, Otto), has glaucous-green foliage See pp. 1086–7.

gg St evident, often tall (caulescent species).

17 *Schœerii*, Baker (*Echeveria Schœerii*, Lindl.). Caulescent, branching lvs large, glaucous, oval, acute, narrowed into a long plane petiole-like part. fls dingy red with yellow tips, broadest at base, in drooping racemes; sepals linear, acute, green, spreading, shorter than the corolla Mex B R 31 27 P. 1087

18 *fulgens*, Baker (*Echeveria fulgens*, Lem.). St. 4–8 in tall, but bearing long leafy fl-branches: lvs. obovate-spatulate, pale glaucous green, clustered fls. bright red with yellow base, in nodding racemes. Mex.

19 *gibbiflora*, Moc & Sessé (*Echeveria gibbiflora*, DC.) Sts 1–2 ft high lvs flat, wedge-shaped, acutely mucronate, crowded at the ends of the branches: fls short-petioled; panicle branches 1-sided, spreading; corolla gibbous at the base between the calyx-lobes, the tube white, the tips touched with crimson. Mex. B R 1247. Var *metallica*, Baker (*Echeveria metallica*, Hort.). Lvs large, obovate-spatulate, 6 in. wide by 7 in long, a beautiful glaucous purple with metallic reflections fls yellowish with red tips. Mex.—An excellent plant for summer bedding P. 1087.

20 *coccinea*, Cav (*Echeveria coccinea*, DC.) Plant soft-pubescent, 1–2 ft. lvs. lance-spatulate: fls scarlet and yellow or paler within, in axillary long leafy, 15–25-fld., loose spikes. Mex. B M 2572. P. 1086.

EE. Corolla not strongly angled.

F Fls. in a dense spike (*Courantia*)

21 *roseata*, Baker (*Echeveria rosea*, Lindl *Courantia rosea*, Lem.) Sts branching, 1 ft lvs oval, erect, acute, mostly in terminal rosettes on the sterile shoots: fls yellow, in dense rose-bracted spikes, sepals linear-acute, rose-colored; corolla bell-shaped, 5-parted. Mex. B.R. 28 22.

FF. Fls. in cymes or panicles (*Dudleya*)

22 *pulverulenta*, Baker (*Echeveria pulverulenta*, Nutt. E. *farinosa*, Hort *Dudleya pulverulenta*, Brit & Rose) Lvs in a rosette, silvery green, very mealy, spatulate, acute, the tips reflexed, the cauline lvs gradually diminishing into broadly cordate, clasping bracts; panicles dichotomously branched, pedicels slightly longer than the pale scarlet or coral fls Plants 1 ft diam. S Calif F S 19 1927–8—A fine plant for carpet-bedding

23 *Purpusii*, Nichols (*Echeveria Purpusii*, Schum., not Brit *Dudleya Purpusii*, Brit & Rose) Cespitose, with powdered, snow-white foliage lvs densely rosulate, broadly spatulate, acuminate fls in a branching upright cluster, corolla conico-tubular, much exceeding calyx, segments scarlet with golden yellow tips S Calif. B.M. 7713 G C III 20 698 Gt 45, p 609.

1084. *Couroupita guianensis*, the cannon-ball tree, showing the trunk and the hanging flowers and fruits.

24 lanceolata, Benth & Hook (*Echeveria lanceolata*, Nutt. *Dudleya lanceolata*, Brit. & Rose) Green or slightly glaucous, acaulescent. lvs. in a rosette, lanceolate, acuminate, slightly mealy; st.-lvs. or bracts small, cordate, clasping, distant; panicle narrow, dichotomous; fls. red and yellow, calyx-lobes broad-ovate, $\frac{1}{16}$ in. long, corolla $\frac{1}{16}$ in. or more long. S. Calif.

25 californica, Baker (D. *Cotyledon*, Brit. & Rose. *Sedum Cotyledon*, Jacq. *Echeveria californica*, Baker). Plant acaulescent, tinged red: lvs. in a rosette, concave, ligulate, lanceolate, acute, glaucous, mealy, slightly yellowish, 8 in long fls. pale yellow, on weak lateral flowering sts 1-2 ft long, with short, ovate, clasping lvs. or bracts and bi- or trifid racemes. Calif.

Many garden names occur in *Cotyledon*, some of which are unidentifiable and some of which probably represent hybrids *C. dentata*, Hort. Hybrid between probably *C. glauca* and *C. gibbiflora* fls. 5-7 ft long. B.M. 8104 — *C. elegans*, N.E. Br. — *Oliverianthus* — *C. ezima*, Hort. = (?) — *C. globosa*, Hort., see page 1087 — *C. globularifolia*, Baker Rosulate, 8 in lvs 30-40, obovate-spatulate, $2\frac{1}{2}$ in or less long fls. white tinged red, 20-40 in a dense thyrse-like cluster. Syria. B.M. 8106 — *C. insignis*, N.E. Br. About 2 ft., wholly glabrous, erect, light green lvs. opposite, broad, to 5 in long fls. light red with lobes greenish yellow inside, $1\frac{1}{2}$ in long, in terminal and axillary cymes. Cent. Afr. B.M. 8106 — *C. mirabilis*, Hort. — *C. mucronata*, Baker = *Echeveria*, p. 1086 — *C. nana*, Mart. Very dwarf, $1\frac{1}{2}$ in or less high, densely branched and forming a tuft. lvs. yellowish green, not apiculate. S. Afr. — *C. Pridmorei*, Mast. Lvs. distributed, the radical ones spatulate-obovate and margins slightly dentulate, the cauline ones at-rolling fls. pale rose, somewhat second in a glandular hairy purple. China — *C. pulvinata*, Hook f. — *Echeveria*, p. 1086 — *C. sedula*, DC. Annual, creeping, smooth lvs. sedum-like, oblong and obtuse, convex fls. few, pink, in summer. Pyrenees. Distinguished from sedum by the campanulate corolla. — *C. spinulosa*, Linn. Small and quaint, spire-like, with a rosette of flat spoon-shaped spine-tipped lvs., 12 in. or more tall fls. yellow, in early summer. Siberia to China and Japan, but not locally. — *C. superba*, Hort. is an enormous tree with yellow fls. — *C. teretifolia*, Thunb. St. somewhat woody, 6-8 in high, simple or branched lvs. 4-5 in long, opposite, nearly terete, acute or cuspidate, hirsute or subglabrous fls. many, corymbose, the peduncle to 18 in, yellow, corolla-tube a little shorter than calyx. S. Afr.

L. H. B.†

COUCH GRASS: *Agropyron repens*

COURÂNTIA (personal name) *Crassulacée*. Caudexcent lvs. alternate, closely set, broad fls. in a dense bracteate spike, calyx-lobes nearly equal, linear, brightly colored, corolla not angled, yellow, stamens 10, filaments united into a tube for half their length. Only one species. First brought into cult about 1842. For cult., see *Cotyledon*. *C. rosea*, Lem (*Cotyledon roseata*, Baker) See No 21, p. 870

J. N. ROSE

COUROUPITA (from a vernacular name in Guiana) *Leguminacée*. Trees of Trop. Amer. (about 9 species) sometimes planted as oddities or for shade, particularly for the curiosity of the great ball-like frs. borne on the trunk. lvs. alternate, oblong, reticulate, entire or crenate-serrate fls. showy and odd, borne in racemes, often from the trunk and larger branches, calyx-tube top-shaped, the limb 6-lobed or -divided; petals 6, somewhat unequal, spreading and more or less incurved, borne on a disk, stamens many, in 2 sets,—one series forming a ring or cup in the center of the fl. and about the single 5-7-celled ovary, the other longer and rising from one side like a fringed palm or ladle over the pistil fr. a large nearly or quite globular ball, coraceous or woody, midch-scent, with many seeds imbedded in the pulp. *C. guianensis*, Aubl. CANNON-BALL TREE. Figs 1084, 1085 Tall soft-wooded tree in Guiana, where it is native. lvs. oblong-obovate, elliptic or broad-lanceolate, acute, entire or very obscurely toothed fls. with concave petals about 2 in long, yellow- and red-tinged on the exterior and crimson-lilac within, very showy, in racemes 2-3 ft long fr. nearly or quite globular, 6-8 in diam., reddish, hard on the exterior, pulpy inside, with very disagreeable odor when ripe. B.M. 3158-9 — Sometimes planted in the tropics, in botanic gardens and elsewhere. Shell of the fr. used for utensils, and the pulp said to be eaten by negroes and to be used for the making of beverages. L. H. B.

COUSSAPÔA (Caribbean name). *Moracée*. Fifteen to 20 milky-jucced trees or shrubs of Trop. S. Amer., 1 or 2 sometimes grown under glass, but apparently not in the American trade. They are sometimes scandent and epiphytic, like other *Ficus*-like things, sending down branches and completely enveloping the supporting tree and strangling it. lvs. alternate, stalked, thick, penninerved or 3-nerved, entire, fls. dioecious, in globose heads, the peduncles solitary or in pairs and axillary, the male clusters few-flid and often paniculate, the females on shorter peduncles fr. oblong, becoming succulent and with the including thickened perianth forming a mulberry-like multiple fruiting body. *C. dealbata*, André (*Ficus dealbata*, Hort.), is described as a very beautiful greenhouse subject, with coraceous elliptic lvs. 1 ft long and half as broad, white-silky beneath and deep green above. I.H. 17:4.

L. H. B.

COVER-CROPS. Green temporary crops, grown for the purpose of improving the soil, either as protection or to be turned down as green manure; word used chiefly in speaking of fruit-growing operations.

The use of cover-crops has become an essential part of orchard management. The name is derived from the fact that the seed is sown in the fall or late summer, and sufficient growth results so that the ground is covered and protected during the winter. The crops are grown for their effect upon the orchard, not for the direct value of the crop. The term was first used in this connection by Buley, Bulletin No. 61, of the New York Station at Cornell, p. 333, December, 1893.

Cover-crops make use of the available plant-food at a time when the trees are beginning to use it less and less. In this way, food that otherwise might be lost is stored up until it becomes available to the trees the following spring through the rotting of the cover-crops. The presence of the cover-crop, with its mat of roots, also prevents soil-washing and erosion with its accompanying loss of plant-food. The legumes, through the action of the bacteria found in their root-nodules, are able to add to the total amount of nitrogen present in the soil. This is the only way in which cover-crops increase the total supply of the plant-food elements, but the decay of the cover-crops increases the humus in the soil and, by the activities thus set up, the locked-up plant-food is released in a soluble form and thus the total available plant-food is increased. The ability of a soil to absorb and retain water is greatly increased in proportion to the humus that the soil contains. For this reason, soils rich in humus are less likely to be injured by erosion from the rapid run-off of the rainfall and less liable to suffer from drought. In soils plentifully supplied with moisture and plant-food, the trees are likely to continue growth so long that the wood does not mature and harden before winter, thus rendering them liable to injury during a severe winter. Such trees usually bear fruit that is poor in quality and in color. To produce mature, well-colored apples, it is essential that excessive growth after midsummer be prevented. The best means of doing this is to grow a crop in the orchard that will compete with the trees for the food and water. Soil protected by a cover-crop does not freeze so quickly or so deeply as when uncovered, and therefore the tree roots under a cover-crop are less likely to be injured by freezing and by heaving. Many

of our best fruit soils contain a large proportion of clay. When the humus-content of such soils becomes low, they are stiff and difficult to work and they dry out and bake quickly. Plowing under cover-crops restores the needed humus. This is important from the farm-management point of view. The period of time during which a clay field may successfully be plowed may frequently be doubled by thus increasing the humus supply. As the physical condition of the soil is bettered, the rootlets of the tree can more easily penetrate it in their search for food, and this larger feeding area means a greater supply of food. Orchards that are to be cultivated should be plowed as early as the land can be worked, in order to prevent excessive loss of moisture through evaporation and the demands of any growing cover-crop. This is especially true when rye, clover, or vetch are grown. Fall plowing is seldom advisable, as much of the benefit of the cover-crop is then lost. The time of seeding depends upon the needs of the fruit and the supply of moisture available. In seasons of plentiful rainfall the cover-crop should be put in early, but in a period of drought the trees need all the moisture there is in the soil and the seeding should be late. In the North Atlantic States, the cover-crops are planted from the latter part of July to the middle of August.

Kinds of cover-crops.

In general, cover-crops may be divided into the leguminous or nitrogen-gathering, and the non-leguminous crops.

1. Leguminous cover-crops—Red and mammoth clover, Canada field peas, and winter vetch are used in the northern states, soybean, cowpea, crimson clover, and vetch in the central and southern states.

2. Non-leguminous cover-crops—Rye, oats, wheat, and barley; rape and turnips; buckwheat and nearly all weeds.

Average quantity of seed per acre.

Barley . . .	2	to	2½ bushels.
Buckwheat . . .			1 bushel.
Clover, red . . .	10	to	15 pounds.
Clover, mammoth . . .	10	to	15 pounds.
Clover, crimson . . .	15	to	20 pounds.
Cowpea . . .	1½	to	2 bushels.
Millet . . .			1½ bushels.
Oats . . .	2	to	3 bushels.
Peas . . .	2	to	3 bushels.
Rape . . .	2	to	5 pounds.
Rye . . .	1½	to	2 bushels.
Soybean . . .	1	to	1½ bushels.
Turnip . . .			4 pounds.
Vetch . . .	½	to	1 bushel.
Wheat . . .	2	to	2½ bushels.

3. Combinations of cover-crops—An ideal cover-crop should possess certain characters. It should make a vigorous vegetative growth by fall so as to furnish an abundance of humus and to hasten the maturity of the trees. The seed should be of such a nature that it will catch well when planted at a time of year when the soil is very dry. Preferably, the cover-crop should winter over. All these characters are seldom found in a single crop and, hence, combinations are desirable. Thus buckwheat, which makes a quick growth, does not live through the winter as does the slower-growing rye, so the two combine well. The following combinations are frequently used:

1.	{ Clover (red or mammoth)	10	pounds.
	{ Winter vetch . . .	15	pounds.
	{ Oats . . .	½	bushel.
	{ Cowhorn turnips . . .	½	pound.
2.	{ Buckwheat . . .	½	bushel.
	{ Oats . . .	1	bushel.
	{ Rye . . .	1	bushel.

COWPEA

3.	{ Oats	1½ bushel.
	{ Clover	15 pounds.
4.	{ Buckwheat	¾ bushel.
	{ Oats	1 bushel.
5.	{ Oats	1½ bushel.
	{ Rye	1 bushel.

In the peach orchard, where large annual growth is not desirable, or in apple orchards making excessive growth, the leguminous crops should be used sparingly, if at all.

C. S. WILSON.

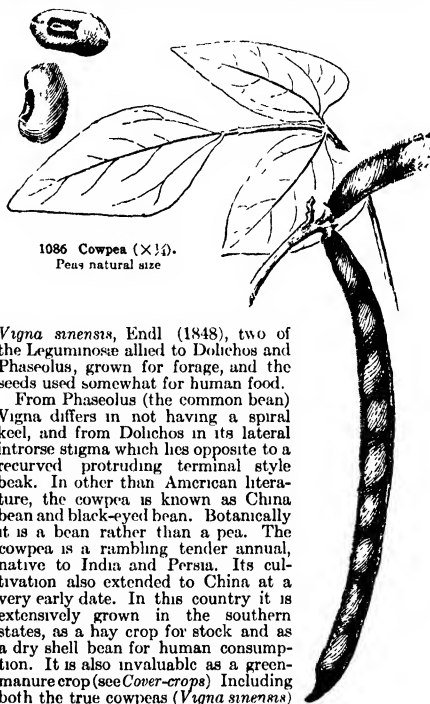

COWANIA (after James Cowan, an English merchant, who intro many Peruvian and Mexican plants into England) *Rosaceæ*. Some 4 or 5 small shrubs from the S W U S. and from Mex, with small crowded lvs and handsome white or purple fls; rarely cult in botanical collections. Closely related to *Fallugia*, but differing in the absence of bracts at the base of the calyx. Cult and prop like *Fallugia*, but apparently more tender like that plant well adapted for planting in rockeries. *C. mexicana*, Don (*C. Stansburiana*, Torr.), has small crowded cuneate 3-7-lobed lvs. and white fls about 1 in across. *C. plicata*, Don (*C. purpurea*, Zucc.), has incised serrate lvs and purple fls.

ALFRED REHDER.

COWBERRY. Usually means *Vaccinium Vitis-Idæa*. In parts of Scotland, *Comarum palustre*.

COW-HERB: *Saponaria Vaccaria*.

COWPEA. Fig. 1086. The American name for the cultivated forms of *Vigna catjang*, Walp (1839), and

Vigna sinensis, Endl (1848), two of the Leguminosæ allied to *Dolichos* and *Phaseolus*, grown for forage, and the seeds used somewhat for human food.

From *Phaseolus* (the common bean) *Vigna* differs in not having a spiral keel, and from *Dolichos* in its lateral introrse stigma which lies opposite to a recurved protruding terminal style beak. In other than American literature, the cowpea is known as China bean and black-eyed bean. Botanically it is a bean rather than a pea. The cowpea is a rambling tender annual, native to India and Persia. Its cultivation also extended to China at a very early date. In this country it is extensively grown in the southern states, as a hay crop for stock and as a dry shell bean for human consumption. It is also invaluable as a green-manure crop (see *Cover-crops*) Including both the true cowpeas (*Vigna sinensis*)

and the catjangs (*V. catjang*). Piper lists 270 varieties. As a class the catjangs may be distinguished from the true cowpeas by the smaller size of the seeds and pods and by the latter remaining upright throughout their growth period, never becoming strictly pendulous even after ripening. At the present time the true cowpeas are much more widely grown than the catjangs but the latter may yet come into more prominence on account of the resistance to the weevil of their small hard seeds. The cowpea is to the South what clover is to the North and alfalfa is to the West. It is sown broadcast after the manner of field peas. From three to five pecks of seed are used to the acre. See Cowpeas, Farmers' Bulletin No. 89, U. S. Dept. of Agric., by Jared G. Smith; Bulletin No. 102, pt. VI, and Bulletin No. 229 of the Bureau of Plant Industry, U. S. Dept. of Agric.; Cyclo. Amer. Agric., Vol. II, p. 260. For a botanical discussion of the cowpea and its taxonomic relatives, see *Vigna*. GEO. F. FREEMAN.

COWSLIP. The true English cowslip is *Primula officinalis*. The plant wrongly called cowslip in America is the marsh marigold, *Caltha palustris*. The "American cowslip" is a popular name for *Dodecatheon meadia*. The name "Virginian cowslip" is sometimes used for *Mertensia virginica*.

CRAB'S-EYE VINE: *Abrus*.

CRAB-APPLE in its widest sense means a small apple. The crab-apples of botanists are particularly fruits of *Pyrus baccata*. For more restricted uses of the word crab, see *Pyrus*.

CRAB-GRASS: One of several names for *Eleusine indica*, also for certain *Panicums*, as *P. sanguinalis* (or *Digitaria sanguinalis*).

CRAMÉE (old Greek substantive). *Cruciferae*. Herbs or sub-shrubs, one grown in the vegetable garden, and one or two in the hardy herbary.

Annuals, biennials or perennials, with thickened sts., and more or less fleshy lvs., glaucous lvs. mostly large, more or less cut, lyrate or pinnatifid fls. small, white, fragrant, in panicle racemes fr. 2-jointed, indehiscent, the lower joint st.-like and seedless, the upper one globular and 1-seeded.—About 20 species in Eu., Asia, and 1 in Patagonia. Of easy cult.

cordifolia, Stev. Excellent foliage plant, withstanding the winters in the northern states: lvs. very large and heavy, cordate and ovate, toothed, glabrous or nearly so fls. small but very numerous, in great branchy panicles 5-7 ft. high and nearly as broad, overtopping the mass of root-lvs. Caucasus Gn 50, p. 349 Gng 4 291.—For the first 2 years from seed the plant makes only lvs.; but the third year it may be expected to bloom, after which the plant usually becomes weak and dies.

maritima, Linn. SEA-KALE. Perennial, smooth, stout, to 2 ft. lvs. large, heavy and cut, more or less fringed or curled, glaucous green fls. many, white, broad, honey-scented, in a tall panicle, in May. Coasts of Eu.—Grown as a garden vegetable. See *Sea-kale*.

C. juncos, Barb. Biennial small species with white fls. in an attractively slender-branched panicle. Iberia.—*C. Kotchyndia*, Boiss. Perennial lvs. somewhat hairy, the radical ones cordate-ovate with rounded dentate lobes, the st.-lvs. few, ovate-oblong, lobed. W. Asia.—*C. tatarica*, Jacq. Perennial, said to be grown in Hungary as "Tartarian bread". Glaucous, more or less rough-hairy radical lvs. decomposed, with linear segms. Hungary, E. L. H. B.

CRANBERRY. A name applied to trailing species of the genus *Vaccinium* (*Ericaceae*); much grown in North America for the fruit. Plate XXIX.

Of the true cranberries, there are two species in North America, the small (*Vaccinium Oxyccocus*), and the large (*V. macrocarpon*). The large cranberry, *V. macrocarpon* (Fig. 1087), is now cultivated on thousands of acres in the United States and this cranberry culture is one of the most special and interesting of all

pomological pursuits. This cranberry grows wild only in North America, where it is native to acid swamps in the cooler parts of the United States and in Canada. Here it trails its slender stems and small oval evergreen leaves over the sphagnum and boggy turf, and the firm red berries which ripen during September and October often persist on the vines till the following spring or even longer. The curve of the slender pedicel in connection with the bud just before the blossom opens, with its resemblance to the head and neck of a crane, is said to have suggested the name cranberry which is now shortened to cranberry.

The low-bush cranberry, or wolfberry (*V. vitis Idaea*), is much used in Nova Scotia and other parts, and is gathered and shipped in large quantities to Boston, but it is not cultivated. This berry is also common in Europe, where it is much prized. The quantities of this fruit imported into the United States from various sources is considerable.

The ideal bog for cranberry-culture should have the following qualifications: (1) Capability of being drained of all surface water, so that free water does not stand higher than 1 foot below the surface in the growing season. (2) Soil that retains moisture through the summer, for cranberries suffer greatly in drought. (3) Sufficient water-supply to enable it to be flooded. (4) A fairly level or even surface, so that the flooding will be of approximately uniform depth over the entire area. (5) Not over liability to frosts.

The water of the streams and pools in the acid swamps or bogs, which are the natural habitat of the cranberry, is usually, but not invariably, of a brownish or amber color, and some of the most common associate plants are the swamp huckleberry or blueberry (*Vaccinium corymbosum*), the cassandra or leather-leaf (*Chamaedaphne calyculata*), the red maple (*Acer rubrum*) and the swamp cedar (*Chamaecyparis thyoides*).

There are three centers for the production of cranberries in the United States. Massachusetts, where cranberry-culture began and from which come the most berries; New Jersey second; and Wisconsin third. While the culture is in most respects similar in these three centers, each has its own characteristic methods of preparation and cure of the bogs. There is also an important and growing cranberry industry in Nova Scotia.

The cranberry bog. Figs. 1088-1090.

To insure success in cranberry-culture, a prime requisite is to locate the bog on soil on which wild cranberries or some of their common associate plants flourish. This is usually a black peaty formation from a few inches to 7 or 8 feet in depth, overlying sand which in turn is frequently underlaid by a "hardpan" that is nearly impervious to water and the presence of which had much to do with the formation of the peat. Another requisite is to make sure of an ample supply of water, preferably of the brownish color, for winter flooding and for protection from frost in spring and fall. Flooding at special times is also the safest and surest weapon against many kinds of insects

1087 *Vaccinium macrocarpon*, the common cranberry. ($\times \frac{1}{2}$)

Without an ample supply of water, cranberry-culture is so hazardous as hardly to be worth undertaking.

The building of the dams is the first step necessary for the improvement of a bog. A foundation for these should be made by digging a trench entirely through the peat, even if it should be 8 feet or more thick, to the clean sand, and this trench should be filled with sand free from all foreign material, above this foundation, embankments are built of clean sand and faced up with sods of live turf to prevent their being washed by the waves of the lake formed. The dams should be sufficiently high to flood the higher parts of the bog a foot deep, which will frequently make the water in the deeper parts 3 to 6 feet or more in depth. Gates or flumes must be constructed at the lowest point in these dams to provide for drawing the water off the bog and provision made for surface drainage. The latter is generally accomplished by opening the natural stream, if there should be one, or by digging an open ditch through the natural drainage center of the piece

ample supply of water permits reflooding when a later severe frost threatens. Reflooding about the first of June, provided the water has not been withdrawn earlier than May 5 to 10, will also furnish protection from a number of damaging insects and will not injure the crop, provided care is taken that the water does not stand on any part of the bog more than forty-eight hours. If a bog should become seriously infested with insects later in the season, it is occasionally profitable to sacrifice what remains of the year's crop and clear the bog of insects by flooding. This sometimes results in a greatly increased yield the following year. Damage from a light frost in the fall, before the berries are picked, may be prevented by raising the water in the ditches and about the roots of the vines. Protection from a heavy frost requires covering the plants with water, but this will cause immature berries to rot and should be done with great caution or the damage from water may be greater than it would have been from frost. During summer the irrigation of

the crop is accomplished by holding the water low or high in the ditches, as the varying season may demand.

Preparation and tillage

Before cranberries are planted, the land must be cleared of all its natural growth, the stumps and roots removed and the ground leveled to a greater or less extent. The more nearly level a bog is made, so that proper drainage is provided for, the more economical it is in the use of water and the easier it is to provide the optimum amount of irrigation during the summer. The first cost of such perfect leveling, however, may be prohibitive or it may require the removal of all the good peaty soil over a considerable area,

1088. A Massachusetts cranberry bog—Picking the fruit.

of land being improved. Side ditches should be dug leading into the stream, or main ditch, in sufficient number to drain off all surface water; they may be made from 1 to 3 feet deep, according to the character of the land to be drained. A reservoir built above the bog is very desirable in facilitating control of the water. In frosty Wisconsin it is considered almost necessary to have three times the area of the bog in reservoir to insure the crops. If a bog is situated on a stream subject to high water, provision must be made for keeping the flood water from the bog, as the crop would be destroyed if it were flooded during blooming time or seriously injured by flooding at any time during the active growing season. Winter flooding of cranberry bogs is to prevent heaving and winter-killing. The water is put on about the first of December or after the vines have become thoroughly reddened by cold weather.

Cranberry bogs, being always lower than the surrounding land, are peculiarly liable to damage by frost, serious loss frequently occurring when an ordinary farmer would not dream of danger, and a good supply of water is the only preventive that has been found efficient. The time of starting growth in the spring may be controlled by the time the water is drained off, and the earlier spring frosts may so be avoided while an

leaving nothing but pure sand in which the cranberries will not grow well. In many places, the removal of the natural growth may best be accomplished by cutting off the tops of the bushes and trees so that they will not extend above the surface of the water and flooding for two years, thus killing all vegetation. While this flooding entails loss of time, it is much easier and cheaper to clear away the dead roots and stumps than live ones, and when no sand is applied to the surface, as is the rule in New Jersey, it greatly lessens the expense of keeping the bog free from weeds for there are no live roots in the ground to send up suckers. In some places, as in most of Wisconsin, this method of drowning out is impracticable, because the surface soil, in which are the roots of all the living plants, will separate from the more perfectly decomposed peat below and rise to the surface of the water in floating islands making death to vegetation by drowning impossible. In such situations the ground must be turfed and all roots and stumps grubbed out. In either case the roots and stumps are best disposed of by piling in heaps and burning. In Massachusetts, it is the custom to cover the cleared and leveled bog with 3 to 5 inches of sand, which makes it still easier to keep the bogs free from weeds and acts as a moisture-retaining mulch for the

underlying peat. Where sanding is practised, it is the custom to apply a fresh coat of sand an inch or less in depth every two or three years; this keeps the vines short and close.

Cuttings for planting are secured by mowing vigorous vines from an old bog with a scythe. These cuttings, preferably not more than 8 or 10 inches long, are thrust diagonally into the surface of the bog from 12 to 14 inches apart. Not more than 3 or 4 inches of the top should be exposed, and if the bog is sanding, care should be taken that the cutting extends well into the muck below. As the vines grow they send out runners in all directions, netting the ground completely over. These sometimes grow as much as 6 feet in length and root in the soil at frequent intervals. From the runners grow upright stems which, in time, cover the bog with a solid mat of vegetation. The uprights are preferably not more than 6 inches high but under some soil conditions grow to a foot or more when the fruit is likely to be scanty. From the time of planting, three to five years must pass before the ground is matted over and a crop may be expected.

The character of the growth of cranberry vines precludes any cultivation in the ordinary sense of the word. The care of the bogs consists in keeping them free from other plants, which is accomplished almost entirely by hand-pulling, the regulation of the irrigation water, and preventive and curative measures for the many diseases and insect enemies to which they are subject.

Fertilizing of cranberries has met with considerable success in increased crops, various brands of commercial fertilizer having been employed. The subject is not well understood, however, and is attracting the attention of many thoughtful growers and their scientific helpers in the state experiment stations.

The pretty little pinkish white flowers of the cranberry open during June, when the bogs are not flooded, but the holding of the winter water till May throws the fullest bloom into the early part of July.

Diseases and insects.

Spraying with bordeaux mixture is very generally practiced to prevent "scald," a fungous disease which

has been especially injurious to the growers of New Jersey and which was so named because it was long thought to be caused by the scalding effect of the hot sun shining on berries wet with dew. As it is seldom possible to run heavy spraying machinery over the bogs, spraying involves the use of very long lines of hose or the laying of pipe lines, or both, the spraying of each

1090 The flume or outlet at the bottom of a cranberry bog.

property being a separate engineering problem.

Insects of many kinds attack the roots, the leaves, the blossoms and the fruit of the cranberry. Knowledge of the life history of each of these is necessary for successful warfare against it, and detailed information is best secured from the various bulletins of the

United States Department of Agriculture and the agricultural experiment stations of New Jersey, Wisconsin and Massachusetts. More varieties of insects may be successfully combated with water than with any other one thing, as already explained. Arsenical poisons are expensive to apply, of indifferent success in destroying insects on the bogs, and they are suspected of being an actual poison to the vines.

Varieties

There are now many varieties of cranberries in cultivation, all of them having been selected from wild vines or vines that appeared naturally in cultivated bogs. These varieties vary in shape, color, size, productiveness, time of ripening and adaptation to different soils. Some of the forms are shown in Figs 1091-1093. The most generally cultivated are the Early Blacks and the Howes, both of which originated in the Cape Cod district and which together make

about 50 per cent of the berries marketed from all three of the cranberry states.

The Early Blacks are ready to harvest about the first of September both in Massachusetts and New Jersey, and the last of the Howes are seldom picked before the middle of October. As the pickers advance over a cranberry bog, they pick clean as they go and do not go back for successive relays of ripening berries as with most other small fruits.

Picking and grading

In Massachusetts most of the picking is done by a scoop, by which the berries are raked from the vines. When the vines are short, the uprights not tangled, and the picker is experienced, berries can be harvested in this way very rapidly and with very little damage to either fruit or vines. The bogs are kept in good condition for "scooping" by pruning every three or four years with a rake the teeth of which are knives placed about 6 inches apart. The scoop (Fig 1091) is also used to a considerable extent in New Jersey and Wisconsin but in these states a great many berries are still picked by hand.

Some of the berries, especially in Massachusetts, are cleaned and packed on the bog as they are picked, and sent directly to market, but this immediate packing tends to poor keeping. Most cranberries, after picking, are put in boxes which are packed in well-ventilated storehouses. Here they are kept from a few days to several months and the cleaning and packing for market is done immediately before they are shipped.

The machine which has been the standard for cleaning cranberries for many years is provided with a fan to blow away all grass, pieces of vine, dried-up berries or anything of like nature that may have gotten in the berries while being picked. The berries are then allowed to roll down a series of steps; those that are sound are elastic and will bounce like little rubber balls. There are bands of cloth stretched above the steps in such a way that when a berry bounces in the right direc-

1091. The oblong or bugle-form type of cranberry. ($\times \frac{1}{2}$)

tion it is received on the cloth and slides down into the box placed for the good berries without more bouncing. The rotten berries having lost their elasticity are not able to bounce over the cloth partition that separates the good from the bad. With berries that are nearly spherical and not too juicy this machine works very well, provided there are no frozen berries

1092. The obovoid or bell-shaped form of cranberry ($\times \frac{1}{2}$)

stood that berries going over these machines are not in the best possible condition for long keeping after they are put on the market. Some varieties of berries which are very juicy and tender can not be put through these machines at all as the steps get so sticky with the juice that the berries will not bounce.

In 1903, a machine was patented by Joseph J. White, which avoids the defects of the bounce machines. This has since been put on the market and its use is spreading among the more careful packers of Massachusetts and New Jersey, but the more complicated machinery and greater cost have prevented its adoption by other growers. This machine is provided with a hopper into which the cranberries are emptied through a screen which removes the coarser grass and vines, from the hopper the berries are fed, single file, to screw conveyors on which they are held by trough-like guards. These guards do not quite touch the screw, leaving a crack through which the remaining bits of grass, vines and dried berries are dropped into a box placed below to receive them.

The screw conveyor passes the berries over a series of selecting plates made of some resilient material, the best found so far being the selected spruce wood prepared for piano sounding-boards. These plates are tapped by small hammers placed beneath, the strength of the blow being regulated by a thumb-screw. The sound berries respond to this gentle tapping by jumping off the screw conveyor and falling on an endless belt a few inches below, which delivers all the sound fruit at one end of the machine. The rotten berries do not respond to the tapping of the selecting plates and are carried to the ends of the screw conveyors where they drop in the same box under the machine that receives the fine grass and the like. Frozen berries are removed by this machine nearly as well as

1093. The globular or cherry-shaped cranberry. ($\times \frac{1}{2}$)

ones and will all go into the box for good fruit. Neither will the bounce machines work well with long or oval berries; when these strike on their pointed ends they fail to bounce and there is always a considerable percentage of sound fruit found in the refuse box. As there may be anywhere from ten to thirty or more steps, it is easily understood that berries going over these machines are not in the best possible condition for long keeping after they are put on the market. Some varieties of berries which are very juicy and tender can not be put through these machines at all as the steps get so sticky with the juice that the berries will not bounce.

rotten ones and the shape of the berries is of no importance, while the berries only drop twice, a few inches each time, and are in much better condition for long keeping than those that go over the bounce machines. After the berries have been cleaned by machine it is customary to place them on tables where women remove any defective berries that may have been missed by the machines.

Marketing; yield.

Most cranberries are marketed in barrels holding about 100 quarts; a few are marketed in crates three of which fill a barrel. Some dealers prefer to buy cranberries "in the chaff," that is, just as they come from the bogs without having been run through any machine. Berries sold in this way are always packed in crates and are cleaned by the dealer, a few crates at a time, as his trade calls for them; they keep better than those that have been cleaned before being shipped.

Evaporated cranberries have been on the market for a number of years and are excellent, there being less difference between the sauce made from them and from fresh fruit than is the case with most kinds of fruit.

From the cranberry centers, the fruit is shipped in carload lots to the large cities of the United States, and from these distributed to the surrounding towns. There is also a small but steadily growing export trade.

A bog in good bearing should yield fifty barrels to the acre, but as many as 200 barrels have been secured.

In 1895 cooperative selling of cranberries was inaugurated by some of the New Jersey growers, who organized the Growers' Cranberry Co., with Joseph J. White as president and Theodore Budd as vice-president. This company was joined by a number of large New England growers and, though handling only 25 per cent of the crop, prospered greatly. Later, A. U. Chaney organized another cooperative selling company. These two companies consolidated in 1910, forming the American Cranberry Exchange, with George W. Briggs, of Massachusetts, as president. The Exchange controls about 50 per cent of the crop of the country and has been remarkably successful in securing good prices for its members while keeping the retail price as low as during the years of fiercest competition.

History.

Cranberry-culture began about a century ago in Massachusetts on the Cape Cod Peninsula. William Kenrick, writing in 1832 in the "Orchardist," says that "Capt Henry Hall, of Barnstable, has cultivated the cranberry twenty years," "Mr F A Hayden, of Lincoln, Massachusetts, is stated to have gathered from his farm in 1830, 400 bushels of cranberries, which brought him in Boston market \$600." In the second and subsequent editions, Kenrick makes the figure \$400. It is not said whether Hayden's berries were wild or cultivated. At the present day, with all the increase in production, prices are higher than those received by Hayden. In the third (1841) and subsequent editions, it is said that "an acre of cranberries in full bearing will produce over 200 bushels, and the fruit generally sells, in the markets of Boston, for \$1.50 per bushel, and much higher than in former years." It was as late as 1850, however, that cranberry-culture gained much prominence. It was in 1856 that the first treatise appeared. B. Eastwood's "Complete Manual for the Cultivation of the Cranberry." About 1845, cranberry-culture began to establish itself in New Jersey.

The culture of cranberries began in Nova Scotia about thirty years ago. The first attempt consisted in improving some of the patches of wild berries found growing around the central district of the Annapolis Valley. Gradually the idea was entertained of planting new areas, and as this proved successful the new industry was soon fairly established. Farmers in the vicinity of Auburn soon took up the industry, and in the fall of 1892 the first carload of cranberries was shipped to Montreal. Since then, Nova Scotia cranberries have met with a ready sale throughout Canada.

1094. Cranberry scoop, sometimes used in picking the berries.

Literature.

The standard books on the cultivation of cranberries are Webb's "Cape Cod Cranberries," and "Cranberry Culture," by Joseph J. White; these are old books and in many respects out-of-date. The best literature on the subject is to be found in the various publications of the United States Department of Agriculture, the bulletins of the agricultural experiment stations of New Jersey, Wisconsin and Massachusetts, the proceedings of the American Cranberry Growers' Association which have been published biennially since 1880, the reports of the Cape Cod Cranberry Growers' Association, and the reports of the Wisconsin State Cranberry Growers' Association.

ELIZABETH C. WHITE.

CRANBERRY TREE: *High-bush cranberry, Viburnum Opulus.*

CRANESBILL. Loosely applied to the whole genus *Geranium*. In America it usually means *G. maculatum*.

CRANULÀRIA (from a fancied resemblance of the pod to a skull or cranium). *Martyniææ*. Coarse but interesting flower-garden annual.

Wide-spreading low viscid-hairy rank forking herb. lvs large, opposite, long-petioled, broadly cordate, reniform or palmately lobed; fls. white, racemed, calyx 3-5-lobed, more or less inflated, corolla very long-tubed, the tube slender and cylindrical, campanulate at the throat, more or less 2-lipped, the 5 lobes rounded and somewhat undulate, the anterior largest, perfect stamens 4, didynamous, affixed at or near the throat, ovary 1-celled; fr. a 2-valved caps. with a long incurved beak, many-seeded.—Two species, Venezuela to Paraguay. Usually confused with *Martynia*, from which it is distinguished readily by having 4 rather than 2 fertile stamens and by the very long and slender corolla-

tube which widens at the throat; the closely related *Proboseidea* has a much broader tube widening nearly from the base.

Annua, Linn. (*Martynia Cranulària*, Glox.). Two feet high: lvs. palmately lobed, the margins dentate; calyx 2-bracted, cut down one side, about one-third the length of the slender straightish corolla-tube; lobes of corolla rounded and not much undulate; style 2-lobed, equalling or slightly exceeding the 2 pairs of stamens. N. S. Amer.—The thick fleshy root is preserved in sugar as a comfit, plant known as "Creole scorzonera" in S. Amer. There appears to be confusion in the seed sold as *Martynia Cranulària*; some of it may be *M. louisiana* or other species. L. H. B.

CRÁSSULA (Latin *thickish*, referring to the thick leaves and stems) *Crassulacæ*. Fleshy and leafy greenhouse shrubs or herbs, grown for the grotesque appearance of some of the kinds and also for the bloom.

Variable in habit and foliage, mostly erect; rarely annual. lvs opposite, usually sessile and often connate, fleshy, very entire and the margins sometimes cartilaginous, glabrous or pubescent or scaly. fls. usually small, white, rose or rarely yellow, commonly in cymes but sometimes capitate, usually 5-merous; calyx 5-parted, the lobes erect or spreading, petals 5, free or joined at the base, erect or spreading; stamens 5, shorter than the petals; carpels 5, many-ovuled.—Species 150 or more, mostly in S. Afr., but a few in Abyssinia and Asia. Many species have been intro. to cult., but only a few are actually grown outside of fanciers' collections. The rocheas sometimes pass as crassulas. See *Rochea*.

The genus *Crassula* gives the name to the order *Crassulacæ*, which contains many cultivated succulent plants, and also others of widely different habit. The order is closely related to the *Saxifragææ*, but differs in having the carpels of the ovary entirely free and equal in number to the petals, but the forms pass easily into the *Saxifragacææ* through *Francoa* and *Tetilla*, and back again through *Triactina*. The genera, as usually treated, are ill defined, and certain species of *Sedum* cross over the lines of *Crassula*, *Cotyledon* and *Sempervivum*, while between *Crassula* and *Tillia* no very clear distinction can be made.

Crassulas are greenhouse plants requiring a dry atmosphere during the resting-period. While making growth, they may be treated like other greenhouse plants in the way of watering, placing them in the lightest and airiest part of the house. The pots must be drained so that any surplus moisture will easily pass through. The soil should consist of sand, loam, broken brick, and a very small quantity of leaf-soil or thoroughly rotted cow-manure. Propagation is usually from cuttings. Some of the species, such as *C. fasciata*, do not give much material for this purpose, and they should, therefore, be headed over and the tops put in dry sand in the spring, allowing water only when they show signs of shriveling. The cut-over plants should

1095. *Crassula quadrifida*.
($\times \frac{1}{2}$)

be encouraged to make side shoots, which may be rooted after they are large enough (G. W. Oliver.)

A. *Floral parts in 4's.*

quadrifida, Baker. Fig. 1095. Perennial. lvs oblong-spatulate, the upper ones rounder, decussate: fls. with their parts in 4's, panicle, white, tinged red. Cape.

AA. *Floral parts in 5's, which is considered to be normal in the genus.*

B. *Lvs petioled.*

cordata, Soland. Plant slender and shrubby, 1-3 ft., erect or diffused and sometimes rooting at the joints: lvs dotted, stalked, cordate-reniform, obtuse, entire, glabrous; cymes panicle-like; fls. reddish, sometimes pure white; petals free, lanceolate, spreading. Cape Winter.—Closely allied to *C. spathulata*.

spathulata, Thunb. Somewhat shrubby, more slender and trailing than *C. cordata*, decumbent, branching: lvs stalked, roundish, crenate, glabrous, shining above; corymbs panicle-like; fls. rosy or flesh-colored; petals acute. Cape L B C 4:359 as *C. cordata*.—Likely to be cult. as *C. cordata*.

BB. *Lvs not petioled (or only tapering to base).*

C. *Foliage glaucous.*

falcata, Wendl (*Röchea falcata*, DC.) Height 3-8 ft.: lvs. grown together at the base, thick, glaucous, oblong, falcate. fls. small, numerous (50 or more), in a crimson, rarely white, dense, terminal corymb; corolla-tube $\frac{1}{4}$ in. long, as long as the limb or shorter. Cape. B M. 2035.

CC. *Foliage not glaucous.*

lacteæ, Soland. Plant shrubby, branching, tortuous below, 1-2 ft.: lvs narrow-obovate, acutish or acuminate, narrowed and grown together at the base, glabrous, spotted along the margin. cymes panicle-like, many-fld, fls. white, small. Cape Winter. B M 1771 L B C 8:735.—A free-flowering window plant of easy cult. There is a form with variegated lvs. Differs from *C. arborescens* in the narrower acute lvs that are more tapering at base, and in the color of the fls.

arborescens, Willd. Fleshy erect shrub, reaching 8-10 ft. lvs. roundish-obovate and obtuse, tapering to base, fleshy, flat and glaucous, dotted above, the edges smooth. fls. rather large, rose-colored, in trichotomous panicle cymes. Cape B M 384 (as *C. Cotyledon*).

C. atrosanguinea, Barbey. Erect, 12-20 in., rigid at reddish, branched at top. lvs. aloe-like, straight or recurved, glabrous, narrowed from base to apex, often 1 in. long, revolute and on the fls. dark red, in a dense terminal many-fld cluster. Transvaal.—*C. coccinea* Linn.—*Röchea coccinea*—*C. conferta*, N. E. Br. Only $\frac{3}{4}$ in. high. lvs. thick and fleshy, ovate-lanceolate fls. numerous, densely crowded in a axile terminal head, the petals scarcely $\frac{1}{2}$ in. long, white. S Afr.—*C. conjuncta*, N. E. Br. Lvs. concave fls. pure white in a compact narrow cluster. S Afr.—*C. decipiens*, N. E. Br. Dwarf tufted perennial. lvs. densely covered with blunt papillæ or nipple-like projections, fleshy, oblong, fls. very small, white, in terminal 3-branched cymes. S Afr. (?)—*C. posmilæa*, Ker-Gawl.—*Röchea jasminæ*—*C. sedifolia*, N. E. Br. Only 1-2 in. high when in bloom. lvs. in small tufts at the base and 3 or 4 pairs on the fls. bright green, glaucous, with red-brown spots along the margin fls. white, 3-9 together in terminal cymes. S Afr.—*C. saridulæa*, N. E. Br. Plant 3-6 in. high, branched at base. lvs. in 4 rows, densely unbracted, ovate, small ($\frac{1}{2}$ in. or less long), glaucous on margin. fls. white, or red outside, 5-7 in small cymes dilated in a narrow terminal panicle. S Afr.

L. H. B.†

CRATÆ-MÉSPILOS: *Crategus grandiflora*.

CRATÆGO-MÉSPILOS. This name has been bestowed on a graft hybrid between *Crategus monogyna* and *Mespilus germanica*, discovered in 1894 in the garden of M. Dardar at Bronvaux near Metz, Germany. Like *Laburnum Adamii*, which is probably the best known of the graft hybrids, it produces at the same time branches intermediate in their characters between the parents and branches resembling more or less closely the parent plants. Two distinct forms pro-

duced on different branches of the parent tree have been prop. and distributed under the names *C. Dardari* and *C. Asneresii*. The first form (*C. Dardari*, Simon-Louis), has the lvs. and the frs. very similar to those of the medlar, but the branches are spiny, the fls. appear in corymbs, are distinctly pedicelled and have 15-20 stamens and the frs. have only 1-3 stones, measure $\frac{1}{2}$ - $\frac{3}{4}$ in. across, and are crowned by persistent upright connivent calyx-lobes. M D G. 1912 101. The second form, *C. Asneresii*, Schneid. (*C. Jules d'Asnières*, Simon-Louis) resembles more *Crategus monogyna*, but is pubescent; the lvs. on the flowering branchlets are usually oval to obovate and often entire, while those of the shoots are ovate or rhombic-ovate and usually with 1 to 3 rounded or rarely acute lobes on either side; the fls. are borne in pubescent, 6-12-fld corymbs, have 20 stamens and 1-2 styles; the fr. is subglobose and less than $\frac{1}{2}$ in. across. G C III. 50 183, 185. Gn. 75, p. 310. M D G 1912 100.—While *C. Dardari* is botanically more interesting, *C. Asneresii* is more ornamental and forms a handsome small tree with gracefully arching branches studded with numerous fl.-clusters. It is prop. by budding or grafting like the horticultural varieties of *Crategus*.

ALFRED REHDER

CRATÆGUS (ancient Greek name, derived from *kratos*, strength, on account of the hardness of the wood) *Rosaceæ*, subfam. *Pômææ* **CRATÆGUS HAWTHORN** Woody plants grown for their handsome foliage, attractive flowers and decorative fruit which, in a few species, is edible, and also for their picturesque habit: very valuable for ornament.

Shrubs or small trees, usually spiny. lvs. alternate, deciduous, stipulate, serrate, often lobed or pinnatifid: fls. white, in some varieties red, in corymbs, rarely solitary, petals and calyx-lobes 5, stamens 5-25, usually 10 or 20; styles 1-5 fr. a drupe-like pome, with 1-5 1-seeded bony stones.—A large genus, widely distributed in the temperate regions of the northern hemisphere, most abundant in N. Amer., where between 800 and 900 species have been described, while from the Old World only about 60 species are known. There exists no recent monograph of the genus, a systematic enumeration of the arborescent American species will be found in Sargent, "Manual of the Trees of North America," pp 363-504, of the species of the southern states in Small, "Flora of the Southeastern United States," pp 532-569; and of the species of the north-eastern states in Gray's Manual, ed 7, p 460-79, and in Britton and Brown, Ill. Flor (ed 2) 2:294-321; for the species cult in European gardens, see Lange, "Revisio Specierum Generis Cratægus" (1897), quoted below as Lange.

The hawthorns are hardy ornamental shrubs and trees, mostly of dense and low growth, with handsome foliage, turning, in most species, to a brilliant coloring in the fall. Almost all have attractive white flowers, pink or crimson in some varieties of *C. Oxyacantha* and *C. monogyna*. Most of the species have very decorative fruit which in *C. Phenopyrum*, *C. nitida*, *C. viridis*, *C.*

1096. Thorns of *Cratægus*. They are modified branches, being in the axils of leaves; sometimes, as in the lower figure, some of the short branches bear leaves.

fecunda, *C. pruinosa*, *C. Carrierae*, *C. persiciens*, *C. Oxyacantha*, *C. monogyna* and others persist on the trees until late into the winter, while some species, as *C. Arnoldiana*, ripen their large fruits, which soon drop, in August, also *C. dahurica*, *C. sanguinea* and the black-fruited *C. nigra* ripen about the same time, and *C. submolis* only a little later, but the earliest of all is the southern *C. asvalis*, which ripens its fruits in May. This and the blue-fruited *C. brachyacantha* are among the most decorative hawthorns for the southern states. The fruit of *C. asvalis*, and that of *C. mexicana* is made into preserves and jellies; also the fruits of the Molles group are suited for jelly-making, and in South Carolina an excellent jelly similar in quality and taste to Guava jelly is made from the fruits of some species of the Flavæ group. In Europe, *C. monogyna* and *C. Oxyacantha* are counted among the best hedge plants; also many American species like *C. Phœnopyrum*, *C. Crus-galli* and possibly *C. macracantha*, *C. intricata*, *C. pastorum*, *C. rotundifolia*, may be used for hedges, but they are stronger growers and cannot be pruned so closely as the European species. The hawthorns grow well in exposed positions and as a rule do not like much shade, they are not particular as to the soil, but grow best in limestone soil, also in a rich, loamy, somewhat moist one, and even in strong clay. Propagated by seeds, sown in fall or stratified, before stratifying, most of the pulp may be removed by laying the fruits in shallow piles and allowing them to decay. Then they are mixed with sand or sifted soil and buried in the ground or kept in boxes in a cool cellar. The young plants should not be allowed to remain over one year in the seed-beds, as they form long tap-roots and are then difficult to transplant. Varieties and rarer kinds are easily budded or grafted on seedling stock of *C. Oxyacantha*, or other common strong-growing species.

The spines of cratægus are modified branches (see Fig 1096). The fruits are pomes (Fig 1097), with structure similar to that of the apple

ALFRED REHDER.

The American hawthorns are highly ornamental subjects for the planting of parks and private estates. The showy flowers in spring and early summer, the conspicuous red, crimson, and scarlet fruits of nearly all of them, which extend amongst the different species from August to early winter and midwinter,—and some of the species markedly retain their fruits without shrinkage of pulp or loss of color until early winter,—the absolute hardhood, and the bold rugged branching habits characteristic to most of them, make them very interesting objects when their leafless forms are outlined in a winter landscape. The landscape gardener cannot make any mistake in planting them in liberal quantities in private estates or public parks.

They are easily transplanted. They are much benefited by liberal pruning when transplanted from nursery rows or from the woodland. The side branches should be pruned in severely, and as the centers of good-sized plants are likely to be full of intricate and congested branches, these should be carefully thinned. In a young state they should be grown to one stem whether they are arborescent or shrubby species. Under this treatment they make beautiful garden plants.

The American hawthorns are almost invariably found growing in heavy limestone clay. They may occasionally overlap into sandy soil. In planting them in sandy soil, it should be liberally enriched with well-rotted manure, and they should be kept well mulched.

The seeds of all of the species of American hawthorns germinate slowly. None of the species germinates before the second year after sowing, and many of the seeds in the same "flat" will not germinate before the third year. In many instances, part of the seeds germinate the second year, and the remainder the third. The seeds of *Cratægus geneseensis* have been known to be

dormant for three years, and all come up thickly at the same time. In some of the groups the seeds of the species germinate more freely than in others. The species in the Molles, Flabellatæ and Tomentosæ groups germinate abundantly. The germination of the species in the Pruinose group have a much lower per-

1097. Pomes of *Cratægus*, one of the large-fruited forms. (Half size)

centage than in the former. The species in the Intricatæ group germinate badly.

The fruit can be sown broadcast in beds without any separation of the seeds, and heavily mulched until the spring of the second year, when the mulching should be removed. This method, however, is not considered good, and has been given up. The best way is to soak the fruits in water, and by maceration the seeds or nutlets are separated from the pulp, and the seeds will sink to the bottom of the tub or vessel. The seeds are then dried in the sun as they can then be handled easily. They are sown in "flats" of convenient size to handle, and piled up in the corner of the shade house and fitted tightly above each other to prevent mice getting at them. During this period of rest they must not be allowed to become dry. In the spring of the second year they are spread out to allow the seeds to germinate. Numbered zinc tags are nailed on the "flats" and the corresponding numbers with the names of the species are recorded.

The American hawthorns can be grafted readily on potted seedling stocks in the greenhouse in winter, any of the species in the Crus-galli group being good to use. They are grafted at the crown. This, however, is an unnecessary operation. All of the species of American hawthorns (and there are over 900 of them) come absolutely true from seed, and whilst they germinate slowly, they start to grow rapidly into plants of good stocky size from about two years after they germinate.

Some of the species of American hawthorns have highly colored foliage in the fall. The species in the Pruinose, Medioximæ and Intricatæ groups have perhaps the most highly colored foliage. Notable examples are *Cratægus opulens*, *C. diffusa*, *C. mainiana*, *C. dissosa*, *C. cognata*, *C. conspecta*, *C. promissa*, *C. exornata*, *C. perjucunda*, *C. fedida*, and *C. verecunda*.

The different species vary greatly in the time of ripening their fruits and in the period of duration. In many instances the fruit drops soon after ripening and in others hangs on for a long period. A selection

of twenty-six species that would give a good fruit display from August until early or mid-winter, would be as follows: *Cratægus matura*, *C. præcox*, *C. Arnoldiana*, *C. Dayana*, *C. Robesoniana*, *C. pedicellata*, *C. gloriosa*, *C. Ellwangeriana*, *C. lauta*, *C. submollis*, *C. champlainensis*, *C. arkansana*, *C. Dunbari*, *C. ferentaria*, *C. opulens*, *C. compia*, *C. gemmosa*, *C. luoniana*, *C. genesseensis*, *C. persimilis*, *C. maineana*, *C. Barryana*, *C. coccinoides*, *C. leptophylla*, *C. durobrwensis*, and *C. cordata*. (See pp. 887-889 for some of these.)

KEY TO THE SPECIES.

A. Veins of the lvs extending to the points of the lobes or to the teeth only, lvs. usually slightly or not lobed fr. not black or blue, except in No 37

B. Stones plain on the inner surfaces.

C. Petioles elongated, usually slender.

D. The petioles glandular at the apex or sparingly glandular throughout.

E. Corymbs many-fl. petioles glandular only at the apex; lvs broad at the base, truncate to broadly cuneate

F. Lvs tomentose or pubescent beneath, at least on the veins.

G. Stamens 20, anthers pale yellow; lvs thick and leathery

H. Fr. ripening in Aug. and Sept. lvs. broadly ovate

HH. Fr. ripening at the end of Oct. lvs. oblong-ovate to oval.

GG. Stamens 10 lvs membranous at maturity

H. Anthers yellow.

I. Fr. crimson, villous, ripening the middle of Aug. lvs dark green and smooth above

II. Fr. orange-red, lustrous, puberulous at the base lvs dark yellowish green, scabrate above

1. *mollis*2. *arkansana*3. *Arnoldiana*4. *submollis*

HH. Anthers rose-color. lvs.

scabrate above

I. Plant a tree. lvs with short lobes corymbs many-fl

II. Plant a shrub. lvs rather deeply lobed-corymbs 4-6-fl.

FF. Lvs. glabrous beneath or nearly so

G. Fr. bloomy until nearly fully ripe

H. Stamens 20 lvs glabrous fr. subglobose, often 5-angled

HH. Stamens 10 lvs. scabrate above, while young fr. obovoid

GG. Fr. not bloomy

H. Stamens 20, anthers pink lvs truncate at the base

I. The lvs dull above, villous beneath when young fr. with conspicuous calyx and with red flesh

II. The lvs lustrous above, quite glabrous fr. with yellow flesh and small calyx

HH. Stamens 5-10 lvs broadly cuneate

I. Anthers pink or rose-purple; stamens usually 10

J. Calyx-lobes coarsely serrate glandularly

usually 5 lvs distinctly lobed

JJ. Calyx-lobes entire or obscurely serrate stones 2-3 lvs slightly lobed

II. Anthers yellow; stamens 5-10 lvs orbicular-ovate fr. with 2-3 stones

EE. Corymbs usually few-fl. petioles sparingly glandular throughout lvs cuneate at the base stamens 10

F. Calyx-lobes glandular-ciliate corymbs slightly villous anthers yellow

FF. Calyx-lobes entire or glandular above the middle corymbs glabrous

G. Anthers purplish calyx-lobes glandular above the middle

GG. Anthers yellow calyx-lobes without glands

DD. The petioles glandless or with a few minute glands lvs cuneate at the base, ovate to lanceolate, not or very slightly lobed, lustrous above, glabrous at maturity stamens 20.

E. Fr. subglobose, 1/4 in. across or less, bright scarlet or orange lvs oblong-ovate to ovate

EE. Fr. ovoid, about 1/2 in. across, dull brick-red, bloomy lvs lanceolate to oblong-ovate

CC. Petioles short, lvs. cuneate at the base, not or very slightly lobed.

D. The petioles glandless

E. Corymbs many-fl

F. Lvs dark green and shining above.

G. Stamens 10 under side of lvs glabrous or nearly so

5 Ellwangeriana

6 Robesoniana

7 pruinosa

8 Barryana

9 coccinoides

10 speciosa

11 pedicellata

12 pastorum

13 rotundifolia

14 intricata

15 Buckleyi

16 Boyttonii

18 nitida

- H. Anthers** rose-color or purple
- I. Fr.** glabrous corymbs glabrous.
- J. Shape** of lvs obovate-obovate to oblanceolate fr. dull red, stones usually 2
- JJ. Shape** of lvs oblong to ovate, fr. crimson, lustrous; stones 3-5
- II. Fr** villous until nearly fully grown lvs oblong-obovate to broadly ovate; corymbs slightly villous
- HH. Anthers** yellow; lvs obovate fr. dull dark crimson
- GG. Stamens** 20
- H. Under** side of lvs villous corymbs densely pubescent
- HH. Under** side of lvs glabrous corymbs slightly pubescent
- FF. Lvs** dull above; stamens 20
- G. Fr** juicy, edible lvs cuneate-oblong or elliptic-lanceolate, tomentose beneath
- GG. Fr** dry, mealy lvs obovate or oval
- H. Length** of lvs 2-4 in., pubescent beneath fr. ovoid, $\frac{1}{2}$ -1 in long, with large dots
- HH. Length** of lvs $1\frac{1}{2}$ -2 in., at maturity hairy only on the midrib beneath fr. globose, $\frac{1}{4}$ - $\frac{1}{2}$ in across, with small dots
- EE. Corymbs** few-fld lvs $\frac{1}{2}$ -2 in long, pubescent beneath; stamens 20-25
- F. Fls** with or before the lvs fr. ripening in May, juicy, bright red lvs $1\frac{1}{2}$ -2 in. long
- FF. Fls** after the lvs fr. ripening very late, dry, dull red or yellow lvs less than $1\frac{1}{2}$ in long
- G. Lvs** obovate, mostly obtuse, crenately serrate; fls usually solitary
- GG. Lvs** oval or ovate, acute, serrate and often lobed, fls 2-6
- DD. The** petioles, margin of lvs and corymbs densely glandular; corymbs 3-7-fld
- E. Stamens** 20, anthers purple; fr. ovoid
- EE. Stamens** 10
- F. Fr** pyriform anthers purplish
- FF. Fr** globose anthers yellow
- BB. Stones** with furrows or irregular cavities on the inner surfaces; fr. lustrous, soft at maturity.
- C. Lvs.** not or only slightly lobed.
- D. Color** of fr. scarlet or orange; stones 2-3 lvs with impressed veins.
- E. Fr** small, ovoid or pear-shaped, upright, orange-red lvs thin, dull above, pubescent below
- EE. Fr** subglobose, larger, nodding, scarlet lvs subcoriaceous, pubescent only on the veins beneath
- F. Anthers** rose-color; stamens usually 20
- FF. Anthers** yellow, stamens 10.
- G. Foliage** glabrous below; stones deeply grooved on the inner surface
- GG. Foliage** usually pubescent on the veins below while young; stones slightly grooved
- DD. Color** of fr. black, nulets 5 lvs broadly elliptic to obovate, glabrous (see also No 42 with blue frs)
- CC. Lvs** more or less distinctly lobed
- D. Length** of lvs more than 2 in lvs pubescent fr. nearly $\frac{1}{2}$ in across
- DD. Length** of lvs less than 2 in lvs. quite glabrous fr. $\frac{1}{2}$ in or less across
- AA. Veins** of the lvs extending to the points of the lobes and to the anthers, lvs. usually distinctly lobed
- B. Fr.** very small, $\frac{1}{3}$ in long or less, red; calyx deciduous
- C. Lvs** triangular-ovate, with shallow and broad lobes, often 3-lobed fr. subglobose, lustrous, nulets 3-5.
- CC. Lvs** ovate, deeply 3-7-lobed fr. ovoid, nulets 1-3
- BB. Fr** larger calyx-teeth persistent.
- C. Color** of fr. black or blue
- D. The** fr. blue, bloomy lvs obovate to obovate-oblong, crenate-serrate, usually not lobed
- DD. The** fr. black, stones with cavities on the inner surfaces
- E. Lvs** with about 5 pairs of lobes fr. lustrous, subglobose, juicy
- EE. Lvs** with 2-3 pairs of lobes fr. ovoid, dull black or purplish black
- CC. Color** of fr. red or yellow
- D. Stones** with cavities on the inner surfaces, 1-2
- E. Styles** 2 lvs 3 5-lobed with short and broad serrulate lobes
- EE. Style** 1 lvs deeply 3-7-lobed, with acute, entire or sparingly toothed lobes
- DD. Stones** plain on the inner surfaces, 2-5
- E. Branchlets** and lvs. pubescent.
- F. Lvs** with glandular toothed lobes, pubescent
- FF. Lvs** not glandular-toothed, lobes often nearly entire
- G. Upper** surface of lvs dull, pubescent, under surface villous
- GG. Upper** surface of lvs glabrescent, lustrous, under surface finely pubescent
- EE. Branchlets** glabrous lvs deeply lobed, glabrous.
- 35. macracantha**
- 36. prunifolia**
- 37. Douglasii**
- 38. sanguinea**
- 39. dahurica**
- 40. Phœnopyrum**
- 41. apifolia**
- 42. brachyacantha**
- 43. nigra**
- 44. pentagyna**
- 45. Oxyacantha**
- 46. monogyna**
- 47. tanacetifolia**
- 48. orientalis**
- 49. Azarolus**
- 50. pinnatifida**
- 31. flava**
- 32. aprica**
- 33. tomentosa**
- 34. succulenta**
- 1. mollis.**

1. *mollis*, Scheele (*C. thufôha*, Koch *C. acerifôha*, Hort. *C. coccinea* var *mollis*, Torr & Gray) Tree, to 30 ft., with short, stout thorns; lvs. broadly ovate, sharply and doubly serrate and with 4-5 pairs of short acute lobes, densely pubescent beneath, 3-4 in long corymbs densely villous-pubescent; fls with red disk fr. about $\frac{1}{2}$ in across, usually pear-shaped, scarlet, more or less pubescent, with thick mealy flesh and 4-5 stones. April, May fr. end of Aug., Sept Ohio to S. Dak. and Kans. S.S. 13:659 Em 494 (as *C. tomentosa*) G.F. 5 221—One of the most decorative species, with large, bright green foliage and showy fls and frs, ripening in Sept., but dropping soon after maturity.

2. *arkansana*, Sarg. Tree, to 20 ft.; branches wide-spreading, forming an irregular open head, unarmed or

with straight spines $\frac{1}{2}$ – $\frac{1}{2}$ in. long: lvs. oval or oblong-ovate, acute, truncate or broadly cuneate at the base, serrate and with 3–4 pairs of short lobes, pubescent on both sides at first, at maturity dull dark green and glabrous above, villous on the veins below, 2–3 in. long corymbs villous; fls. nearly 1 in. across: fr. ovoid, bright crimson, slightly villous at the ends, $\frac{3}{4}$ –1 in. long, with thick subacid flesh and usually 5 stones.

1098. *Cratægus Arnoldiana* (X $\frac{3}{4}$) No 3

May; fr. end of Oct., falling gradually Ark S.S. 13'660.—Very handsome in autumn with its abundant brilliant frs. persistent for some time; the lvs. turn clear yellow

3. *Arnoldiana*, Sarg. Fig. 1098. Tree, to 20 ft., with stout ascending branches forming an open head with zigzag branchlets, armed with stout spines 2–3 in. long lvs. broadly ovate to oval, acute, truncate to broadly cuneate at the base, doubly serrate and with many shallow broad lobes, at first hairy above and soft-pubescent below; later smooth, dark green and lustrous above, slightly villous on the veins below, 2–3 in. long. corymbs tomentose; fls. $\frac{3}{4}$ in. across: fr. subglobose, bright crimson, villous toward the ends, $\frac{3}{4}$ in. long, with thick subacid flesh and 3–4 stones. May; fr. middle of Aug., soon falling. Mass S.S. 13'668.

4. *submollis*, Sarg. Tree, to 25 ft., with ascending or spreading branches forming a broad handsome head. spines numerous, thin, usually straight, 2–3 in. long: lvs. ovate, acute, broadly cuneate at the base, doubly serrate and with 3–4 pairs of acute short lobes, scabrous above, below at first soft-pubescent, later only puberulous on the veins, 2–3 in. long: corymbs tomentose; fls. 1 in. across: fr. pear-shaped or ovoid, bright orange-red and lustrous, $\frac{3}{4}$ in. long with persistent erect calyx; flesh yellow, mealy; stones usually 5. May; fr. early in Sept., soon falling. Que. to Mass and E. N. Y. S.S. 4:182 (as *C. mollis*).

5. *Ellwangeriana*, Sarg. Tree, sometimes to 20 ft., with stout ascending branches forming a broad symmetrical head, and with zigzag branchlets. lvs. oval, acute, rounded or broadly cuneate at the base, coarsely and often doubly serrate with many short acute lobes, at first hairy above and villous below on the veins, later scabrous and light green above, nearly glabrous below, $2\frac{1}{2}$ – $3\frac{1}{2}$ in. long: corymbs densely villous; pedicels short; fls. 1 in. across: fr. ovoid, bright crimson, very lustrous, slightly villous at the ends, 1 in. long, with thin yellow acid flesh and 3–5 nutlets. May, fr. at the end of Sept., soon falling. N. Y. and Ont. to Mich., south to W. Pa. S.S. 13:671. G.C. III. 47:130. A.F. 24:325. F.E. 33:488.

6. *Robesoniana*, Sarg. (*C. spissiflora*, Sarg.) Shrub, with numerous erect sts., to 12 ft., or occasionally small tree, to 20 ft. spines few, stout, 1– $1\frac{1}{2}$ in. long: lvs. oblong-ovate, acute, or acuminate, rounded or broadly cuneate at the base, sharply doubly serrate with many broad acute lobes, pubescent below on the veins while young, glabrous at maturity, scabrate above, 2–3 in. long: corymbs pubescent, 4–6-fld., compact, calyx villous, lobes glabrous outside. fr. ovoid, scarlet, $\frac{3}{4}$ in. long, with small calyx; flesh thin, mealy; stones 4–5. May, fr. Sept., soon falling. N. Y. to S. Ont.—This species was formerly sold by Ellwanger & Barry under the name *C. coccinea*.

2 PRUINOSÆ.

7. *pruinosa*, Koch (*C. coccinea* var. *viridis*, Torr. & Gray) Shrub or tree, to 20 ft. branches spreading with numerous stout straight spines lvs. elliptic or ovate, acute, usually broadly cuneate at the base, irregularly and often doubly serrate, with 3–4 pairs of short acute lobes, red when unfolding, later dark bluish green above, paler below, glabrous, 1–2 in. long, corymbs rather few-fld., fls. slender-pedicelled, $\frac{3}{4}$ – $\frac{1}{2}$ in. across; stamens 20, anthers pinkish: fr. subglobose, apple-green and glaucous until nearly fully ripe, finely dark purple with yellow sweet flesh and 5 stones, calyx prominent with a well-developed tube. May; fr. Oct. Vt. to Va., and Ill. S.S. 13:648

8. *Barryana*, Sarg. Shrub, to 15 ft. branches spreading or ascending with slender spines lvs. broadly ovate, rounded or abruptly cuneate at the base, sharply doubly serrate and slightly lobed, scabrate above, glabrous and glaucous below, 2–3 in. long corymbs glabrous, calyx-lobes entire or sparingly dentate, fls. $\frac{3}{4}$ in. across, stamens 7–10, with purple anthers fr. obovoid, crimson with small pale dots, pruinose, $\frac{3}{4}$ in. long, with usually 3 nutlets. May; fr. in Oct. W. N. Y.

3 DELTOIDES

9. *coccinioides*, Ashe Fig. 1099. Tree, sometimes 20 ft. branches stout, spreading, forming a broad handsome head spines thick, $1\frac{1}{2}$ –2 in. long, lvs. broadly ovate, acute, rounded or truncate at the base, doubly serrate, with several pairs of broad acute lobes, at first yellowish green and lustrous above, villous on the veins beneath, later dull dark green above, paler and nearly glabrous beneath, 2–3 in. long fls. $\frac{3}{4}$ in. across, in compact 5–7-fld. sometimes slightly villous corymbs: fr. subglobose, dark crimson and lustrous, $\frac{3}{4}$ in. across, with thick subacid reddish flesh and 4–5 stones. May; fr. early in Oct. and falling gradually Mo., Ind., and Kans. S.S. 13:674. M.D.G. 1901. 358, 359.—Very handsome small tree, the foliage tinged red when unfolding and turning scarlet and orange in autumn

10. *speciosa*, Sarg. Shrub, to 15 ft., usually with many sts. spines numerous, 1–2 in. long lvs. ovate, acute or acuminate, rounded or subcordate at the base, doubly serrate and with 4–5 pairs of broad and short acute lobes, tinged red when unfolding and nearly glabrous, at maturity thick, dark green and lustrous

above, paler below and quite glabrous, 2-3 in. long; corymbs glabrous, 5-8-fl'd, fls 1 in across fr depressed-globose, bright crimson and lustrous, nearly 1 in broad, with thin yellow flesh and 5 stones. May; fr the middle of Sept, soon falling. Mo. S T S 1 33 -- Very handsome with its lustrous lvs., large fls and brilliant fr.

4 COCCINEÆ.

11 *pedicellata*, Sarg. Tree, to 20 ft., with rather slender spreading or ascending branches forming a symmetrical head; spines straight or slightly curved, $1\frac{1}{2}$ -2 in long; lvs broadly ovate, broadly cuneate or truncate at the base, coarsely and often doubly serrate, above the middle with 4-5 pairs of short acute lobes, at maturity membranous, dark green and scabrous above, paler and nearly glabrous below, 2-4 in long fls $\frac{1}{2}$ in across in loose slightly villous corymbs, calyx-lobes coarsely glandular-serrate fr pear-shaped or ovoid, bright scarlet, lustrous, with conspicuous persistent calyx, flesh thin, mealy, stones 4-5. May, fr. Sept Pa to Conn, N Y, and Ont. S S 13-677.

5. TENUIFOLIÆ.

12 *pastorum*, Sarg (*C. macrosperma* var. *pastorum*, Eggleston) Glabrous shrub, sometimes to 15 ft., with many erect sts, armed with numerous stout or slender spines. lvs ovate, acute, usually rounded at the base, doubly serrate, slightly lobed, at maturity thick, dark dull blue-green, glaucescent below, $1\frac{1}{2}$ -2 in long; fls. $\frac{3}{4}$ in across in many-fl'd corymbs, calyx-lobes lanceolate, entire or obscurely serrate fr ovoid, bright scarlet, lustrous, about $\frac{1}{2}$ in long, with thick, yellow and mealy flesh and 2-3 stones. New England. May; fr Sept S S 4-180 (as *C. coccinea*).

6 ROTUNDIFOLIÆ.

13 *rotundifolia*, Moench (*C. coccinea* var. *rotundifolia*, Sarg. *C. glandulosa*, Willd.) Shrub or bushy tree, sometimes to 20 ft, with slender, straight or curved spines. lvs ovate-orbicular to oval, or obovate, acute, broadly cuneate at the base, rather coarsely serrate and usually with 3-4 pairs of short acute lobes, glabrous, $1-2\frac{1}{2}$ in long corymbs glabrous or slightly villous, fls $\frac{3}{4}$ -1 in across, calyx-lobes and bractlets very glandular fr subglobose, about $\frac{1}{2}$ in long, red with yellow sweet fleshy and 2-3 stones. May, fr Sept Nova Scotia to Sask, Ill and Va. G C II 11 557 Gn 22, p 115, 33, p 464 --The most northern species. Var *puberula*, Sarg (*C. coccinea*, Linn, in part) Branchlets, petioles and the lvs on the veins more or less pubescent below while young.

7 INTRICATÆ.

14 *intricata*, Lange. Shrub, to 10 ft., branches upright or spreading, with rather long curved spines. lvs elliptic-ovate, acute, cuneate at the base, doubly serrate with 3-4 pairs of short acute lobes, at first slightly pubescent, later scabrate above, bright green, slightly paler beneath and nearly glabrous, $1-2\frac{1}{2}$ in long corymbs slightly villous, fls about 1 in. across, calyx-lobes serrate fr subglobose to ovoid, sparingly villous or glabrous, dull reddish brown, with usually 3-4 stones. May, fr Oct, Nov. Mass and Vt to Pa. Lange 1.

15 *Bückleyi*, Beadle. Large shrub or tree, often to 25 ft., with stout spreading or ascending branches and stout straight spines $\frac{1}{2}$ in long; lvs broadly ovate or oval, acute, usually rounded at the base, coarsely serrate and incisely lobed with acuminate lobes, glabrous and thick and firm at maturity corymbs 3-7-fl'd, compact, glabrous, fls. $\frac{3}{4}$ in across; sepals serrate toward the apex and stipitate-glandular fr subglobose, usually angled, about $\frac{1}{2}$ in across, yellowish green and flushed red or red, with 3-5 stones. May; fr Sept and Oct. Va to N C and Tenn. S.M 464

16 *Boyntonii*, Beadle. Tree, occasionally to 20 ft., with stout ascending branches; spines straight, thin, $1\frac{1}{2}$ -2 in. long. lvs broadly ovate to oval, acute, sharply serrate with glandular teeth and often with 2-3 pairs of short acute lobes, bronzy red when unfolding and slightly viscid, at maturity yellowish green, thick and firm and glabrous, $1-2\frac{1}{2}$ in long, petioles glandular: fls $\frac{3}{4}$ in across, in 4-10-fl'd glabrous corymbs, calyx-lobes entire or obscurely glandular-serrate above the middle fr depressed-globose, yellowish green flushed with red, about $\frac{1}{2}$ in across, with 3-5 stones. May, fr. Oct. Va. to Ky, Tenn and Ala. S S 13:650.

8 VIRIDES.

17. *viridis*, Linn. (*C. arborescens*, Ell.) Tree, to 35 ft, with spreading branches forming a round, rather compact head. spines slender lvs oblong-ovate to oval, acute or acuminate, serrate above the cuneate base, dark green and lustrous above, paler below, finally glabrous, 1-3 in long corymbs glabrous; pedicels slender; calyx-lobes lanceolate, entire fr globose, bright red, $\frac{1}{2}$ - $\frac{1}{4}$ in across, with usually 5 stones. Md, Va to Ill, Iowa, Texas and Fla. May, fr. Oct, persisting through the winter. S S 4 187

18 *nitida*, Sarg. Tree, to 30 ft., with spreading branches unarmed or with thin straight spines. lvs. elliptic to oblong-obovate, acuminate, coarsely serrate except at the cuneate base, often slightly lobed, dark green and lustrous above, paler below, glabrous, 1-3 in long corymbs glabrous, calyx-lobes elongated, entire or sparingly glandular-serrate. fr. ovoid or subglobose, dark dull red, about $\frac{1}{2}$ in long with thick mealy flesh and 2-5 stones. May, fr Oct, persisting through the winter. Ill, Kans. S S 13:703 --Like *C. viridis* very ornamental with its lustrous foliage and persistent frs

1099 *Cratægus coccinioides* (×¼). No. 9

9. CRUS-GALLI.

19 *Crus-galli*, Linn COCKSPUR THORN Shrub or tree, to 40 ft. branches wide-spreading, rigid, often pendulous, with numerous slender spines. lvs. obovate or oblanceolate, irregularly and sharply serrate, usually rounded at the apex, quite glabrous, 1-2½ in long, often semi-persistent. corymbs glabrous; calyx-lobes entire or minutely serrate. fr. usually globose, red, with usually 2 stones; flesh thin and dry. May, June; fr late in Oct. Que., south to N. C., west to Mich. SS 4 178 Em 492 R.B. 1 116 G F 7 295. G C III 28 244, suppl Sept 29.—A very decorative species of distinct habit, handsome in bloom and with showy, bright red fr., remaining on the branches often until spring; the lvs assume a brilliant orange and scarlet color in fall. Often used for hedges. Var *inferius*, Lange Spineless form Var *linearis*, Ser Lvs linear-lanceolate Var *nana*, Nichols Dwarf form Var *pyracanthifolia*, Ait Lvs elliptic or obovate, usually acute; fr. smaller, brighter red. W N Y and Pa to Fla and Tenn SS 13 637. Var. *salicifolia*, Ait Lvs. oblanceolate or lanceolate, thinner. Var. *splendens*, Ait (var *lucida*, Hort.) Lvs elliptic-oblanceolate, very shining. Var *ovalifolia*, Lindl (C *pennsylvanica*, Hort., not Ashe). Lvs. elliptic or elliptic-obovate, less lustrous, fr. ovoid. B R 22:1860. Gn 22, p. 146, 33, p. 468—This is probably not a variety of *C. Crus-galli*, but a distinct species identical with one of the recently described species of this group

20 *Cánbyi*, Sarg Shrub or bushy tree, to 20 ft.: branches wide-spreading, with thick usually straight spines. lvs oblong-obovate to elliptic, acute or obtuse, coarsely and often doubly serrate above the middle, glabrous, 1½-3 in long: corymbs glabrous; calyx-lobes entire or sparingly serrate: fr subglobose or ovoid, about ½ in. long, dark crimson, with juicy flesh and 3-5 stones. May; fr. Oct. E Pa., Del., Md. SS 13:638

21. *fecunda*, Sarg Small tree, to 25 ft. branches wide-spreading, with slender spines: lvs. oblong-ovate to oval, usually acute, doubly serrate, with strongly marked veins, 1½-3 in long corymbs slightly villous; calyx-lobes glandular-serrate: fr subglobose to ovoid, ½-¾ in long, orange-red, with thick flesh and 2-3 stones. May; fr. Oct. Mo., Ill. S.S. 13:641.

22. *Arduénæ*, Sarg. Shrub or tree, to 20 ft.: branches spreading, forming a round-topped head: spines slender: lvs. oblong-obovate, acute, acuminate or rounded, crenulate-serrate from below the middle, with obscure veins, 1½-2½ in long, corymbs glabrous, pedicels slender, calyx-lobes entire or slightly serrate:

1100 *Cratægus punctata* No 26

fr. ovoid, dull dark crimson, about ½ in long, with 1-2 stones. May; fr the middle of Sept. Pa. to Ill, Mich and Ont S M 373.

23. *Carrièrei*, Vauv. Small tree, to 20 ft., with spreading branches and stout spines: lvs elliptic or oblong-obovate, acute, pubescent below, glabrous above at

length and lustrous, irregularly serrate, 3-4 in. long: corymbs rather few-fl., pubescent; fls large, with red disk; calyx-lobes linear, serrulate: fr. bright orange or brick-red, ovoid, about ½ in long, with 1-3 stones. May. R H 1883 108 G C III 21:118, 119.—Probably hybrid between *C. Crus-galli* and *C. mexicana*, originated in France. Possibly not different is *C. Laidleyi*, Herneq, described with larger subglobose fr.

24. *persistens*, Sarg Low tree, 12 ft. or more. branches wide-spreading, with numerous stout spines to 2 in. long lvs lanceolate to oblong-obovate, acuminate, cuneate at the base, coarsely serrate above the middle, at maturity glabrous, dark green and lustrous above, pale beneath, 2-3 in long corymbs slightly villous, fls over ¾ in across; calyx-lobes glandular-serrate above the middle or entire, stamens 20, anthers white, styles surrounded at the base by a broad ring of pale tomentum. fr. ovoid or slightly obovate, crimson, not lustrous, over ½ in across, flesh thick and mealy, with 2-3 stones. May fr in Oct S T S 2 190 —Of unknown origin, possibly a hybrid of *C. Crus-galli*. Raised at the Arnold Arboretum. The lvs remain on the branches unchanged until those of all the other hawthorns have fallen and the frs persist until late into the winter. One of the most conspicuous of winter fruiting plants.

10. MEXICANÆ.

25 *mexicana*, Sess & Moc (C *hypolasia*, Koch). Small tree, to 30 ft. branchlets tomentose, unarmed or with short spines lvs cuneate-oblong or elliptic-lanceolate, obtuse or acute, crenate-serrate and often slightly lobed toward the apex, pubescent above, sometimes nearly glabrous, tomentose below, 1½-3½ in long corymbs white-tomentose, fls ¾ in wide, calyx-lobes entire or with a few teeth at the apex, stamens 20, with pink anthers fr. ovoid to pyriform, orange or dull orange-red, ¾-1 in thick, edible, with 3-5 nutlets March, fr Oct., Nov. Mex B R 22:1910

11. PUNCTATÆ

26 *punctata*, Jacq Fig. 1100. Tree, to 25 ft. branches horizontally spreading, with short, stout spines or unarmed: lvs obovate, obtuse or acute, narrowed at the base into a rather long margined petiole, irregularly serrate, on the shoots often slightly lobed, villous below, with impressed veins above, 2-4 in long corymbs villous, fls large, calyx-lobes entire fr pyriform or subglobose, dull red, dotted, about ½ in across, with 5 stones. May; fr Oct., falling soon. From Que to Ont, Ill and Ga SS 4 184 A F 28 805 Var *aurea*, Ait (var *anthocarpa*, Roem C *crociata*, Ashe). Fr yellow.

27 *collina*, Chapm Shrub or small tree, occasionally 25 ft. branches wide-spreading, with stout spines, on the trunk with large branched spines lvs obovate or oval, acute, broadly cuneate at the base, irregularly, often doubly serrate, at maturity yellowish green above, paler below and glabrous except on the midrib. corymbs villous, calyx-lobes glandular-ciliate; anthers yellow fr subglobose, dull red, ½-¾ in. long, with yellow mealy flesh and usually 6 stones. May; fr. Oct. Va to Tenn. and Ala. SS. 13.654.

12. ÆSTIVALES.

28. *æstivalis*, Torr. & Gray. MAY HAW. APPLE HAW Tree, to 30 ft., with a round compact head, unarmed or with stout straight spines 1-1½ in. long: lvs elliptic to oblong-obovate, acute or rounded, gradually narrowed into the ¼-1 in long petiole, sinuate-dentate or crenate-serrate, at maturity dark green and lustrous above, below, particularly on the veins, densely rusty-pubescent, 1½-2½ in long. fls. with the lvs., 1 in across, in 2-5-fl. glabrous corymbs; calyx-lobes entire or minutely glandular-serrate. fr depressed-

globose, fragrant, $\frac{1}{2}$ – $\frac{3}{4}$ in. across, bright red, crowned by the conspicuous calyx, with juicy subacid flesh and 3–5 stones. Feb., March; fr. May. Fla. to Ark and Texas. S.S. 4:192.—The fr is made into preserves and jellies.

13. UNIFLORÆ.

29. *uniflora*, Moench (*C. parvifolia*, Ait. *C. tomentosa*, Eggleston, not Linn. *C. florida*, Loud.) Dense, low shrub, with numerous slender spines, rarely spineless, 3–8 ft. lvs on short not glandular petioles, cuneate, obovate or oblong-obovate, irregularly or doubly crenate-serrate, pubescent on both sides, at length glabrous above, $\frac{1}{2}$ – $1\frac{1}{2}$ in long fls $\frac{1}{2}$ in. across, 1–3-fld corymbs, calyx pubescent, with large serrate lobes fr pyriform or globose, yellow, $\frac{1}{4}$ in across, with 3–5 stones May, June Ga and Ala to Fla S.S. 4 191

30 *Valiæ*, Brit Shrub, to 12 ft, with slender straight spines. lvs. oval or ovate, acute, cuneate at the base, crenate-serrate and often slightly lobed, at maturity glabrous and lustrous above, pubescent below, $\frac{1}{2}$ – $1\frac{1}{2}$ in long fls $\frac{1}{2}$ in across, in 2–6-fld, pubescent corymbs, calyx-lobes glandular-serrate fl globose, $\frac{1}{2}$ in across, dull red, with 3–5 stones May, fr Oct. Va to Ga. and Ala

14 FLAVÆ

31 *flava*, Ait Tree, to 20 ft branches wide-spreading, with thin nearly straight spines lvs broadly obovate or elliptic, acute or nearly rounded, cuneate at base, coarsely and doubly serrate, on vigorous shoots usually slightly lobed, the teeth tipped with red glands, at maturity puberulous only on the veins below, about 2 in long, petioles glandular, short corymbs few-fld, slightly villous, calyx-lobes glandular-serrate, fls $\frac{3}{4}$ in across, stamens 20, with purple anthers fr ovoid, dark orange-brown, $\frac{1}{2}$ in long, with dry and mealy flesh and 5 stones. April, fr in Oct Ga and Fla S.S. 13 693.—The true *C. flava* is not in cult., the plant now cult as *C. flava* is quite different and is apparently not very closely related to this species, it has so far not been found growing wild in E. N. Amer., though it was apparently intro. from the southern states As it has not yet been determined to which species it belongs, it may be enumerated here as var *lobata*, Lindl. Shrub or small tree lvs ovate or obovate, cuneate at the base, acute, crenately serrate and often slightly lobed, at maturity pubescent on the veins beneath, 1–2 in long: corymbs pubescent, few-fld, stamens 10 fr pyriform, green or reddish with hard flesh, and 3–5 stones. B.R. 23.1932, 1939 G.C. III 27 404—Tender

32 *âprica*, Beadle A shrub or small tree, sometimes to 20 ft, with spreading branches and slender zigzag branchlets armed with thin straight spines 1– $1\frac{1}{2}$ in long lvs broadly obovate or oval, acute or rounded at the apex, narrowed into the short petiole, serrate usually only above the middle and often slightly lobed, with gland-tipped teeth, pubescent on both sides while young, at maturity glabrous, dark yellow-green and thickish, $\frac{3}{4}$ – $1\frac{1}{2}$ in long fls $\frac{3}{4}$ in across, in 3–6-fld compact pubescent corymbs, calyx-lobes glandular-serrate. fr globose, $\frac{1}{2}$ in across, dull orange-red, with 3–5 stones. May; fr Oct Va to Ga and Tenn S.S. 13 698.—This species has proved hardy at the Arnold Arboretum.

15 TOMENTOSÆ

33. *tomentosa*, Linn. (*C. Calpodendron*, Medikus. *C. pyrifolia*, Ait. *C. leucophloëos*, Moench. *C. Chapmani*, Ashe). Fig 1101. Shrub or small tree, to 20 ft, with spreading branches unarmed or with short spines lvs cuneate, obovate-oblong or elliptic, acute, serrate and often slightly lobed, dull green and usually finely glabrous above, below pubescent, 2–5 in. long: corymbs pubescent, compound and many-fld; fls $\frac{1}{2}$ in across, calyx-lobes serrate fr usually oval, dull yellow or

yellowish red, $\frac{1}{4}$ – $\frac{1}{2}$ in. across, sweet and succulent, in upright corymbs, stones 2–3, with 2 furrows on the inner side June; fr. Oct Ont to Minn, south to Tenn and Mo S.S. 4:183 G.F. 2:425 (adapted in Fig. 1101). Gn. 22, p. 145. B.R. 22:1877.

34 *succulenta*, Link (*C. macracantha* var. *succulenta*, Rehd.) Tree, sometimes to 20 ft, with stout ascending branches, armed with numerous stout

slightly curved spines lvs elliptic, acute or acuminate, gradually narrowed into the stout winged petiole, coarsely and usually doubly serrate and with many short acute lobes, at maturity dark green, thickish and somewhat lustrous above, pale green and usually puberulous on the veins below, 2–3 in long fls $\frac{3}{4}$ in across, in many-fld villous corymbs; stamens usually 20, sometimes 15 fr globose, bright scarlet, $\frac{1}{2}$ – $\frac{3}{4}$ in across, with juicy sweet flesh and 2–3 stones. May, fr Sept., Oct. Que and Ont to Mass and Ill S.S. 4 181 (as *C. coccinea* var *macracantha*)

35 *macracantha*, Lodd (*C. coccinea* var *macracantha*, Dudley) Fig 1102. Shrub or small tree, to 20 ft, of dense growth, with numerous long and slender spines lvs rather slender-petioled, broadly elliptic or ovate, doubly serrate, glabrous, at maturity thickish, shining and dark green above, almost glabrous beneath, 1– $2\frac{1}{2}$ in long corymbs slightly villous; fls $\frac{3}{4}$ in across, stamens 10, calyx-teeth glandular-serrate fr sub-globose, $\frac{1}{2}$ in diam, dark cherry-red, shining, with usually 2–3 stones May, June. W N Y and Vt to Pa. S.S. 13 689. B.R. 22:1912. L.B.C. 11 1012 (as *C. glandulosa*). A.G. 11 509. M.D.G. 1906 561 G.W. 5 245.—Sometimes cult. under the name of *C. Douglasii* See page 3567.

36 *prunifolia*, Pers Shrub or tree, to 30 ft branches spreading or somewhat ascending, spin'y lvs obovate, or roundish obovate, doubly serrate, glabrous or pubescent on the veins beneath when young, 2–3 in. long corymbs pubescent, stamens 10; anthers pink fr red, stones with 2 furrows on the inner side, sometimes nearly plain May, June—Origin unknown, by some thought to be a hybrid between *C. Crus-galli* and *C. macracantha* or *C. succulenta* B.R. 22 1868 G.W. S. 111 Var *variegata*, Hort. Lvs. variegated with yellowish white F.W. 1877 65.

16 DOUGLASIANÆ (page 3567).

37. *Douglasii*, Lindl. (*C. sanguinea* var. *Douglasii*, Torr. & Gray). Tree, to 40 ft., with slender, often pendulous branches, unarmed or with short spines: lvs. short-petioled, broadly ovate or oblong-ovate, acute, gradually narrowed at the base, serrate and slightly lobed, nearly glabrous, pubescent on the midrib above, chartaceous, 1-4 in long: corymbs glabrous; fls. $\frac{1}{8}$ - $\frac{1}{2}$ in across; stamens 20; calyx-lobes triangular-ovate, usually glandular-serrate above the middle. fr ovoid, $\frac{1}{2}$ in. long, black and lustrous, with sweet, light yellow flesh and 3-5 nutlets. May; fr. Aug., Sept. Brit. Col. and N. Calif. to Wyo. S.S. 4:175. B.R. 21:1810.

17. SANGUINEÆ.

38. *sanguinea*, Pall. Shrub or small tree, to 20 ft., with upright, spreading branches and short spines: lvs. ovate or broadly ovate, narrowed into the petiole, irreg-

1102. *Cratægus macracantha* (X½). No 35

ularly serrate and slightly lobed, more deeply lobed on vigorous shoots, at first hairy above and often also below, at maturity glabrous or nearly glabrous, $1\frac{1}{2}$ -3 in. long: corymbs pubescent or glabrous; fls. large; stamens 20, with purple anthers. fr. $\frac{1}{2}$ in. diam. May; fr. in Aug., Sept. E. Siberia. Var. *chlorocarpa*, Schneid. (var. *xanthocarpa*, Regel). Fr. yellow, smaller: anthers whitish.

39. *dahurica*, Koehne (*C. purpurea*, Bosc. *C. sanguinea* var. *altica*, Loud.). Shrub or small tree: spines to $1\frac{1}{2}$ in. long; lvs. ovate or broadly elliptic-ovate, acute, broadly cuneate at the base, sharply serrate, those of the flowering branches very slightly or scarcely lobed, those of the shoots distinctly and acutely lobed, glabrous, $\frac{3}{4}$ -2 in. long: corymbs glabrous, fls. $\frac{1}{2}$ in across: fr. subglobose, $\frac{1}{2}$ in. across, orange-red. April, May; fr. Aug. E. Siberia.—The earliest leafing species of all hawthorns; very graceful; hardy.

18. CORDATÆ.

40. *Phænoxyrum*, Medikus (*C. cordata*, Ait. *C. acerifolia*, Moench. *C. populifolia*, Walt.). WASHINGTON THORN. Tree, to 30 ft., with slender spines: lvs.

slender, petioled, triangular or broadly ovate, usually truncate at the base, 3-5-lobed, sharply serrate, $1\frac{1}{2}$ -2½ in. long: corymbs many-fl., glabrous; styles 5: fr. depressed-globose, $\frac{1}{4}$ in. across, shining, bright coral-red; calyx deciduous, leaving a circular scar; stones 3-5. May, June; fr. Sept., Oct. Va to Ala. and Mo. S.S. 4:186. B.R. 12:1151. F.E. 28, p. 103 (habit).—A very desirable species, with beautiful fall-coloring and large clusters of bright red fr. remaining a long time on the branches. Formerly much used for hedges.

19. APIIFOLIÆ.

41. *apiifolia*, Michx. (*C. Marshallii*, Eggleston). Shrub or small tree, rarely 20 ft., with stout spines and the branchlets pubescent when young. lvs. slender-petioled, broadly ovate, pinnately 5-7-cleft, serrate, glabrous or pubescent, $\frac{3}{4}$ -1½ in long: corymbs few-fl., villous; styles 1-3: fr. ovoid, $\frac{1}{4}$ in. high, scarlet, with 1-3 stones; calyx often deciduous. April, May, fr. Oct. Va. to Fla., Ark. and Texas. S.S. 4:188.—A handsome species with graceful foliage and an abundance of white fls. in spring and small but brightly colored frs. in fall.

20. BRACHYACANTHÆ

42. *brachyacantha*, Sarg. & Engelm. Tree, to 50 ft., with stout spreading branches, armed with numerous short usually curved spines, $\frac{1}{4}$ -2½ in long: lvs. obovate-oblong, oblong-lanceolate or elliptic, acute or sometimes obtuse, cuneate at the base, crenulate-serrate, rarely slightly lobed, glabrous at maturity, lustrous above, $\frac{3}{4}$ -2 in long: corymbs many-fl., glabrous, fls. $\frac{1}{2}$ in across, turning orange in fading, stamens 15-20: fr. subglobose, $\frac{1}{2}$ -1 in. across, bright blue and bloomy, with 3-5 stones. April, May; fr. Aug. La. and Texas S.S. 4:177.—The only species with blue fr.; hardly only S.

21. PENTAGYNÆ.

43. *nigra*, Kit. (*C. carpathica*, Lodd.) Shrub or small tree. branches pubescent or tomentose, with short spines: lvs. short-petioled, ovate or ovate-elliptic, deeply pinnately 5-9-lobed with serrate lobes, slightly pubescent above, densely pubescent beneath, 2-3 in long: corymbs dense, 10-15-fl., tomentose; pedicels short, fls. white, becoming slightly red, anthers yellowish: fr. subglobose, $\frac{1}{2}$ in. across, black, lustrous, juicy, with 5 stones. May; fr. in Aug. S.E. Eu. L.B.C. 11:1021 L.I. 30.

44. *pentagyna*, Waldst. & Kit. (*C. melanocarpa*, Bieb.). Shrub or small tree, to 15 ft.: young branchlets pubescent, with short spines: lvs. ovate to obovate, irregularly and usually sparingly serrate, pinnately 3-7-lobed, hairy above while young, finally nearly glabrous above, pubescent below, 1-2 in long: corymbs villous; fls. $\frac{1}{2}$ in. across, anthers red: fr. ovoid or obovoid, purplish black, $\frac{1}{2}$ in. long, with 4-5 stones. May; fr. Sept., Oct. S.E. Eu., Caucasus. B.R. 22:1874; 23:1933 (as *C. oxyacantha Olveriana*). R.H. 1901, p. 310.

22. OXYACANTHÆ.

45. *Oxyacantha*, Linn. HAWTHORN or MAY of English literature. Shrub or small tree, to 15 ft., with spreading glabrous branches and stout spines: lvs. short-petioled, cuneate or truncate at the base, rounded or broadly ovate, 3-5-lobed, with broad, serrulate lobes, 1-2 in long: corymbs 5-10-fl., glabrous: fr. globular or roundish oval, $\frac{1}{2}$ -¾ in. high, scarlet; stones 2, with 2 furrows on the inner side. May. Eu., N. Afr. B.R. 13:1128 (as *C. oxyacanthodes*). Var. *bicolor*, Rehd. (*C. oxyacantha* var. *Gumperti bicolor*, Hort. *C. oxyacantha rubra*, Schneid.) Fls. white in the center, edged red. F.S. 16:1651. Var. *Paulii*, Rehd. (var. *coccinea*, Hort. Var. *Pauli's New Double Scarlet*. *C. oxyacantha* var. *splendens*, Schneid.). Fig. 1103. With

double, bright scarlet fls; one of the most showy. I H 14 536 F. 1867. 117 Var *adrea*, Loud (*C. Oxyacantha* var. *anthocarpa*, Lange) With yellow fr. Var. *quercifolia*, Loud Lvs with broad, rounded and crenate lobes. —Most of the garden forms usually listed as varieties of *C. Oxyacantha* belong to the following species. Even the varieties enumerated above are by some botanists not considered true *C. Oxyacantha*, but referred to *C. media*, Bechst., a hybrid between this and the following species, the existence of hybrid forms makes the distinction between the two species still more difficult.

46. *monogyna*, Jacq (*C. Oxyacantha*, Hort.) Shrub or tree, to 20 ft., with stout spines. lvs on rather slender petioles, ovate, 3-7-lobed, lobes with few teeth at the apex, 1-2 in long corymbs many-fld, with usually hairy pedicels fr oval, with usually 1 stone, $\frac{3}{4}$ - $\frac{1}{2}$ in high May, June Eu and N Afr to Himalayas (Gn 33, p 165, 37, p 467, 40, p 500, 52, p 266, 55, p 452 R H 1900, p 72 (all as *C. Oxyacantha*). —Many garden forms are cult., some of the most distinct are the following. Var. *punica*, Rehd Fls deep red, single. F S 15 1509, fig 1. L B C 14 1363. Var. *rosea*, Hort. Fls pink, petals with white claw. Var. *albo-plena*, Schneid With white double fls. F S 15 1509, fig 2. Var. *rubro-plena*, Schneid With double red fls. F S 15 1509, fig 3. Varieties differing in lvs and habit: Var. *laciniata*, Loud Lvs deeply pinnatifid with incised serrate lobes. Var. *pteridifolia*, Rehd (*C. Oxyacantha* var. *pteridifolia*, Loud Var. *glauifolia*, Hort.) Similar, but lvs longer, with narrower and more incised lobes. F S 20 2076. Var. *ferox*, Schneid (*C. Oxyacantha* var. *ferox* Carr. *C. Oxyacantha* var. *hirsuta*, Carr.) Branches with fascicles of numerous stout spines. F S 14 1468. G C III 24 13. Var. *inermis*, Rehd (*C. Oxyacantha inermis*, Dauthenay.) A spineless form. R H 1900, pp 72, 73. Var. *pendula*, Loud With pendulous branches. Gn 68, p 288. G M 44 827. M D G 1902 25, 26. Var. *roseo-pendula*, Rehd (*C. Oxyacantha* var. *pendula rosea*, Hort.) A pendulous form, with pink fls. Var. *stricta*, Loud (var. *pyramidalis*, Hort.) Of fastigate, upright habit. G C III 41 184. M D G 1906 390. Var. *semper-florens*, Rehd (var. *Briantia*, Carr.) Low, graceful shrub, flowering until fall. R H 1883, p 140. Gn 29, p 431, 33, p 465. There are also some varieties with variegated lvs.

23 ORIENTALES

47. *tanacetifolia*, Pers. Shrub or small tree branches with short spines or unarmed, branchlets tomentose lvs cuneate, obovate, pinnately 5-7-cleft, with the lobes glandular-seriate, villous-pubescent, 1 2 in long. corymb dense, 5-7-fld, calyx-lobes large, deeply glandular-serrate, fls large, fr pubescent, yellow, 1 m or more across, with lacinate bracts at the base. May, June Asia Minor. B R. 22 1884. Gt 43, p 215.

48. *orientalis*, Pall (*C. odoratissima*, Lindl *C. apiculata*, Hort.) Shrub or small tree, with spreading, almost unarmed branches and tomentose branchlets: lvs short-petioled, cuneate, obovate or oblong, pinnately 3-5-cleft, with the lobes incisely serrate at the apex, tomentose pubescent, 1-2 in long corymb dense, tomentose; calyx-lobes entire or depressed globose, brick- or orange-red, $\frac{3}{4}$ -1 in across, with 4-5 stamens. June, S E Asia. Minor B M 2314. B R 22. 1885 (as *C. odoratissima*) Gn 28 632 (as *C. tanacetifolia*) and p 635. G M 40 824. Var. *sanguinea*, Rehd (*C. sanguinea*, Schrad, not Pall *C. Tournefortii*, Griseb.) Lvs more glabrescent fr. dark red, with 2-4 stones. B R 22 1852.

49. *Azàrolus*, Linn (*C. Aronia*, Ser. *C. maiba*, Linn. f.) Shrub or tree, to 25 ft., with pubescent branchlets: lvs short-petioled, cuneate-obovate, deeply 3-5-lobed, with the lobes nearly entire or incised at the apex,

grayish green, pubescent, $1\frac{1}{2}$ - $2\frac{1}{2}$ in long corymbs few-fld, densely tomentose fr orange-red or yellow, globular, or ovoid, $\frac{3}{4}$ -1 in across. May N Afr. Asia Minor. B R. 22 1807 (as *C. Aroma*) R H. 1856. 441 Var. *sinatica*, Boiss. Lvs glabrous fr smaller, reddish yellow. B lt 22. 1855 (as *C. maroccana*). Gn. 22, p 146; 28, p 634.

24. PINNATIFIDÆ.

50. *pinnatifida*, Bunge Fig 1104 Shrub or small tree, to 20 ft. lvs slender-petioled, cuneate, elliptic-ovate, pinnately 5-9-cleft, incisely serrate corymbs many-fld, usually pubescent fr globular or pyriform, dark red, punctate $1\frac{1}{2}$ - $3\frac{1}{2}$ in high, stones 3-5. June. N China, E Siberia to Korea. R H 1901 308. Gt. 1862 366. Var. *major*, N E Br (*C. Korolkowii*, Schneid, not Henry *C. Britschneideri*, Schneid *C. californica*, Hort. *C. latifolia*, Hort.) Lvs larger, less deeply lobed: fr pyriform, 1 in long. G C II 26 620. R H 1901 308.

C. althæa, Lange = *C. Wattiana* — *C. ambigua*, C. A. Mry. Related to *C. monogyna*. Lvs deeply 4-7-lobed, sparingly hairy on both sides, 1-2 in long, corymbs many-fld, ovoid, usually with 2 stones. S Russia. — (*C. Bâsteri*, Sarg = *C. fetida* — *C. beata*, Sarg. Allied to *C. pruinosa* Shrub, to 15 ft. lvs oblong-ovate, villous above while young anthers dark maroon-color fr.

1103. Paul's thorn—*Cratægus Oxyacantha* var. *Pauli*. (×½)

crimson, pruinose, ripens end of Sept. N Y — *C. Beckwithæ*, Sarg. Allied to *C. pastorum* Shrub or tree, to 18 ft. lvs ovate, usually truncate at the base, at maturity thin calyx-lobes glandular-seriate fr subglobose, crimson, with 5 stones. N Y — *C. bellula*, Sarg. Related to *C. pruinosa* Shrub, to 12 ft., glabrous lvs ovate, bluish green and lustrous above, 2-3 in long stamens 8-10 fr dull crimson, bloomy, $\frac{3}{4}$ in across, with usually 4 stones. Mich. S T S 1 50 — *C. berberifolia*, Torr & Gray. Related to *C. Crusgalli*. Lvs obovate or obovate-oblong, obtuse, pubescent below, lustrous and nearly glabrous above, $1\frac{1}{2}$ -2 in long corymbs pubescent, anthers yellow fr orange with red cheek. La. S S 4 179 — *C. celsiana*, Bosc. Shrub lvs pinnately lobed, slightly pubescent beneath corymbs many-fld, fr ovoid, red. Origin unknown, probably hybrid of *C. pentagyna* — (*C. champianensis*, Sarg. Allied to *C. mollis*. Tree, to 20 ft., spiny lvs ovate, usually truncate at the base, lobed, glabrous above, pubescent on the veins below, 2-2 $\frac{1}{2}$ in long corymbs villous, usually 4-5-fld, stamens 10, fr obovoid or ovoid, scarlet, $\frac{3}{4}$ in long, in Sept. Que and Ont. to Vt. and N Y S S 13 169 — *C. chlorodora*, Maxim. Allied to *C. sanguinea*. Lvs pinnately 1-fld, truncate at the base, with short lobes, glabrous at length, corymbs many-fld, nearly glabrous fr, black, with green flesh. Japan — *C. corymbosa*, Sarg. Closely related to *C. pruinosa* Shrub, to 10 ft., spiny lvs ovate, acute or acuminate, slightly lobed, dull bluish green, glabrous corymbs 5-7-fld; anthers yellow fr ovoid or pyriform, pruinose, dull crimson at maturity, over $\frac{3}{4}$ in long, in Oct. N Y — *C. salicicola*, Sarg. (*C. salicicola* var. *compta*, Ledeb.) Allied to *C. pruinosa* Shrub, spiny, glabrous lvs oblong-ovate, usually rounded at the base, slightly lobed, glabrous corymbs many-fld, stamens 7-10, anthers dark rose fr obovoid, light cherry-red, $\frac{3}{4}$ in long, in Oct. W N Y. — *C. conspersa*, Sarg. Allied to *C. pruinosa* Tree, to 20 ft., spiny: lvs broadly ovate, rounded or subcordate at the base, lobed, yellow-green, pubescent on the midrib below corymbs 5-6-fld, slightly hairy, compound anthers white fr subglobose, crimson, over $\frac{1}{2}$ in across, in Oct. Ont. — *C. crenulata*, Roxb = *Pyracantha crenulata*. — *C. cuneolata*, Sieb & Zucc. Belongs to group *Cuneata* Shrub: young branchlets villous lvs short-petioled, cuneate-obovate or cuneate-oblong, crenate-serrate, glabrous above, spiny, ringy hairy below corymbs villous, 3-7-fld, stamens 20, anthers red fr, with 5 stones, plain inside China and Japan. I. 5 — *C. capullifera*, Sarg. Allied to *C. rotundifolia* Shrub, to 20 ft. lvs, obovate or rhombic, slightly lobed, lustrous and scabrate above: corymbs slightly villous, fr cup-shaped, stamens 10, anthers pink fr, scarlet, with 3-4 stones. N Y — *C. Dayana*, Sarg. Allied to *C.*

pedicellate Tree, to 15 ft, spiny lvs broadly ovate, acuminate, rounded or cuneate at the base, dark yellow-green, slightly hairy on the veins below while young corymbs 10-14-fld, fls $\frac{3}{4}$ in. across, stamens 20 fr obovoid, crimson, in Sept, soon falling. W. N. Y.—*C. difflua*, Sarg. Allied to *C. pruinosa*. Intricately branched spiny shrub, to 15 ft, glabrous lvs ovate, acuminate, rounded or cuneate at the base, dark bluish green and slightly serrate above corymbs 6-12-fld, stamens 10 fr subglobose, scarlet, less than $\frac{1}{2}$ in. across, in Oct. W. N. Y.—*C. Duppeidna*, Lange (*C. tanacetifolia* var. *Leana*, Hort. *C. tanacetifolia* \times *C. punctata*?), Small tree, spiny lvs rhombic-elliptic, lobed, sparingly pubescent above, densely beneath corymbs densely villous, stamens 20 fr, subglobose, reddish yellow or dull red. Origin unknown. Ga 33, p. 408.—*C. discosa*, Sarg. (*C. pruinosa* var. *discosa*, Engelm.), Allied to *C. pruinosa*. Slender spiny shrub, to 10 ft, glabrous lvs ovate to rhombic, cuneate at the base, dark bluish green corymbs 5-7-fld, stamens 10, anthers purple fr subglobose, crimson, in Oct. Mass.—*C. daungharica*, Zabel. Allied to *C. sanguinea*. Tree

1104. *Cratægus punctatula* ($\times \frac{3}{4}$).
No. 50

lvs. deeply lobed, sparingly pubescent or nearly glabrous corymbs slightly pubescent fr black, stones without or with slight furrows. Of unknown origin.—*C. Dindara*, Sarg. Shrub, to 12 ft, spiny lvs ovate to suborbicular, usually rounded at the base, slightly lobed, glabrous or slightly rough above corymbs 10-14-fld, fr. subglobose, crimson, $\frac{1}{2}$ in. across, in Oct. W. N. Y. Belongs to group *Anomala*, allied to *tenuifolia*—*C. desobridens*, Sarg. Allied to *C. coccinoides*. Shrub, to 20 ft, spiny lvs ovate, with 3-4 pairs of short lobes, glabrous corymbs glabrous, stamens 20; fr. bright red, in Oct. N. Y. S. S. 1-2—*C. elliptica*, Ait. (*C. glandulosa*, Moench. *C. flava* var. *pubescens*, Gray) Allied to *C. flava*. lvs. broader, of firmer texture, more pubescent and glandular; fr. subglobose, red or yellow. Southern states. B. R. 22, 1890 (as *C. spatulata*)—*C. elliptica*, Beadle, in *C. senta*, Beadle, a species allied to *C. flava* S. S. 13 697—*C. elliptica*, Mohr, in *C. signata*, Beadle, a species allied to *C. Crus-galli* S. S. 13 694—*C. ezorata*, Sarg. Allied to *C. pruinosa*. Shrub, to 10 ft, spiny; lvs ovate, usually rounded at the base, slightly lobed, dark yellow-green and rough above corymbs 5-6-fld, stamens 7-10; anthers pink fr. subglobose, scarlet, less than $\frac{1}{2}$ in. across, in Sept. Ont.—*C. Fázoni*, Sarg. Allied to *C. rotundifolia*. Shrub, to

10 ft, spiny; lvs broadly ovate, with 4-5 pairs of short lobes, nearly glabrous at maturity corymbs villous, stamens 5-10 fr. dark crimson, in Sept. N. H. S. S. 1 60—*C. ferentaria*, Sarg. Allied to *C. macracantha*. Intricately branched shrub, to 12 ft, with stout spines lvs ovate or lvs rhombic or ovate, pubescent below on the veins corymbs slightly villous, stamens 7-10, anthers white fr. subglobose or ovoid, $\frac{1}{2}$ in. long, scarlet, with usually 2 stones, ripening in Oct. W. N. Y.—*C. flabellata*, Spach (*C. Grayana*, Engelm.), Allied to *C. pedicellata*. Shrub, to 10 ft, lvs ovate, with short acute lobes at first sparingly hairy above and villous at the veins beneath corymbs slightly villous, calyx-lobes sparingly glandular-serrate, stamens 20 fr ovoid, crimson, with 3-5 stones, in Sept. Que.—*C. floridana*, Zuccagni—*Pyrus crataegifolia*—*C. fátida*, Ashe (*C. Baxteri*, Sarg.), Allied to *C. intricata*. Intricately branched, spiny shrub, to 12 ft, glabrous lvs ovate or oval corymbs usually 5-6-fld, calyx-lobes serrate fr. subglobose, orange-red or reddish brown, about $\frac{1}{2}$ in. thick, with 3-4 stones, in Oct. Mass. Ont and Va.—*C. Fontanesiana*, Steud. Allied to *C. Crus-galli*. lvs elliptic or elliptic-lanceolate, almost glabrous, shining, above corymbs many-fld, pubescent fr. red. Probably hybrid of *C. Crus-galli*—*C. Férberce*, Sarg. Allied to *C. pastorum*. Shrub, to 15 ft, lvs ovate to oval, cuneate or rounded at the base, slightly lobed, stamens 20, anthers dark rose-color fr. globose or ovoid, scarlet, with thin and juicy flesh. Mass.—*C. formosa*, Sarg. Allied to *C. pruinosa*. Shrub, to 15 ft lvs oblong-ovate, rounded or cuneate at the base, slightly lobed, slightly hairy above while young corymbs many-fld fr. ovoid or obovoid, scarlet, pubescent, with 3-5 stones. N. Y.—*C. gemmola*, Sarg. Allied to *C. succulenta*. Tree, to 30 ft, spiny lvs broadly obovate to broadly elliptic, doubly serrate and often slightly lobed, at maturity pubescent on the midrib beneath corymbs villous fr. scarlet, lustrous, in Oct. N. Y. Mich and Ont. S. S. 13 686—*C. genescensis*, Sarg. Allied to *C. Crus-galli*. Small tree, to 12 ft, spiny, glabrous lvs obovate-oblong, pointed at the rounded or acute apex, with prominent veins corymbs many-fld, lax, anthers pink fr. ovoid, scarlet, $\frac{1}{2}$ in. long, with 1-3 nutlets, in Oct. W. N. Y. G. C. III 54 15—*C. glandulosa*, Moench—*C. elliptica*—*C. gloriosa*, Sarg. Allied to *C. pedicellata*. Tree, to 25 ft, with few spines lvs ovate, cuneate or rounded at the base, rough above, slightly pubescent on the veins below, sometimes finally glabrous corymbs 10-15-fld, stamens 7-10 fr. ovoid, often unsymmetrical, deep crimson, in Sept. W. N. Y.—*C. grandiflora*, Koch (*C. lobata*, Bosc. *Cratægus-mesophyllo-grandiflora*, Camus) Small tree lvs elliptic, serrate, often slightly lobed toward the apex, pubescent fls 1-3, larger fr. ovoid, pubescent, with 3-5 stones supposed to be a hybrid between *Micropilus germanica* and a *Cratægus* G. F. 10 35 R. H. 1869, p. 80—*C. Grayana*, Engelm.—*C. flabellata*—*C. Harbisonii*, Beadle. Belongs to group *Præetate* allied to *Intricata*. Tree, to 25 ft, lvs oval or broadly obovate, corymbs serrate, petioles glandular corymbs many-fld, with copious glandular bracts fr. red or bright red, in Oct. S. S. 13 691—*C. heterophylla*, Fluegge. Allied to *C. monogyna*. lvs larger, usually trifid, fr. larger, bright red corymbs many-fld, B. R. 14 1161, 22 1847—*C. nemoralis*, Lange. Possibly *C. Crus-galli* \times *penicillata*, lvs elliptic to ovate, densely serrate or slightly lobed, lustrous above, pubescent on the veins beneath corymbs villous, stamens 15, with purple anthers fr. purplish black, Origin unknown—*Holmesiana*, Sarg. Allied to *C. pedicellata*. Tree, to 30 ft, lvs oval or ovate, slightly lobed, at maturity yellowish green, glabrous fls $\frac{1}{2}$ — $\frac{3}{4}$ in. across, stamens usually 5, anthers purple fr. ovoid, crimson, with usually 3 stones. Montreal to Pa. W. N. Y. and Ont. S. S. 13 676—*C. integrifolia*, Sarg. Allied to *C. tomentosa*. Tree, to 10 ft, spiny lvs broadly obovate or oval, broadly cuneate at the base, slightly lobed, glabrous corymbs villous, calyx-lobes entire fr. subglobose, $\frac{1}{2}$ — $\frac{3}{4}$ in. across, scarlet, lustrous. Que. G. C. III 47 60—*C. iræna*, Sarg. Allied to *C. pedicellata*. Shrub, to 12 ft, lvs ovate, cuneate or rounded at the base, slightly lobed, lustrous and glabrous above stamens 20, anthers yellow fr. ovoid, dark red, lustrous. Que.—*C. Karolkoovi*, Henry—*C. Wattiana*. See also No 50—*C. laeta*, Sarg. Allied to *C. Ellwangeriana*. Arboreal shrub, spiny lvs ovate, acuminate, serrate above, sparingly pubescent on the veins below corymbs 8-12-fld, compact fr. ovoid, bright orange-red, $\frac{1}{2}$ in. long, with 5 nutlets, in Sept. Origin unknown, much planted in Boston parks—*C. leopollya*, Sarg. Allied to *C. pruinosa*. Slender intricate, spiny shrub, to 15 ft, glabrous lvs broadly ovate, usually rounded or truncate at the base, dark blue-green above corymbs 5-7-fld, compact, anthers yellow fr. obovoid, bright red, $\frac{1}{2}$ in. long, with usually 4 stones, in Nov. W. N. Y.—*C. lioniana*, Sarg. Allied to *C. Crus-galli*. Tree, to 20 ft, spiny corymbs lvs oblong-ovate, acute or rounded at the apex finely and often doubly serrate corymbs lax, 10-18-fld, calyx-lobes glandular-serrate fr. subglobose to ovoid, dark crimson, $\frac{1}{2}$ in. long, with 2-4 stones, in Oct. B. R. 14 Y. 2 129—*C. lobata*, Buisson. Grandiflora, lvs broadly ovate to obovate, slightly lobed, glabrous corymbs villous, few-fld, stamens 20, with purple anthers fr. ovoid, crimson, in Sept. Ill. S. S. 13 679—*C. manetiana*, Sarg. (*C. leopollya* var. *minutina*, Engelm.) Allied to *C. pruinosa*. Tree-like shrub, to 15 ft, spiny, glabrous lvs ovate to deltoid, acuminate, hairy while young, corymbs many-fld, stamens 10, anthers dark purple fr. globose, scarlet, scarcely pruinose, about $\frac{1}{2}$ in. thick, in Oct. W. N. Y.—*C. Martiana*, Sarg. Allied to *C. pastorum*. Shrub, to 10 ft, with few spines, glabrous lvs oval to ovate-oblong, usually cuneate at the base, dark green above, yellow-green below corymbs many-fld; stamens 5-10, anthers red fr. ovoid, dark purplish crimson, $\frac{1}{2}$ in. long, in Aug. W. Mass. N. Y.—*C. Maximowiczii*, Beadle. Allied to *C. sanguinea*. Small tree, to 20 ft, lvs ovate, slightly lobed, pilose below corymbs densely pilose fr. pilose when young, finally glabrous. Amuriland, Manchuria—*C. microcarpa*, 1 in. C. *C. spatulata*—*C. opulenta*, Sarg. Allied to *C. pruinosa*. Shrub, to 15 ft, spiny, glabrous lvs ovate to oval, acuminate, hairy above while young corymbs 5-8

fld, compact fr. subglobose, obscurely angled, crimson, slightly pruinose, $\frac{1}{2}$ in long, in Oct. W N Y — *C. Palmeri*, Sarg. Allied to *C. Crus-galli*. Tree, to 25 ft. lvs broadly ovate to oblong, rounded or acute at the apex, coarsely serrate, glabrous corymbs glabrous, stamens 10, with yellow anthers. fr. dull green tinged with red, in Oct. S M 381 — *C. peregrina*, Sarg. Allied to *C. mollis*. Tree lvs ovate, broadly cuneate, with 5-6 pairs of narrow lobes, glabrous above, villous beneath corymbs many-fld, villous fr. ovate-globose, dark dull purple, pubescent at the base and apex, $\frac{1}{2}$ in across. Origin unknown, probably S W Asia S T S 2 191 — *C. perueunda*, Sarg. Allied to *C. pruinosa*. Spiny shrub, glabrous lvs, ovate, acuminate, dark green above corymbs 8-10-fld, anthers white fr. ovoid, orange-yellow, $\frac{1}{2}$ in long, in Sept. W N Y — *C. perulata*, Sarg. Allied to *C. Crus-galli*. Shrub, to 8 ft. lvs oblong-ovate to oval, usually acute, veins prominent, slightly hairy while young corymbs slightly villous, stamens 10-20 fr. subglobose or ovoid, crimson, lustrous, with 1-2 stones. N Y — *C. praeceps*, Sarg. (*C. praecox*, Sarg.) Allied to *C. rotundifolia*. Shrub, to 10 ft. spiny lvs rhomboidal to oval, slightly hairy while young, glabrous at maturity and scabrous above corymbs slightly villous, many-fld, stamens 10 fr. subglobose, dark crimson, $\frac{1}{2}$ in thick, in Aug. Vt. Que — *C. praeclara*, Sarg. Allied to *C. pruinosa*. Shrub, to 12 ft. spiny glabrous lvs oblong-ovate, acuminate, deeply lobed, corymbs lvs, many-fld, stamens 5-7, anthers pink fr. ovoid, crimson, not pruinose, lvs than $\frac{1}{2}$ in long, in Sept. W N Y — *C. Pyraeutha*, Pers — *Pyraeantha coccinea* — *C. rutilaria*, Nutt. Allied to *C. Douglasii*. Shrub lvs ovate-lanceolate, serrate, glabrous at length. Wyo. to Colo and Utah S S 4 170 — *C. Sargentii*, Boodle. Allied to *C. crinita*. Tree, to 20 ft. lvs elliptic to oblong-ovate, slightly lobed, glabrous at maturity corymbs slightly villous or glabrous, stamens 20, with purple anthers fr. yellow or orange-yellow, tinged with red, in Sept. Ga. to Tenn and Ala. — *C. longipetala*, Reg. & C. Wattian — *C. spaldingii*, Michx. Shrub or tree, to 20 ft. lvs cuneate, oblanceolate, crenately serrate or 3-lobed at the apex corymbs many-fld fr. scarlet, globular, $\frac{1}{2}$ in across. Southern states S S 4 185 B R 22 1846 (as *C. microcarpa*). The only species of the group *Microcarpa* allied to the *Aspidula*. *C. trifida*, Chapm. Shrub or small tree, to 20 ft. lvs ovate or elliptic, serrate, often slightly lobed, pubescent, 1-2½ in long corymbs 3-fld, hirsute, fls 1 in across, stamens 20, anthers yellow fr. globose, red. Ga. Ala. Belongs to the group *Triflora*, allied to *Triflorata*. — Very distinct and handsome, has proved hardy at the Arnold Arboretum — *C. virecunda*, Sarg. Allied to *C. intricata*. Shrub, about 3 ft., spiny, glabrous lvs oblong-ovate or oval, acute or acuminate, light bluish green corymbs 6-10-fld, stamens 7, anthers white, fr. ovoid or obvoid, less than $\frac{1}{2}$ in long, with 2-3 stones, in Sept or Oct. W N Y — *C. Wattiana*, Hemsl. & Leco (*C. altaica*, Lange *C. songarica*, Regel) Allied to *C. sanguinea*. Lvs smaller, truncate at the base, glabrous corymbs glabrous fr. yellow or reddish yellow, smaller. Cent. Asia Var. *incisa*, Schneid. (*C. Karolkowii*, Henry *C. sanguinea* var. *incisa*, Regel) Lvs more deeply and acutely lobed R H 1901 301 — *C. Wilsonii*, Sarg. Allied to *C. tomentosa*. Shrub, to 20 ft. lvs ovate or obvoid, acute or obtuse, lustrous above, sparingly villous beneath fr. ovoid, red, nearly $\frac{1}{2}$ in long, with 1-3 stones. Cent. China

ALFRED REHDER

CRATÆVA (after Cratævas, an obscure writer on medicinal plants, not, as sometimes stated, at the time of Hippocrates, but at the beginning of the first century B C, since he named a plant after Mithridates) *Capariidææ*. Tropical trees and shrubs, sometimes planted in the warm parts of the country.

Leaves 3-foliate; fls in corymbs, usually polygamous, with the odor of garlic; sepals and petals 4; stamens 8-20, torus elongated berries ovate-globose, with a slender stripe — Ten species, around the globe. The bark of the garlic pear, *C. gynandra*, blisters like cantharides. *C. religiosa*, from Malabar and the Society Isls is a sacred tree, and is planted in native graveyards. The bitter, aromatic lvs and bark are used by them in stomach troubles. The above and some other species are cult. in Eu. as ornamental greenhouse shrubs.

religiosa, Forst. f. (*C. Nurdia*, Buch-Ham.). A spreading unarmed deciduous tree of graceful proportions. lvs. long-petioled, the lfts. 2½-3 times as long as broad, fls. 2-3 in across, showy, yellow, or purplish yellow, the petals long-clawed. — Once cult by Francesco, Santa Barbara, Calif. but reported by him as no longer in cult. there. Excellent greenhouse plant N.

N. TAYLOR †

CRATEROSTIGMA (Greek, referring to character of stigma). *Scrophularidææ*. Torenia-like perennial low nearly stemless herbs of E. and S. Afr., sometimes grown under glass. Lvs. radical, plantago-like, many-nerved, entire; fls. lilac and purple, spicate, racemose or even solitary; calyx tubular, 5-nribbed and narrowly 5-toothed, corolla tubular, 5-nribbed and 5-toothed, the

tube enlarged toward the top, the limb 2-lipped, the dorsal lip concave and entire or emarginate, the other large and spreading and 3-lobed, stamens 4 and perfect, in unequal pairs, style filiform, 2-lobed and dilated at apex. fr. an oblong caps included in the calyx. Differs from *Torenia* in technical floral characters and in being nearly or quite stemless and with only radical lvs. — About 4 species. *C. pumilum*, Hochst. (*Torenia auriculata* folia, Donbr.) has fls. on slender pedicels ½-1¼ in long, the corolla-lobes pale lilac blotched with purple and veined with white; lvs sessile, ovate, in a basal rosette, pubescent beneath and nearly glabrous above. E. Africa. F.M. 10:534. — A stemless perennial.

L. H. B.

CRÈPIS (Greek for *Sandal*; application obscure). *Compositæ*. A large group of annual, biennial and perennial herbs, a few of which are now and then grown in outdoor gardens for the showy flowers.

Much like *Hieracium*, differing mostly in the simpler involucre, white soft pappus, and beaked achene. lvs radical and cauline, the former mostly ruinate, repand or pinnatiseet, the latter mostly clasping heads pedunculate, solitary or paniculate, all the florets perfect and ligulate, the rays yellow, orange or red fr. a smooth achene. — Perhaps 250 species in the north temperate zone, some of them weedy and widely dispersed. Among the cult kinds is *C. sibirica*, which resembles a sow-thistle in habit, and has corymbs of reddish blue fls about the size of a hawkweed, or a small dandelion. It is one of the coarser border plants, and rare. Rather light, sandy soil, and full exposure to the sun are essentials to the welfare of this plant. It is contented in a rather dry position, either in the rockery, or in the border. It is prop by division. A common plant on the moss of English thatched cottages is *C. virens*, a yellow-fld plant resembling a dandelion. *C. rubra* appears to be the commonest annual species cult abroad.

1105. *Crepis rubra*. (×¼)

sibirica, Linn. Perennial, 2-3 ft high, and at least as wide when in bloom plant covered with short rough hairs; root large, fleshy lvs rough, wrinkled, the lower coarsely dentate, the upper often somewhat cordate, 12 in long, including a petiole half as long fls bright yellow in a strictly terminal corymb; involucre loose, hairy. July Eu, Asia Minor, Himalayas Gn 53, p. 493 — The tallest and largest-fld of the genus. Its white plummy masses of seeds are also attractive.

aurea, Reichb. Black-hairy; height 1 ft or less; fls. orange, mostly solitary, lower lvs. spatulate-oblong, toothed, shining. June. Alps. — One of the commonest perennial species of the genus abroad. Repays cult soil.

rubra, Linn. Fig 1105. Annual; height ½-1½ ft; fls. red, usually solitary, the involucre being hispid. An attractive little flower-garden plant. Var. *alba*, Hort., has flesh-colored or whitish fls. Italy, Greece.

C. barbata, Linn. = *Tolpis* — *C. montana*, Reich. 12-18 in. lvs. unequally dentate fls. yellow in a large head. High mts., Switzerland, etc. Mentioned as grown in this country, but apparently not in the trade.

L H B †

CRESCÉNTIA (after Crescenzi, thirteenth century Italian agricultural writer) *Bignoniaceæ*. This genus is chiefly interesting for the calabash tree, which has

1106. *Crescentia Cujete* — The calabash. ($\times \frac{1}{2}$)

no near allies of horticultural importance; yields the calabash fruit.

Tropical trees, glabrous: lvs. alternate, solitary or clustered at nodes. fls. large, tubular, with a fluted 5-cut limb, yellowish, with red or purple veins; calyx 2-parted or deeply 5-cut — About 5 species, in Mex. and Cent. Amer. The calabash tree is a native of Trop. Amer., is especially familiar in the W. Indies, and can be grown outdoors in extreme S. Fla. and S. Calif. The outer skin of the fr. is removed and the seeds and pulp from within, and the hard woody shell is used for water-gourds and for all sorts of domestic vessels, according to size and shape. The growing fr. can be made to assume various forms by skilful tying. It is a tree 20-40 ft. high, and readily distinguished from all others by its peculiar habit of growth, as it bears large, horizontal, scarcely divided branches, which bear clusters of lvs. at intervals. The tree is becoming important in the manufacture of tobacco-pipes.

Cujète, Linn. Fig. 1106. A handsome tree when growing in the open, with wide-spreading well-foliated branches. lvs. 4-6 in. long, broadly lanceolate, tapering at the base, dark glossy green. fls. solitary, pendulous; calyx 2-parted; corolla constricted below the middle, and then swollen above, malodorous when decaying; stamens 4, sometimes 5: fr. frequently 18-20 in. through. The growing tree has somewhat the habit of a Burbank plum tree. B. M. 3430. N. TAYLOR. †

CRESS. A name applied to the pungent herbage of several species of the Cruciferae, used as salad.

The leaves of the ordinary garden cress (*Lepidium sativum*), sometimes called peppergrass, have a pleasant pungency, somewhat like that of the water-cress, which makes the plant well adapted to be used as a popular condiment, served with salads, especially lettuce, and also for garnishing purposes. The quick sprouting habit of the seed is proverbial. Often the plants show above ground the third day after seed is sown. But if cress is wanted in its prime continuously, new sowings must be made every few days. Sow seed rather thickly in rows a foot apart, selecting any good garden loam. The reason that this useful plant is seldom seen in the average home garden is probably

its liability to be attacked by hordes of flea-beetles which seem to have a particular fondness for cress pungency. But it is easily grown under glass, in flower pots, flats, or on a bench, in any light and fairly warm place and in any good soil. Grown thus it is usually free from flea-beetle injury, and goes well with forced lettuce. Seed is easily grown, either in the open or under glass. The plants are allowed to mature their seeds, are then pulled and the seed rubbed or thrashed out and cleaned. There are slight variations in the form of the leaves, some of which are more or less curled, others more of the broad-leaved type.

Water-cress (*Nasturtium officinale* of the older books, but known as *Radicula Nasturtium-aquaticum* and *Roripa Nasturtium* in recent books), Fig. 1107, is a hardy perennial, and finds a congenial place in small, running streams, shallow pools or ditches, wintering well when covered with water. It is usually found freely, bunched, in most of our markets and at green grocers'. It grows readily from seed as well as from freshly cut pieces of branches, and soon spreads over a large area. The best product comes from clear running water.

Similar to water-cress in pungency is the upland cress (*Barbarea praecox*), a hardy biennial. It also grows easily from seed sown in the open or under glass in ordinary soils and situations. The root-leaves are used for garnishing and seasoning, but they are not of the highest quality. See p. 454, Vol. 1.

Other plants sometimes grown under the name of cress are *Cardamine pratensis* (p. 661) and *Splanchthes oleracea* (which see). The very pungent root-leaves of the former are said to be eaten, but apparently the plant is not cultivated for this purpose.

T. GREINER.

CRÏNUM (Greek name for a lily) *Amarylhidææ*. Large and showy flowering bulbs, mostly tender, closely allied to Amaryllis and distinguished by the longer perianth-tube; flowers usually white or in shades of red, largely summer bloomers, but differing widely in this respect.

Stems arising from a tunicated bulb with a more or less elongated neck: lvs. mostly persistent, usually broad, sometimes several feet long fls. few or many in a 2-bracted umbel, often very fragrant and with 3 types of coloring, pure white, banded red or purplish down the center, or flushed with the same colors, perianth salverform or funnel-shaped, the tube straight or curved, long-cylindrical, segments linear, lanceolate or oblong, nearly or quite equal, stamens 6, attached on the throat of the corolla, with long filiform filaments and very narrow versatile anthers; ovary 3-celled, the ovules few in each cell, the style long and filiform, somewhat bent

1107 Water-cress—*Radicula Nasturtium-aquaticum*.

downward, the stigma not lobed: fr. a roundish or irregular caps., at length dehiscent; seeds large, green, thick — Probably 100 species in warm and tropical regions around the world, in moist or wet places. The crinums are amaryllis-like plants of great beauty. They are widely grown, often under the name of "lilies," some of them as greenhouse plants, some as

coolhouse subjects, and a few as hardy border plants. The bulbs are often very large, sometimes as much as 2 or 3 feet long, neck and all, the leak-like neck gradually tapering from the bulb proper. In some species the bulb is short and onion-like. Fig. 1108 shows forms of crinum bulbs. In some species the flowers are 1 foot long and half as broad, and sometimes the leaves reach the length of 6 feet and a width of 5 or 6 inches. The flower-stalk is solid, leafless, usually arising from the side of the bulb-neck. The genus might be roughly divided into the evergreen kinds, mostly with leak-like bulbs and symmetrical star-like straight-tubed usually erect flowers, and the deciduous-leaved kinds, mostly with roundish bulbs and nodding bell-shaped more or less irregular flowers.

The crinums require so much room that they are not often seen in commercial collections in this country. They are particularly adapted to mild and warm climates, and therefore full notes on such handling of them are given here. They are not much grown in American greenhouses. The species cross freely, and many fine hybrids are known, some of them under Latin species-names.

Hardy crinums

The species of Crinum require widely different culture, and their geographical distribution furnishes an important clue as to the degree of warmth required. There are two species hardy in the northern states, *C. longifolium* and *C. Moorei*, the latter being less reliable than the former but with finer flowers. These two species differ from others in blooming all summer instead of during a short period, and in the more lasting qualities of their flowers. An interesting hybrid between the two, *C. Powellii*, is harder than *C. Moorei*, and the flower, though better than *C. longifolium*, is not quite so showy as that of *C. Moorei*. The hybrid has three well-marked colors, white, rosy and purplish. A single bulb of the white variety has given fifty flowering bulbs in four years. It is excellent for placing in conspicuous positions on terraces or lawns, or in corners where flowers are wanted to combine with architecture or statuary for summer effect. The Agapanthus is frequently grown also for such purposes. Of course large specimens are needed for this use, but they are easily secured and they last from year to year. The bulbs of crinums are mostly grown in Holland and in Florida. The only native species, *C. americanum*, the "swamp lily of Florida," makes a brilliant and striking spectacle when seen in places far from cultivation, as in the Everglades.

The most reliable of the hardy crinums in the North is probably *C. Powellii*. If the bulbs are planted 2½ to 3 feet deep (to the bottom of the bulb) in well-drained soil, the plant stands without protection in the neighborhood of New York City. Let them stand 2 to 3 feet apart. This crinum makes a very ornamental summer plant, even the strong foliage producing a tropical effect. It produces offsets very freely, but they are deep in the ground. It seems not to produce seed in the North. *C. longifolium* is also hardy, but is better with a covering in winter; and it is inferior to *C. Powellii* in leaf and flower. *C. Moorei* is equally hardy except that the bulbs grow near the surface and are therefore so much exposed as often to be ruined by frost. It is a very desirable summer species. It often seeds in the latitude of New York City, and these fleshy seeds germinate readily if placed on the surface of moist soil. It produces offsets freely, which are used in propagation. It has very strong fleshy roots; and when grown in pots or tubs (which is a desirable practice) it should be given plenty of room. This species has a long columnar neck with a spreading cap or crown of leaves, and large white or pink flowers. *C. variable* (*C. capense*) is hardy south of the Ohio. There are a number of half-hardy species; and most of the

greenhouse kinds make very desirable lawn or porch plants when well established in large pots or tubs.

Tender crinums.

There are more than fifty species of greenhouse crinums, all of them worth growing because of their handsome flowers; some of them have very ornamental foliage. Most of the species are seldom seen in this country, possibly because they occupy too much space and give a comparatively small number of flowers to recompense the grower for their upkeep. It is not necessary to keep the evergreen species growing all the time after the flowers have been produced. The plants may be put out-of-doors under a lath-house for four or five months. The soil should be of a lasting nature with good drainage so that frequent repotting will not be necessary. When the plants are in a growing state, frequent applications of manure water will be found to be beneficial. In the warmer parts of the country,

1108 Crinum bulbs as named in the trade. Left to right, *C. Moorei*, *C. giganteum*, *C. Kirkii*, *C. Powellii*.

many of the tropical species should be plunged or planted out in the open border, where they often give a satisfactory quantity of flowers. In winter, the plants may be carried over under the bench of a temperate house. They should be given water occasionally during April and the first half of May to encourage new root-growth. When planted out in rich soil, nearly all of them will produce their gorgeous flowers out-of-doors, and during winter they are best treated as dormant bulbs with a little more heat than given such plants as cannas and richardias, planting them out as soon as the weather is favorable. A few of the tropical crinums are grown for their foliage principally, and are often seen in public conservatories and palm-houses where they suffer but little from dense shade. The flowers of most species are exceedingly handsome but only for a comparatively short time; during the remainder of the year when out of bloom there are hosts of things that are much more ornamental. Tropical crinums should be grown in this country nearly altogether for outdoor work; we then get the best out of them because our hot summers are favorable to their growth and for the production of bloom. Those species not amenable to this treatment do not give results at all in keeping with the space and time devoted to them. (G. W. Oliver.)

Crinums in Florida and the South.

The various species of *Crinum* belong to the most important, the most beautiful and the most popular of Florida garden plants. No plants grow so easily, with so little attention, and no plants are so floriferous and so deliciously fragrant. Some of the species, as *C. zeylanicum*, *C. erubescens* and *C. Sanderanum*, are so common in gardens, that they are little appreciated by people in general. Planted together in masses or in borders and in front of shrubbery, they look extremely beautiful. They grow best in rich, somewhat moist soil, but they are also perfectly at home in the high pinelands ridges when well fertilized and cultivated. There is great confusion in the nomenclature of these plants, scarcely half a dozen being correctly named in the various catalogues. The following notes are based on many years' experience with crinums in Florida, and the names represent plants that the author considers to be proper representatives of the species.

C. abyssanicum has white flowers and is attractive, but it does not grow well in the sandy soils of Florida.

C. amabile. Very much like *C. augustum* in growth and the flowers also much the same, but it is considerably smaller and multiplies rapidly by offsets, every three or four years it must be replanted in fresh rich ground, and the offsets must then be removed. It is a very beautiful plant, and much more floriferous than the *C. augustum*, flowering in every month of the year. The perfume of the masses of flowers in spring and summer is so strong that it pervades the entire garden. It does not bear seeds in Florida, but the pollen is fertile and can be used in cross-breeding.

C. americanum. Common along muddy banks of lakes and rivers. A very beautiful pure white, intensely fragrant species and very valuable in hybridizing work. Flower-stems usually 3 feet high, bearing mostly four flowers. Grows well in gardens, particularly in rich moist soil.

C. amatum. A rather small-growing Asiatic species with long slender bulbs and white flowers tinged red on the outside. Rare.

C. anaticum. The columnar stem-like bulb, about 12 to 15 inches long, grows mostly above the ground. In planting it should never be set deep in the ground, a few inches is sufficient. The leaves are arranged in a rosette. They are about 3 feet long, very broad near the bulb, gradually narrowing to a sharp point at the end. The color is light bluish green. Flowers almost all the year round, even in winter when the weather is warm, usually 20 flowers in an umbel being borne always a little above the foliage on a strong stem. The flowers are pure white, with linear narrow segments, filaments and stigma a pale yellowish white in the lower third. Strangely and deliciously fragrant. A real gem among our garden flowers. Hardy all over the Gulf Coast region, where it forms in time large and impressive clumps of tropical foliage. Bears large pea-green fleshy seeds abundantly. Excellent for raising hybrids.

C. augustum. "Great Mogul" of Barbados. The largest-growing of all our crinums, specimens 4 feet high and 6 to 8 feet in diameter being not uncommon. It needs rich moist soil and a fair amount of good fertilizer. Leaves are very broad, 4 to 5 feet long, narrowing gradually to a sharp point, deeply channelled. It blooms continually for months. Flower-stem an inch in diameter, purplish-red, 4 feet high, bearing a large umbel of glossy purplish crimson flower-buds which are pink inside after opening. Nearly twenty flowers to each umbel, giving a large mass of very beautiful and deliciously fragrant blossoms. This umbel is so large and heavy that it soon bends over and finally lies flat on the ground. For this reason, it is necessary to tie it to a strong bamboo stake. It is difficult to propagate, as offsets are formed slowly. A plant five years old has formed only two side-shoots. Although it affords good pollen for hybridizing purposes, it does not seed. Hardy in New Orleans.

C. campanulatum (*C. calfrum*). Very distinct, with beautiful glaucous green leaves and umbels of six to eight rosy red campanulate flowers. The flowers are much recurved at their edges. It blooms several times each year. One plant, about thirty years old, never made a side-shoot. It grows wild in ponds in southern Africa and very likely needs moist soil.

C. Caraguanum (offered in the trade as *C. virgineum* which is really a white-flowering species from Brazil). It also goes under the name of *C. grandis*. This is a doubtful plant, being perhaps an old English hybrid. It is very distinct from all other crinums, very beautiful and deliciously fragrant and a night-bloomer. Flower-stem 3 feet high, with an umbel of six to eight pure white flowers with a faint red band in the center. The petals are reddish and the stem is purplish grayish green. Bears no seed.

C. caribaeum. Reminds one of *C. americanum*, but flower-stem grayish purple on a green ground. Flowers pure white, very fragrant. Rare.

C. caespitae. Bulbs conical, very large, 8 to 10 inches in diameter. Forms offsets tardily, if at all. Flower-stem short. Flowers fifteen to twenty in an umbel, white, bell-shaped, faintly tinged with pink.

C. erubescens (usually advertised as *C. ambratium*). One of the most common species in Florida gardens. Increases rapidly by offsets. Leaves long, thin and narrow, 2 to 3 feet long. Flower-stem 2 to 3 feet tall, purplish green, carries usually four to six very beautiful fragrant flowers, pure white with a faint pink keel,

outside purplish red. Does not bear seeds, and pollen, and is useless for cross-breeding. Found everywhere in gardens.

C. ambratium. Extremely rare, and not in the trade. Flowers pure white, with a soft red band in the center of each petal. One plant formed only five offsets in the course of eight years.

C. giganteum. Perhaps the most beautiful species, the leaves being as ornamental as an aspidistra or a draena. Evergreen like *C. pedunculatum*, *C. amabile*, *C. augustum*, and *C. anaticum*. The leaves are about 4 feet long, thick deep green, beneath a bluish tint. It forms large clumps in the course of a few years. Flowers six to eight in an umbel, bell-shaped, creamy white in the bud, pure white when fully expanded, exhaling a very strong vanilla-like perfume. They appear as early as the middle of August, and even in winter when the weather is warm. Needs rich moist soil and does not thrive satisfactorily on high dry land. An excellent species for hybridization.

C. macranthum. Allied to *C. giganteum*, but bulbs much larger and leaves rather glaucous green, strongly nerved, with serrated edges. Flowers similar, but creamy white. Flowers usually two or three times during the year. This is as beautiful as *C. giganteum*, but it does not form such large clumps in the course of a few years. Seeds freely.

C. Kunthianum. A large-growing species, with a fine rosette of bright green spreading leaves and large umbels of pure white flowers. Its variety *nicaraguense* is a still larger-growing plant. The flower-stem is about one foot high, bears five or six very large white flowers with a faint pink band in the center, purplish on the outside. The flowers of both are strongly fragrant.

C. longifolium. An excellent plant for hybridizing. The leaves are glaucous green, strongly nerved, with serrated edges, flushed with deeper red on the outside. A fine foliage plant, though flowers not very showy. The white variety, *C. longifolium album*, with very beautiful pure white bell-shaped flowers, is a very showy plant and much superior to the type.

C. macrocarpum. Forms very large bulbous with long slender necks. A beautiful species with pink flowers, but very difficult to grow in light soils. It does not flower regularly each year.

C. Moorei. Bulb very large, 6 to 8 inches in diameter, with a very long slender, stem-like neck about 10 to 12 inches long. The leaves are very beautiful, long and thin and very wavy. It usually flowers in March in central Florida. Flowers four to ten in an umbel, bell-shaped, rosy or pinkish red and deliciously fragrant. There is a beautiful white form of this extremely beautiful species. Hardy. *Schmidtii*, which usually flowers also in March or April. Both kinds bear seeds if hand-pollinated with their own pollen or crossed with different other species. This crinum will not thrive well in the light sandy soils. It requires a heavier soil with some clay in it, and grows well only in a rich-bushy soil.

C. pedunculatum. Very rare in Florida gardens. Reminds one of *C. anaticum*, but the bulb is shorter, more massive and the leaves thinner and of a brighter green. Flowers twenty to twenty-five in an umbel, pure white and intensely fragrant. It needs rich mucky soil to do its best. It does not thrive on dry ground. It is a much shyer bloomer than *C. anaticum*, with which it is often confused.

C. podophyllum. This is another evergreen species, almost a miniature *C. ambratium*. Leaves glaucous green, strongly nerved, with serrated edges. Bulb only a few inches in diameter and very short. Flower-stem about 10 inches high bearing only a few pure white strongly fragrant flowers. Flowers only once during the summer.

C. pratense. Bulb 5 to 6 inches in diameter. Flowers white. Requires moist rich soil. Rare.

C. purpurascens. This small species, with linear undulated leaves about a foot long, forms large clumps in rich moist soil, thriving with caladiums, marantas, ferns, and other shade-loving plants. Flowers five to six in an umbel, slightly red in bud and pink when expanded. Flower-stem purplish, only about 6 to 8 inches high.

C. Sanderanum (Milk-and-Wine Lily). Common in Florida gardens. Flowers white, keeled with bright red, deeper red on the outside. Flower-stems 3 feet high, carrying five or six flowers in the umbel. Bears no seed.

C. scabrum. One of the showiest. Flowers large, amaryllis-like, pure white, banded crimson, reminding one of *Hypanthium stellatum*. Very fragrant, but flowers of short duration. Flowers three or four times during spring and summer. Bears seed abundantly and can be easily cross-fertilized with other species. Grows well on high dry pine land, but, like all crinums, requires rich soil.

C. variable. When in bloom, this is the showiest of all the species. Bulbs very large, conical. Flower-umbels consist of fifteen to twenty large pure white bell-shaped flowers, being borne well above the foliage, standing upright. The flowers are faintly striped with pink. Three or four stems are usually pushed up at the same time from one large bulb, and beds consisting of twenty-five or fifty bulbs are a magnificent sight. The flowers are always open at the same time. This crinum is strictly a night-bloomer, its flowers beginning to open in the dusk of evening, remaining in perfect condition until sunrise. A clump or a bed of this species in full bloom during a moonlight night has a wonderful effect. It looks particularly beautiful under the palm. This species is hardy as far north as southern Missouri and Kentucky, with a little protection in the form of stable manure or dry leaves. It has been received under the names *C. Kirkii*, *C. ornatum* and *C. latifolium*. Does not seed.

C. yemensae. Flowers pure white, bell-shaped and somewhat fragrant. Bears seeds. Excellent for cross-breeding purposes.

C. zeylanicum (often sold as *C. Kirkii*). Perhaps the most common of all the crinums, being found in almost every garden, even in the city. The flowers are usually four to six in an umbel, borne on tall purplish stems. They are deep crimson in the bud

state, white with a red stripe, when fully expanded. They usually flower in June and July after the rainy season has set in. Bears large grayish green fleshy seeds abundantly and is a fine plant to be used in hybridizing.

A. *Pervanth erect, salver-shaped, with linear segms.; stamens spreading. (Stenaster.)*

B. *Color of perianth white; tube greenish.*

1. *asiaticum*, Linn (*C. tozcarum*, Roxbg.). Bulb 4-5 in thick, neck 6-9 in. long. lvs 20-30 to a bulb, 3-4 ft. long, 3-4 in broad, peduncle 1½-2 ft long, 1 in. thick; fls 20-50 in an umbel; spathe-valves 2-4 in. long, pedicels ½-1 in long; perianth white; tube erect, tinged with green, 3-4 in long, segms. 2½-3 in long; filaments tinged red, 2 in long; ovule 1 in a cell. Trop. Asia. B.M. 1073. G.F. 4:283. Baker gives 5 botanical varieties, of which the most important in the American trade is probably var. *sinicum*, Baker (*C. sinicum*, Roxbg. *C. pedunculatum*, Hort, not R. Br.). St JOHN'S LILY. Bulb 6 in. thick, 18 in. long; lvs 5 in broad, with undulated edges, forming a massive crown 4-5 ft high; peduncle 2-3 ft. long; fls. 20 or more, the tube and segms longer than in the type; perianth white. China. The bulb usually divides into 2 of equal size; small offsets are rarely produced. Seedlings flower in 5 years. Var. *declinatum*, Baker (*C. declinatum*, Herb.), has a declined instead of erect bud; perianth-segms tinged red at tip B.M. 2231. Var. *procerum*, Baker (*C. procerum*, Carey), is larger than the type with lvs 5 ft. long, 6 in. wide. perianth-tube and limb 5 in long, the latter tinged red outside. Rangoon. B.M. 2684. Var. *anomalum*, Baker, is freakish-looking, its lvs being expanded into a broad, membranous, striated and plaited wing. B.M. 2008 (as *C. plicatum*). C. *eboraci*, Herb. (*C. hybridum* Todd & R. Hort.). Similar to the variety next mentioned, but half the size. Garden hybrid between a small form of *C. asiaticum* and *C. longifolium*. C. *eboraci* var. *cappum*, Reasoner (*C. cappum*, Reasoner). Habit much like *C. asiaticum*, but lvs tapering to a slender point, semi-erect, 4 ft. high; fls. about 20, segms. 4 in. long, ½ in. broad, spreading, white, sometimes changing to pink. Garden hybrid between *C. asiaticum* var. *sinicum* and *C. longifolium*. Increases both by offsets and splitting of the bulb into two. C. *sinico-scabrum*, Hort, hybrid of *C. asiaticum* var. crossed with *C. scabrum*, and intermediate in aspect and fl.—*C. asiaticum* is the largest of the cult. species, good specimens standing 5 ft. high and having a greater spread. The evergreen reticulated lvs. are ornamental. It blooms several times each year in good greenhouse or greenhouse conditions.

2. *pedunculatum*, R. Br. (*C. australe*, and *C. exaltatum*, Herb. *C. canaliculatum*, Roxbg.). Bulb 4 in. thick; neck 6 in. long. lvs. 25-30 to a bulb; fls. 20-30 in an umbel; spathe-valves 3-4 in. long; pedicels 1-1½ in. long; perianth greenish white, not tinged with red outside,

the segms. linear and spreading and shorter than the tube; filaments short, bright red; style shorter than the filaments; ovules 3 in a cell. Austral. B.R. 52.—The bulb grows above ground on a large rootstock; summer; coolhouse.

3. *caribaeum*, Baker (*C. floridanum*, Griseb., not Fraser). Lvs. lorate-oblong, 1 ft. or less, 3-4 in. broad, narrowed to the base; umbels 3-4-fl.; perianth-tube 3-4 in. long, nearly straight; segms. white, linear, spreading, nearly as long as tube. W. Indies.

B.B. *Color of perianth purplish red outside; tube purplish red.*

4. *amabile*, Donn. Bulb small; neck 1 ft. or more long; lvs. 25-30 to a bulb, 3-4 ft. long, strap-shaped, tapering to the point, the margin entire. peduncle 2-3 ft. long; fls. 20-30 in an umbel, very fragrant; spathe-valves 4-5 in. long; pedicels ½-1 in long; perianth with a crimson center band, tinged outside bright purplish red; tube bright red; segms. 4-5 in long; stamens an inch shorter than the segms. Sumatra B.M. 1605. R.H. 1856. 241.—Summer; warmhouse. Supposed by Herbert to be a spontaneous hybrid between *C. asiaticum*

1109. *Crinum americanum*. (X ½)

var. *procerum* and *C. zeylanicum*. fls. sterile; bulb increases by small offsets; has been sold under the name of *C. augustum* (Hort, not Roxbg.), which is a similar but smaller natural hybrid presumably between *C. bracteatum* and *C. zeylanicum*, and has more obtuse lvs. than *C. amabile*.

AA. *Pervanth erect, salver-shaped, with lanceolate segms.; stamens spreading. (Platyaster.)*

B. *Lvs. few, 6-12 to a bulb.*

5. *americanum*, Linn. Fig. 1109. FLORIDA SWAMP LILY. Bulb stoloniferous, ovoid, 3-4 in. thick, neck short. lvs. 1½-2 in. broad and 2-4 ft. long, curved, denticulate; fls. 3-6, usually 4 on an erect scape 20-30 in. high; pedicels 0 or very short; perianth creamy white, the lobes linear or lance-linear; tube greenish, equaling or exceeding the lobes. Native in river swamps Ga. and Fla. and westward. B.M. 1034.—Blooms in spring and summer, but some fls. may occur in winter far S.

6. *pratense*, Herb. Bulb ovoid, 4-5 in. thick; neck short; lvs. 6-8, linear, suberect, 1½-2 ft. long, 1½-2 in. wide, channeled, narrowed to point, margin entire; fls. 6-12 on a lateral compressed peduncle 1 ft. or more high; perianth white, the tube greenish and 3-4 in. long, the segms. nearly or quite as long, ½ in. broad, lanceolate; filaments shorter than segms, bright red. Low grounds, India. Summer. Var. *elegans*, Carey, has a longer-necked bulb, decumbent, peduncle, and tube an

inch shorter than the segms. B M 2592 Var. *venustum*, Carey, has about 30 fis in an umbel India.

7 *amœnum*, Roxbg Bulb globose, 2-3 in. diam, with a very short neck: lvs 10-12, suberect, linear, 2 ft or less long, rough-edged, tapering to the apex. fis 6-12, the peduncle standing 1-2 ft high; perianth-tube greenish, 3-4 in long; segms. white tinged red outside, 2-3 in. long, lanceolate, filaments bright red, shorter than segms. India Summer; warmhouse. Var *Mearsi*, Bedd (C *Mearsi*, Bedd.). Very small: lvs 1 ft. or more long, 1 in. wide, very smooth peduncle 3-5 in long, 6-10-fld, fis white, the tube slender and 5 in long; segms lanceolate, $2\frac{1}{2}$ in. long and $\frac{1}{2}$ in broad. Upper Buima. G.C. III 42 62—Whole plant not more than 2 or 3 in high when not in bloom; blooms well in a 3-in. pot

BB Lvs numerous, 20 or more to a bulb.

8. *augustum*, Roxbg (C *ambula* var. *augustum*, Gawl) Bulb conical, 6 in thick, neck long lvs 20-30, strap-shaped, 2-3 ft long, 3-4 in broad: fis 12-30, on a lateral much-compressed peduncle 2-3 ft. high, pedicels sometimes an inch long, color strong purplish red outside, banded within; tube purplish; segms. lanceolate, 4-5 in. long, filaments half length of segms., red. Mauritius; Seychelles. B.M. 2397. B R. 679—Warmhouse; effective

9 *erubescens*, Ait Bulb ovoid, 3-4 in thick, the neck short. lvs many, curved, strap-shaped, thin, 2-3 ft long and 2-3 in broad, slightly rough on edges. fis 4-12, on peduncle 2 ft. or more high, the pedicels 0 or very short, color reddish outside, white within; tube bright red, 5-6 in. long; segms. half as long as tube, lanceolate, reflexing Trop. Amer. B M 1232. L.B.C. 1 31.—Summer; warmhouse.

10 *Kunthianum*, Roem. (C *erubescens*, HBK., not Ait.) Bulb ovoid, 3 in diam, with a short neck: lvs about 20, strap-shaped, spreading, 2-3 in broad, undulate but entire. fis 4-5 in an umbel, the peduncle 1 ft high, the pedicels 0 or very short, pure white, tube 7-8 in long; segms lanceolate, $2\frac{1}{2}$ in long; filaments less than 2 in long, bright red. Colombia. Var. *nicaraguense*, Baker, is purple outside, the segms. a little longer and lvs. longer and narrower.

11 *purpurascens*, Herb Bulb ovoid, short-necked, 2 in. diam, stoloniferous lvs 20 or more, linear, thin, 3 ft or less, prominently undulate. fis. 5-9, on a peduncle 1 ft or less long, tube very slender, 5-6 in. long, segms lanceolate, half as long as tube, pink or purplish; filaments bright red Upper and Lower Guinea, in streams and lakes, the lvs often floating B M 5525. G.C. III. 47:114—Amphibious. Summer; warmhouse.

AAA Perianth funnel-shaped, tube permanently curved, segms oblong ascending, stamens and style contiguous and declined (Codonocrinum.)

B. Bulbs long-necked (No. 30 omitted).

C. Margin of lvs. not ciliate, but often scabrous

12. *longifolium*, Thunb. (*Anaryliss longifolia*, Linn C. *riparium*, Herb. C. *capense*, Herb.) Bulb ovoid, 3-4 in. diam: lvs. 12 or more, strap-shaped, 2-3 ft. long, 2-3 in wide, margins rough fis 6-12, pedicels 1-2 in. long; perianth tinged red on the back, and sometimes on the face, with a white variety, tube cylindrical, 3-4 in. long, about equaling the limb; segms. oblong, acute, 1 in. or less broad; stamens nearly as long as segms.; filaments red. Cape. Natal. B M 661. Var. *album*, Hort. Gn. 52, p 123.—Probably the hardest pure species of crinum, enduring the win-

1110.
A young plant of
Crinum Moorei.

ter of the Middle States, if protected with litter during cold weather. Prop. by offsets or seed, which latter is produced abundantly C. *grandiflorum*, Hort., is a hybrid with C. *Careyanum*, said to partake of the hardness of C. *longifolium*. Sometimes described as having a short-necked bulb.

13. *Macowanii*, Baker. Bulb globular, 9-10 in. diam, with neck 6-9 in long. lvs. 12-15, strap-shaped, thin, 2-3 ft long, 4 in or less broad: fis. 10-15, on a stout green peduncle 2-3 ft high; tube curved, green, 3-4 in. long; segms about equaling the tube, pink, oblong, acute, 1-1 $\frac{1}{2}$ in broad. Natal.—Late autumn, greenhouse, or half-hardy.

14. *Moorei*, Hook. f. (C *Makoyanum*, Carr C. *Colensoi*, C. *Mackenzii* and C. *natalense*, Hort.) Fig. 1110 Bulb ovoid, neck 12-18 in long lvs 12-15, strap-shaped, 2-3 ft long, 3-4 in wide, margin entire, veins rather distant, distinct fis 6-12, on peduncle 2-3 ft high, the pedicels $1\frac{1}{2}$ -3 in long; tube greenish, about 3 in. long and with a funnel-shaped pinkish limb of equal length, the segms oblong, nearly acute, convergent, filaments pink, an inch shorter than segms. Natal and Kaffraria B M 6113 G.C. III 2 499, 48:59. R H 1887 300 and p 417 R B 22 p 196, 23.61 Var *album*, Hort. Gt 31:1072. Yvacei*, Boiss. Bulb ovoid, 4 in across, without distinct neck lvs linear-lorate, 2 ft or less long, 2 in broad, rough-edged fls about 15, on peduncle 1 ft or less high, white with red mottling, perianth funnel-shaped, 8 in long, the tube curved and red, the segms linear-lanceolate, and a little shorter than tube Mozambique R H 1908 132 — *C. Wimshursti*, Worsley Differs from *C. Samuelli* in lvs not rough-edged, fls on short pedicels, faintly fragrant, less lasting and with longer style Cent Afr — *C. zambarense*, Hort = (?) L. H. B. †

CRITHMUM (Greek for barley, from some resemblance in the seed) *Umbelliferae*. SAMPHIRE. A single species, *C. maritimum*, Linn, on shores in Great Britain, W. Continental Eu, and the Medit. region, rarely planted in wild gardens or borders. It is a fleshy glabrous perennial herb, seldom more than 1 ft. high, somewhat woody at the base: lvs. 2-3-ternate, the segms. thick and linear: umbels compound, of 15-20 rays, involucrate, the umbellules with involuclcs;

petals very minute, entire, fugacious: fr. ovoid, not compressed, about ¼ in. long. Thrives well in a sunny situation, and will grow at considerable distance from the sea. Prop. by division, and by seeds sown as soon as ripe.

CROCÓSMIA (Greek, odor of saffron, which is perceivable when the dried flowers are placed in warm water) *Iridaceae*. Gladiolus-like garden plant.

This genus has but one species, and is not clearly distinguished from the closely allied *Tritonia*, but it differs in the stamens being separated at equal distances instead of grouped at one side, the form of the limb, the tube not swollen at the top, and the fr. 3-seeded, sometimes 5-seeded, instead of many-seeded.

The name of this genus is spelled *Crococina* by Baker, but it was first spelled *Crococina*. The fls with coppery tips shading into orange-yellow are very distinct and attractive. Pax, in Engler & Prantl, combines the genus with *Tritonia*.

Crococina aurea is a showy bulbous autumn-blooming plant, which is hardly south of Washington, D C, with slight protection, and in the North is treated like gladioli, the bulbs being set out in the spring, after

danger of frost, and lifted in the fall for winter storage. It is of easy culture, and is propagated by offsets or by seeds which should be sown in pots, under glass, as soon as ripe. Corms should be stored in peat or sphagnum to prevent them from becoming too dry.

aurea, Planch (*Tritonia aurea*, Papp.) Height 2 ft. corm globose, emitting offsets from clefts in the side scape 1½-2 ft high, leafy below, naked or only bracted above, compressed, 2-winged. lvs. distichous, shorter than the scape, linear, ensiform,

1112. *Crococina aurea* var. *imperialis*. (×½)

strated, but with a distinct midrib fls sessile in the panicle, perhaps 25 scattered over a long season, with buds, fls and seeds at the same time; perianth bright orange-yellow toward center; tube slender, curved, 1 in. long; segms longer than the tube caps 3-celled. Trop and S. Afr July-Oct F.S. 7.702. B M. 4335. B.R. 33.61 (*Tritonia*). Also interesting as one parent of a bigeneric cross resulting in *Tritonia* (*Montbretia*) *crococinaeflora* Var. *imperialis*, Hort, Fig 1112, grows about 4 ft. high. Var. *maculata*, Baker, has dark blotches above the base of the 3 inner segms. J.H. III 33:567.

J. N. GERARD.
WILHELM MÜLLER.

CROCUS (Greek name of saffron). *Iridaceae*. Low spring-flowering and autumn-flowering garden bulbs, showy, and well known.

Stemless plants (the grass-like lvs. rising from the

ground or corm), with solid bulbs or corms: fls showy, in many colors, funnel-shaped and erect, with a very long tube and 6 nearly or quite equal segms; stamens 3, attached in the throat of the perianth and shorter than the segms; style 3-lobed, the branches entire or forked or much fimbriated, ovary 3-lobed seeds many, nearly globular: fr. an oblong 3-valved caps.—Probably 75 species, many of them variable, in the Medit region and extending into S. W Asia. The fls open in sunshine. They come in fall or spring, but the best-known species are spring-flowering, which are amongst the earliest and brightest of spring bloom. Crocuses force easily (see *Bulb*). A half-dozen corms may be planted in a 4-in pot for this purpose. Crocuses are scarcely known in the American trade under their species names. Inasmuch as the flowers of the common crocus close when taken out of the sun, they are not popular as window-garden or house subjects. Crocuses have been much hybridized and varied. There are many color-forms. The common crocuses of the trade have descended from *C. vernus* chiefly, but *C. susianus*, *C. masiacus*, *C. stellaris*, *C. biflorus* and *C. sativus* are frequent. The Dutch bulb-growers cult. many species, and these are offered for sale in their American lists, the species are therefore included in the following synopsis. In this account, the treatment by Baker is followed (*Handbook of the Iridaceae*).

Botanically, the genus divides itself into three groups on the characters of the style-branches the branches entire, once-forked or fimbriated at the apex, or cut into several capillary divisions. Horticulturally, the species fall into two groups,—the spring-flowering and the autumn-flowering. These groups are not so definitely separated as it would seem, however. Some of the species bloom in winter in regions in which the ground does not freeze hard, others begin to bloom in July or August, some may continue to bloom till winter closes in. Yet these two flowering periods mark very important differences in the utilization of the plants and the primary division in the following treatment is made on this basis. The colors are now much varied by cultivation and hybridizing, but they are well marked in the specific types as a rule. They run largely in yellow, white and purple.

The covering or tunic of the bulbs may be uniformly membranaceous, or it may be composed of strongly reticulated or parallel fibers. Fig. 1113. The flowers appear usually just in advance of the grass-like foliage-leaves. The floral leaves are small and more or less dry or scarious and arise directly from the corm and may be seen as a spathe-like structure inside the leaf-tuft, this is usually known as the basal spathe. The real spathe subtends the bloom, and it is always one-flowered; this floral spathe may be one-leaved or two-leaved.

Culture.—Many forms of crocus are well known, where they are justly valued as among the showiest and brightest of winter and spring flowers. They thrive in any ordinary soil. About two-thirds of the species are classed as vernal and the remainder as autumnal flowering, but the various members of the tribe would furnish nearly continuous bloom from August to May were the season open. While there are numerous species interesting to a botanist or a collector, practically the best for general cultivation are *Crocus Imperati*, *C. susianus* (Cloth of Gold crocus) and the Dutch hybrids, mostly of *C. masiacus*. These bloom in about the order named. The rosy flowers of *C. Imperati* may be expected with the earliest snowdrops. The named species, having shorter flower-tubes than the Dutch hybrids, are not so liable to injury by the severe weather of the early year. The autumnal species are not satisfactory garden plants, the flowers mostly appearing before the leaves, and being easily injured. *C. speciosus* and *C. sativus* are probably the most satisfactory. The latter species has been cultivated from time immemorial, the stamens having a medi-

cal reputation, and being a source of color (saffron). The cultivation of this species is a small industry in France, Spain and Italy.—The corms of crocuses should be planted about 3 or 4 inches deep, in a well-worked and perfectly drained soil which is free from clay or the decaying humus of manure. They should be set only 2 or 3 inches apart if mass effects are desired. They may be planted in September or October for bloom in the spring or the following autumn; or the autumn kinds may be planted early in spring. The corms should be carefully examined and all bruised and imperfect ones rejected, as they are very susceptible to attacks of fungi, which, gaining a footing on decrepit corms, will spread to others.—The careful gardener will examine all exotic small bulbs annually, or at least biennially, until they show by the perfection of their new bulbs that they have become naturalized, or are suited to their new environment. In this case they may be allowed to remain until crowding requires their division. This examination should take place after the leaves are matured and dried up. Inasmuch as new corms form on top of the old ones, the plants tend to get out of the ground; it is well therefore to replant the strongest ones every two or three years. Increase

1113 Reticulated and membranaceous tunics. *Crocus susianus* (left) and *C. sativus* (right).

may be had from new corms which are produced more or less freely in different species on top or on the sides of old corms.—Seeds are often produced freely, but are likely to be overlooked, as they are formed at the surface of the soil. These germinate readily and most freely at the growing time of the plant. They should preferably be germinated in seed-pans, which should be exposed to freezing before the natural germinating time. Seedlings usually flower the third season.—The Dutch hybrid crocus is often useful for naturalizing in the lawn, although the grass may run out the plants in a few years, if the bulbs are not replaced by strong ones, they will not last more than a year or two if the foliage is mown off, but if the foliage is allowed to remain until ripe and if the lawn is fertile, the plants may remain in fair condition three or four years or more. (J. N. Gerard.)

A. *Blooming in spring (sometimes in midwinter and continuing toward spring).*

B. *Style-branches entire or merely toothed.*

C. *Fls. yellow, at least inside (varying to whitish forms): basal spathe absent.*

D. *Outer segms. striped or feathered outside.*

1. *susianus*, Ker CLOTH-OF-GOLD CROCUS. Fig. 1114. Corm $\frac{3}{4}$ in. diam.: lvs 6-8 in a tuft, reaching to the fl., narrow-linear, with revolute edges and a central band of white. upper spathe 2-lvd.: perianth-segms. $1\frac{1}{2}$ in. or less long, orange-yellow, becoming reflexed, the outer ones brownish or striped on the outside; anthers orange, longer than the filaments; style-branches long and spreading. Crimea B.M. 652 (adapted in Fig. 1114).—Blooms very early, Feb., Mar.

2. *chrysanthus*, Herb (not B.R. 33:4, fig. 1, which = *C. Ohneri* var *Suterianus*) Corm small: lvs as high as the fl., very narrow: upper spathe 2-lvd., nearly as long as perianth-tube. perianth-tube 2-3 times as long as the segms., the latter $1\frac{1}{4}$ in. or less long, and plain orange-yellow (varying tinted or striped on the outside, or even nearly white); throat glabrous; anthers orange, twice as long as the roughened filaments; style-branches red-orange. Macedonia and Asia Minor. Gn 74, p. 140. Var *alboidus*, Hort. Fls whitish. Gn.W. 25-229

1114 *Crocus susianus*. ($\times \frac{1}{2}$)

per spathe 2-lvd.: perianth-tube short, the segms. 1-1 $\frac{1}{2}$ in long, bright orange, the outer ones striped and feathered with brown on the back; anthers pale orange, a little longer than the filaments; style-branches somewhat overtopping the anthers. Mar.

DD *Outer segms. not striped (at least not in the specific types).*

4. *moesiacus*, Ker (*C. aureus*, Sibth. & Smith). Dutch Crocus. Later: corm larger: lvs. 6-8 in a tuft, overtopping the fl., narrow-linear, with reflexed edges and white central band: upper spathe 2-lvd., inner valve very narrow or obsolete; segms. very obtuse, bright yellow, $1\frac{1}{2}$ in long, one-half to a third the length of the tube: anthers pale yellow, hastate at the base, somewhat longer than the filaments; style-branches overtopped by the anthers. Transylvania to Asia Minor. B.M. 2986—Variable. A sulfur-yellow form is *C. sulphureus*, Ker. B.M. 1384. There is a striped form. B.M. 938. A cream-white form is *C. lacteus*, Sabine.

5. *ancyrensis*, Maw. Corm $\frac{3}{4}$ in. diam.: lvs. 3-4, as tall as the fl., very narrow: upper spathe 2-lvd.: perianth-tube exerted; segms. bright orange-yellow, 1 in. or less long, not striped nor colored outside; anthers orange-yellow, much longer than the filaments; style-branches red-orange. Asia Minor.—Blooms early.

6. *Korolkowii*, Maw & Regel. Corm globose, 1 in. diam. with matted fibers: lvs. 8-12, very narrow, with

reflexed edges and a central white band: upper spathe, of 1 or 2 membranous valves: perianth-tube shortly exerted; segms. about 1 in long, bright orange-yellow and not striped, the outer ones grayish brown on the outside; anthers orange-yellow; style-branches entire and orange-yellow. Turkestan, etc. Var. *dytsicus*, Bowles, has the outer segms. deep brown outside and with narrower margins of yellow.

CC. *Fls. lilac, purple or white.*

D. *Basal spathe (rising directly from the corm inside the lvs.) absent.*

7. *biflorus*, Mill. SCOTCH CROCUS. Corm $\frac{3}{4}$ in. or less in diam. lvs. 4-6, overtopping the fls., very narrow, with deflexed edges and a white central band: upper spathe 2-lvd.: perianth-tube exerted, the segms. $1\frac{1}{2}$ in. long, purple-tinted, the outer ones 3-striped down the back, the throat bearded and yellowish; anthers orange, exceeding the filaments; style-branches orange-red. S. and S. W. Eu B.M. 845—Runs into many forms, some of them almost white. Some of the named botanical forms are: Var. *argenteus*, Baker (*C. argenteus*, Sabine, *C. piceus*, Haw., *C. lineatus*, Jan). Less robust and with only 3 or 4 lvs. to a tuft and smaller fls. more tinged with purple and the outer segms. dark-striped outside. Italy B.M. 2991 (as *C. minimum*). Var. *pustillus*, Baker (*C. pustillus*, Tenore). Fls. smaller than in var. *argenteus*, paler, the 3 outer segms. striped with dark purple. Italy B.R. 1987 (var. *striatus*, with petals pale purple and not striped). Var. *Weidenii*, Baker (*C. Weidenii*, Hoppe), with uniform slaty purple limb. Dalmatia B.M. 6211. Var. *Adamii*, Baker (*C. Adamii*, Gay). Limb pale purple, the outer segms. 1-colored or with 3 pale purple stripes. Caucasus. B.M. 3868 (as *C. amulatus* var. *Adamicus*). Var. *nubigenus*, Herb. Segms. very small and nearly white, the outer ones with a broad band of purple on the back. Asia Minor. Var. *Pestalozzae* (*C. Pestalozzae*, Boss). Small-fl., with 1-colored whitish segms. Asia Minor. Var. *Alexandri*, Hort. (*C. Alexandri*, Velen). Fls. larger than in *C. biflorus* type, outer segms. flushed all over the back with bright lilac and with a narrow margin of white, or often with only feather-like stripes on white grounds. B.M. 7740

8. *aërius*, Herb (*C. Sibthorpianus* var. *stairicus*, Herb.). Corm globose, $\frac{3}{4}$ in or less diam, the tunic bristle-ringed at top lvs 3-6 in the tuft, as high as the fl., very narrow, with reflexed margins and a white band: upper spathe 2-lvd. perianth-tube little exerted; segms. 1 in. or less long, unstriped, pale or dark lilac, the throat yellow and glabrous, anthers orange, twice the length of the slightly papillose filaments. Armenia, Kurdistan. B.M. 6852B. Gn 74, p. 212 Early.

DD *Basal spathe present*

E. *Throat of perianth glabrous.*

9. *versicolor*, Ker (*C. fragrans*, Haw. *C. Reinwardtii*, Reiche). Corm $\frac{3}{4}$ in. or less in diam, with tunics of matted parallel fibers: lvs. 4-5, as high as the fls., otherwise like the last upper spathe 1- or 2-lvd., perianth-tube exerted; segms. $1\frac{1}{2}$ in. long, pale or dark purple, often striped and feathered with dark purple; throats glabrous, whitish or yellowish; anthers yellow, twice as long as the filament; style-branches, orange-yellow, equalling or overtopping the anthers. S. France. B.M. 1110.

10. *banaticus*, Heuff. Corm globular, $\frac{1}{2}$ in. diam.: lvs. usually 2, thin and flattish, and becoming $\frac{1}{4}$ in. broad, glaucous beneath: upper spathe 1-lvd. perianth-tube scarcely exerted; segms. $1\frac{1}{2}$ in or less long, bright purple, and never striped, but often dark-blotched toward the tip; throat glabrous; anthers orange, a little longer than the white filaments; style-branches short, orange-yellow, somewhat fringed at the tip. Hungary

11. *Tommasinianus*, Herb. Corm globular, $\frac{1}{2}$ in diam.: lvs. appearing with the fls., narrow ($\frac{1}{4}$ in. broad): upper spathe 1-lvd. perianth-tube little exerted; segms. $1\frac{1}{2}$ in. or less long, pale red-blush, sometimes dark-blotched at the tip; throat glabrous, anthers pale orange, a little longer than the white glandular filaments; style-branches short, orange-yellow. Dalmatia and Servia.—Distinguished from *C. vernus* by its glabrous throat.

1115 *Crocus vernus*. (X $\frac{1}{2}$)

orange, twice as long as filaments; style-branches nearly entire, orange-red. Greece, Crete. G. W. 22 287. G. M. 49 54. Var. *purpureus*, Hort. Fls. darker purple than the type. Var. *versicolor*, Hort. Outer perianth-segms. white feathered with purple or dark violet, inner segms. white, yellow at base inside. Gn. 73, p. 201.

13. *reticulatus*, Bieb. Corm $\frac{1}{4}$ in. diam., covered with honeycombed fibers: lvs. 3-5, as high as the fl., very narrow, with reflexed edge and a white band: upper spathe 2-lvd. perianth-tube much exerted; segms. 1-1 $\frac{1}{2}$ in. long, white to purple, the 3 outer ones striped, throat glabrous; anthers orange, twice the length of the orange filaments; style-branches scarlet, overtopping the anthers. S. E. Eu.—Varies to white.

bb. Throat of perianth pubescent or bearded

14. *vernus*, All. Fig. 1115. Corm 1 in. or less diam.: lvs. 2-4, as high as the fl., often $\frac{1}{4}$ in. broad, glaucous beneath, but green above, with reflexed edges, and a central white band: upper spathe 1-lvd., about as long as perianth-tube: perianth-segms. 1-1 $\frac{1}{2}$ in. long, lilac, white or purple-striped; throat pubescent, never yellow, anthers lemon-yellow, exceeding the filaments, style-branches orange-yellow. S. E. Eu. B. M. 860, 2240. R. H. 1869, p. 331. Gn. 54, p. 79.—The commonest garden crocus.

15. *etruscus*, Parl. Corm 1 in. or less in diam.: lvs. about 3, very narrow, as tall as the fl., upper spathe 1-lvd.: perianth-tube short exerted; segms. 1-1 $\frac{1}{2}$ in. long, lilac, or the outer ones cream-colored and sometimes purple-feathered outside; throat yellow, slightly pubescent; anthers orange, twice as long as the glabrous filaments, style-branches nearly entire, orange. Italy.

16. *Malyi*, Vis. Corm depressed-globose, 1 in. or less diam., with fine parallel fibers in the tunic which is slightly reticulated upward: lvs. narrow-linear, not so tall as the fl., with reflexed margins and white central band: upper spathe 2-lvd., foliaceous: perianth-tube yellow, scarcely exerted; segms. white, $1\frac{3}{4}$ in. long; throat orange-yellow and bearded; anthers orange, twice as long as the filaments; style-branches orange, slightly divided at tip. Dalmatia. G. C. III. 37:163. G. M. 51:455.

bb. Style-branches fimbriate at the top, or once-forked.

17. *Imperati*, Tenore. Fig. 1116. Corm nearly or quite 1 in. diam.: basal spathe present: lvs. 4-6, exceeding the fls., very narrow. upper spathe 1- or 2-lvd.:

perianth-tube little exerted; segms. 1-1 $\frac{1}{2}$ in. long, lilac or even white, the outer ones buff and 3-striped on the outside; anthers yellow, exceeding the filaments, style-branches fimbriate. Italy. B. R. 1993. Gn. 54, p. 79. Very early.

18. *Oliveri*, Gay. Corm nearly globose, $\frac{1}{2}$ - $\frac{3}{4}$ in. diam.: basal spathe absent: lvs. 4-5, as tall as the fl., becoming $\frac{1}{4}$ in. broad: upper spathe 2-lvd.: perianth-tube little exerted, segms. bright orange-yellow and never striped, $1\frac{1}{2}$ in. or less long; throat glabrous; anthers orange, twice the length of the roughish filaments; style-branches orange, slender-forked. Var. *Suternianus*, Baker (*C. chrysanthus*, Bot. Reg.) has narrower and more rolled lvs. Greece to Asia Minor. No. 2.

bb. Style-branches cut into capillary divisions: basal spathe absent: upper spathe 2-lvd.

19. *vitellinus*, Wahl. (*C. syriacus*, Boiss. & Gaill.). Corm $\frac{1}{4}$ in. or less diam.: lvs. 4-6, as tall as the fls., narrow-linear: perianth-tube short, exerted, segms. 1 in. or less long, orange-yellow, the outer brown-tinged outside; style-branches divided into many capillary parts. Asia Minor. B. M. 6416.—Rare in cult. Var. *graveolens*, Baker (*C. graviolens*, Boiss. & Reut. *C. syriacus*, Baker). Lvs. narrower outer segms. flushed with black or bearing 3 distinct stripes of black down the back.

20. *Fleischeri*, Gay (*C. Fleischerianus*, Herb. *C. smyrnensis*, Pösch). Corm $\frac{1}{4}$ in. or less diam., the tunic a dense mass of regularly interlacing fibers. lvs. about 6 to a tuft, as high as the fls., very narrow and having reflexed edges and a white band: perianth-tube not exerted; segms. 1-1 $\frac{1}{4}$ in. long, white, acute, the outer with 3 slender lilac lines on the back; throat yellow and glabrous; anthers small, orange, about as long as the filaments; style-branches brick-red. Asia Minor, on limestone hills.

21. *candidus*, Clarke (*C. Kikui*, Maw). Corm globose, $\frac{1}{4}$ in. diam.; tunic of matted parallel fibers. lvs. as high as the fl., becoming $\frac{1}{4}$ in. broad, the margin ciliated and the keel very narrow: perianth-tube little exerted; segms. 1-1 $\frac{1}{4}$ in. long, white tinged yellow towards throat (which is glabrous), the outer ones tinged or feathered with purple on back; anthers orange, about as long as the filaments; style-branches cream-white. Asia Minor. G. 31:17. Var. *luteus*, Hort. Fls. yellow, more deeply colored at the base, 3 outer segms. veined and mottled with purple.

22. *hyemalis*, Boiss. & Blanche. Corm globose, $\frac{1}{4}$ in. or less diam., the tunic membranous: lvs. about 4 to the tuft, as high as the fl., with reflexed margins and a white band: perianth-tube little exerted, segms. 1-1 $\frac{1}{2}$ in. long, white, with a long central purple line and three shorter lines, throat yellow, glabrous; anthers orange, twice as long as filaments; style-branches red. Palestine. Var. *Föxii*, Maw, has nearly black anthers. Gn. 74, p. 188.

aa. Blooming in autumn (sometimes in late summer and continuing toward autumn).

b. Style-branches entire or very nearly so.

c. Fls. white or lilac: basal spathe present (except in No. 26); upper spathe 2-lvd.

23. *sativus*, Linn. SAFFRON. *Crocus*. Fig. 1117. Corm 1 in.

1116. *Crocus Imperati*. (X $\frac{1}{2}$)

or more diam : lvs 6-10, as tall as the fl, very narrow, siliate-edged; perianth-tube little exerted; segms. oblong and obtuse, bright lilac or even white; throat pubescent; anthers yellow, longer than filaments; style-branches 1 in or more long, bright red (the source of saffron). Asia Minor. R.H. 1895, p. 573.—The commonest fall-blooming species.

24. *hadriaticus*, Herb. Much like *C. sativus*: usually smaller-fl., pure white, the segms. pubescent at base; anthers bright orange, more than twice longer than the white or purple filaments. Greece, etc.—Runs into several forms. Var. *melitensis*, Hort. Fls. feathered with purple and brown. Malta. Var. *Wilhelmii*, Hort. Fls. pale, with purple markings outside near the throat.

25. *zonatus*, Gay. Corm somewhat flattened or deflexed, $\frac{1}{2}$ – $\frac{3}{4}$ in. diam.: lvs. appearing after the fls., narrow-linear. perianth-tube exerted, 2-3 in.; segms. 1-2 in. long, rose-lilac, purple-veined and orange-spotted within, throat yellow, pubescent; anthers white, 2-3 times longer than the yellow filaments; style-branches short and yellow. Cilicia. G.C. III. 23:85.

26. *caspius*, Fisch & Mey. Corm ovoid, $\frac{3}{4}$ in. or less diam., with rigid tunic that has matted parallel fibers toward base. lvs 4-5 in a tuft, not reaching the fl, very narrow, with a white band and reflexed margins. perianth-tube much exerted; segms. white, not striped, 1-1 $\frac{1}{4}$ in. long; throat yellow, glabrous or slightly pubescent; anthers pale yellow or cream-colored, twice the length of filament, style-branches much exceeding anthers, slender, yellow. Near Caspian Sea. Oct. G.C. III. 34:443.

cc. Fls. yellow: basal spathe present; upper spathe 1-lvd.

27. *Scharojänii*, Rupr. Corm globose and very small, the membranous lvs developed in spring and remaining till the fl. appears; perianth-tube much exerted; segms. bright yellow, 1-colored, 1 $\frac{1}{2}$ –1 $\frac{3}{4}$ in. long; throat yellowish white; anthers pale yellow; style-branches nearly entire, orange-red, shorter than the stamens. Caucasus, Armenia, blooming end of July and in Aug. G.C. III. 32:321.

BB. *Style-branches fimbriated or forked at the top: basal spathe present, upper spathe 1-lvd.*

28. *longiflorus*, Raf. Corm $\frac{1}{2}$ in. diam.: lvs. 3-4, very short at flowering time, very narrow; perianth-tube much exerted, segms. oblong and bright lilac, 1 $\frac{1}{2}$ in., never striped, throat slightly pubescent, yellow; anthers orange, more than twice as long as the filaments; style-branches scarlet, slightly compound. S. Eu. B.R. 30:3.—Not frequent.

29. *serotinus*, Salisb. Corm 1 in. or less: lvs. 4-6, as high as the fl., very narrow. perianth-tube little exerted; segms. oblong, 1 $\frac{1}{4}$ in. in lilac or purple, indistinctly or not at all striped; throat glabrous; anthers yellow, much exceeding the filaments; style-branches orange-yellow, fimbriated. Spain. B.M. 1267.—Not frequent.

30. *Sälzmännii*, Gay (*C. tinglänus*, Herb.). Corm somewhat depressed, 1 in. diam.: lvs. about 6, not prominent at flowering time, very narrow; perianth-tube much exerted; segms. 1 $\frac{1}{2}$ in. long, plain lilac; throat pubescent, yellowish; anthers orange, longer than the filaments; style-branches slender, orange. Morocco. B.M. 6000.

1117 *Crocus sativus* (X $\frac{3}{2}$)

1118. *Crocus speciosus* var. *Aitchisonii* (X $\frac{1}{2}$)

Hook. f. B.M. 5776), has lilac fls. Var. *marathonseus*, Baker (*C. marathonseus*, Heldr.), has style-branches less divided than in the type, shorter and not overlapping the anthers. G.C. III. 40:335. Gn. 70, p. 273. G.M. 49:767.

cc. Fls. lilac (varying to white in No. 39).

d. Basal spathe present; upper spathe 1-lvd.

34. *medius*, Balb. Corm globular, 1 in. or less diam.: lvs. 2-3, appearing in spring, narrow, becoming a foot or more high; perianth-tube much exerted; segms. 1 $\frac{1}{2}$ –2 in. long, bright lilac; throat glabrous, whitish; anthers pale orange, twice the length of the yellow filaments; style-branches scarlet, with many capillary divisions. S. France, Italy.

35. *nudiflorus*, Smith. Corm very small, stoloniferous: lvs. 3-4, appearing after the fls., $\frac{1}{2}$ –2 in. long; throat glabrous; anthers large and yellow, twice as long as the filaments. Mts. S. France and Spain.—Long known in cult., but not common.

36. *astrius*, Herb. Corm globular, $\frac{3}{4}$ in. or less in diam.: lvs. about 3, appearing in fall but not maturing till spring; perianth-tube short-protruded; segms. 1 $\frac{1}{2}$ in. long, lilac; throat pubescent; anthers bright yellow, longer than the white filaments; style-branches orange, with many capillary divisions. Spain.

BBB. *Style-branches capillary-divided.*

c. Fls. white.

d. Basal spathe present.

31. *niveus*, Bowles. Very robust and vigorous: corm globose, $\frac{3}{4}$ –1 in. diam., the tunic of fine reticulated fibers; lvs. 6 in the tuft, equaling the fls.: basal spathe 2 $\frac{1}{2}$ in. long; spathe 2-lvd., 4 in. long, leafy at top; perianth-tube $\frac{1}{2}$ in. long, the segms. white but with an orange glabrous throat; anthers yellow, 3 times as long as the filament. Probably Greece.—Differs from *C. Boryi*, to which it is closely related, by the basal spathe being present, yellow anthers, naked filaments, and reticulated tunic.

DD. Basal spathe absent.

32. *laevigatus*, Bory & Chaub. Corm ovoid, $\frac{3}{4}$ in. or less diam., with rigid tunic broken into many small imbricated parts; lvs. 3-4 in a tuft, as high as the fl., very narrow, with reflexed margins and a white band; upper spathe 2-lvd, very short; perianth much exerted; segms. about 1 in. long, white and 1-colored or with 3-5 stripes of lilac on the back of outer segms; throat yellow, glabrous; anthers white, about as long as the papillose filaments; style-branches bright yellow, exceeding the anthers. Greece. Var. *Fontenayi*, Bowles, is very late-blooming, and the fl. has a buff tint, outside finely feathered with purple, and clear lilac inside. Gn. 74, p. 176.

33. *Boryi*, Gay. Corm globular, $\frac{3}{4}$ in. or less diam.: lvs. 3-6, narrow-linear, as high as the fls.: upper spathe 2-lvd perianth-tube short-exserted; segms. 1-1 $\frac{1}{2}$ in. long, white, sometimes lilac-lined at the base outside; throat yellow, glabrous; anthers white, somewhat longer than the orange filaments; style-branches scarlet, divided into many capillary segms and exceeding the anthers. Greece. Var. *Tournefortii*, Baker (*C. Orphanidis*, Hook. f. B.M. 5776), has lilac fls. Var. *marathonseus*, Baker (*C. marathonseus*, Heldr.), has style-branches less divided than in the type, shorter and not overlapping the anthers. G.C. III. 40:335. Gn. 70, p. 273. G.M. 49:767.

XXXI. The White Spine cucumber.

37. *byzantinus*, Ker (*C. iridiflorus*, Heuff.). Corm $\frac{1}{2}$ in diam.; lvs 2-4, developing after the fls.; perianth-tube much exerted; segms 2 in. or less long, the outer ones dark lilac and acute, the inner ones shorter and pale lilac or white, anthers orange, longer than the filaments S E Eu B.M. 6141. B R 33 4.—An old garden plant, but rarely seen in this country.

DD *Basal spathe absent, upper spathe 2-lb.*

38. *pulchellus*, Herb. Corm small, somewhat depressed; lvs produced after flowering, maturing in spring, perianth-tube much exerted, segms 1- $\frac{1}{2}$ in long, bright lilac, more or less indistinctly striped, throat glabrous, bright yellow, anthers white, longer than the pubescent yellow filaments, style-branches orange, with many capillary branches. Greece to Asia Minor B R 30 3

39. *speciosus*, Bieb. Corm not stoloniferous, 1 in. or less lvs usually 3, developing after the fls, thin, very narrow, becoming 1 ft long perianth-tube much exerted; segms 1 $\frac{1}{2}$ -2 in, lilac and feathered with darker color, anthers very large, bright orange, much exceeding the filaments S E Eu and Asia B.M. 3861 Gn 62, p 265, 71, p 613 B R 25 40.—Handsome and variable Var *albus*, Hort Fls white Var *Aitchisonii*, Foster (*C. Aitchisonii*, Hort.) Fig. 1118 More graceful than the type and larger, fls paler in color, the segms more pointed, divisions of stigma more numerous and more spreading or even drooping fls very pale bluish lilac. Asia G. 28-415 Gn M 8 228. L H B

CROP. The product secured from an area of cultivated plants; as, a crop of wheat, a crop of mushrooms, a crop of violets. The word is used generically for classes of products, as grain crop, root crop, forest or timber crop, fiber crop, flower crop, seed crop, salad crop. It is employed also as a verb,—the cropping of the land, to crop to fruit.

Other limitations of the word refer to duration and inter-relations *catch-crop*, a secondary crop grown between the succession of other crops, as in the time between a crop of radishes and a crop of cabbages, or between the rows or stands of other plants, *companion-crop*, a catch-crop grown between other growing plants, as lettuce between rows or hills of beans; *succession-crop*, a catch-crop succeeding another crop as late celery following early potatoes, *cover-crop*, a catch-crop grown usually late in the season, or in winter, to protect the land and to afford green-manure. Rotation-cropping is a form of succession-cropping. Double-cropping may be either companion-cropping or succession-cropping, or both. L H B.

CROSSÁNDRA (Greek, *fringed anthers*). *Acanthaceæ*. Warmhouse evergreen shrubs of minor importance.

Upright, with entire or somewhat toothed, often verticillate lvs, glabrous, or the infl. hairy fls. in dense sessile spikes, red or yellow, with prominent bracts, corolla cylindrical, more or less curved, somewhat enlarged at the throat, with a flat or spreading oblique limb, stamens 4, in pairs—Perhaps 20-25 species from India, Trop Afr., and Madagascar. The one commonly in the trade has handsome 4-sided spikes of scarlet-orange fls., perianth has 5 segms, the 2 upper ones being smaller, stamens 4, of 2 lengths caps. oblong, acute, 4-seeded. It is cult. S. outdoors to a slight extent, and also rarely in northern greenhouses. Should be grown in rich loam, peat or leaf-mold, and sand Prop. by cuttings in sand over bottom heat, preferably under a bell-jar.

undulifolia, Salisb. (*C. undulobulbiformis*, Nees). Height 1 ft., rarely 3 ft.: lvs. opposite, ovate-acuminate, stalked; fls. scarlet-orange, overlapping one another in dense closely bracted, achmea-like spikes, 3-5 in. long India. B.M. 2186. R.H. 1891:156. B.R. 69.

C. flava, Hook. Unbranched shrub, 6-8 in high: st green, glabrous lvs, opposite, close together, large for the size of the plant, 6 in long, ovate-lanceolate, dark green above, paler beneath, wavy, more obtuse than in the above, lower lvs stalked, upper ones sessile, spike 4-sided, spiny, fls yellow, tube much exerted, jointed Trop W Afr B.M. 4710—*C. guineensis*, Nees. Height 2-6 in at light red, rusty pubescent lvs 2-4 pairs, 3-5 in long, elliptic, green above, with golden netted nerves, reddish beneath: spike solitary, terminal, slender, 3-5 in high, fls numerous, small, pale lilac, with 2 darker spots on the 2 smallest segms and a white eye Guinea B.M. 6340—A handsome foliage plant.

N. TAYLOR

CROSSOSOMA (Greek, referring to a fringe-like body on the seeds) *Ranunculaceæ*, by Bentham & Hooker referred to *Dilleniaceæ*, and by Engler made the type of the family *Crossosomathaceæ*. Four much-branched woody plants of Mex., Ariz. and S Calif.: very glabrous, with grayish bark and whitish wood: lvs. oblong or narrower, entire, alternate, nearly or quite sessile, some of them fasciated fls mostly white, solitary and short-stalked at the ends of the branchlets *C. californicum*, Nutt. has been mentioned in gardening literature abroad: 3-15 ft high lvs 1-3 in long, not much fasciated fls large, with nearly orbicular white petals more than $\frac{1}{2}$ in long, the anthers long-oblong. follicles $\frac{3}{4}$ in or more long, many-seeded. Isl. of Santa Catalina *C. Bigelovii*, Wats., is lower, the fls mostly fasciated and fls only half as large, the petals white or purplish. Ariz. to S E. Calif.

CROTALÁRIA (Greek, *rattle, castanel*; from the rattling of the seeds in the pod) *Leguminosæ*. **RATTLE-BOX**. Annual outside herbs, and shrubs grown in greenhouses or in the open far South.

Herbs or shrubs of various habit: lvs. simple (actually unfoliolate) or compound fls. in terminal racemes or rarely the racemes opposite the lvs., calyx-tube short, the teeth narrow, as long as or a little shorter than the pea-like corolla—A cosmopolitan genus of perhaps 250 species, in tropics and subtropics mostly. For best results, the seed should be started early indoors, after being soaked in warm water. The name is sometimes misspelled *Crotalaria*. Greenhouse kinds are subject to red spider *C. juncea* yields the Sunn hemp of India. Our common rattle-box, *C. sagittalis*, is often a troublesome weed.

A *Lus* apparently simple

retusa, Linn. Annual, 1 $\frac{1}{2}$ ft. high branches few, short. lvs. entire, very various in shape, but typically obovate with a short mucro, clothed beneath with short appressed hairs fls about 12 in a raceme, yellow, streaked or blotched with purple, standard roundish, notched Cosmopolitan June-Aug—Intro. 1896, as a novelty and called "dwarf golden yellow-flowering pea," "golden yellow sweet pea," etc. The fls are much less fragrant than the true sweet pea.

verrucosa, Linn. Annual, erect and nearly glabrous, the branches and fl-stalks 4-angled. lvs. ovate, shortly petioled, blunt fls racemose, numerous, their variegated blue corollas making a magnificent show in early spring Cosmopolitan in the tropics. B.M. 3034. B.R. 1137. P.M. 13.223

AA *Lus foliolate* (compound).

B *Fls. striped with brown or red.*

longirostrata, Hook & Arn. Greenhouse plant, herbaceous or somewhat shrubby, much branched, 3 ft. high, branches long, slender, glabrous, petioles 1 $\frac{1}{2}$ in. long; lifts 3, oblong, with a minute mucro, glabrous above, hoary beneath, with very short, appressed, silky hairs racemes erect; calyx with 2 upper lobes ovate, the 3 lower ones lanceolate; fls. as many as 25 in a raceme, yellow with reddish or reddish brown stripe along the back of the unopened fls; standard wider than long, reflexed, notched. W Mex., Guatemala B.M. 7306. F.R. 1:809.—Flowering from Dec. to March. Intro. into Kew through the U. S. Dept. Agric. in 1891.

BB. *Fls not striped, pure yellow.*

incana, Linn. A woody perennial, 2-4 ft., with stout round branches, the whole plant silky-hairy lvs $1\frac{1}{2}$ -2 in. long, obtuse, cuneate below, membranous fls. 12-20 in a raceme, yellow, at least $\frac{1}{2}$ in long; pod nearly sessile, loosely hairy. Common throughout the tropics. B. R. 377.

capensis, Jacq Stout, much-branched shrub, 4-5 ft high; branches terete, appressedly silky, stipules when present petiolulate, obovate and lf-like, obsolete or wanting on many petioles; lfts broadly obovate, obtuse or mucronulate, glabrous or minutely pubescent on one or both sides racemes terminal or opposite the vs, loose, many-fl'd., the fls usually more than 1 in long; calyx and pod pubescent; wings transversely wrinkled and pitted. S. Afr.—Cult in S Fla

C. Trôpes, Matten. An erect or prostrate annual racemes lateral, often 20-fl'd. or more, fls. small, yellowish Italian Somaliland.

WILHELM MILLER.
N. TAYLOR.†

CRÔTON (Greek name, probably of the castor bean) *Euphorbiaceæ*. Herbs, shrubs or trees of no special horticultural value, some cultivated for economic products which they yield

Pubescence stellate or scaly. lvs. usually alternate. fls mostly in terminal spikes or racemes, usually monœcious, sometimes diœcious; sepals usually 5-10, small, petals present at least in the staminate fls; stamens 5 to many, incurved in the bud; ovary 3-celled, 1 ovule in each cell.—Five hundred or more species in the warmer parts of the world, chiefly in Amer. Several herbaceous species native in S. and W. U. S.

1119. *Croton alabamensis*.

For *Croton tectorius*, see *Chrozophora*; for *C. sebiferus*, see *Sapum*. See also *Codiaeum* for the commonly cultivated crotons of florists.

Tigilium, Linn. CROTON-OIL PLANT. PHYSIC-NUT. PURGING CROTON. Small tree: lvs. ovate, acuminate, serrate, petiolate, varying from metallic green to bronze and orange; pistillate fls. apetalous. S E. Asia. Blanco. Fl Pl. 382. The powerful purgative, croton oil, is obtained from the seeds. Offered in S. Calif. as an ornamental and curious plant.

Elutéria, Benn CASCARILLA. SEASIDE BALSAM. SWEETWOOD. Petals in both staminate and pistillate

fls: lvs ovate-lanceolate, acuminate subcordate. Bahamas B. M. 7515 — This species and *C. Cascarilla*, Benn., Bahamas and Fla., yield the cascarilla bark

alabamensis, E. A. Smith Fig 1119. Shrub, 6-9 ft. high lvs evergreen, nearly entire, oblong-lanceolate, upper side nearly smooth, lower side densely silvery scaly both staminate and pistillate fls with petals. Local in Ala., rarely cult G F. 2.594 (see Fig. 1119). J. B. S. NORTON.

CROWFOOT: *Ranunculus*.

CROWN IMPERIAL: *Fritillaria Imperialis*.

CRUCIANÉLLA (Latin, a little cross, from the arrangement of the leaves) *Rubiaceæ* CROWSWORT. Hardy rock plants of minor importance

Herbs, often woolly at the base, branches usually long, slender, 4-cornered upper lvs opposite, without stipules, lower lvs. or all in whorls of 3 or more, linear or lanceolate, rarely ovate or obovate fls small, white, rosy or blue —About 30 species, natives of the Mediterranean region and W. Asia The genus is closely related to *Asperula*, and is distinguished by the fls having bracts, not an involucre, and the style-branched distinctly unequal instead of nearly equal The first species below has lately been referred to *Asperula* It is of easy cult., preferring light, moderate loam and partial shade A delicate plant for the front of borders, and capital for the rockery. Prop. chiefly by division, and also by seeds.

stylosa, Trin (*Aspérula ciliata*, Rochel) Annual, prostrate, 6-9 in high lvs in whorls of 8 or 9, lanceolate, hispid. fls small, crimson-pink, in round terminal heads $\frac{1}{2}$ in diam., floral parts in 5's, style club-shaped, long exserted, very shortly twice cut at the top June-Aug. Persia Grown, and often acting in England, as a perennial

angustifolia, Linn Annual lower lvs 6 to a whorl, linear, on an erect or sometimes branching, smooth st fls white, in spike-like clusters, small, the petals sometimes short mucronate. Mediterranean July

C. chlorostachys, Fisch & Mey Annual, rough and spreading, but the whole plant only 4-6 in high fls small, in spike-like clusters —*C. glomerata*, Bieb (*Asperula glomerata*, Griseb.), has yellowish green fls in many interrupted spikes Palestine to Persia Properly an *Asperula*.

N. TAYLOR †

CRYPTANTHUS (Greek, for hidden flower) *Boraginaceæ* NIEVITAS This genus includes many species referred by some writers to *Eritrichium* and *Krynitzkia*, but probably none of them is in cult They are mostly annuals, with white fls., which are usually sessile calyx 5-parted to the base, as long as the corolla-tube; segments more or less hispid or with hooked bristles, in fr. closely embracing the nutlets, eventually deciduous; nutlets 4, sometimes 3, 2 or 1, smooth, papillate, or mucronate, never rugose—Over 60 species, in Pacific N. Amer., southward, into N Mex and Chile. **C. glomerata**, Lehm. (*Krynitzkia glomerata*, Gray), is a coarse biennial, 1-3 ft high lvs spatulate or linear-spatulate Plants along eastern base of Rocky Mts. **C. barbiger**, Greene (*K. barbiger*, Gray *Eritrichium barbigerum*, Gray) Nine to 12 in high lvs. linear S Calif

CRYPTANTHUS (Greek, for hidden flower) *Bromeladææ* Brazilian epiphytal bromeliads, differing from *Aechmea* and *Bilbergia* (which see for culture) in the tubular calyx and the dense heads of flowers nearly sessile amongst the leaves.

Leaves crowded in a rosette, recurved-spreading, spinulose-serrate fls in a terminal head, nearly buried beneath the bracts; petals oblong, joined at the base; stamens attached to corolla-tube—Monogr. by Mez (who recognizes 8 species) in DC. Monogr. Phaner. 9 (1896); by some, all are considered to be forms of one species.

A. Lvs. not narrowed or petiolate above the sheath.

acabilis, Beer (*Tillandsia acabilis*, Lindl. *C. undulatus*, Otto & Dietr.). A few inches high, suckering freely. lvs sea-green, long-pointed and spreading, weak-spiny: fls. white, nestling deep in the foliage. B R. 1157.—A very variable plant, of which Mez recognizes the following leading types:

Var. **genuinus**, Mez. Stemless or very nearly so: lvs. sub-elliptic-lanceolate, strongly undulate, gray-scurfy beneath, scurfy above.

Var. **discolor**, Mez (*C. discolor*, Otto & Dietr.). Stemless or nearly so. lvs. elongated, scarcely undulate, silvery-scurfy below, glabrous or nearly so above.

Var. **ruber**, Mez (*C. ruber*, Beer) Produces a branching st. or trunk. lvs short, strongly undulate, reddish.

Var. **bromelioides**, Mez (*C. bromelioides*, Otto & Dietr.) St tall. lvs much elongated, scarcely undulate, remotely spinulose.

Var. **diversifolius**, Mez (*C. diversifolius*, Beer). St-bearing lvs elongate-lanceolate, deep green above, silvery-scurfy beneath

zonatus, Beer Fig. 1120 Lvs oblong-lanceolate, the margin undulate and densely serrate-spinulose, marked with transverse bands of white: fls. white.

bivittatus, Regel (*Bilbérna bivittata*, Hook. B. *mtata*, Hort.) Nearly or quite stemless: lvs long-oblong, curving, long-pointed, somewhat undulate, spiny, dull brown beneath, green above and with 2 narrow buff or reddish bars extending the length of the lf.. fls. white. B M 5270.

AA Lvs. narrowed or petiolate above the sheath.

Beuckeri, Morr. Lvs 10-20, oblong, pointed, canaliculate at base, very finely spiny, brownish green or rose and spotted or striped with light green fls. white.

C. nitida, Bull. A recent importation from Brazil, described as a stemless species with sessile dark olive-green lvs., marked with a band of cream-color each side of the midrib

L. H B
GEORGE V. NASH †

CRYPTOCORYNE (Greek-made name, referring to the spadix being inclosed or hidden in the spathe). Syn *Myrioblastus* *Araceae* Aquatic or paludose herbs of 20-30 species in Trop Asia and the Malayan Archipelago, rarely seen in choice collections but apparently not in the trade. They have creeping and stoloniferous rhizomes, strongly ribbed oblong or linear or ovate lvs, monocious fls without perianth, the upper ones on the spadix staminate and the lower pistillate spathe closed, the infl. wholly included. The species require the treatment given under arums. *C. ciliata*, Fisch., 1 ft. lvs narrow, stalked, fls. fragrant in a long tubular peduncled spathe which is fringed at the top. *C. retrospandis*, Fisch., plant slender with very narrow almost grass-like lvs, and small spathe terminating in a spiral or twist. *C. Griffithii*, Schott, with lvs ovate or orbicular-oblong marked with fine red lines; spathe purple B M. 7719

CRYPTOGAMS are flowerless plants, producing not seeds but spore. The whole vegetable kingdom was formerly thrown into two classes, the flowering plants or phanerogams and the flowerless or cryptogams. Cryptogam means "concealed nuptials," and phanerogam "visible nuptials." These names were given when it was thought that the sexual parts of the flowerless plants were very obscure or even wanting. The word is now falling into disfavor with botanists. Cryptogams are of less horticultural interest than the flowering plants, although they include the ferns, and some interesting smaller groups, as selaginellas, lycopods or club mosses. The word cryptogam is now mostly given up by botanists as representing a taxonomic group, as the name is founded on imperfect

or false analogies. The plants covered by this name are now distributed in the great divisions of thallophytes, bryophytes and pteridophytes; and the phenogams or phanerogams are spoken of as spermatophytes (see the categories on p. 2, Vol. I.).

CRYPTOGRAMMA (Greek, *a concealed line*, alluding to the sub-marginal sori). *Polypodiaceae*. Hardy subalpine ferns of both hemispheres of interest mainly to the collector

1120. *Cryptanthus zonatus*.

Leaves of 2 sorts, the fertile lvs contracted and the sori covered by the infolded margin of the segms., forming pod-like bodies. Besides our native species, a third one, *C. crispus*, is found in Eu., and a fourth in the Himalayas. Name often incorrectly written Cryptogramme. Cult. simple.

acrostichoides, R. Br. **ROCK-BRAKE**. Height about 8 in.: lvs. numerous, 4-6 in. long, on tufted straw-colored stalks, tri-quadrupinnatifid, with toothed or incised segms., the sporophylls with longer stalks, less divided and with pod-like segms. Canada to Colo., Calif., and northward.

Stelleri, Prantl (*Pellaea grisealis*, Hook. *P. Stelleri*, Baker) **SLENDER ROCK-BRAKE**. Lvs 4-10 in. long, very delicate in texture, withering by Aug., few to a plant, about 2 pinnate—Grown best in loose well-drained leaf-mold. A rather rare rock fern of the eastern states, offered by some dealers in hardy ferns. Grows in crevices of cliffs, or in moss

R. C. BENEDICT †

CRYPTOLEPIS (Greek, *hidden scale*) *Asclepiadaceae* Shrubs, erect or twining, of Trop Asia and Afr. Lvs opposite. fls. in a loosely forking, few-flid. cyme; calyx deeply 5-parted, with 5 scales at base, corolla with spreading limb, the tube short-cylindrical or campanulate, the lobes 5 and linear, spreading or deflexed and twisted; corona of 5 scales attached at or near the middle of the tube. follicles terete and smooth, spreading—Species 20. Cult. only in S. Calif. and S. Fla. *C. Buchananii*, Roem & Schult. A twining shrub with yellow fls., resembling those of an echites: lvs 3-6 in. long, leathery, shining above; cymes very short-stalked, paniculate. India *C. longiflora*, Regel. Dwarf and compact growing, with long lvs tinted with red; tubular white fls., as in *Bowardia jasminiflora*. Native country unknown.

CRYPTOMERIA (Greek, *kryptos*, hidden, *meros*, part; meaning doubtful) *Pandaceae* Ornamental evergreen cultivated for its handsome habit and foliage.

Large pyramidal tree, with a straight slender trunk, covered with reddish brown bark and with verticillate spreading branches, ascending at the extremities: lvs spirally arranged, linear-subulate, acute, slightly curved, decurrent at the base. fls. monocious; stami-

nate oblong yellow, forming short racemes at the end of the branches, pustulate globular, solitary, at the end of short branchlets, cone globular, with thick, wedge-shaped scales, furnished with a recurved point on the back and with pointed lobes at the apex, each scale with 3-5 narrow-winged, erect seeds.—One species in China and Japan, extensively planted for avenues, and as timber trees in the latter country, where the light and easily worked but durable wood is much used.

It is hardly as far north as New York, and thrives in sheltered positions even in New England. It seems, however, in cultivation, not to assume the beauty it possesses in its native country. With us, it looks best as a young plant, when it much resembles the *Araucaria excelsa*. It is therefore sometimes grown in pots. It thrives best in a rich, loamy and moist soil and sheltered position. Propagated by seeds or by cuttings of growing wood, especially var. *elegans*, which grows very readily. The horticultural varieties are also sometimes increased by grafting.

japónica, Don. Tree, attaining 125 ft.: lvs. linear-subulate, compressed and slightly 4- or 3-angled, bluish green, $\frac{1}{2}$ -1 in. long; cone brownish red, $\frac{3}{4}$ -1 in. across. S Z. 124 H. I. 7-668. R. H. 1887, p. 392. Gng. 4:197. F. E. 10:510 G. F. 6:446.—Of the garden forms, the most desirable is var. *elegans*, Beissn. (*C. elegans*, Veitch) Low, dense tree, with horizontal branches and pendulous branchlets: lvs. linear, flattened, soft, spreading, longer than in the type, bright green, changing to bronzy red in fall and winter. Very handsome when young, but short-lived. Var. *araucaroides*, Carr. Of regular pyramidal habit, with short, thick falcate lvs., resembling *Araucaria excelsa*. Var. *compacta*, Beissn. Of very compact habit, with bluish green foliage. Var. *pyramidalis*, Carr. Of narrow pyramidal compact habit, dark bluish green, not changing to reddish brown during winter. Var. *Lébbii*, Carr. Of compact habit, with shorter and more appressed bright and deep green lvs. Var. *nana*, Knight. Dwarf and procumbent, densely branched form; adapted for rockeries. Var. *spiralis*, Veitch Slender shrub, with strongly falcate lvs., twisted spirally around the branchlets. S Z. 124, fig. 4. ALFRED REHDER.

CRYPTOPHORÁNTHUS (Greek, meaning to bear hidden flowers). *Orchidaceae*. A few Trop. American orchids closely allied to *Masdevallia* and *Pleurothallis*, remarkable for the almost closed lip within which is hidden the lip: sepals united at the base into a short tube and joined also at the apex, the petals being inside; there are openings or "windows" on either side where the sepals spread apart at their middles. The species require the cult. given *Pleurothallis*. Apparently none is in the American trade. *C. maculatus*, Rolfe (*Pleurothallis maculata*, Rolfe), is a little plant with numerous yellow densely crimson-spotted fls. *C. Dayana*, Rolfe (*Masdevallia Dayana*, Reichb. f.) and *C. atropurpureus*, Rodr. (*Pleurothallis* and *Masdevallia fenestrata*, Hort.), may be expected; the former has upper sepal yellowish white and purple-spotted keels, and inferior sepals (joined) orange with brown spots; the latter has dark purple solitary fls. *C. Moorei*, Rolfe, has small dull red-purple fls. with darker lines, the lateral openings about $\frac{1}{2}$ in. long: lvs. broadly elliptic, purple beneath, about $1\frac{1}{2}$ in. long.

CRYPTOPYRUM: *Truticum*.

CRYPTOSTÉGIA (Greek, *krupto*, conceal, and *stego*, cover; referring to the 5-angled crown in the corolla tube, which is not exposed to view). *Asclepiadaceae*. Tropical climbers.

Leaves opposite: fls. large and showy in a terminal trichotomous cyme; corolla funnel-shaped, the tube short.—Only 2 species, 1 from Trop. Afr., and 1 from Madagascar. The juice of *C. grandiflora*, when exposed

to the sunshine, produces caoutchouc. See Diet. Economic Products India 2:625. The plant is cult. in India for this purpose. It is rarely cult. in Old World greenhouses for ornament. It is said to be of easy cult. in a warmhouse and prop. by cuttings.

grandiflora, R. Br. (*Nerium grandiflorum*, Roxbg.). St. erect, woody: branches twining: lvs. opposite, short-stalked, oblong, entire, 3 in long, $1\frac{1}{2}$ in. wide. fls. in a short spreading cyme, reddish purple, becoming lilac or pale pink, about 2 in. across, twisted in the bud fr a follicle. Old World, probably Indian origin, but established in the African Isls of the Indian Ocean, especially Reunion. Hooker, however, thinks that it was originally a Trop. African plant. B. R. 435.—Once cult. at Oneco, Fla., by Reasoner, and not uncommon in botanic gardens under glass. Called pulay or palay in India where it is widely cult. as an ornamental. Not important as a rubber plant.

madagascariensis, Hemsl. A climbing glabrous shrub: lvs. short-petioled, leathery, variable in outline, 2-4 in long, fls. $2\frac{1}{2}$ -3 in. across, pink or whitish, not lilac as in many specimens of *C. grandiflora*, corolla lobes longer than the tube. Madagascar.—A very showy greenhouse climber with cymose inf.

N. TAYLOR †

CRYPTOSTÉMMMA (Greek, *hidden crown*) *Compositae*. Two or 3 hoary herbs, by some united with *Arctotis*, apparently not in the trade, but sometimes mentioned in gardening literature: diffuse or creeping, with basal or alternate lvs. that are dentate or lyrate-pinnatisect, villous above and white-tomentose or woolly beneath, heads radiate, yellow or more or less purplish, rather large, peduncled, or solitary on leafless scapes, the rays sterile: achenes densely villous, 5-ribbed, the pappus palaceous and in 1 series. *C. calendulaceum*, R. Br. (*C. lustanum*, Hort.), is a free-blooming annual with pale yellow rays and a dark brown disk, the heads on 1-fld. peduncles: lvs. pinnatifid, 3-nerved. Cape and Austral. B. M. 2252 G. C. III. 28,390, desc. *C. Forbesianum*, Harv., and *C. niveum*, Nichols. (*Microstaphium niveum*, Less.), of S. Afr., may be more or less in cult. Both have yellow rays, in the latter the heads being solitary and the plant decumbent or creeping and the lvs. ovate, cordate or orbicular; in the former the lvs. are mostly pinnatisect, the margins revolute.

CRYPTOSTYLIS (*hidden style*, Greek) Syn. *Zosterostylis*. *Orchidaceae*. Eight or 10 terrestrial orchids of the E. Indies, Malaya and Austral., allied to *Pogonia*. Lvs. solitary or few, narrow and membranaceous, on stiff petioles: fls. rather large, racemose or spicate on simple sheathed scapes, the sepals and petals very slender or even awl-like and nearly or quite equal; lip large, sessile, the broad base enclosing the column and then expanding into a broad blade. *C. arachnites*, Blume. Rootstock fleshy: lvs. erect, green, lanceolate: fls. on a scape 18 in. or less high, many and spider-like, the sepals and petals green and the fleshy lip purple and mottled, pubescent and grooved. India (Ceylon, Khasia). B. M. 5381. A curious indoor orchid.

CTENANTHE (Greek, *comb-flower*). *Marantaceae*. About a dozen Brazilian plants closely allied to *Calathea* and *Maranta*, differing from the former in belonging to the 1-seeded section of the family and from the latter in having a shorter corolla-tube and different shaped fls. Sepals 3, free and equal, somewhat parchment-like; corolla-tube short but wide, the lobes 3 and nearly equal and hooded at the apex; staminal tube very short, 2 exterior stamnodia petal-like, short, obovate and hooded, with lateral deflexed lobes. The ctenanthes are perennial herbs with basal and cauline lvs. that are more or less petiolate, and crowded fls. in terminal spikes or racemes. They are glasshouse plants requir-

ing the treatment of calathea; apparently little known in American collections. The species fall into two groups, those with variegated and those with green lvs. Of the former group are *C. Kummeriana*, Eichl., and *C. Oppenheimiana*, Schum., the former being 20 m. or less tall and with villous ovary and raceme, the latter robust and 3 ft. or more tall and ovary glabrous. Of the plain-lvs kinds, *C. Luschinathiana*, Eichl. (*C. compréssa* var. *Luschinathiana*, Schum.), and *C. setosa*, Eichl., may be found in choice collections, both species grow about 3 ft. high, the former having ovate-acute bracts and the latter long-acuminate brown-villous bracts.

CUCKOO FLOWER: *Cardamine pratensis*.

CUCKOO-PINT: *Arum*

CUCUMBER. Plate XXXI The common cucumbers are derived from an Asian species, *Cucumis sativus* (see *Cucumis*), which has long been known in cultivation. The so-called West India gherkin, which is commonly classed with the cucumbers, is *Cucumis Anguria*. The snake, or serpent cucumber is more properly a muskmelon, and should be designated botanically as *Cucumis Melo* var. *flexuosus* (cf. A. G. 14 206). The "musk cucumber" is *Cucumis moschata*, Hort., which is probably identical with *concombre musqué*, referred to *Sicana odorifera* by Le Potager d'un Curieux, known in this country as cassabanana. The Mandera cucumber is *Cucumis Sacleuxii*, Paill. et Bois. (Pot. d'un Curieux), but it is not in cultivation in this country. None of these is of any particular importance except the common types of *Cucumis sativus*. These are extensively cultivated in all civilized countries as field and as garden crops. They come into commerce as pickles packed in bottles and barrels, and are very extensively used in this form. Of late, the forcing of cucumbers under glass has come to be an important industry in the eastern states.

Field culture.

The common cucumber is an important field and garden crop and may be classed as one of the standard crops of the vegetable-garden. The fruit is used as a table salad, eaten raw, with the usual salad seasonings, and is pickled in large quantities. The cucumber is pickled in both large and small sizes, both by the housewife and commercially on a large scale. The small fruit, of not more than a day or two's growth and measuring from 1 to 2 inches in length, makes the most desirable and delicate of pickles. These are packed in bottles for the commercial trade and bring fancy prices. Larger sizes are pickled and sold by the keg or barrel.

The cucumber is a native of the tropics and tender of frost. It should be planted in a warm location, after danger from frost is past. For the early crop—and curliness is of prime importance to the commercial vegetable-grower—a sandy soil is preferable, supplied with an abundance of well-rotted stable manure. The seed may be sown in hills 3 feet apart with rows 6 feet apart, or may be planted by machine (the common seed-drill) in drills 6 feet apart. In either case, an abundance of seed should be used, for severe injury by insect pests often occurs in the early stages of the cucumber's life. Plants may be started under glass to hasten maturity. The seed is sometimes sown in pots or baskets or in inverted sods and these protected and so managed that the cucumber plant receives those conditions most suitable to its rapid and healthy growth. These conditions are: a temperature between 60° and 65° at night, which may be allowed to rise to 100° in bright sunshine; an ample supply of moisture; sufficient ventilation, without draft, to prevent a soft brittle growth. It is almost impossible to transplant cucumber seedlings and secure satisfactory results if the roots are disturbed. A glass-covered frame may be used over seed planted in the field, and yields good returns on labor and equip-

ment. Any method whereby marketable cucumbers may be obtained a few days earlier, if not extravagant of time and labor, will pay handsomely.

The cucumber, in the field, should yield marketable fruits in seven to eight weeks from seed and continue in profitable bearing until frost. It is customary among commercial growers to allow two or three plants to the hill, and when grown in drills, one plant is left every 18 to 24 inches.

During the height of the growing season, which is usually in August when the days are hot and nights moist and warm, the cucumbers need to be picked every day. The fruit is ready to harvest when it is well filled out, nearly cylindrical in shape. When immature it is somewhat furrowed. When allowed to remain too long, it becomes swollen in its middle portion and cannot be sold as first quality. Cucumbers are marketed by the dozen, the field crop often bringing as much as 60 cents a dozen at the first and selling as low as 5 cents a dozen at the glut of the market.

The cucumber plant is affected by serious insect pests and fungous diseases. Of the insect pests, the striped cucumber beetle is the most serious and difficult to combat. It feeds on the leaves, usually on the

1121 House of English cucumbers.

under sides, and appears soon after the cucumber seedlings break ground. This cucumber beetle seems to be little affected by the common remedies for chewing insects. This is probably largely due to its activity, the beetle moving to unpoisoned parts of the plant, and also to the fact that rarely, in commercial practice, is the under side of the leaves thoroughly poisoned. Arsenate of lead applied in more than ordinary strength is the most satisfactory remedy. Hammond's Slug Shot, dusted lightly over the plants, will drive the bugs away, while a teaspoonful of paris green mixed with two pounds of flour makes also an excellent mixture with which to fight the bugs. Or cover the young plants with small wire or hoop frames, over which fine netting is stretched. If the plants are kept quite free from attack till these protectors are outgrown, they will usually suffer little damage. Plants started in hotbeds or greenhouses may usually be kept free at first, and this is the chief advantage of such practices. The cucumber beetles are kept away somewhat at times by strewing tobacco stems thickly under the plants; an kerosene emulsion will sometimes discommode the young squash bugs without killing the vines, but usually not. What is known as the cucumber blight (*Pseudoperonospora cubensis*) has done much to discourage the growth of cucumbers. This fungus may be repulsed by thorough spraying with bordeaux and the plants should

be kept covered with bordeaux throughout their growth. This will require at least three or four sprayings. The growth of the vines, which usually completely covers the ground, prevents late sprayings, which are often necessary to maintain healthy growth and insure maximum returns.

The common field varieties most popular in the United States grown for a slicing cucumber are of the White Spine type. Many of the so-called White Spine varieties now on the market are not typical of the original White Spine cucumber, which is a fruit averaging about 6 inches in length, rather blunt on both ends, with white prickles appearing at frequent intervals over the surface. The seed end is light-colored, in mature specimens almost white with whitish stripes extending toward the stem end from one-third to one-half the length of the cucumber. What is often cata-

1122. Three prominent varieties of English or Forcing cucumber. S. Sion House; E. Duke of Edinburgh, T. Telegraph. ($\times \frac{1}{2}$)

logue as the Improved White Spine has become more popular among growers within recent years. This type possesses some of the characteristics of the popular English type of cucumber known as the Telegraph. The improved type has been obtained by crossing the White Spine with the Telegraph or some closely related variety. This cross has resulted in an increased length and darker green color, with a fewer number of spines and seeds and a more common tapering of the ends. All of these changes have apparently been beneficial and have been well fixed by careful selection. This is well illustrated by the cucumber of the White Spine type sold as Woodruff Hybrid.

The English type of cucumbers is raised on a small scale in this country but infrequently for market purposes.

Forcing of cucumbers.

The commercial production of cucumbers under glass has assumed large proportions. This crop ranks second in commercial importance among greenhouse-

grown vegetable crops, lettuce only exceeding it in importance. The cucumber crop is ordinarily grown in the spring of the year after two or three crops of lettuce have been removed, and it continues to occupy the ground until the vines cease bearing, due either to poor management, pests or some similar trouble. The cucumber should come into bearing six to eight weeks after setting in the houses. It is the customary plan to plant the seed in 4- to 6-inch clay pots about two weeks before the house to be used is ready for setting. These pots are often placed over manure heat and should always be in a warm house separate from the lettuce. Two weeks should be sufficient to allow the plant a good start, two or three pairs of leaves being all the development desired before setting in the permanent location. Careful management is essential to a healthy growth, for many pests prove more serious in the glasshouse than in the field. A night temperature not below 60° F. is very essential, while the day temperature may go to 90° F. without danger in bright sunshine. The appearance of the plants will immediately indicate, to the experienced observer, the conditions under which the crop has been grown. A short stocky growth between joints with dark green foliage is desirable. There are localities in which growers make cucumbers the all-the-year-round crop in the glasshouse, usually growing crops from two seedlings during the entire season. It requires more skill to produce good cucumbers during the fall and winter months than from February on, and the yield is much lighter in the late fall and early winter than for the spring crop. All cucumbers require an abundance of moisture and food. It has become a common practice in certain sections to mulch the cucumber vines in the greenhouse with good quality strawy manure to the depth of 3 or 4 inches and apply the water directly on the manure. This practice eliminates the packing and puddling of the soil often caused by direct heavy watering, increases the supply of readily available plant-food and gives the roots a good opportunity to grow near the surface where air is available and still be protected from the drying out which occurs when the soil is directly exposed to the sun.

The pruning and training of the cucumbers in the greenhouse is of much importance. A number of methods are in common use, one of the most common and practical of which is: Stretch a wire tightly the length of the house at the base of the plants which may be set in rows 3 feet apart and 18 inches to 2 feet apart in the rows, fasten at the base of each plant a soft but strong twine known in tobacco-growing sections as tobacco twine, securing this single twine to an overhead wire running parallel and directly over the ground wire, but not stretching the string tight. As the cucumber plant grows, it is twined about this string to which it clings by tendrils. When the plant reaches the upper wire it is either allowed to grow at will over wires provided for an overhead support and from which the cucumbers usually hang down where they can be easily picked, or it is pruned and the encouragement of fruiting along the upright stem continued. In the meantime more or less fruit has been harvested and at each joint a lateral branch has appeared. It is necessary to cut these off. Some growers prefer to take them off back to the main stem, while others, if a cucumber is obtainable on the first joint of the lateral, nip the lateral just beyond this point.

"In the greenhouse, cucumbers are liable to damage from mite, aphid, root-gall and mildew. For the mite, syringe the plant and pick off the infested lvs; for aphid, use tobacco fumigation and pick infested lvs; for root-gall, use soil which has been thoroughly frozen; for mildew, improve the sanitary conditions, and then use sulfur"—Bailey, "Forcing-Book."

Yields of twenty-five to one hundred and twenty-five cucumbers have been secured from single plants. The expert growers, under normally good circumstances,

may expect to obtain a yield of six to seven dozen marketable cucumbers from a plant.

Varieties of cucumber.

There are a great many varieties of cucumbers in cultivation. This means that the group is variable, the varieties comparatively unstable, and varietal distinctions somewhat uncertain. Nevertheless, there are certain dominant types which may be separated, and around which most of the varieties may be conveniently classified. The principal types are the following:

Common cucumber, *Cucumis sativus*

I. English forcing type (var *anglicus*) Fig. 1122. Large-yld., strong-growing, slow-maturing plants, not suited to outdoor cult. fr. large, long, smooth, usually green, with few or early-deciduous black spines. Telegraph, Lion House, Tully Hybrid, Kenyon, Lorne, Edinburgh, Blue Gown

II. Field varieties (fall or ridge cucumbers)

a. Black Spine varieties

1. Netted Russian type. Small, short-jointed vines, bearing more or less in clusters, small, ellipsoidal fr. covered with many small, black, deciduous spines. fr. green, ripening to dark reddish yellow, on a cracking, chartaceous skin. Early-maturing and prolific. Netted Russian, Everbearing, New Siberian, Parisian Prolific Pickle

2. Early Cluster type. Small or medium vines. fr. small, usually less than twice as long as thick, indistinctly ribbed, green, ripening yellow, with scattered, large, black spines. Early Cluster, Early Fraunce

3. Medium Green type. Intermediate in size of vine and fr. between the last and next. fr. about twice as long as thick, green, ripening yellow, with scattering, large black spines. Nichols Medium Green, Chicago Pickle

4. Long Green type. One of the best fixed types, representing, perhaps, one of the more primitive stages in the evolution of the group. Vines large, long and free-growing. fr. large and long, green, ripening yellow, with scattered, large, black spines. Long Green, Japan, or Climbing

b. White Spine varieties

5. White Spine type. A strong and important type. plants medium large, vigorous. fr. medium large about three as long as thick, green, ripening white, with scattering, large, white spines. There are many selected strains of White Spine. Cool and Crisp, Davis Perfect and Lordhook famous long hrs.

6. Giant Pera type. Mostly poorly fixed varieties having large, rather umbellately vixs, bearing large, tardily and sparsely, fr. very white or whitish, smooth or with scattering, deciduous, usually white spines. Chicago Giant, Goliath, Giant Pera, White Wonder, Long Green Chain

Sikkim cucumber, *Cucumis sativus* var. *sikkimensis*. Plant small and stocky, much like the common cucumber. fr. large, reddish brown marked with yellow. (The Egyptian h. var. *cucumbar*, of Hugel & Schmidt, as we have grown it, is apparently an odd form of *Cucumis sativus*, and may belong here. It has a radium-colored white fr., densely covered with soft, white hair. The plant resembles the Sikkim cucumber.) Not in general cult.

pickling, the medium sorts for slicing, and the large, late varieties for ripe fruits. The White Spine varieties are great favorites for slicing, and only less so for pickling

F. A. WAUGH,
H. F. TOMPSON.

CUCUMBER TREE: *Averrhoa* and *Magnolia*.

CUCUMIS (old Latin name) *Cucurbitaceae*. Tendril-bearing soft tender herbs, some of which are grown for their edible fruits

Annual or perennial-rooted (the common cult.

1124. Pistillate flower of *Cucumis Melo* (Natural size)

species annual, with large alternate entire or palmately lobed or dissected lvs. monocious (rarely dioecious), sterile fls. in clusters, not stalked in the axils, the fertile ones solitary and mostly short-stalked in the axils, corolla of 5 deep acute lobes, stamens not united, stigma 3, obtuse, tendrils simple fr. a pepo, mostly 3-celled, usually indurcent, fleshy or thick, globular, oblong or cylindrical, sometimes echinate, many-seeded. — About 30 species of villous or spinescent climbers and trailers with annual sts., in warm parts of the globe, most abundant in Afr. Monogr. by Cogniaux, DC Monogr. Phaner. 3. See, also, Naudin, Ann. Sci. Nat. (Bot.) IV 11, 9, 12, 108

A. The melon group fr. smooth at maturity or only pubescent (not spiny or tuberculate)

Melo, Linn. MELON MUSKMELO. Figs 1123, 1124. Long-running, hairy or villous annual lvs. large, soft-hairy, round-heart-shaped or reniform, sometimes rounded-lobed and more or less denticulate:

1123. Staminate flower of *Cucumis Melo*. (Nat. size)

1125. *Cucumis sativus* Staminate flower at; pistillate at p. (X1/3)

Snake or Serpent cucumber, *Cucumis Melo* var. *flexuosus*. Vines resembling those of muskmelon. fr. very long, twisted, ribbed-cylindrical, green, tardily yellowing, covered with dense, woolly hairs.

West India gherkin, *Cucumis Anguria*. Figs 1127, 1128. Vines small and slender, somewhat resembling a slender watermelon plant; fr. very abundant, small, ellipsoid, covered with warts and spines, green, tardily whitening. Good for pickles

These varieties are mostly all good for one purpose or another. The small sorts are naturally preferred for

male fls. clustered, the peduncle short. fr. very variable, pubescent or becoming glabrous. S. Asia and Trop. Afr. — Very variable, and widely cult.

1. Subspecies or var. *agr stis*, Naudin. The wild or run-wild or spontaneous plant: slender; fr. small, short-petioled, often in 2's or 3's fr. oblong or turbinate, size of a plum, not edible. — To this subspecies

Cogniaux refers such names as *C. Chale*, Linn., *C. pubescens*, Willd., *C. maculatus*, Willd., *C. campherianus* Kunth, *C. Gurma* and *C. Chaeta*, Wall., *C. maderaspatanus*, Roxbg., *C. eriocarpus*, Boiss., *C. pycnocarpus* and *C. jucundus*, Muell., *C. trigonus*, Benth (not Roxbg.), *C. Pancherianus*, Naudin, and the varietal names *maculatus*, *Cossonianus*, *tezanus*, *cantonianus*, *saharunporensis*, *anatolicus*, *ethiopicus* of Naudin.

2. Subspecies or var. *culta*, Kurz. The many forms of the cult. melon: plant very robust; fls. long-pedunculate, 3-5 together and large. fr. large to very large, edible: widely variable; when forced under glass the lvs tend to be more prominently lobed. See *Melon*. Forms of this group may be distinguished as follows. Var *Chito*, Naudin (*C. Chilo*, Morr.) ORANGE MELON MANGO MELON. MELON APPLE. VINE PEACH. GARDEN LEMON VEGETABLE ORANGE. Vine less robust than that of the muskmelon, and lvs smaller: fr size, shape and color of an orange or lemon, without markings, with a white or pale yellow cucumber-like flesh, with no muskmelon odor. Not edible in its natural state, but useful for the making of preserves (or "mangoes") and pickles. Name pronounced *keeto*. Cf Bull 15, Cornell Exp Sta; AG 14 206.—The "Lemon cucumber" offered by dealers is apparently a form of *C. sativus*, the fruit being nearly round with yellow and green markings and smooth skin, like the lemon.

Var *Dudaim*, Naudin (*C. Dudaim*, Linn. *C. odoratissimus*, Moench) DUDAIM MELON. POMEGRANATE MELON. QUEEN ANNE'S POCKET MELON. Vine small, as in the last: fr size and shape of an orange, somewhat flattened at the ends, very regular and smooth, marbled with longitudinal markings of cinnamon-brown overlying yellow, exceedingly fragrant. A most handsome gourd-like fr. and highly and deliciously perfumed. Not eaten. A nearly odorless and scarlet-rindd form is separated by Naudin as var. *erythraeus*.—Var. *acidulus*, Naudin. CUCUMBER MELON. Frs oblong or cylindrical, mottled or uncolored, the flesh white and cucumber-flavored. No varieties in the American trade are of this group, but they are occasionally seen in botanical gardens and experimental grounds that import seeds of oriental plants.—Var. *flexuosus*, Naudin (*C. flexuosus*, Linn.). SNAKE MELON SNAKE CUCUMBER. Fr. many times longer than broad, greenish at maturity, variously curved and furrowed. AG 14: 203. Fr often 2-3 ft long, and 1-3 in diam. Grown mostly as an oddity, but it is useful for the making of conserves. The hard-shelled snake gourd is a *Lagenaria* (which see).—Var. *inodorus*, Naudin. WINTER MELON. Lvs. lighter colored, less hairy, narrower. frs possessing little or none of the common musk-

melon odor, and keeping long. The winter muskmelons are little known in this country, although they are worthy of popularity. Much cult. in parts of the Medit. region.—Var. *saccharinus*, Naudin. PINEAPPLE MELON. Comprising varieties of oblong shape and very sweet flesh. Not sufficiently distinct from the next.—Var. *reticulatus*, Naudin. NUTMEG or NETTED MELONS. Frs softer rindd, more or less netted, or sometimes almost plain or smooth. Comprises the common muskmelons, aside from cantaloupes.—Var. *cantalupensis*, Naudin. CANTALOUPE.

ROCK MELONS. Frs mostly hard-rindd, more or less warty, scaly or rough, often deeply furrowed or grooved. Name derived from Cantalupi, near Rome, a former country seat of the Pope, whither this type of melons was brought from Armenia. In the U S the word cantaloupe is often used as a generic name for muskmelon, but it is properly a name of only one group of muskmelons—the hard and scaly-rindd (see Waugh, G F 8 183).

AA. The cucumber group: fr. spiny or tuberculate (nearly unarmed in *C. Sacleuxii*)

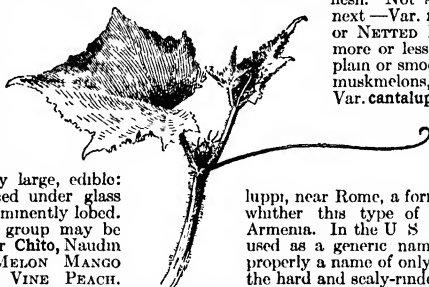

sativus, Linn. CUCUMBER. Figs 1125, 1126. Long-running, prickly lvs usually 3-lobed (or strongly angled), the middle lobe most prominent and often pointed: fr. prickly or muricate, at least when young, but in some varieties becoming smooth, mostly oblong, the flesh white. S Asia. See *Cucumber*. Runs into many fr-forms in cult, but not so widely polymorphous as *C. Melo*.—Var. *anglicus*, Bailey. Figs 1121,

1122. ENGLISH or FORCING CUCUMBER. A product of cult and selection, distinguished from the common or field cucumbers as follows: frs (and ovaries) very long and slender, little if any furrowed, spineless or nearly so when

grown, nearly or quite green at maturity, comparatively few-seeded. fls. very large; lvs very broad in proportion to their length, with shallower sinuses. vines very vigorous, with long and thick tendrils.—Var. *sikkimensis*, Hook f., cult in the Himalayan Mts, but not known to be in this country, has large 7-9-lobed lvs and cylindrical-club-shaped fr. B M 6206.

Anguria, Linn. (*C. echinatus*, Moench. *C. angurioides*, Roem. *C. grossulariformis*, Hort.). BER CUCUMBER. WEST INDIAN GHERKIN. GOOSEBERRY GOURD. Figs 1127, 1128. Sls slender, hispid lvs deeply cut into 3-5 narrow obovate or spatulate divisions, watermelon-like fls small, the pistillate long-stalked. l. 1-3 in. long, cucumber-like but more spiny. Supposed to be native to the American tropics. B M 5817.—Cult. both for the oddity of its frs. and for the making of pickles. The gherkins of mixed pickles, however, are young cucumbers.

dipsaceus, Ehr. (*C. berdana* and *C. ambigua*, Fenzl. *C. cranaceus*, Hort.). DIPSACEOUS GOURD. OSTRICH-EGG GOURD. HEDGEHOG GOURD. Plant and foliage like that of *C. Melo*: fls. long-stalked: fr. 1-2 in long, oblong or nearly spherical, becoming hard and dry, densely beset with long scales or hairs, and looking like a bur. Arabia,

1126. Branch of *Cucumis sativus*.

1127. Spray of *Cucumis Anguria*. (X $\frac{1}{2}$)

1128. Fruit of *Cucumis Anguria*. (X $\frac{1}{2}$)

Afr. R.H. 1860, p. 210.—Cult. as an ornamental gourd.

Sacledxii, Paill. & Bois. **MANDERA CUCUMBER**
Slender, hairy, whitish: lvs. rev. dish-reniform, obscurely lobed and irregularly dentate, scabrous on both surfaces and grayish green, fls. solitary, males on long-filiform peduncles, the females on shorter but slender peduncles and with hairy ovary. fr. ovoid, 3-4 in. long and half as thick at the middle, somewhat scabrous, with longitudinal stripes of lighter green, seeds brown, $\frac{1}{2}$ in. long Zanzibar — Said to be ornamental and the fruits useful for pickles

1129 Young Turban squash, on which the remains of the corolla still persist. The central part of the fruit is the ovary.

C. acutangulus, Hort = *Luffa* — *C. Citrullus*, Ser = *Citrullus vulgaris* — *C. Colocynthis*, Linn = *Citrullus Colocynthis* — *C. metuliferus*, Mey. Hispid annual, with palmately somewhat 3-lobed cordate petiolate lvs., and elong-obluse spiny fr. about 4 in. long R. Afr. — *C. peruvian*, Innes = *Cucurbita* — *C. prophetarum*, Linn Slender perennial with ashly scabrous long-stalked mostly 3-5-lobed lvs., and longitudinally white-striped softly spinose fr. 1-1 $\frac{1}{2}$ in. long Afr. — *C. Vilmoriniana*, Hort. A plant of unrecorded origin, with cut lvs. and abundance of canary-yellow soft-spined frs.

L. H. B.

CUCURBIT. A plant of the genus *Cucurbita*. Sometimes shortened to *Cucurb*

CUCURBITA (classical name). *Cucurbitacea* Gourd PUMPKIN SQUASH. Vine-like tender herbs, tendrill-bearing, grown for their edible and ornamental fruits

Annual, or the root perennial-rhizomatous, rough-hairy and scabrous, with large often palmately lobed lvs., the tendrils bifid or multifid fls. monocious, large, yellow, solitary in the axils, the staminate long-stalked, the pistillate short-stalked, corolla 5-lobed; stamens 3, arising from the bottom of the fl., and united in a column; stigmas 3, but 2-lobed; ovary inferior, inclosed in a hollow receptacle; tendrils 2-3-forked. About 10 species in warm parts of Asia, Afr., Amer. The morphology of the pepo or gourd-fruit may be illustrated by the Turban squash. Figs. 1129-31. In this fr. there is a "squash inside a squash." The inner part bears the corolla and the styles. It is the ovary. The corolla is attached about the edge of the inner squash, as the withered remains in Fig. 1129 show. Sometimes the withered corolla becomes detached, but hangs to the withered remains of the stigmas, as in Fig. 1130 The longitudinal section of the flower

1130 Young Turban squash, in which the withered corolla has become detached, but hangs to the remains of the styles and stigmas.

(Fig. 1131) explains the structure. The corolla is shown at *c, d*. The top of the ovary is at *o*. The stigmas are on the ovary. The part encircling the ovary (outside of *o*) is the hollowed receptacle. Ordinarily the receptacle is closed at the top, completely confining the ovary, but in the Turban squashes the receptacle does not extend over the top of the ovary, and the ovary therefore protrudes. The older morphologists held this outer part of the squash to be adnate calyx, rather than receptacle. The cucurbits are monographed by Cogniaux, DC Monogr Phaner 3 Also by Naudin, Ann. Sci. Nat (Bot.) IV, vol. 6. See Pumpkin and Squash.

The terms squash and pumpkin are much confused. In Europe, the large varieties of *Cucurbita maxima* are known as pumpkins, but in this country the fruits of this species are known usually as squashes. In America, the words pumpkin and squash are used almost indiscriminately, some varieties in all species being known by those names. The field or common pie pumpkins are *C. Pepo*, so are vegetable marrows; also the summer squashes, as the Scallop, Pattypan and Crookneck varieties. The Hubbard, Marblehead, Sibley and

1131. Section of flower of Turban squash. Showing the ovary inside the hollowed receptacle.

1132. Plant of *Cucurbita Pepo*.

Turban kinds are *C. maxima*. The Cushaws, Canada Crookneck, Japanese Crookneck, Dunkard, and Sweet Potato pumpkins (or squashes) are *C. moschata*. The fruit-stem (as shown in Figs. 1133, 1136, 1141) is a distinguishing characteristic of the ripe fruits *C. Pepo* and *C. maxima*, and *C. maxima* and *C. moschata* apparently do not intercross. *C. Pepo* and *C. moschata* have been crossed, but it is doubtful if they intermix when left to themselves. In Europe, the word gourd (or its equivalent in various languages) is used generically for cucurbits; but in this country it is restricted mostly to the small, hard-shelled forms of *C. Pepo* (var. *ovifera*) grown for ornament, and to *Lagenaria vulgaris*

A. Plant annual.

B. Les lobed. stalks of frs. strongly ridged.

Pépo, Linn. (*C. Melopepo*, Linn.). PUMPKIN. Figs. 1132, 1133. Annual. long-running, prickly on sts and petioles: lvs. 3-5-lobed, dark dull green: corolla-tube widening upwards, the pointed lobes erect; calyx-lobes narrow, not lf.-like; peduncle very hard and deeply furrowed when mature, not enlarging next the fr. the fr. very various in form, color, season, size. Probably native to Trop. Amer., but unknown wild — Cult. by the Indians when Amer. was discovered, in fields of maize. For studies in the nativity

1133. Stem of *Cucurbita Pepo*.—Early Sugar pumpkin.

of the pumpkins and squashes, see De Candolle, *Origin of Cultivated Plants*; Gray and Trumbull, *Amer. Journ. Sci.* 25:372, Sturtevant, *Amer. Nat.* 1890:727; Wittmack, *Ber. der Deutschen Bot. Gesell.* 6:373 (1888).

Var. condensá, Bailey BUSH PUMPKINS SCALLOP and SUMMER CROOKNECK SQUASHES Plant compact, little or not at all running. Of horticultural origin

Var. ovifera, Bailey (*C. ovifera*, Linn.) GOURD Fig 1134 Plant slender, running lvs. smaller than in *C. Pepo*, usually very prominently lobed, fr. small, hard and inedible, egg-shaped, globular, pear-shaped, oboate, often striped. R H 1894:429—Sold in many vars by seedsmen, under the names of *C. Pepo* vars. *pyriformis*, *depressa*, *annulata*, etc. See Gourd.

moscháta, Duchesne (*C. meloniformis*, Carr.) CUSHAW. CHINA, CANADA CROOKNECK and WINTER CROOKNECK SQUASHES Figs 1135-37 Annual long-running, less prickly and sometimes soft-hairy: lvs. more rounded than those of *C. Pepo*, but lobed, often grayish fl. with a widening tube, and large, erect lobes; calyx-lobes large, often lf.-like, peduncle becoming deeply ridged and much enlarged next the fr. Possibly of E. Asian origin

1135. *Cucurbita moschata*.

BB Lvs. not lobed (except sometimes on young shoots): stalks of frs. not prominently ridged

máxima, Duchesne SQUASH Figs 1138-41 Annual long-running, the sts. nearly cylindrical, little prickly and often hairy lvs. orbicular or kidney-shaped, commonly not lobed, the basal sinus wide or narrow, the margin shallowly apiculate-sinuate corolla-tube nearly the same diam. at top and bottom (Figs 1139, 1140), the corolla-lobes large and soft, and wide-spreading or drooping peduncle at maturity soft and spongy, not ridged nor prominently enlarged next the fr. fr. very various, but not light yellow nor warty nor crookneck-shaped, usually late-ripening, the flesh orange and not stringy. Nativity undetermined. **Var. sylvestris, Naudin** A form found wild in the Himalayan region, with fr. as large as a man's head.

AA. Plant with perennial root.

foetidissima, Kunth (*C. perennis*, Gray *Cucumis perennis*, James). CALABAZILLA. Fig 1142 Perennial long-running, scarcely prickly: lvs. large, cordate-

triangular, grayish pubescent, the margin shallowly apiculate-erectate, fl. nearly as large as in *C. Pepo* and similar in shape, the pistillate on a peduncle 2-3 in. long, fr. size and shape of an orange, smooth, green and yellow splashed, not edible. Sandy arid wastes, Neb and Colo. to Texas and Mex. and westward to Calif. R H 1855:61; 1857, p. 54.—In its native haunts, the root is tuberous, 4-7 in. diam. and penetrating the earth 4-6 ft. Roots at the joints. The plant has a fetid odor. Sold by seedsmen as a gourd, but the fr. does not often ripen in the northern states. Useful on arbors and small trees, when coarse vines are wanted

1136 Stem of *Cucurbita moschata* Large Cheese pumpkin

ficifolia, Bouché (*C. melanosperma*, A. Br.) St. very long, stout, becoming somewhat woody lvs. pale green, often marbled, in outline ovate or suborbicular, cordate at base, roundly 5-lobed and the sinus rounded; calyx-tube short and campanulate fl. large (often 1 ft. long), fleshy, round-ovoid, white-striped, the flesh white, seeds ovate, black. E. Asia, but widely cult. in warm countries for its ornamental watermelon-like frs. A var. *mericana*, Hort. (*C. mericana*, Spreng.), is mentioned, with seeds twice the size of those of the type, and said to grow wild in the neighborhood of Mazatlan, Mex.

C. Andriana, Naudin Allied to *C. moschata* sts. long and rooting at the nodes lvs. large, marbled with white fls. of the form of those of *C. maxima* but much smaller fr. obovoid, 8 in. long, marked with white and yellow. Uruguay R H 1896, pp. 542-3.

C. californica, Torr. Canescent lvs. thick, 2 in. across, 5-lobed the lobes triangular and mucronate tendrils parted to the base fls. 1 in. or more long on pedicels 3/4-1 in. long. Calif., imperfectly known — *C. digitata*, Gray Perennial, the root fleshy, sts. slender and long, usually rooting tendrils short and weak, 3-5-cleft lvs. scabrous, 3-5-palmately narrow-lobed fls. 2-3 in. long on slender pedicels 1-4 in. long fr. subglobose, yellow, 2-4 in. diam. Calif. to New Mex. — *C. palmata*, Wats. Moss Orange Canescent lvs. cordate, thick, 2 or 3 in. across, palmately 5-cleft to middle with narrow toothed lobes fls. 3 in. long on stout peduncles fr. globose, 3 in. diam. S. Calif. I. H. B.

CUDRANIA (derivation unknown) *Moræceæ* Woody subjects cultivated for their foliage and as hedge plants. Deciduous trees or shrubs, often thorny, with alter-

1137 Fruit of *Cucurbita moschata*—Tonasu, a Japanese variety.

nate, petioled and stipulate lvs.; fls. dioecious, in axillary globular heads; staminate with 4 sepals and 4 stamens and 2-4 bracts at the base; pistillate with 4 sepals inclosing the 1-ovuled ovary, growing into a fleshy subglobose fr. with a castaneous rind.—About 3 species, in S. and E. Asia and Trop. Austral., of which only one is sometimes cult. It requires protection in the N. and is usually prop. by greenwood cuttings in summer under glass

tricuspidata, Bureau (*Maclura tricuspidata*, Carr. *C. triloba*, Hance). Shrub, or small tree, to 20, rarely to 60 ft., with slender, thorny branches: lvs. elliptic-ovate, acuminate, entire, sometimes 3-lobed at the apex and on young plants even tricuspidate, nearly glabrous, 1½-3 in long: fl. heads axillary, solitary or in 2's, on short peduncles: fr. globose, about 1 in across. China. R.H. 1864, p. 390; 1872, p. 56, 1905, p. 363 (habit). H.I. 18:1792.—Recently recommended as an excellent hedge-plant for the S. In China the lvs. are used as a substitute for mulberry lvs. and it is called silkworm thorn, the fr. is edible. Between this species and *Maclura pomifera*, a hybrid has been raised, described as *Macluradãna hybrida*, André R.H. 1905:362. ALFRED REENDER.

CULINARY HERBS are those herbs used for flavoring in cookery, but the term has a wide application, including species used for garnishing and sometimes as potherbs. The culinary herbs are of very minor importance in American gardens, and yet a few of them, as anise, caraway and coriander, are well and favorably known. The species are mostly aromatic. They are largely of the Umbelliferae and Labiatae. No special

1139 Staminate flower of *Cucurbita maxima*—Hubbard squash. (X½)

1140 Pistillate flower of *Cucurbita maxima*—Hubbard squash. (X½)

difficulty attaches to their cultivation, and little more may be said here than to present an alphabetical list with statements as to uses, duration of plant, and means of propagation. They all thrive in mellow fertile garden land. Usually they are grown at the side of the main garden plantation, and they may add a certain charm to the garden as well as to supply an agreeable aroma to the kitchen products. See the little book on "Culinary Herbs" by M. G. Kains, 1912.

Angelica (*Archangelica officinalis*) Umbelliferae. Biennial or perennial. Uses: Stems and leaf-stalks as salad, or roasted like potatoes, garnish, as "candied angelica," stems blanched and used as vegetable, leaves as spinach, seeds for flavoring, oil of angelica obtained from seeds for flavoring. Propagated by seeds in late summer or early autumn.

Anise (*Pimpinella Anisum*) Umbelliferae. Annual. Uses: Leaves as garnish, flavoring, and potherb, seeds and oil for flavoring and perfumery. Propagated by seeds in early spring.

Balm (*Melissa officinalis*) Labiatae. Perennial. Uses: Foliage for flavoring and salad, oil for perfumery and flavoring beverages. Propagated by divisions, layers, cuttings and seeds.

Basil (*Ocimum basilicum*) Labiatae. Annual. Uses: As flavor in highly seasoned dishes, oil as perfumery. Propagated by seeds.

Borage (*Borago officinalis*) Boraginaceae. Annual. Uses: Herbage as potherb and salad, garnish, flavor in beverages. Propagated by seeds in spring.

Caraway (*Carum Carvi*) Umbelliferae. Biennial or annual. Uses: Herbage eaten cooked or as salad, roots as vegetable, seeds for flavoring, oil in manufacture of perfumery and soups. Propagated by seeds in May or early June.

1138. *Cucurbita maxima*.

Catnip or catmint (*Nepeta Cataria*) Labiatae. Perennial. Uses: As bee forage, leaves as condiment, formerly a medicinal remedy. Propagated by seeds in autumn or spring.

Chervil (*Anthriscus Cerefolium*) Umbelliferae. Annual. Uses: Leaves for seasoning and for mixed salads. Propagated by seeds.

Chives (*Allium Schoenoprasum*) Labiatae. Perennial. Uses: Leaves for flavoring. Propagated by individual bulbs or division of clumps in early spring.

Clary (*Salvia Sclarea*) Labiatae. Perennial. Uses: Leaves in cookery, wine made from plant when in flower. Propagated by seeds in spring.

Coriander (*Corandrum sativum*) Umbelliferae. Annual. Uses: Seed in confectionary and as ingredient in condiments, flavor in beverages. Propagated by seeds in spring or autumn.

Cumin (*Cuminum odoratum*) Umbelliferae. Annual. Uses: Seeds as ingredient in curry powder, for flavoring pickles, pastry and soups. Propagated by seeds in spring.

Dill (*Anethum graveolens*) Umbelliferae. Annual. Uses: Seed as seasoning, extensively for commercial pickles, oil for perfuming soap, young leaves as seasoning and salads, dill vinegar as condiment. Propagated by seeds in spring.

Fennel (*Pancicium vulgare*) Umbelliferae. Biennial or perennial. Uses: Herbage as garnishes and flavors, as salads, seeds for flavoring beverages, and for confectionary, oil as perfumery. Propagated by seeds, and grown as an annual.

Finochio or Florence fennel (*Pancicium dulce*) Umbelliferae. Annual. Uses: As a vegetable. Propagated by seeds.

Fennel Flower (*Nigella arvensis*) Ranunculaceae. Annual. Uses: Whole plant or seed used in cookery. Propagated by seeds in spring.

Hoarhound, or horehound (*Marrubium vulgare*) Labiatae. Perennial. Uses: Formerly in cookery and medicine; now for candy only. Propagated by seeds in spring.

Hyssop (*Hyssopus officinalis*) Labiatae. Perennial. Uses: Herbage in salads; oil in preparation of soaps, etc. Propagated by divisions, cuttings and seeds in spring.

Lavender (*Lavandula angustifolia*, L. *Spica*) Labiatae. Perennial. Uses: Flowers and oil in perfumery, sometimes as condiment and in salads. Propagated by divisions or cuttings, or rarely seeds.

Lovage (*Levisticum officinale*) Umbelliferae. Perennial. Uses: Young stems in confectionary. Propagated by division or seeds in late summer.

Margold (*Calendula officinalis*) Compositae. Annual. Uses: Flower-heads as seasoning, fresh flowers to color butter. Propagated by seeds in spring.

Marjoram (*Origanum vulgare* and *O. Marjoram*) Labiatae. Perennial (*O. Marjoram* treated as annual). Uses: Herbage for seasoning, oil in perfuming soaps, etc. Propagated by cuttings, division or layers and seeds in spring.

Mint (*Mentha piperita*) Labiatae. Perennial. Uses: Herbage as seasoning, leaves in jelly. Propagated by cuttings, offsets and divisions in spring.

Parsley (*Petroselinum hortense*) Umbelliferae. Biennial. Uses: Roots as potherb, top as potherb, leaves for seasoning and garnish. Propagated by seeds in spring.

Pennyroyal (*Mentha Pulegium*) Labiatae. Perennial. Uses: Leaves as seasoning, pennyroyal oil. Propagated by division, or rarely cuttings.

Peppermint (*Mentha piperita*) Labiatae. Perennial. Uses: Oil as flavoring, perfume in soaps, etc. Propagated by division or running rootstocks.

1141. Stem of *Cucurbita maxima*—Hubbard squash.

Rosemary (*Rosemarinus officinalis*). *Labiate*. Perennial. *Uses*: Herbage as seasoning, oil for perfuming soaps and in perfumery. Propagated by cuttings, root division, layers in early spring, and seeds.

Rue (*Ruta graveolens*). *Rutaceae*. Perennial. *Uses*: Leaves as seasoning and flavor in beverages, oil for aromatic vinegar and toilet preparations. Propagated by seeds, cuttings, layers or division of tufts.

Sage (*Salvia officinalis*). *Labiate*. Perennial. *Uses*: Leaves for seasoning dressings, sauces, chews, etc., oil in perfumery. Propagated by division, layers and cuttings, also seeds.

Sampshire (*Crithmum maritimum*). *Umbelliferae*. Perennial. *Uses*: Leaves pickled in vinegar, sometimes with other vegetables. Propagated by seeds in autumn.

Savory, Summer (*Satureia hortensis*). *Labiate*. Annual. *Uses*: Seasoning. Propagated by seeds in spring.

Savory, Winter (*Satureia montana*). *Labiate*. Perennial. *Uses*: Seasoning. Propagated by seeds, cuttings, layers and division.

Southernwood (*Artemisia Abrotanum*). *Compositae*. Perennial. *Uses*: Young shoots for flavoring cakes, etc. Propagated by seed, also cuttings in early summer.

Tansy (*Tanacetum vulgare*). *Compositae*. Perennial. *Uses*: Seasoning. Propagated by division of clumps, or seeds.

Tarragon (*Artemisia Dracunculae*). *Compositae*. Perennial. *Uses*: Herbage in salads and with meats, seasoning, as a decoction in vinegar, oil to perfume soups, etc. Propagated by cuttings, layers and division.

Thyme (*Thymus vulgaris*). *Labiate*. Perennial. *Uses*: Herbage as seasoning, oil as perfumery, oil-crystals as disinfectant. Propagated by seeds in spring, also cuttings, layers and divisions.

L. H. B.

CUMIN, or CUMMIN: The seeds of *Cuminum odoratum* (or less properly *C. Cyminum*), black cummin, *Nigella arvensis*, sweet cummin, or anise, *Pimpinella Anisum*. See *Culinary Herbs*.

Flowers small, white or purplish, 2-lipped, borne in corymbed cymes or clusters. The genus contains not more than 16 species, 2 N. American, 2 Mexican, and the others S. American. They are somewhat woody, and usually have small lvs.; the whorls of fls. are sometimes loosely corymbose, sometimes axillary, few-fl'd., much shorter than the lvs., sometimes many-fl'd., in dense spikes or terminal heads, calyx 10-13-nerved, 5-toothed; perfect stamens 2.

mariana, Linn. (*C. origanoides*, Brit.). **MARYLAND DITTANY**. **STONE-MINT**. Height 1 ft.: lvs smooth, ovate, serrate, rounded or heart-shaped at the base, nearly sessile, dotted, 1 in. long; fls. purple-pink in a loose cymose cluster which is terminal. Dry hills, S. N. Y. to Ohio, south to Fla. J.H. III. 35 321. Mn. 7:201. See also *Dittany*.

CUNNINGHAMIA (after J. Cunningham, botanical collector, who discovered this conifer in China in 1702) *Pindeae*. Evergreen trees cultivated for their handsome foliage.

Trunk stout. branches verticillate, spreading, pendulous at the extremities. lvs. linear-lanceolate, rigid, densely spirally arranged and 2-rowed in direction. fls. monoeceous; staminate oblong, pistillate globose, both sexes in small clusters at the end of the branches. cones roundish-ovate, 1-2 in. long, with roundish-ovate,

1142. *Cucurbita foetidissima*.

CUMMINGIA (for Lady Gordon Cumming) of gardeners (name bestowed by D. Don in 1828), sometimes spelled *Cumingia* (Kunth, 1843), is now referred to *Conanthera*. *Amarylhidaceae*. The *conantheras* are of about four species in Chile, one of which is rarely in cult. as a tender summer-blooming bulb. They are said to be difficult to keep long in cult. They are cormous plants, with basal linear or linear-lanceolate lvs., erect sts. paniculate-branching above, fls. blue on bractless pedicels. perianth funnelform, the tube short; lobes longer than tube, oblong, nearly equal, spreading or becoming reflexed, stamens 6, attached in the throat, shorter than the perianth-lobes, all perfect, the filaments very short; ovary 3-celled, the style subulate. *Conanthera campanulata*, Lindl. (*C. Simsii*, Sweet. *C. bifida*, Sims, not Ruiz & Pav. *Cummingia campanulata*, D. Don) is 1-1½ ft. high, with linear lvs. shorter than the st. or peduncle and blue paniculate pretty fls. B.M. 2496.

CUNILA (origin unknown). *Labiate*. A low-growing tufted hardy native perennial of this genus is rarely cultivated in border: for its profusion of bloom.

serrate and pointed, coraceous scales, each with 3 narrow-winged seeds at the base.—Two species, in S. W. China and in Formosa. The species in cult. is a very decorative conifer for warmer temperate regions, much resembling the *Araucaria brasiliensis*. It prefers a half-shaded position and sandy and loamy humid soil. Prop. by seeds or cuttings of half-hardy wood in late summer under glass; short sprouts from the old wood of the trunk or larger branches are the best; cuttings from lateral branches grow into weak and one-sided plants.

lanceolata, Hook. (*C. sinensis*, R. Br.). Tree, attaining 80 ft.: lvs. linear-lanceolate, with broad, decurrent base, sharply pointed, finely serrulate, light green and shining above and with 2 broad, whitish bands beneath, 1½-2½ in. long; cones 1-2 in. high. China, cult in Japan. B.M. 2743. S Z 104, 105. R H 1903, pp. 549-551. G W 13, p. 330; 14, p. 13. J.H. III. 49:447. F. 1854, p. 169.—The second species, *C. Konishi*, Hayata, from Formosa, is not in cult.; it has narrower and much smaller lvs., glaucous on both sides, and smaller cones; it is very different and forms a transition to *Taiwania*. **ALFRED REHDER.**

CUNONIA (named for John Christian Cuno, who catalogued his garden in Amsterdam at the middle of the 18th century). *Cunoniaceae*, formerly included in the *Saxifragaceae*. A half dozen trees or shrubs of the southern hemisphere, one of which is sometimes grown under glass.

1143 *Cuphea hyssopifolia*
($\times 1/2$)

Colony, is a large glabrous shrub or tree to 50 ft. lvs 2-3 pairs, oblong-lanceolate, sharply serrate; fls small, very numerous, in opposite racemes, the stamens much exerted. Said to be of easy cult. in a sandy-peaty soil, prop by cuttings of half-ripened wood. L. H. B.

CUPANIA *Blighia*

CUPHEA (Greek, *curved*, referring to the prominent protuberance at the base of the calyx-tube). *Lythraceae*. Mostly small greenhouse and conservatory plants.

Plants often clammy lvs opposite, rarely whorled or alternate, ovate, lanceolate, or linear, entire: the fls are often borne in 1-sided racemes, and some of the species have a very odd look from the bold angle made by the slender ascending pedicel and the descending calyx-tube, with an odd projection at the base—An exceedingly interesting genus of 200 species of tropical and subtropical American herbs and shrubby plants, with remarkable variations in the petals. In *C. ignea*, perhaps the most attractive of the group, the petals are entirely absent, and the showy part is the brilliantly colored calyx-tube. At the other extreme is *C. hyssopifolia* with 6 petals (the normal number in the genus), and all of equal size. Between these two extremes (shown in Figs 1143 and 1145) are at least two well-marked intermediate types. One of these (exemplified in *C. procumbens*) has 2 large and 4 small petals, the other (*C. lilacea*) has 2 conspicuous petals and the other 4 are completely abortive. These two types are unique among garden plants. The series of intergradient forms is completed by *C. cyanea*, in which there are only 2 petals, and these minute, and *C. micropetalata* in which there are 12 barely visible petals, alternating with and shorter than the calyx-teeth. In addition to the species described below, *C. Hookeriana*, Walp., is cult. as *C. Roezli*, Carr. It has lanceolate lvs., with vermilion and orange calyx. R. H. 1877: 470. According to many American botanists, the correct name for these plants is *Parsonsia*, *Cuphea* applying only to another widely separated genus.

Nearly all cupheas are grown from seed and treated as tender annuals, but *C. ignea* is chiefly propagated by cuttings. They are of easy culture, and the whole series is worth growing.

Grisebiana, 6	miniata, 8	Zimpfii, 2
hyssopifolia, 5	pinetorum, 4	

A. Petals 6, but very minute and inconspicuous.

1. *micropetalata*, HBK (*C. emmens*, Planch & Lind.). St shrubby, more or less branched, 1-2 ft. high; branches and calyx scabrous: lvs oblong-lanceolate, acute at both ends, but without a distinct petiole, rigid, scabrous: fls borne singly in succession at a point above the axils, which distinguishes this species from all others here described, petals 6, minute, borne between the calyx-teeth, and shorter than them, calyx 12-toothed, scarlet at the base, yellow towards the top, greenish at the mouth, stamens and filaments red; ovary 2-celled, many-seeded. Mex HBK. Nov. Gen. Sp. 6, p. 209, t. 551. R. H. 1857, p. 151. F. S. 10 994. —The picture first cited shows a 1-sided raceme, the second a panicle and the third a common raceme. In this species the calyx-tube is the attractive portion, while the petals are inconspicuous. The tube is not 2-lipped, but almost regular. See page 3567.

AA. Petals 6, all conspicuous, but 2 of them much larger than the others

2. *lanceolata*, Hook (*C. Zimpfii*, Roezli). An erect sticky annual, 3-4 ft high, the branches stout, purplish green: lvs petiolate, opposite and alternate, $1\frac{1}{2}$ -3 in long, entire fls axillary, solitary, purple or reddish purple, often deflexed, stamens hardly longer than the petals. Sept., Oct. B. M. 6412 —A good, showy herbaceous border plant.

3. *procumbens*, Cav. Annual, herbaceous, 1 ft high, procumbent, sticky-pubescent, with characteristic purplish hairs. lvs ovate-lanceolate, with white hairs, $1\frac{1}{2}$ -3 in long, gradually decreasing in size until they become bract-like; petiole short. fls numerous, peduncles longer than the petioles, 2 or 3 times shorter than the calyx, calyx 6-toothed, purplish at the base, green at the tip, with 12 raised streaks, and a pubescence like that of the st., petals 6, the 2 larger ones on the upper lip of the calyx purple, filaments included. Mex. B. R.

1144 *Cuphea Lilaea*.
(Natural size)

182. *C. purpurea*, Hort. F. S. 4:412. R. B. 22-85, said to be a hybrid between *C. miniata* and *C. viscosissima*, is probably not distinct.

4. *pinetorum*, Benth. Perennial and somewhat woody, usually procumbent: lvs lanceolate, ciliate, 1-2 in long. fls purple, the calyx $\frac{1}{4}$ in. long, colored; stamens 11, the filaments unequal. In sandy plains. Mex. —A useful plant S.

AAA. Petals 6, all of the same size.

5. *hyssopifolia*, HBK. Fig. 1143. St shrubby: branches numerous, strigose lvs lanceolate, rather acute, obtuse at the base, glabrous above, strigose-pilose along the midrib and veins, as may be seen with a hand-lens. fls. with their slender pedicels scarcely longer than the lvs.; calyx glabrous; petals 6, somewhat

unequal, dilute violet; stamens 11, included, filaments villous; ovary 5-6-seeded. Mex.—This is the least attractive of the species here described, and is no longer advertised, but it probably still lingers in conservatories. It is readily distinguished from its showier relatives by its much smaller lvs. (less than $\frac{1}{2}$ in long) and much-branched and woody appearance.

1145. *Cuphea ignea*.
($\times 34$)

Mex. B.R. 32:14 (as *C. strigulosa*, Lindl.) F.S. 1.15 and P.M. 11.241 as *C. strigulosa*, but neither of these plates is the *C. strigulosa*, HBK., which is a different species, with a shrubby st.: branches and calyx clammy-nispid. lvs. ovate-oblong, acute at both ends, clammy, glabrous above, strigose-scabrous below: petals nearly equal; ovary about 8-ovuled.

BB. *Size of petals larger, half as long as the calyx or longer. c. Calyx 6-toothed.*

7 *Llavea*, Lindl. RED-WHITE-AND-BLUE FLOWER. Fig. 1144 Sts. numerous, herbaceous, hispid: branches ascending: lvs. almost sessile, especially near the top, ovate-lanceolate, strigose: racemes short, few-fl.; calyx green on the ventral side, purple on the back and at the oblique 6-toothed mouth; petals 2, large, scarlet, obovate, the other 4 abortive, stamens 11. Guatemala B.R. 1386 J.H. III 31 305.—It is doubtful whether the plant described by Lindley is the same as the Mexican plant originally described by Lexarza, which was said to have petals of "dilute scarlet." Lindley's plant had a green calyx, but the plant in the trade is colored! Used for baskets and bedding. Often misspelled *Llavea*.

cc *Calyx 12-toothed*

8 *miniata*, Brongn. St. shrubby, erect: branches few, hispid: lvs. opposite, the upper ones not quite opposite, with a very short petiole, ovate, acute, entire, with white, silky hairs which are denser beneath fls. solitary, subsessile, axillary, the peduncle adnate to the branch in such a way as to appear between and below the petioles, raceme few-fl., 1-sided F.S. 2 73. P.M. 14:101 R.H. 1845. 225. R.B. 22:85 Var. *alba*, Hort. A white-fl. variety. Var. *compacta*, Hort. S.H. 2 43 Gt. 46, p. 637—This is referred to *C. Llavea* of Lexarza, by Index Kewensis. The above description is from the original in F.S. 2:73. Van Houtte describes several hybrid varieties in F.S. 5, p. 487, which differ chiefly in size, color, and marking of petals. Calyx 1 in long, hispid, green at the base, purple above, 12-toothed at the tip; petals 2, scarlet, wavy. The specific name *miniata* means cinnabar-red, and refers to the petals.

AAAAA. *Petals 0.*

9 *ignea*, DC. (*C. platycentra*, Hort., not Benth.). Fig. 1145. Branches somewhat angled; lvs. petioled, ovate-lanceolate, acuminate, narrowed at the base, lightly scabrous: fl.-stalks 2-4 times longer than the fl.-stalks, calyx glabrous, shortly 6-toothed, bright

red except at the tip, which has a dark ring and a white mouth, petals 0, stamens 11 or 12, glabrous Mex. F.S. 2.180. P.M. 13:267—This is still sold as *C. platycentra*, although De Candolle corrected the error in 1849 (F.S. 5.500 c). This is a remarkable instance of the persistence of erroneous trade names.

WILHELM MILLER.
N. TAYLOR.†

CUPRESSUS (ancient Latin name from Greek, *Kuparissos*) CYPRESS. *Pinaceae*. Evergreens, cultivated for their graceful habit and the dark green or glaucous foliage, some are timber trees.

Trees, rarely shrubs, with aromatic evergreen foliage: branchlets quadrangular or nearly so: lvs. opposite, small, scale-like, appressed, minutely denticulate-ciliate, on young seedling plants linear-subulate and spreading: fls. monœcious, minute, solitary on short branchlets; staminate ovate or oblong, yellow; pistillate subglobose: cones globular or nearly so, consisting of 3-7 pairs of ligneous, peltate scales, with a mucro or boss on the flattened apex, each bearing many or numerous seeds, but the lower scales usually sterile and smaller; they ripen the second year—About 12 species in Cent. Amer., north to Calif. and Ariz., and from S. Eu. to S. E. Asia. Monogr. by M. T. Masters, in Journ. of Linn. Soc. 31 312-51 (1895). By some botanists, the allied genus *Chamaecyparis* is included.

The cypresses are highly ornamental evergreen trees, greatly varying in habit, hardly only in California and the Gulf states. The hardest seems to be *C. Macnabiana* and *C. arizonica*, which will stand many degrees of frost in a sheltered position, also *C. macrocarpa*, *C. sempervirens*, *C. funebris* and *C. torulosa* are of greater hardness than the others. They stand pruning well, and some species are valuable for hedges, *C. macrocarpa* being especially extensively planted for this purpose in California. *C. arizonica* yields excellent timber. The cypresses seem not to be very particular in regard

1146 *Cupressus sempervirens*. Verona.

to soil and situation, but prefer a deep, sandy-loamy soil. For propagation, see *Chamaecyparis*. The young plants should be removed several times in the nursery to secure a firm root-ball; otherwise they will not bear transplanting well.

ALFRED REHDER

CURATÉLLA (name refers to the plants being used or worked used for polishing weapons and metal) *Dilleniáceæ*. Three or 4 S. American and W. Indian small trees or scandent shrubs, of which one is sometimes mentioned in horticultural literature. They are warmhouse evergreens, with white fls in dense panicles. Sepals and petals 4-5, stamens many, carpels 2 (rarely 1), more or less cohering, follicular. *C. ameri-*

cana, Linn., of W. Indies and S. Amer., grows to 10 ft., erect, tortuous. lvs. oval, rough on the upper side, toothed, fls malodorous, in lateral compound racemes: bark wrinkled and cracked.

CURCÚLIGO (Latin, *curculio*, weevil; referring to the beak of the ovary) *Amaryllidáceæ*. Warmhouse and conservatory foliage plants with the habit of a young palm and an odd flower-cluster.

Stemless herbs, with short rhizomes, radical long narrow usually plicate lvs., and small fls. in spikes or clusters on short scapes that may be nearly concealed at the base of the plant perianth 6-parted, the segms. spreading and about equal, stamens 6, attached at the base of the segms., ovary 3-celled — The genus is closely related to *Hypoxis*, but differs in its succulent indehiscent fr. and because in many species the ovary has a long beak which looks like a perianth-tube, but this beak is always solid, and bears on its summit the style which is in the center of the perianth — Twelve species in eastern and western tropics of which *C. recurvata* is grown S and N, being used by florists for vases, jardinières, and general decorative work, and also used outdoors in summer. It is of easy cult, but requires perfect drainage. It is a question to be determined whether the plants mostly in cult are *C. recurvata* or *C. latifolia*, the recurved dense ovoid head of fls. quickly distinguishes the former species.

The curculigos are very ornamental plants for large greenhouses, where a high temperature is maintained. To have them looking their best they should, if possible, be planted out in a bed, where they will attain a height of 5 feet. Their gracefully arching leaves are so constructed that they move continually from side to side with the slightest movement of the air. The variety *variegata* is one of the best variegated-leaved plants. While not so robust as the green form, it is more adapted to pot culture. The soil should be two parts loam and another of rotted cow-manure and sand. Drainage must be carefully arranged, as the plants need an abundance of water. The green-leaved kind stands the summers well in the neighborhood of Washington, D C, if protected from the sun and afforded an abundant supply of water. As house-plants they are likely to suffer for lack of moisture.

Propagation is by division. The pieces, before potting, will make new roots rapidly if placed in the sand-bed of a warm propagating-house for a few days.

recurvata, Dry. Height $2\frac{1}{2}$ ft or more. root tuberos lvs from the root, 1-3 ft long, 2-6 in wide, with a channeled stalk one-third or one-fourth the length, the blade lanceolate, recurved, plaited scapes very rarely as long as the lf-stalks, covered with long, soft brown hairs, recurved at the end, bearing a head of drooping yellow fls., each $\frac{3}{4}$ in across; the scape is frequently only 1-3 in long, the fls appearing almost on the ground; bracts 1 to each fl and about as long. Trop Asia, Austral. B.R. 770. (with scape abnormally long). Var. *striata*, Hort., has a central band of white. Var *variegata*, Hort., has longitudinal bars of white.

latifolia, Dry. Fig 1148. Height 2-3 ft. differs from *C. recurvata* in having a very short-stalked erect inf., the bright yellow fls. in a dense cluster near the base of the plant: lvs. lanceolate, 1-2 ft long and 1-5 in. wide, the petiole 12 in. or less fr 1 in long, club-shaped or pyriform, hairy, with black seeds: the plant produces numerous suckers which, when removed, are easily grown, and bloom in about a year; said to be a beautiful and hardy house-plant, more satisfactory than palms for one without a conservatory. India, Malaysia B.M. 2034. B.R. 754. L.B.C. 5-443 (as *C. sumatrana*).—Variable in foliage.

1148. *Curculigo latifolia*.

XXXII. The Fay currant, one of the large red varieties.

CÚRCUMA (Arabic name). *Zingiberaceæ*. Curious and showy warmhouse herbaceous plants with great spikes of large concave or hooded bracts, from which the flowers scarcely protrude.

Erect herbs, the st. rising to 10 ft. from a thick tuberiferous rootstock. lvs. usually large; fls. in a dense cone-

1149 *Curcuma petiolata* leaves ($\times \frac{1}{2}$)

like thyrse, borne behind concave or hooded imbricated obtuse often colored bracts, calyx and corolla tubular, the former 2-3-toothed, the latter dilated above and with 5 ovate or oblong lobes, stammodium petal-like, 3-parted, the middle lobe anther-bearing fringed by the bracts. The latest monograph, 1901 by Schumann in Engler's Pflanzenreich, hft 20, recognizes 42 species, mostly in Trop Asia and some in Trop Afr. The fleshy bracts are perhaps the showiest feature of the plant, the topest ones being colored with gorgeous tropical hues. Rhizomes of some of the species yield East India arrowroot, while others furnish turmeric. The rhizome of *C. zedoaria* of India is very pungent and has properties similar to ginger. The genus is allied to *Alpinia* and *Amomum*.

In spring the tubers should be deprived of last year's mold and repotted in a fresh mixture of light loam, leaf-mold and turfy peat, the pots being well drained, and placed in a warm pit or frame in bottom heat. Water should be given sparingly until after the plant has made some growth. The young roots are soft and succulent, and are likely to rot if the soil remains wet for a long time. After flowering, the leaves soon show signs of decay, and water should be gradually withdrawn. During the resting period the soil should not be allowed to get dust-dry, or the tubers are likely to shrivel. The plants are propagated by dividing the tubers in spring.

cordata, Wall. Lvs. 1 ft. long, sheathing, ovate, acuminate, the same color on both sides, obliquely penninerved, bracts in a cylindrical spike, the upper part forming a sterile part called a coma, which is a rich violet, with a large, blood-colored spot, fls. yellow, with a pink hood. Burma. B.M. 4435—This is now referred to *C. petiolata*, Roxbg., but it seems at least horticulturally distinct, with its rose-pink bracts.

petiolata, Roxbg. QUEEN LILY. Figs. 1149, 1150. Lvs. 6-8 in. long, peculiar in this genus as being more or less rounded or cordate at the base, the stalk 4-5 in. long fls. spicate, the spikes 5-6 in. long, bracts 20-30, connate at their bases, and wholly including the pale yellow fls. India. B.M. 5821—The most beautiful and showiest of the curcumas.

longa, Linn. Lvs. 2-2½ ft., the blade about 1 ft. and narrowed at the base; fls. spicate, autumnal, the spikes

4-6 in. long; bracts pale green, not wholly inclosing the pale yellow fls. India. B.R. 886.—The dried rhizomes of this furnish the well-known turmeric of India, used as a condiment and as a dye. Intro. by the Royal Palm Nurseries.

C. albiflora, Twantes, differs from some others here described in having its spikes sunk below the lvs. instead of standing high above the lvs., and all the bracts have fls., while the others have a sterile portion of the spike which is brightly colored. In this species the spike is short and green and the fls. are prominent and white. Ceylon. B.M. 5009.—*C. australasica*, Hook. f., has its upper bracts soft, rosy pink and the fls. pale yellow. Austral. B.M. 5620.—*C. Rancouana*, Wall., has a long and splendid spike, with bracts gradually changing from green to the vividest scarlet-orange fls. pale yellow. Burma. B.M. 4067.—*C. rubescens*, Roxbg. (*C. rubricaulis*, Link.) Lvs. stalked, oblong, with red sheath, said to be brown in the center fls. red. E. Indies.—*C. zedoaria*, Roscoe, has the upper bracts white, tinged with carmine, and handsomely variegated lvs., which, with the green of the lower bracts and the yellow of the fls. makes a striking picture of exotic splendor. Himalayas. B.M. 1546.

N. TAYLOR.†

CURMÉRIA: *Homalomena*.

CURRENT. The currants grown for their fruit in America are derived mainly from two species, namely, the European red currant, *Ribes vulgare* (*R. rubrum*) (Fig. 1151), and the European black currant, *R. nigrum* (Fig. 1152). There are two promising American species, of which few, if any, improved varieties have been introduced, the swamp red currant (*R. triste*) and the wild black currant (*R. americanum*). Another American species of which at least one named variety has been offered for sale is the Buffalo or Missouri currant (*R. aurum*) (Fig. 1154), also grown because of its ornamental flowers. The currant is not known to have been under cultivation before the middle of the sixteenth century. It is not mentioned by any of the ancient writers who wrote about fruit, and was evidently not known to the Romans.

Currants are natives of comparatively cold or very cold climates; hence most varieties succeed over a very wide area in America. They are among the hardest of fruits from the standpoint of resistance to cold or changes of temperature, but in hot and dry sections they do not thrive, and, on this account, are unsatisfactory in parts of the southern states.

The currant is not so generally used in America as some other fruits, as few persons care for them when eaten raw, and when cooked they are usually made into jelly and consumed by only a comparatively small proportion of the people. In the coldest parts where other fruits do not succeed well, the currant is more popular, and is used much more generally. It is a wholesome and refreshing fruit and deserves much more attention than it receives at the present time.

The currant does not vary so much when grown from seed as most cultivated fruits, and, being so easily propagated from cuttings, it has not been improved so much as it otherwise would have been. Moreover, size in currants was not of great importance until recent years, when competition in marketing has become keener. It is only during the past fifty or sixty years

1150. *Curcuma petiolata* in flower. ($\times \frac{1}{2}$)

that many new varieties have been introduced. At the beginning of the nineteenth century, few named sorts were recognized, the currant being generally known simply under the names black, red and white.

Propagation of currants.

The usual method of propagating currants is by means of cuttings. These root very readily and good plants are secured after one season's growth. The best time to make the cuttings is in the autumn, as currants begin to grow very early in the spring, and once the buds have swollen they cannot be rooted successfully. Wood of the current season's growth is used. This may be cut early in the autumn as soon as the wood has ripened, from the end of August to the middle of September being the usual time. It should be cut in as long pieces as possible to save time in the field, and put in a cool moist cellar or buried in sand. If the cuttings can be made at once, it is best to do so. These are made by cutting the wood into pieces, each about 8 to 10 inches long, although an inch or two more or less is not of much consequence. The base of the cutting should be made with a square cut just below the last bud. There should be at least $\frac{1}{2}$ inch of wood left

1151. Common currant—*Ribes vulgare*, in bloom. ($\times \frac{3}{4}$)

above the top bud of each cutting, as there should be a strong growth from the upper bud, and if the wood is cut too close it is liable to be weakened. A sloping cut is best for the upper cut, as it will shed rain better, but this is not important. When made, the cuttings should be planted at once, which is usually the best plan, or heeled in. If heeled in, they should be tied in bundles and buried upside down in warm well-drained soil, with about 3 inches of soil over them. The object of burying them upside down is that by this method the bases of the cuttings will be nearer the surface where the soil is warmer and there is more air, and will callus more quickly than if they were further down. The cuttings should callus well in a few weeks, and may then be planted outside, if thought advisable. Cuttings may be kept in good condition over winter by heeling-in

or burying in sand in a cool cellar, or after callusing under a few inches of soil outside, they may be left there over winter if covered with about 4 to 5 more inches of soil to prevent their drying out. Good results are secured with the least trouble by planting the cuttings in nursery rows as soon as they are made. The soil should be well prepared and should be selected where water will not lie. Furrows are opened 3 feet apart and deep enough so that the top bud, or at most two buds, will be above ground. The cuttings are placed about 6 inches apart on the straight side of the furrows and soil thrown in and tramped well about them. When only a smaller number are to be planted a trench may be opened with a spade. It is important to have a large proportion of the cutting below ground, as more roots will be made and the plants will be stronger. There would also be danger of the cuttings drying up before rooting if too much of the wood is exposed. If the season is favorable the cuttings should callus well and even throw out a few roots by winter. Where there is little snow in winter, it is a good practice to cover the tops of the cuttings with about 2 inches of soil, which will be a good protection for them. This soil should be raked off in spring. In the spring, cultivation should be begun early and kept up regularly during the summer to conserve moisture and favor rooting and the development of the bushes. By autumn they should be large enough to transplant to the field.

In Great Britain and Europe, currants are often grown in tree form and are prevented from throwing up shoots from below ground by removing all the buds of the cuttings except the top one before planting in the nursery. This system is not recommended for most parts of America as it has been found by experience that snow breaks down currants grown in this way, and when borers are troublesome it is not wise to depend on one main stem.

Most of the cultivated varieties of currants have originated as natural seedlings, little artificial crossing having been done with this fruit. Currants grow readily from seeds, and it is easy to get new varieties in this way. The seeds are washed out of the ripe fruit, and after drying, may either be sown at once or mixed with sand and kept over winter in a cool dry place and sown very early in the spring. The best plan is to sow them in the autumn in mellow well-prepared and well-drained soil, since when this is done they will germinate very early in the spring, while if sown in the spring the seed may be all summer without sprouting. The seed should not be sown deep, from $\frac{1}{4}$ to $\frac{1}{2}$ an inch being quite sufficient. If sown very deep they will not germinate. The young plants may be transplanted from the seed-bed to the open in the autumn of the first year if large enough, but if the plants are very small they may then grow another season, when they should be planted out at least 4 by 5 feet apart, so as to give them room enough to fruit for several seasons, in order that their relative merits may be learned. If intended to remain permanently, the plants should be at least 6 by 5 feet apart. The bushes should begin to bear fruit the second or third year after planting out. Each bush will be a new variety, as cultivated fruits do not come true from seed. If a seedling is considered promising it may be propagated or increased by cuttings, as already described.

The soil and its preparation.

Currants should be planted in rich soil in order to get the best results. The soil should also be cool, as the currant is a moisture-loving bush. The currant roots near the surface; hence if the soil is hot and dry the crop will suffer. A rich, well-drained clay loam is the best for currants, although they do well in most soils. If the soil is not good, it should receive a good dressing of manure before planting, which should be well worked into the soil, the latter being thoroughly

pulverized before planting is done. A northern exposure is to be preferred, as in such a situation the currants are not likely to suffer in a dry time.

Planting.

The best time to plant currants is in the autumn. If planted in the spring, they will probably have sprouted somewhat before planting, and on this account their growth the first season will be checked. When the soil is in good condition, currants, especially the black varieties, make strong growth, and the bushes reach a large size; hence it is best to give them plenty of space, as they will do better and are more easily picked than if crowded. Six by 5 feet is a good distance to plant. If planted closer, especially in good soil, the bushes become very crowded before it is time to renew the plantation.

Strong one-year-old plants are the best, but two-year-old plants are better than poorly rooted yearlings. It is better to err on the side of planting a little deeper than is necessary than to plant too shallow. A good rule to follow is to set the plants at least an inch deeper than they were in the nursery. The soil should be well tramped about the young plant so that there will be no danger of its drying out. After planting, the soil should be leveled and the surface loosened to help retain moisture.

Cultivation.

As the currant, to do well, must have a good supply of moisture, cultivation should be begun soon after planting, and the surface soil kept loose during the summer. While the plants are young the cultivation may be fairly deep between the rows, but when the roots begin to extend across the rows, cultivation should be shallow, as many of the roots are quite near the surface.

Fertilizers

After the first application of manure, no more should be necessary until the plants begin to fruit, unless other crops are grown between, after which an annual top-dressing of well-rotted barnyard manure is desirable. When only a light application of manure is given, the addition of 200 to 300 pounds to the acre of muriate of potash would be very beneficial. Wood-ashes also would make a good fertilizer with barnyard manure. There is little danger of giving the currant plantation too much fertilizer. Unfortunately, it is usually the other way, this fruit being often very much neglected.

Pruning.

The black and red currants bear most of their fruit on wood of different ages, hence the pruning of one is a little different from the other. The black currant bears most of its fruit on wood of the previous season's growth, and it is important always to have a plentiful supply of one-year-old healthy wood. The red and white currants produce their fruit on spurs which develop from the wood two or more years of age, and it is important in pruning red and white currants to have a liberal supply of wood two years and older; but, as the fruit on the very old wood is not so good as that on the younger, it is best to depend largely on two- and three-year-old wood to bear the fruit. A little pruning may be necessary at the end of the first season after planting in order to get the bush into shape. From six to eight main stems, or even less, with their side branches, will, when properly distributed, bear a good crop of fruit. Future pruning should be done with the aim of having

from six to eight main branches each season and a few others coming on to take their places. By judicious annual pruning, the bush can be kept sufficiently open to admit light and sunshine. A good rule is not to have any of the branches more than three years of age, since when kept down to this limit the wood will be healthier, stronger growth will be made, and the fruit will be better.

1152. Black currant—*Ribes nigrum*.
(About natural size.)

When to renew the plantation.

A currant plantation will bear a great many good crops if well cared for, but if neglected the bushes lose their vigor in a few years. The grower will have to decide by the appearance of the bushes when to renew the plantation; but as a currant plantation can be renewed at comparatively little labor, it is best to have new bushes coming on before the old ones show signs of weakness. At least six good crops may be removed with fair treatment, and ten or more can be obtained if the bushes are in rich soil and well cared for. When one has only a few bushes for home use, they may be reinvigorated by cutting them down to the ground in alternate years, and thus securing a fresh supply of vigorous young wood.

Yield of currants.

The red currant is one of the most regular in bearing of all fruits, and as it is naturally productive, the average yield should be large. Bailey, in the "Farm and Garden Rule-Book," puts the average yield at 100 bushels per acre. Card, in his book on "Bush-Fruits," says that it ought to be 100 to 150 bushels, "with good care," and reports 320 bushels. At the Central Experimental Farm, Ottawa, Canada, the Red Dutch averaged for four years at the rate of 7,335 pounds to the acre, or over 183 bushels. The largest yield from red currants obtained at the Central Experimental Farm was in 1900, when six bushes of the Red Dutch currant yielded 73 pounds, 15 ounces of fruit. The bushes were 6 by 5 feet apart. This means a yield at the rate of 17,892 pounds to the acre, or, at 40 pounds per bushel, 447 bushels 12 pounds to the acre. The same variety in 1905, in a new plantation, yielded 55½ pounds from six bushes, or at the rate of 13,431 pounds to the acre, or 335 bushels 31 pounds. These are very large yields, and while half of this amount may not be expected in ordinary field culture, the fact that such yields can be produced on a small area should be an inspiration to get more on a larger one.

The average yield of black currants has been somewhat less than the red, although individual yields have been large. The Saunders currant yielded for four years at the rate of 6,534 pounds to the acre, or over 163 bushels; the Kerry at the rate of 6,382 pounds to the acre, or over 159 bushels. The highest yield of black currants was obtained in 1905, when six bushes of Kerry planted 6 by 5 feet apart, yielded 62 pounds of fruit, or at the rate of 15,004 pounds to the acre, equal to 375 bushels, estimating at 40 pounds to the bushel.

Red and white currants.

The red currant makes excellent jelly, and its popularity is largely due to this fact. A large quantity of red currant jelly is made every year in Canada. Red currants are used to a less extent for pies and as jam and are also eaten raw with sugar. As a fruit for eating out-of-hand, the red currant is not very popular, but there are few fruits so refreshing. The white currants are better liked for eating off

1153. Native black currant—*Ribes flodum*.
The fruit is immature ($\times \frac{1}{2}$)

the bush than the red, as they are not so acid. The Moore Ruby is a red variety, however, which is milder than most others, and for this reason is better adapted for eating raw. The red currant does not vary so much in quality as the black.

Red currants will remain in condition on the bushes for some time after ripening, and therefore do not have to be picked so promptly as the black.

Varieties. Varieties of red currants vary considerably in hardiness, the Cherry, Fay, Comet, Versailles, Wilder and others, while bearing very large fruit, are decidedly more tender than some of the others, hence they should not be planted in the coldest parts. The Franco-German and Prince Albert currants are later than most other varieties, and when it is desired to lengthen the season, these may be planted.

Varieties of red and white currants recommended: Red—for general culture—Pomona, Victoria, Cumberland Red, Red Dutch, Long Bunched Holland, Red Grape. Where bushes are protected with snow in winter, and for the milder districts—Pomona, Victoria, Cumberland Red, Wilder, Cherry, Fay, and Red Cross. White—White Cherry, Large White, White Grape.

Black currants.

There are not so many black currants grown in America as red, but there is a steady demand for them, and it is thought there will be an increasing demand as they become better appreciated. They make excellent jelly and the merits of black currant jam have long been known.

Black currants vary considerably in season, yield and quality, and therefore it is important to know those

that are the best. As most varieties of black currants drop badly from the bushes as soon as ripe, it is important to pick them in good time.

Varieties of black currants recommended: Saunders, Collins Prolific, Buddenborg, Victoria, Boskoop Giant. Of those not yet on the market which are considered equal or better than those above, the following are the best: Kerry, Eclipse, Magnus, Clipper, Climax and Eagle, and the Success, for an early variety when yield is not so important as size and quality.

Crandall currant.

This is a variety of the Buffalo or Missouri currant (*Ribes odoratum*). A tall, strong, moderately upright grower; moderately productive. Fruit varies in size from small to large, in small, close bunches, bluish black, skin thick, sub-acid with a peculiar flavor. Quality medium. Ripens very unevenly. Season late July to September. As this variety ripens after the others, the birds concentrate on it and get a large proportion of the fruit.

Some of the most injurious insects affecting the currant

Currant aphid (*Myzus ribis*). When the leaves of currant bushes are nearly full grown, many of them bear blister-like elevations of a reddish color, beneath which will be found yellowish plant-lice, some winged and some wingless. The blisters are due to the attacks of these insects, and when, as is sometimes the case, they are very abundant, considerable injury is done to the bushes. Spraying forcibly with whale-oil soap, or kerosene emulsion will destroy large numbers of these plant-lice at each application, but the liquid must be copiously applied and driven well up beneath the foliage by means of an angled nozzle. Two or three applications at short intervals may be necessary.

Currant borer (*Sesia tipuliformis*). Early in June a beautiful little bluish black fly-like moth, with three bright yellow bands around the body may be seen darting about, around, or at rest on the leaves of currant bushes of all kinds. This is one of the most troublesome enemies of these fruits. The moth lays an egg at a bud on the young wood, and the caterpillar, when hatched, eats its way into the cane and destroys the pith. It remains in the wood during the winter, and the moth emerges during the following summer. Close pruning is the best remedy. Burn the wood.

Currant maggot (*Epocha canadensis*). Red, black and white currants are in some places seriously attacked by the maggots of a small fly. These maggots come to full growth just as the berries are about to ripen, causing them to fall from the bushes, when the insects leave them and burrow into the ground to pupate. Attacked fruit is rendered useless by the presence of the maggots inside the berries; and frequently it is not until the fruit is cooked that

1154 Buffalo currant.
R. aureum ($\times \frac{1}{2}$)

1155.
Currant
cutting

the white maggots can be detected. Gooseberries are sometimes injured but far less frequently than black and red currants. The only treatment which has given any results is the laborious one of removing about 3 inches of the soil from beneath bushes which are known to have been infested, and replacing this with fresh soil. That which was removed must be treated in some way, so that the contained puparia may be destroyed. This may be done either by throwing it into a pond or by burying it deeply in the earth.

Currant worm or *imported currant sawfly* (*Pteronux ribesii*). By far the best known of all the insects that injure currants and gooseberries, is the "currant worm." The black-spotted dark green false caterpillars of this insect may unfortunately be found in almost every plantation of currants or gooseberries, every year in almost all parts of America where these fruits are grown. The white eggs are laid in rows along the ribs of the leaf on the lower side, toward the end of May. From these the young larvæ hatch and soon make their presence known by the small holes they eat through the leaves. Unless promptly destroyed, they will soon strip the bushes of their leaves, thus weakening them considerably so as to prevent the fruit from ripening the first year, and also reducing the quality of the crop of the following season. There are at least two broods in a season in most places, the first appears just as the leaves are attaining full growth, and the second just as the fruit is ripening. The perfect insect is a four-winged fly which may be seen flying about the bushes early in spring. The male is blackish, with yellow legs and of about the same size as a housefly, but with a more slender body. The female is larger and has the body as well as the legs yellow. For the first brood a weak mixture of paris green, one ounce to ten gallons of water, may be sprayed over the bushes, or a dry mixture, one ounce to six pounds of flour, may be dusted over the foliage after a shower or when the leaves are damp with dew. For the second brood paris green must not be used, but white hellebore, or hellebore may be used for first brood, but it is necessary to kill quickly. This is dusted on as a dry powder, or a decoction, one ounce to two gallons of water, may be sprayed over the bushes. It is, of course, far better to treat the first brood thoroughly, to reduce the number of females which lay eggs for the second brood.

Oyster-shell scale (*Lepidosaphes ulmi*). Several kinds of scale insects attack currants. These plants seem to be particularly susceptible to the attacks of the well-known oyster-shell scale of the apple, and the San José scale. In neglected plantations these injurious insects increase rapidly, and a great deal of injury results to the bushes. The remedies for scale insects are direct treatment for the destruction of the infesting insect, and preventive measures, such as the invigoration of

the bush by special culture and pruning, to enable it to throw off or outgrow injury. Infested plantations should be cultivated and fertilized early in the season, and all unnecessary wood

1156 To illustrate the pruning of a currant bush. The old cane, a, is to be cut away. The straight new canes at left are to remain.

should be pruned out. As direct remedies, spraying the bushes at the time the young scale insects first appear in June with kerosene emulsion or whale-oil soap, or spraying in autumn before the hard weather of winter sets in with a simple whitewash made with one pound of lime in each gallon of water, give the best results. Two coats of the whitewash should be applied, the second one immediately after the first is dry. In putting on two thin coats of the wash instead of one thick one, far better results have been secured.

For the San José scale, the lime-and-sulfur wash is necessary, and must be repeated every year.

Diseases of the currant.

The currant is affected by very few diseases. The only ones that do much injury are the following:

Leaf-spot, rust (*Septoria ribis*). The leaf-spot fungus affects black, red and white currants, causing the leaves to fall prematurely, and thus weakening the bushes.

This disease is first noticed about mid-summer, when small brownish spots appear on the leaves.

These often become so numerous that they affect a large part of the foliage, soon causing the leaves to fall. As the disease often appears before the fruit is picked, it is difficult to control it if the bushes are not sprayed previously. By using the ammoniacal copper carbonate the bushes may be sprayed a week or two before it is expected, without discoloring the fruit, giving a second application, if necessary. As soon as the fruit is picked, the bushes should be thoroughly sprayed

1157 Tree-form training of currant

with bordeaux mixture. Experiments have shown that this disease can be controlled by spraying.

Currant anthracnose (*Gloeosporium ribis*). This disease, which may be mistaken for the leaf-spot, affects different parts of the bush, including the leaves, leaf-stalks, young branches, fruit and fruit-stalks. On the leaves it is made evident during the month of June by the small brown spots which are usually smaller than those made by the leaf-spot fungus. The lower leaves are affected first, and finally the upper ones. They turn yellow and gradually fall to the ground, and when the disease is bad the bushes are defoliated before their time. On the petioles or leaf-stalks, the disease causes slightly sunken spots. The fruit is affected with roundish black spots which are more easily seen when the fruit is green. On the young wood the diseased areas are light in color and are not so noticeable. The wood is not nearly so much injured by the disease as the leaves. The spores which spread this disease are found in pustules, the majority of which are under the upper epidermis of the leaf. Where the spores are to appear, the surface of the leaf is raised and blackened

in spots looking like small pimples. When the spores are ready to come out the skin breaks and they escape and re-infect other parts. When the foliage drops early on account of this disease the fruit is liable to be scalded by the sun. The fruit may also wither before ripening properly, owing to lack of food or of moisture, as, the leaves having fallen, they are unable to keep up the necessary supply. The premature falling of the leaves prevents the buds from maturing properly, hence they are not in so good condition to bear fruit the next year. Spraying with bordeaux mixture is recommended as an aid in controlling this disease. It would be wise, when currant anthracnose is troublesome, to spray the bushes thoroughly before the leaves appear. A second spraying should be made when the leaves are unfolding, and successive sprayings at intervals of ten to fourteen days until the fruit is nearly full grown, and there is danger of its being discolored by the spray when ripe. Paris green should be added to the mixture when the first brood of the currant worm appears. A thorough spraying after the fruit is harvested is desirable.

W. T. MACOUN.

CUSCUTA (origin of name obscure). *Convolvulaceæ*. **DODDER** Degenerate parasitic twiners, bearing clusters of small flowers. They are leafless annuals, with very slender yellow, white, or red stems, which become attached to the host-plant by means of root-like suckers. The seeds fall to the ground and germinate in

1158. Dodder, twining on its host.—*Cuscuta Gronovii*.

the spring.—Species 100, widely distributed. As soon as the young shoot reaches an acceptable host, the root dies and the plant becomes parasitic. Failing to find a host, the plant dies. Didders are common in low, weedy places. Some species are also serious pests, as the clover dodder, alfalfa dodder, and flax dodder. One of the common species (*C. Gronovii*, Willd.), of low grounds, is shown in Fig. 1158.

CUSHAW: *Cucurbita moschata*.

CUSTARD APPLE: *Annona*.

CUT-FLOWER INDUSTRY IN NORTH AMERICA. The feature that most distinguishes American floriculture from that of Europe is the great preponderance of the cut-flower trade as compared with the sales of plants. Forty years ago the passion of Americans for cut-flowers was remarked by travelers, but however

important the cut-flower trade may then have appeared it has had a marvelous growth since that time. Prior to the Civil War it would have been impossible to purchase any considerable quantity of cut-flowers in the winter season in any of the large cities. The green-houses were small flue-heated structures in which a great variety of plants was grown, hence it would have been impossible to secure a quantity of any one kind. There were no middlemen to collect even the small quantities produced in a locality, and when large numbers of blooms were required, advance notice was expected and the person wishing the flowers had to do the collecting from the various establishments. After the period mentioned, floricultural establishments rapidly increased in number and size. This growth has continued until today. Instead of being concentrated about large cities, there is scarcely a city of 5,000 or even less that does not have its florist. Not less than \$100,000,000 is now invested in the cultivation and sale of cut-flowers in America. Although statistics of the cut-flowers alone are not available, a conservative estimate based on the United States census of 1910 places their annual value at \$25,000,000.

From forty to sixty years ago the camellia was the most valued cut-flower, either for personal adornment or for bouquets, and sometimes as much as \$1, \$2 and even \$3 were obtained for single flowers at the height of the holiday season. Then came a period of decline during which they were almost forgotten except in a few private collections, but now they are seen upon the market as pot-plants. The florist of the present generation wonders how they could have been admired to the extent that they should lead as cut-flowers. Perhaps no better idea of the requirements of the former cut-flower trade can be given than to quote the record of a leading New York florist establishment for 1867 which shows a product as follows: Camellias about 45,000, bouvardias 20,000, carnations 70,000, double primroses 100,000, and tuberoses 50,000. Other flowers on the market in those days were daphne, abutilon, callas, sweet alyssum, pansies, eupatorium, heliotrope and a few tea roses. The most profitable white cut-flowers, in the opinion of many florists, were *Stena serrata*, Double White camellia, *Calla alba*, *Lilium candidum*, *Deutzia gracilis*, and Double White Chinese primrose.

It will be noted that roses were not important in the cut-flower trade of this period. It is a fact that very few were grown under glass. A few florists were growing Bon Silene, Lamarque and Safrano roses, occasionally devoting an entire house to them, but more often in houses with other flowers. The rapidly-awakening demand for all kinds of flowers brought good prices for roses and stimulated the florists to give this flower more attention. The time was one of changing ideals and the old formal camellia, show dahlia and Chinese chrysanthemum were passing, while new and less formal flowers were coming into favor. The flower-buying public, however, wanted something larger than the small tea varieties then grown. Every new variety from Europe that had any promise was tried, and from that day to this scarcely a new introduction has escaped a searching test as to its adaptability for culture under glass. The Marechal Niel was grown for the discriminating trade, and it continued the leading variety until it was supplanted by the everblooming, more prolific and more easily cultivated Perle des Jardins. Likewise, the hybrid perpetuals were tried, and some of them, notably General Jacqueminot, were found to force well. This variety, when it could be had for the holidays, brought \$1 and \$2 a bud.

The roses of this time were produced on plants grown in deep beds or in pots or boxes. The latter method enabled the grower better to time his crops, while the former involved less time and attention. The endeavor to secure the advantages of both naturally resulted in

the shallow raised bench, and this method of growing cut-flowers has been adopted for practically all now grown in large quantities, in fact, this system of culture is perhaps the greatest single feature which distinguishes American floricultural methods from those of Europe. Simultaneously it became very generally recognized that to grow roses successfully required separate houses and a different temperature. For a long time it was thought that a special form or construction was necessary, viz., the three-quarter span, but now the even-span house is in general use.

The present cut-flower production

Having made these important advances in cultural methods, it needed but the introduction of the epoch-making rose, Catherine Mermet, to place the rose in the first place among cut-flowers. This variety came at once into great popularity with the flower-buying public and was very profitable to the growers, thereby attracting capital to the flower business. The competition to produce and market the best quality of flowers elevated the standards in cut-flowers to a higher level. Although the introduction of Catherine Mermet did much for the flower business, it is as the parent of Bride and Bridesmaid that the variety is generally remembered. These "sports" have been the leading white and pink varieties for twenty years, and have been displaced only during the last five years by White Killarney and Killarney, although many claimants arose to dispute their leadership. These roses succeeded because they were profitable with every florist who could grow roses, and it is doubtful whether we shall ever see varieties so generally successful over so wide a territory. The market is seeking a greater variety among roses than it did during the years these roses held sway, but all this is advantageous to the rose specialists. Next in importance to Bride and Bridesmaid and their successors, White Killarney and Killarney, is the American Beauty (Madame Ferdinand Jamain). This variety can be grown successfully and profitably only by growers who have special conditions. As the variety is still without a rival, it continues to be popular with the wealthy flower-buyers.

The American carnation may be regarded as the greatest contribution America has yet made to the floriculture of the world. The plant is unlike any type grown in Europe and its development is due to American plant-breeders, Dörner, Fisher, Ward and many others. During the last fifty years it has been improved in form, size, color and productiveness. Hundreds of varieties have been introduced and the progress has been so rapid that the best have lasted but a few years. Within the last ten years the American carnation has become popular in England, and now new varieties are appearing from over the sea. The United States census of 1890 shows that roses were first, carnations second, and that the two comprised 65 per cent of all cut-flowers. This relative standing has been maintained to the present time.

The development in chrysanthemums has been no less marked. From the old formal Chinese sorts, the popular fancy turned to the large informal Japanese kinds. Now a change to the single and pompon types is being experienced. The varieties of greatest commercial importance have been for the last ten or fifteen years of American origin. The English, French and, finally, the Australian varieties have led as exhibition flowers, but only an occasional variety has proved meritorious as market cut-flowers. (See *Carnation*, *Chrysanthemum*, *Rose*, and other special articles.)

At the present time the important cut-flowers are roses, carnations, violets, chrysanthemums, sweet peas, lilies, narcissi, orchids, lilies-of-the-valley, mignonette, snapdragons, marguerites and gardenias. A modern cut-flower establishment in the region of New York

grows for its wholesale trade the following numbers of plants:

Roses	100,000
Chrysanthemums	240,000
Carnations	15,000
Lilies	(75,000 for Easter) 150,000
Lilies-of-the-valley	300,000
Orchids	25,000

These are grown in a range of houses comprising 900,000 square feet of glass requiring 8,000 tons of coal, 300 employees, 25 horses, 4 automobiles, and a 250-acre farm with a dairy of 160 cows to supply the manure required.

The past ten years have witnessed the development of the new winter-flowering types of sweet peas, and now these flowers bid fair to rival the violet and chrysanthemum for position after roses and carnations.

Orchids, particularly cattleyas, now are being grown by commercial florists for cut-flowers. Although of recent development, during the last ten or twelve years, all large establishments have an orchid department, while many smaller growers are specializing in their culture.

Lilies, through the means of cold storage, may now be had by forcing throughout the year. The varieties of Japanese longiflorums have largely supplanted the old *Lilium Harrisii* kind. *Lilium speciosum* varieties are now largely grown.

The anthurium is now being grown by several specialists and doubtless will yield varieties adapted to greenhouse culture.

The most important outdoor flowers for cutting are peonies, gladioli and asters. The peony is now a most important Memorial Day cut-flower, and many acres are devoted to its culture in regions in which the improved varieties mature their flowers early enough. By means of cold storage, flowers of certain varieties may be kept in good condition for as much as four weeks. The florists are enabled to have a supply of this flower for commencements, weddings, and the like, throughout the latter part of May, June and early July.

Gladioli are increasing in popularity as summer cut-flowers because of their keeping qualities under ordinary conditions. Not only are the white varieties useful, but the magnificent colored varieties are being used in large numbers for bouquets on dining-tables in hotels and restaurants.

The selling.

The marketing of cut-flowers is a business of itself. Many an excellent grower fails because he is not expert in selling his blooms. The cutting of the blooms must be properly done and at the right stage of development. The proper stage in the development when cutting should be done varies with the variety and the season. Roses should be cut as the petals begin to unfold, when the tip of the bud is bursting and the outer petals have reached the proper color. Carnations are picked when fully developed or when three-quarters developed. The latter stage is determined by the pistils having reached an even length with the center petals. Most flowers should be cut early in the morning, and as soon as cut should be placed in clean fresh water, after which they are carried to the cooling-room. The vases in which the flowers are placed should be deep enough to allow plunging the stems two-thirds their length in water. The temperature of the water should be 10° to 15° higher than that of the cooling-room which is 45° to 50°. The temperature is thus gradually lowered to that of the storage-room. The flowers remain in the cooling-room until the picking is done, when they are graded.

Along with the advance in cultural methods and to meet market requirements, flowers have been graded. Although the kinds of flowers grown and the quality

differ but little in the various flower markets, the grades are not yet uniform. However, this ultimately will be brought about through the Florists' Telegraph Delivery Association, an organization which enables a resident of San Francisco, for example, to have an order filled and delivered at an address in Boston, Montreal, Baltimore or elsewhere. The American Rose Society adopted the following grades for tea and hybrid tea roses: 9, 12, 15, 18, 24 inches of stem. Of course the flowers must be good to accord with this standard. American Beauty is graded Specials, above 38 inches; fancy, 32 to 36 inches; extras, 24 to 32 inches; firsts, 13 to 23 inches; seconds, 8 to 13 inches; thirds all under 8 inches. On the Chicago market this variety is graded into specials, 36-, 30-, 24-, 20-, 18- and 12-inch stems. Carnations on the New York market are usually graded into fancies, extras and firsts. Fancies are all perfect blooms, from $2\frac{3}{4}$ to $3\frac{1}{2}$ inches in diameter, with straight stems 16 to 24 inches or more in length. Extras are those blooms which fall short in one or the other of the above requirements. Firsts comprise all merchantable flowers which do not pass as extras or fancies. During the grading, all the leaves from the lower 6 inches are stripped off as well as any side shoots in the axils of the remaining leaves. Chrysanthemums are classed as small, medium, fancy and special. Whatever the grades used in any market, it is important that they be definite, and that the grower use care in grading his own products.

The present methods of the growers in disposing of their flowers to the retail florists are as follows: The large wholesale growers maintain wholesale stores of their own, dealing with the retailers direct and conducting a shipping trade. The growers at a distance from the city market usually consign to the wholesale commission florist whose held is as broad as that of the wholesale grower. These two classes of florists keep in close touch with their customers, even those at a distance, by the ordinary means of communication and in some cases by traveling representatives. The smaller growers living close to a large city adopt any one of five methods, that is, (1) form a cooperative association with an expert salesman to sell the flowers, (2) organize a flower-market and operate a flower-stand; (3) consign the flowers to a commission florist, (4) supply certain retailers regularly, (5) operate their own retail stores. The particular method to be adopted in any individual case depends upon the local conditions and the business ability of the grower. The grower-specialist usually will find it more remunerative to arrange with retailers better able to dispose of his high-class product.

The development of the methods of packing and handling flowers has been a great factor in the business. In the old days flowers were brought to market, or as was more often the case, the retailers went to the growers and carried them into the city in market-baskets. They were delivered to the customers in the same way. When flowers were to be shipped, which was seldom, any convenient box was adapted to the

purpose. At present the florists employ wooden and folding paper boxes for different classes of trade. These are in various sizes adapted to the kind of flower to be packed and to the quality shipped. Furthermore, the package is clean, light, strong and entirely in keeping with the goods. The perfection of the railway and express service has facilitated the delivery of flowers to the consignee. Not only has this enabled growers to get their flowers to the city, but has made it possible for florists over the country to secure flowers when they do not have a sufficient supply. The great wholesale flower business of Chicago is built in a large measure upon the demand of florists in towns and cities over the vast territory extending from Winnipeg to the Gulf of Mexico, and from the Alleghenies to the Rockies.

The packages now used to carry the flowers to the wholesale market are either return or gift boxes, the former, are strong wooden boxes with a hinged lid 12 to 16 inches wide and 5 to 6 feet long. These packages are returned to the grower. Some do not find it profitable or possible to have shipping-boxes or -crates returned and must use gift boxes which may be of wood or heavy paper. The common box used by the wholesalers in shipping flowers to distant customers when the package must be handled many times, is the light wooden box. This is made of thin wood, $\frac{1}{2}$ -inch ends and $\frac{1}{4}$ -inch tops, bottoms and sides, with two interior cleats to hold the flowers down. These boxes are made in sizes 4 to 8 inches deep, 12 to 16 inches wide, and 36 to 50 inches or more long. The boxes are first lined with paper, usually four to eight thick-

1159. Carnations packed for shipment.

nesses of newspapers, according to the season. Then a layer of waxed paper is put in. Roses, whether on their way into or out of the wholesale market, are seldom bunched. Carnations, when shipped out or when sent in by a wholesale grower to his own store, are usually not bunched, but growers who sell through the commission florist should bunch the flowers as it facilitates handling when the flowers arrive on the market. Sweet peas, violets and similar flowers are always bunched. The number of flowers in a bunch will depend upon the requirements of the market. Usually sweet pea bunches contain twenty-five, violets, fifty or one hundred; peonies, thirteen; and carnations, twenty-five flowers. The bunches of violets are encircled by a rim of twenty to thirty leaves and the combination must be attractively done if even the best flowers are to bring a good price. Sweet peas are bunched without foliage, while most flowers bear their natural foliage.

Long-stem flowers, such as roses and carnations, when not tied in bunches, are packed one by one in rows across the width of the box, beginning at one end. The first row rests upon a pillow made of a roll of paper, and each succeeding row is separated from the preceding row by a strip of wax paper. This continues until five rows have been put in each end of the box. Five or six rows of flowers in each end constitute a layer. The flowers of each layer are covered with a sheet of wax paper, and the packing goes on until the box is filled; but only four to six layers should be put in a box.

Over the stems in the center are placed eight to ten thicknesses of well-saturated newspapers, after which cleats are nailed in place. This will prevent the flowers from becoming disarranged in shipping. When different grades of roses are to be packed in the same box, the specials are placed in first unless shipment has a long distance to travel, when two or three rows of the cheap, short grades should go next the end of the box because of danger of injury to the flowers. Each grade is separated from the next by sheets of tissue paper and the different grades are filled in until the short lengths complete the box. It should be a general rule to pack white flowers in the top of the box. Every box should contain a statement of the contents for the information of the recipient. No icing is usually needed in winter, but in warm weather the foliage of roses may be sprinkled with water or chilled ice. Carnations are cooled by lumps of ice wrapped in wet newspapers and placed between the cleats of the boxes. Violets are preserved by wrapping the stems in soft tissue paper and dipping this in cool water. Sweet pea stems are wrapped in wet cotton wool, great care is being taken to prevent wetting the blooms.

In the early days of the cut-flower business, the grower retained his own flowers. He found time to propagate the plants, tend the furnace, grow the crops, cut the blooms, make floral designs and, if necessary, pack and ship his product. The rapid growth of the cities, making it impossible for the florist to conduct his business near the centers of trade, led to the retail florist. This man, having no glass, could open a flower-stand or store in the most favorable locations, giving it his entire time. The present-day flower stores are the achievements of his skill and industry in developing the art side of the florist business.

The changing demands.

The uses to which cut-flowers are put have changed. Forty years ago the taste was for formal designs. The flowers were picked with short stems, and in the case of carnations only the open buds were cut, while the remaining buds on the stem were allowed to develop. These flowers were wired to wooden sticks for basket work or to bloom-corn straws for bouquets. The details for making the formal pieces of that time will be found in Henderson's "Practical Floriculture." That the florists of that day enjoyed a good trade is seen in the fact that on New Year's Day, 1867, one New York firm sold \$6,000 worth of flowers, and it was estimated that the total sales in the city amounted to \$50,000. The same authority estimates the annual sales of flowers in New York at \$400,000 and in Boston \$200,000. Probably the sales of the whole country did not exceed \$1,000,000. Often \$200 or \$300 were spent for flowers for a reception, and the spending of \$1,500 for a similar purpose, as well as a \$6,000 church decoration, were then the highest achievements of the profession.

The public taste of the present day is for loose, artistic arrangements of long-stemmed flowers. The popular funeral emblems are forms of the wreath which are either made of one kind of flowers or of a great variety of material. Flat sprays and bunches of flowers, and palm (sago) leaves tied with ribbon are also commonly used. House decorations consist of vases of long-stemmed flowers. Roses, carnations, chrysanthemums, pines and gladioli are suitable for this purpose. Table decorations for dinner are also made of long-stemmed flowers in vases, with some placed on the cloth with ferns or asparagus. Bridal bouquets are arranged often in shower effects by means of narrow ribbon. A remarkable advance has been made in the use of ribbon. Instead of the florist going to the nearest drygoods store for the ribbon he needed, the present-day florist carries his own supply of specially prepared ribbon. As soon as a new shade of color appears in roses, a new ribbon is manufactured to match the

color. The accessories now required to conduct a successful florist business are numerous, requiring a considerable outlay of money; and the trade in this class of floral supplies is a very large one. Every large city now has its supply houses. The kinds of flowers used throughout the United States and Canada vary very little and this is confined to varieties rather than species. The growth of the cut-flower business in Canada also has been rapid, and artificial boundaries have not divided the florists of the two countries. A good book on cut-flower culture is "How to Grow Cut-Flowers," by M. A. Hunt. There are no works on the handling of cut-flowers. On the use and arrangement of flowers, the best literature is found in the current trade papers. Among the foreign works which may prove helpful are "Floral Decoration," by Felton; "The Book of Cut-Flowers," by R. P. Brotherton; and the German special journal, "Die Blumkunst."

A. C. BEAL.

CUTTINGS, PROPAGATION BY. A cutting is the gardener's name for a piece of stem, root, rootstock or leaf, which, if cut off and planted under suitable conditions, will form new roots and buds, reproducing the parent plant.

The word cutting, when unrestricted, is given to parts of the stem; a part or the whole of the leaf, when so used, is called a leaf-cutting; a piece of root or rootstock is called a root-cutting. The scales of some bulbous plants, as of the lily, can also be used as cuttings. A union used in grafting might be called a cutting which unites and grows on another plant. Plants secured by division or layering are provided with roots before they are detached from the parent plants, and, therefore, are not properly cuttings. There are intermediate states between these different categories, however, so that hard-and-fast definitions do not hold.

1160 Section of propagating-bed. Shows four pipes beneath, the door in the side, and the frame cover.

The practice of propagating by means of cuttings, together with the discussion of the reasons, results and bearings, constitutes a department of horticultural knowledge that has been denominated *cuttage*, as the practices, reasons and philosophy of tilling have been called *tillage*.

Multiplication by cuttings is a form of bud-propagation in contradistinction to sexual reproduction, i.e.,

1161 Permanent propagating-frames in a greenhouse.

propagation by seeds. It is a cheap and convenient way of securing new plants. All plants cannot be profitably increased by these means. Why they differ we do not know; the gardener learns by experience what species yield a good percentage of healthy plants, and acts accordingly.

The following table will show the different ways in which cuttings are made:

Cuttings	Stem	Growing wood.	Soft e g., verbena.
			Hardened e g., tea roses
		Ripened wood.	Long, in open air e g., grape
			Short, under glass e g., Japanese cedar
	Roots or rootstocks	Short, under glass e g., <i>Anemone japonica</i>	
		Long, in open air e g., blackberry	
	Leaf	Entire e g., <i>echeveria</i> .	
		Divided e g., <i>Begonia Rex</i> .	
		Bulb-scales e g., lilies.	

There is less variation in cutting-progeny than in seed-progeny, and therefore cuttings (or layers or cions) are used when it is desired to keep a stock particularly true to name. They are used largely for the multiplication of forms that are specially variable from seed (which have not become fixed by seed selection), and of mutations as between the different branches or parts of a plant (bud sports). Thus, the varieties of roses, chrysanthemums, carnations, most begonias, and currants and grapes can be grown from cuttings. Cuttings are also employed when seeds are difficult to secure, as in many greenhouse plants, or when propagation by seeds is difficult and cuttings are easy, as in poplars and willows.

The cutting-bed.

Under glass cuttings are commonly planted in pure sand, such as a mason would use for making mortar. Sphagnum moss is sometimes used and various substances like brick-dust, coal-ashes, jadoo fiber have been tried, but without much success. Sand and well-rotted leaf-mold mixed half and half, is occasionally employed for geraniums, for lily scales, root-cuttings and some succulent plants.

Sphagnum is useful in rooting *Ficus elastica*, the base of the cutting being wrapped in a ball of moss and plunged in a bed of moss. English

ivy, oleander and other plants can be struck in water, but this method is cumbersome. Peter Henderson's saucer method is valuable in hot weather. the cuttings are planted in sand, kept saturated and fully exposed to sun.

In the open air, a well-protected place, a part of the frame-yard, for example, should be chosen for a cutting-bed. The aspect should be southerly and the soil must be well drained. The soil should also be trenched to the depth of 2½ to 3 feet, all poor material removed and additions of humus, in the form of peat, leaf-mold or well-rotted barnyard manure incorporated. Provision for watering should be easy. If the soil is a heavy clay, add sand.

Structures in which cuttings are started.

Figs. 1160-1165

Large establishments have one or more houses set apart for this and similar purposes called "propagating-houses." In smaller places a propagating-bed or -bench can be made at the warmest end of the warmest house. It should be placed over the pipes where they leave the boiler, and, in order to secure bottom heat when needed, the space between the bench and the floor should be boarded up, having a trap-door to open on cold nights (Fig. 1160). Cutting-frames inside a greenhouse are also shown in Fig. 1161. Side partitions should also be provided to box in all the heat from the pipes under that part of the bench. Good dimensions for such a bed are, width 3 feet, length 6 feet or any multiple of six thus making it simple to use a hothed sash when confined air is wanted. The depth of the frame should be from 6 to 10 inches in front and about the same behind. The bottom of the bed may be either wood, slate or metal and should be well drained. place a layer of potsherds first, then moss, and from 2 to 3 inches of sand on top. The sand should be clean, sharp and well compacted: before planting it should be watered if at all dry. It is sometimes advisable to have the bed filled with moss (sphagnum), into which pots or boxes containing cuttings are plunged: the moss should be moist, neither too wet nor dry, and well packed.

In many cases, when large quantities of one sort of easily struck cuttings are to be planted, the ordinary greenhouse bench covered with sand is sufficient (Fig. 1162).

Hand-lights and bell-glasses are sometimes used under glass for small quantities of cuttings instead of frames. They may be of every convenient size up to 12 or 15 inches in diameter. The important point is that

1162. Cutting-bench shaded with lath

provision for good ventilation be always provided: if too much water accumulates inside the glass it can be wiped off with a cloth. They are somewhat obsolete devices for providing a close atmosphere and intensifying bottom heat. The modern gardener finds that sunlight and shading with apers put directly over the cuttings is quite sufficient for all plants except a few

1163. Propagating-box.

difficult subjects. Figs. 1163-1165 illustrate forms of hand structures. Out-of-doors cold-frames are employed for striking cuttings in summer. They are made of concrete or plank, and are about 5½ feet wide, 18 inches deep behind and 12 inches in front. They are of any convenient length, which is a multiple of three and are covered with standard hotbed sash. Instead of coldframes, light hotbeds are sometimes employed for rooting cuttings in the open air in summer. They entail more care and the results do not offset the gain.

Cuttings of growing wood Figs 1166-1171

These cuttings are made either of the soft growing tips, as in coleus (Fig 1166, also Fig 1027, p. 827), salvia, verberna (Fig 1167), geranium (Fig 1168) and others, or, of the same wood in more mature condition, but by no means ripe, as in tender roses (Fig. 1169), and *Azalea indica*. The cuttings of plants like *Euphorbia pulcherrima*, erica, epacris, are used in the soft growing state, if a well-built propagating-house is obtainable, but in an ordinary house, a part of which is used for other purposes, the older and better ripened wood will be more successful.

It is generally true that cuttings of hardened wood will always root, although they require more time and may not make the best plants, but it is not true that cuttings of the soft wood will always root. In many cases, as in the rose, they succumb before they callus, much less produce roots. In plants of rapid growth and good vitality, the proper condition of the soft growing wood for cuttings can be determined by its readiness to snap, not bend, when bent back: the hardened wood is in the right state as long as it continues to grow.

The treatment of cuttings in both classes is practically the same. They should be planted in sand under glass.

The wood for soft cuttings should be fresh, and precautions should be taken to prevent wilting during making and planting: if the weather is hot, sprinkle the floor and bench of the workroom: if they are delicate and exposed for an hour or more, lay them between folds of moistened paper. The average length of these cuttings is from 1 to 3 inches, but they can be made

1165. Small propagating-box, adapted to a window.

longer or shorter, much depends upon the nature of the plant. The best growers prefer short cuttings; the advantage of a long piece to begin with is more than offset by greater danger of wilting and consequent retrogression. It is not necessary to cut to a bud, i. e., at the node, in the more easily

1164. Propagating-box or hood.

handled plants except in some herbaceous tuberous-rooted plants, like dahlia (see Fig. 1170), and *Salvia patens*, in which a crown must be formed to insure future growth. Make the cut where it will give the proper length. A part of the leaves should be removed, always enough to secure a clean stem for planting, and as many more as are needed to prevent disastrous wilting; this factor varies greatly. In a hardwood cutting of lemon verberna all leaves are taken off, in zonale geraniums from the open ground few if any are left, in coleus and verberna about one half are removed, while in *Olea fragrans*, *Daphne odora*, and heath, only enough for planting. Use a sharp knife; but scissors are handy for trimming and sometimes for making cuttings of those small-wooded plants which root easily.

The cuttings of plants with milky juice should be washed before planting. Sometimes the lower ends are allowed to dry for several hours, the tops being protected against wilting. Large and succulent cuttings, e. g., of pineapple, cotyledon and cactus, should be dried before planting by letting them lie on the surface of the propagating-bed for several days, or they may be planted in dry sand at first. Under these conditions a callus forms which tends to prevent decay; but the wood must not shrivel.

Peter Henderson has introduced a method which is likely to increase the percentage of rooted plants, and which is desirable in slow-growing varieties, like the tricolor geraniums. He advises that the cutting should be partly severed and allowed to hang to the parent plant for a few days, this results in a partial callus or even roots, before the cutting is entirely removed.

In planting cuttings, use a dibble or open a V-shaped trench. Never thrust the cutting directly into the soil. Plant deep enough to hold the cutting upright and no deeper (as in Fig. 1171), making due allowance for the sand settling; the distance apart should be just enough to prevent them from pressing against each other. It must be remembered that they stay in the bed only until rooted. As soon as growth begins, they are potted off. When the cuttings are inserted, the sand should be firmly pressed about them, and they should be watered with a syringe or with a fine rose; the forcible application of water compacts the sand, thus excluding air, and prevents undue wilting.

Give shade immediately, using lath shutters outside, cloth screens or papers placed directly on the cuttings within, and attend to this very carefully for the first few days. Lift the shades early in the afternoon, and put them on late in the morning, but keep them on during the middle of the day, thus gradually accustoming them to full light.

Cuttings should never suffer from dryness. The sand should always be kept moist to the verge of wetness. Ventilation should be given on bright days, but all exposure to draft avoided. A good temperature for propagating is from 60° to 65° F., increasing these figures for tropical plants and reducing them for more hardy kinds. It is debatable whether bottom heat and

1166. Cutting of soft growing wood. (as of Coleus.)

1167. A rooted verberna cutting.

confined air are advisable for cuttings of growing wood. The older gardeners employed both, but now neither is commonly used, except for tropical plants, like croton, or when a constant succession of crops of cuttings is required. There is no doubt that with this aid cuttings will root more quickly, but more skill and care are required, neglect bringing on fungous disease, which results in unhealthy plants or total loss. If bottom

1168. A geranium cutting.

1169. A rose cutting.

heat is used, the average temperature of the bed should be 10° or so above that of the air, but less will suffice. Indeed, in beds made as described above, in good weather the sand is enough warmer than the greenhouse atmosphere to answer every purpose. If a confined air is wanted, ventilation and shading must be carefully looked after, and precautions taken against the accumulation of condensed moisture within the bell-glass or frame.

Although it is tender plants, in the main, that are propagated by cuttings of growing wood, the above methods can be practised advantageously with some hardy plants. The wood, which is invariably more successful if hardened, is obtained either from plants forced for this purpose, e.g., *spirea*, *Deutzia gracilis*, or it is gathered in June and July out-of-doors, e.g., *hila*, *hydrangea*. They should be potted off in 2- or 3-inch pots, in a rather sandy soil, when the roots are from $\frac{1}{4}$ to $\frac{1}{2}$ inch long. It is sometimes good economy to box them, i.e., plant them a few inches apart in flats, when not immediately required.

Some hardy perennials, like *Phlox subulata*, *Campanula carpatia*, *Gentiana acutis* and the hardy candytuft, can also be easily increased in this way. Make the cuttings 2 to 3 inches long and plant in flats or pots in sand or a sandy soil in October, November or December, before any hard frost. Keep in a coolhouse and pot off when rooted. They make nice plants for planting out the following spring. Plants of this same nature can also be propagated in the open air in autumn. Make the cutting longer, 6 inches when possible, and do the work earlier, in September or in August in some cases.

1170. Hardened-wood cutting of dahlia.

1171. A carnation cutting.

1172. Hardwood cutting of currant.

Cutting of ripened or dormant wood. Figs 1172-1174.

Many plants grow readily from twigs of the year's growth taken in fall or winter or very early spring. The "soft-wooded" plants usually propagate most readily by this means. These cuttings of mature wood may be either long or short.

Long cuttings of ripened wood in open air.—This method is used to propagate many hardy trees and shrubs, e.g., willows, currants, grapes, forsythia. Wood of the current year's growth is gathered in autumn or early winter, before severe frost, and either stored in a cool cellar, covering with moss or fresh earth to prevent drying, or immediately made into cuttings. These cuttings are usually 6 inches or more long and should contain at least two buds. It is not necessary to cut to a bud at the base, but the upper cut should be just above one. Figs 1172, 1173. They should be tied in bundles with tanned rope, taking care to have them lie "heads and tails" to facilitate planting, and with the butts on the same level, to promote callusing. They should then be buried in well-drained soil, with the butts down and protected against frost. In early spring they should be firmly planted in V-shaped trenches in well prepared soil set an inch or so apart, with the rows 1 or 1½ ft. apart. The upper bud should be just at the surface; to prevent suckers the lower buds may be removed. In autumn they should be dug, graded and heeled-in for winter. Some varieties will require a second or third year's growth in the nursery, others are ready for permanent planting, as willows and poplars, which often grow 6 feet the first year. This is one of the very cheapest ways of propagating, and will pay when only 25 per cent root. This method is generally used with deciduous-leaved plants, but some conifers, e.g., Siberian arbutus, will strike. Remove enough twigs to get a clean stem for planting, and allow 2 or 3 inches of top above ground.

1173. Cuttings of grape, to show how planted.

The excrescences, knots or knaurs, which are found on the trunks and the main limbs of olive trees, are sometimes used as cuttings for propagation.

The excrescences, knots or knaurs, which are found on the trunks and the main limbs of olive trees, are sometimes used as cuttings for propagation.

Short cuttings of ripened wood. (Fig 1174.) Cuttings of this class are used under glass with tender or half-hardy species, and sometimes with new introductions, in cases in which the grower is short of stock, and when the plant is delicate and small. The wood should be gathered before severe frost and the cuttings made and planted directly in October and November. Make them from 2 to 4 inches long (sometimes a single eye only is used) and plant with a dibble, in pure sand in pots, pans or flats (boxes about 16 inches square and 3 inches deep). If a layer of potting soil is placed under the sand, the young plants have something to feed on and do not need to be potted so soon after rooting; if this is done, drainage should be given. It is important to keep them cool until a callus is formed or roots produced. If the buds start into growth before this, the cuttings become exhausted and are likely to die. After rooting,—the time required varies from one to six months—they may either be potted or the strong-growing sorts be planted out in well-prepared beds in May or June, where they are likely to make a satisfactory growth. The weaker kinds may remain a year in pots or flats, be wintered in a pit, and planted out the next spring. Some greenhouse plants, e.g., camellia, laurustinus, tender grapes,

are propagated in this way with cuttings of fully ripened wood, and others, as cactus and dracena, with wood which is much older. They should be given the care described under the head of "Cuttings of growing wood" (p. 927), but they must not be forced too hard at first. The temperature should be regulated by the nature of the plant. The safest rule to follow is to give a few degrees more heat for propagating than the plant received when the cutting was removed.

Hardy shrubs can also be propagated by cuttings of growing wood, somewhat hardened, planted in coldframes in June and July. They are called "cuttings of green wood," and are made from 4 to 6 inches long and sometimes longer. They are closely planted in sand, or soil one-half sand and one-half leaf-mold, in rows 4 to 6 inches apart. They must be carefully watered, shaded and ventilated for ten days or more after planting. Much of the success of this method depends upon the weather; it brings in a gambling element a few hot and dry days are dangerous. A light hotbed may be used instead of a coldframe but this means more care. The rooted plants are left in the frame all winter, protected and planted out the following spring.

Root-cuttings Fig 1175.

The cuttings of this class are made of either root or root-stock and are useful in propagating some plants, either in the greenhouse or in the open air. Tender plants, like *bougainvillea*, and those which are hardy but of delicate growth, e.g., *Azalea japonica*, are handled under glass, blackberries, horse-radish, and so on out-of-doors. The cuttings are made in autumn or winter, the roots of hardy plants being gathered before severe frost and either planted directly or kept in moss until spring. This process of storing develops a callus and has a tendency to produce buds. For greenhouse work, the cuttings are made from 1 to 2 inches long, the larger roots being selected, although the small ones will grow. They are planted in pans or flats, in soil composed of equal parts sand and well-rotted leaf-mold. Ordinarily they are set horizontally. If planted vertically, in cuttings from the true root, the end which was nearest the crown should be uppermost, but if made from the rootstock, that end should be uppermost which grew farthest from the crown. In either case they should be covered, as seeds are covered, and the whole made firm. Root-cuttings of hardy plants should be kept cool at first and brought into heat only when ready to grow. They may be kept in a pit or cool cellar. Tender plants require the same or a little higher temperature than that in which they thrive.

1173. Root-cutting of blackberry. (X 1/2)

in the sand and sometimes produces a second or even a third crop. The tuberous rootstock of *Arum maculatum*, and plants of like nature, can be cut into pieces, remembering that the bud-producing portion of arum is the top, and each part will grow successfully. Exercise care in watering and maintain a good temperature.

1174. Short cuttings of ripened wood.

The rootstocks of cannas are cleaned and cut into pieces 1½ to 2 inches long and planted in a warmhouse in February (Fig 784, p. 657). As soon as buds push and roots form they are potted off and grown until the season for bedding out. Dahlias are not, properly speaking, propagated from rootstock, but by division; the plant cannot produce adventitious buds. There must always be a bit of the crown attached to the tuber. The propagation of dahlias so closely resembles the methods here described that it is perhaps well to mention it.

Root-cuttings for planting in the open ground are made from 4 to 6 inches long, and are planted firmly in V-shaped trenches or furrows in spring, being covered 2 inches or more deep. Roots as large as one's little finger are chosen, and good results are secured with plants of vigorous growth. In plants like lily-of-the-valley, common lilac, *calycanthus*, Scotch and moss roses, unless short of stock, it is better to encourage the natural growth of the suckers and propagate by division, but they all can be multiplied as above described.

Variation, curiously enough, is not always reproduced by means of root-cuttings.

Leaf-cuttings. Fig 1176.

Many leaves are capable of producing roots. Some have the further power of developing buds after rooting, and of these last a few furnish an economical means of bud-propagation, particularly when the stem growth is insufficient. In *cotyledon* (*echeveria*) the whole leaf is used, the smaller ones from the flower-stalk being often the best. Choose those that are fully matured, and dry them for a few days on sand, but do not let them shrivel. The treatment, otherwise, is as given above for cuttings of growing wood. In *gloxinia* and other Gesneraceae, the whole leaf (Fig 1176), half a leaf, or even a lesser portion, is used. When enough clear petiole is obtainable, no further preparation is needed. When a part only of the leaf is planted, some of the blade must be cut away. As a rule, no bud is developed the first season a tuber is formed, which will grow in due time.

1176 Leaf-cutting of gloxinia

The common *Begonia Rex* is increased by leaves in various ways. The whole leaf may be planted as a cutting, keeping the petiole entire or cutting it off where it unites with the blade, or the whole leaf may be pinned or weighted to the surface of moist sand (Figs 501-503, p. 470), and, if the principal veins are severed at intervals of an inch, a plantlet will appear at every cut. The best way is to divide the leaf into somewhat triangular pieces, each part having a strong vein near the center. Plant in sand, in good temperature, and treat precisely as if they were cuttings of growing wood. Roots and buds will soon grow, and a good plant will result within a reasonable time. Pot off when roots are ¼ inch long. Certain other begonias may be similarly multiplied.

Other cuttings

The thickened scales of bulbs, like lilies, can be used for propagation. Remove the scales intact and plant upright, like seeds, in soil made of equal parts of sand and rotted leaf-mold (Fig 1177). September and October are the usual months for this work. If they

1177. Lily scale producing bulblets.

are kept in a cool greenhouse, the young bulbets will appear in the course of the winter, but top growth will come later, in summer.

This is a slow, laborious process, and is seldom practised except in propagating new varieties. The granular scales of achimenes and plants of like nature can be used for propagating, sowing them in a sandy soil as seeds are sown; but this method is not a good one in ordinary cases. The scales of *Zamia horrida* have been made to produce new plants, as have also the tumescent scales of an amaryllis.

For further details of cutting, consult Lindley's "Theory and Practice of Horticulture," 2d ed.; Burbidge, "The Propagation and Improvement of Cultivated Plants," Peter Henderson's "Practical Floriculture," Bailey's "Nursery-Book."

B. M. WATSON.

CYANÁNTHUS (Greek for blue flower). *Campanulacæ*. Ten or a dozen herbs, probably mostly perennial, of the high mts of Cent and E. Asia, with showy blue fls. terminating the ascending mostly simple hairy sts.: corolla funnelliform, tubular or bell-shaped, 5-lobed; stamens free from the corolla, the ovate anthers more or less connate around the pistil fr a caps with persistent calyx, loculicidally 3-5-valved lvs. alternate, usually small, entire or somewhat lobed. *C. lobátus*, Wall, may be expected in collections of choice alpinæ, 4-5 in.: lvs. small, narrowing to base, tooth-lobed at summit; fls. bright blue, 1 in. diam, resembling a shining periwinkle fl, funnelliform with reflexed lobes, the corolla exceeding the calyx-tube and hairy in the throat. B. M. 6485. Other species mentioned in recent horticultural literature are *C. microphyllus*, Edgew. (*C. luyfblus*, Wall), with slender wiry sts, small entire lvs, and fls. like those of *C. lobatus* but with very hairy throat and longer narrower segms; *C. incanus*, Hook. f. & Thoms, with numerous wiry sts, small nearly sessile lvs, and yellow campanulate fls. with hairy calyx; the W. China form of this (var. *leocalyz*) has a less hairy calyx; *C. Hookeri*, Clarke, is an annual with small stalked lvs and blue fls, from China and India, has rigid sts. with short lateral fl-branches. L. H. B.

CYANÉLLA (from the blue color). *Amaryllidacæ*; it has been referred to *Liliacæ* and also to *Hemerodacæ*. A half-dozen or less small bulbs from S. Afr., sometimes grown in the way of ixiæ. Plants with rhizomes or tumescent corms, radical or basal lanceolate or linear lvs, and simple or rarely branched sts. fls. violet, rose, yellow or white, solitary or racemed-paniculate; perianth-tube 0, the segms. distinct or very nearly so; stamens 6, attached to base of segms., all perfect, often dimorphous: fr. a loculicidal 3-angled caps., on bractless pedicel. The cyanellas are summer- and fall-flowering bulbs with us. The following are the kinds likely to be found: *C. capensis*, Linn. Lvs. lanceolate, undulate: st. paniced, leafy, 1 ft.: fl. purple. B. M. 568. *C. lutea*, Linn f. (*C. odoratissima*, Lindl.) Less branched. lvs. linear-lanceolate, acuminate, not undulate: fls. rose, changing to yellow. B. R. 1111. L. H. B.

CYANIDING, CYANIDIZING: *Diseases and Insects*, p. 1044, discussion of fumigating by hydrocyanic acid gas.

CYANOPHYLLUM: *Tamonea*.

CYANÔTIS (Greek, referring to the blue petals). *Commelinacæ*. Probably 40 creeping, ascending or weak branching often woolly or hairy herbs, much like *Tradescantia*; they

are native in warm countries about the globe. Lvs. sheathing, small or medium in size, various fls. in scirpoid cymes or variously disposed, mostly blue or rose-colored, sepals 3, lanceolate-carinate, nearly equal, usually combined at

base into a short tube; petals 3, also nearly equal, often connate in a tube, the limb spreading and suborbicular; stamens 6, all perfect, nearly equal, ovary sessile, 3-celled and each cell 2-ovuled. Easy of cult.; prop by cuttings. There are few species in cult.; perennial; grown in greenhouses or warm-houses. *C. hirsuta*, Fisch & Mey, from Abyssinia, villous or glabrous, has erect st, globose tubers, linear soft-hairy lvs, and rose-colored perianth and blue-bearded filaments. B. M. 7785. *C. barbata*, Don, of E. India, has elongated branching nearly glabrous st, narrow-oblong or nearly linear lvs, and blue spatulate-oblong petals free to the base; ovary hirsute at apex and the style bearded. *C. kewensis*, Clarke, of E. Indies, is procumbent, reddish-hairy, leafy, the branches fleshy lvs a half or more longer than broad, sessile and amplexicaul petals rose-purple, ovate, free, filaments bearded. B. M. 6150 (as *Erythrolis Beddomei*). *C. nodiflora*, Kunth, of S. Afr., is covebby or woolly but becoming glabrous, the fibrous roots terminating in tubercles. lvs. narrowly linear-lance: petals blue, lightly connate. B. M. 5471. L. H. B.

CYATHÆA (Greek, a cup, alluding to the indusia). *Cyathacæ*. A large genus of tree ferns in both hemispheres, with a globose indusium which ultimately ruptures at the apex and becomes cup-shaped. All the species in cult. have decompound lvs. Most of them are large plants, species with trunks 20-30 ft. high being common, but there are a few species that have lvs. and sts. no more than 2 ft. long. Strictly speaking, the genus *Akophila* is a part of *Cyathæa*. Many other species from Colombia and the W. Indies besides those described below are well worthy of cult.

The species offer a great variety. Those of temperate regions are mostly stout and not spiny; the tropical species are more slender and in many cases densely armed with stout spines. All species are evergreen. The culture of cyathæas is simple in warmhouses. They require an abundance of water at the roots and the trunks should be kept constantly moist. The foliage lasts longer if it has been mured to the sun during summer. Like all other tree ferns, cyathæas need little pot-room. They rarely produce adventitious growths along the trunk or at the base and none is prolific. The plants are, therefore, usually propagated by spores, which germinate freely, making attractive young plants in two seasons. (Adapted from Schneider, "Book of Choice Ferns")

L M UNDERWOOD.

CYCAS (Greek *kúkas*, the name of a palm tree) *Cycadaceæ*. Several beautiful palm-like plants, common in cultivation under glass. Plate XXXIII

The Cycadaceæ are of great interest because they occupy a place intermediate between flowering plants and the cryptogams. Like the former they have fr with a large starchy endocarp, but like the latter their sexual prop is accomplished by means of spermatozooids and archegonia, corresponding to the male and female elements in animals. The plants are dioecious, the male infl is in the form of an erect cone composed of modified staminal lvs which bear on the under surface globose pollen sacs corresponding to microsporangia, the female infl consists of a tuft of spreading carpellary lvs, having their margins coarsely notched, in the notches are situated the ovules, which are devoid of any protective covering, and correspond to macrosporangia. Pollination under natural conditions is effected by the wind. The pollen settles on the ovules and sends down a tube into the tissue of the nucellus. Archegonia are formed, egg-cells develop, and in the pollen-tube are produced spermatozooids provided with minute movable cilia by which they are propelled, very much as in the spermatozoa of animals. These are discharged over the archegonia and fecundate the egg. The discovery of spermatozooids in the cycads was made by a Japanese student, S. Ikeno, while investigating the process of reproduction of *Cycas circinalis*. Those of Zama endemic in Fla., were described and figured by H. J. Webber, who found the mature spermatozooids of the latter genus to be the largest known to occur in any plant or animal.

Most of the species of *Cycas* are arborescent, having a trunk marked with rings of growth and with the scars of fallen petioles. The trunk is usually simple and columnar (though sometimes it is branched), and is elongated by a terminal bud. The pinnate leaves form a beautiful terminal crown like that of a palm or tree-fern. Cycads are found among the fossils of many geological formations, especially in those of the early Mesozoic. The latter formations are grouped together on this account, and the geological epoch which they represent is sometimes designated as the "Age of the Cycads."

Cycads are among the most ornamental plants of tropical and subtropical gardens. In the United States they are often designated "sago palms," although they have nothing in common with a palm except the general habit of growth. In Florida, according to H. Nehrling who has a plantation at Gotha, near the center of the

state, they thrive equally well on high pine land and in the rich soil of the low hummocks. *C. circinalis* is apparently the most sturdy of the cultivated species. It is almost free from diseases; but it is more sensitive to cold than *C. revoluta*. The latter, on the other hand, is subject to diseases in low flat wooded situations. A third species, *C. siamensis*, which is comparatively rare, seems to be perfectly hardy in Florida. In cultivating cycads, Nehrling has attained the best results by keeping the weeds away from the base of the trees and loosening the soil from time to time, taking care not to injure the small network of tubercle-bearing roots surrounding the trunk. The tubercles, which are about the size of a pea, are interesting to the plant physiologist, and are apparently conducive to the plant's well-being. Nehrling gathers the pollen from the male plants and sprinkles it by hand over the female flowers to insure fertilization of the naked ovules.

Plants are propagated by seeds, which keep well for a month or more after ripening. According to E. N. Reaoner, they should be sown in shallow boxes or the greenhouse bench, lightly covered with sand, and after germination, potted off in small pots of moderately rich, light soil. The growing plants do best in partial shade. The old plants frequently send up suckers around the base of the trunk. These may be taken off when in a dormant state and rooted, care being taken to remove the leaves to guard against excessive transpiration. Growing cycads require sunshine and moisture.

The beautiful glossy leaves of cycads are used in many countries for ornamenting temples and for decorating altars. On the island of Guam they are used for palm leaves on Palm Sunday, and in the early days they were carried by children in religious processions, marching from one village to another under the guidance of the Jesuit missionaries. Cycads are popular conservatory plants, of easy culture, and tenacious of life, even when neglected for a long time. Their stems

1180. *Cycas pectinata*.

deprived of leaves are easily transported in bulk and will soon resume growth when planted. In the southern United States, cycads are injured by frost but often revive after having apparently been killed.

D. *Lvs. 5-8 feet long, with pinnæ 10-12 in. long.*

circinalis, Linn. (*C. Thoudartii*, R. Br.). FERN PALM. A palm-like tree with cylindrical trunk and a crown of

glossy, fern-like, stiff but gracefully curved pinnate lvs.; trunk clothed with the compacted woody bases of petioles, usually columnar and simple, but often branching when the terminal bud has been cut off, or in clusters of several springing from the base of an old trunk which has been cut down; in addition to the true lvs., modified lvs. in the form of simple short subulate woolly prophylls; true lvs. 5-8 ft. long, long-petioled, the petiole bearing short deflexed spines near the base; pinnæ alternate, 10-12 in. long and quite narrow, linear-lanceolate, acuminate, subfalcate, the midrib stout and prominent beneath, bright green above, paler beneath; male infl. in the form of an erect woolly cone composed of scales bearing globose pollen-sacs on the under surface and tapering at the apex into a long spine; female infl. in the center of the crown of lvs., consisting of a tuft of spreading buff-colored, woolly, pinnately-notched lvs. (carpophylls) about 6-12 in. long, spinous toothed along the margin, and bearing in the notches the naked ovules, ovules 3-5 pairs, borne above the middle; fr. about the size of a walnut, with a thin fleshy covering, and a fleshy starchy endosperm resembling that of a horse-chestnut. S. India, Ceylon, Sumatra, Java, Philippines, Madagascar, E. Trop. Afr., Guam.—In Fla. the lvs. of this species are often destroyed by sharp frosts, but the trunk is rarely injured and will soon send forth new lvs. when the weather becomes warm again. Nehrling recommends that fine specimens be protected by a tent or by a house of lattice-work covered with canvas, and with the sides also inclosed if necessary. In this house a large kerosene lamp will be sufficient to keep the plant from freezing. In Tampa, Fla., this species appears to flourish, some of the specimens having trunks 6-8 ft. high. It grows best in rich moist soil and in partial shade. On the island of Guam, the nuts of this species form a food staple for the natives in times of famine following hurricanes. These are so poisonous that the water in which the kernels are soaked is fatal to animals. After having been soaked for some time and the water repeatedly changed, the kernels become harmless, and are ground up into meal and dried for future use. They are usually prepared in the form of cakes, which are said to be nutritious although rather tasteless.

DB. *Lvs. less than 5 ft. long; pinnæ 3-8 in. long.*

média, R. Br. NUT PALM of Australia. Trunk attaining height of 8-10 ft. or sometimes twice this

1181. *Cycas revoluta*.

height, rarely branched at the top; lvs. 2-4 ft. long or more, the pinnæ very numerous, straight or falcate, obtuse or pungent-pointed, flat or slightly concave above, prominently keeled beneath, the margins often slightly decurrent on the rachis, glabrous or slightly pubescent when young, the longer ones varying from 3-8 in., the lower ones shorter and more contracted at the base, the lowest ones prickly-like, sometimes continuing to base of petiole; cones variable in size, but apparently smaller than in *C. circinalis*, which this species otherwise resembles; seeds 1-1½ in. long, glabrous. Austral., along the northern coasts; also Queensland.

cc. *Scales of male infl. shortly acuminate.*

Rumphii, Miq. Closely related to the preceding, but growing taller in its natural habitat, sometimes reaching a height of 20 ft. or more. lvs. shorter and with fewer lfts. scales of male cone thickened and obliquely truncate at the tip, with a short upcurved sometimes caducous point; carpophylls a foot long, narrower than in *C. circinalis*, with an entire often elongate subulate tip, seeds oval or subglobose, 2-2¼ in. long by 1½-1¾ in. diam. Moist wooded regions of Burma, Ceylon (possibly intro.), Andaman Isls., Nicobar, Malaya, New Guinea, and N. Austral.—This species when growing in cult. is usually much lower, and has a full large crown of lvs., with lanceolate pinnæ thinner and paler than those of *C. circinalis*. Much grown in tropical gardens of E. Indies, male plants rare.

BB *Modified fr.-bearing lvs. pectinate along the margins*

c. *Trunk much swollen at the base blade of carpophyll ovate-rhomboid*

siamensis, Miq. A small palm-like tree sts 2-6 ft., much swollen at the base. lvs. 2-4 ft., stiff spreading, pinnæ 3-8 in. long, linear mucronate-acuminate, blade of carpophyll tawny-woolly when young, at length glabrescent above, ovate-rhomboid, long-acuminate, margin deeply pectinate lacerate scales of male infl. about ¾ in. long, with a slender terminal point of the same length; seeds 1½ in. long, obovoid-oblong. Burma, Siam, Cochinchina.—Apparently hardy in Fla. It is rare, occurring in only a few gardens. It is a beautiful species, easily recognizable by its trunk which is swollen very much like that of *Dasyllirion*, and according to Nehrling grows much faster than the species more commonly cult. It is certainly deserving of more general cult.

cc. *Trunk not swollen at the base blade of carpophyll broadly orbicular.*

pectinata, Griff. Fig. 1180. A glabrous evergreen palm-like tree, to 10 ft. high in its native habitat but usually much shorter in cult. lvs. ascending, recurved, 5-7 ft. long, pinnæ 7-10 in. long, narrowly linear tapering into a minute apical spine, subfalcate, blade of carpophyll covered with dense tawny wool throughout, 6 in. long, broadly orbicular, long-acuminate, its margin deeply subulate-pectinate, stalk about equal in length to the blade with 2 or 3 pairs of ovules above the middle; spiny marginal teeth ¾ in. long, terminal point 1½ in. long, tapering from a flat base, with 1 or 2 spinous teeth; seeds about 1½ in. long, ovoid, male cone 18 in. long, 6 in. diam., cylindric-ovoid; anther-bearing scales 1½ in. long, 1 in. diam., deltoide-clavate, the apex much thickened, abruptly acuminate, terminal point 1½ in. long, spine-like, ascending. India, Nepal, East Bengal, 2,000 ft. elevation, Assam, Martaban, in pine forests G.F. 4:114 (adapted in Fig. 1180).

AA. *Margins of pinnæ revolute.*

B. *Blade of carpophyll pectinate.*

revoluta, Thunb. SAGO PALM. Figs. 1181, 1182. A graceful palm-like tree or shrub, becoming 6-10 ft. high, with the trunk simple or branching lvs. long and recurved (2-7 ft.); pinnæ numerous, subopposite, curved downward, narrow, stiff, acute, terminating in a spine-like tip, dark shining green, the margin revolute; carpophylls with the blade broadly ovate, densely clothed with brownish felt-like wool, pectinate, ovules 2 or 3 pairs borne near the base; fr. ovate, compressed, red, about 1½ in. long. S. Japan.—This is the most common cycas in conservatories. It is of Javanese origin and is much harder than the species mentioned above. In Fla. it is usually found in all of the better parks and gardens, where it is suitable as a center about which to arrange other ornamental

shrubs. According to Nehrling, this species is of slow growth. In the male plants there are usually several heads. The male infl is usually 18-20 in long and cylindrical in form. The female infl is in the form of a semi-globose head, yielding 100-200 large bright red nut-like seeds, which ripen about Christmas time. The new lvs. appear all at one time, usually in May. They have a beautiful glaucous green color and at first stand erect. Young plants are easily grown from seeds. Unfortunately this beautiful species is, in Fla., subject to blight for which no remedy has yet been found. It appears to thrive best in open situations; and in Cent. Fla. it grows with little care, flowering and fruiting abundantly. The nuts are eaten by the natives, and from the pith of the trunk a kind of sago is prepared for which the common name "sago palm" is given it. The leaves are much used in funeral decorations.

1182. Leaf of *Cycas revoluta*.

nb Blade of carpophylls dentate-lobate.

Béddome, Dyer (*C. revoluta*, Bedd., not Thunb.) A low shrub with sts only a few in high lvs about 3 ft long, pinnæ about $\frac{1}{2}$ in wide, strongly revolute, carpophylls 6-8 in. long, with the blade 3 in long and 1 in broad, ovate-lanceolate, tapering into a long-acuminate point, strongly dentate-lobate, bearing 2 pairs of ovules above the middle. seeds globose, $1\frac{1}{2}$ in diam., male cone about 1 ft. long and 3 in. diam., very short-peduncled, antheriferous scales long-acuminate, acumens in upper half of cone strongly deflexed, near the base of the cone ascending.—E. Madras, abundant on the hills.

Other cultivated cycads are *C. neo-caladonia*, Lind. "A very ornamental palm-like plant, of a different species from the cycads ordinarily grown," intro into the U. S. by W. T. Swingle. Much like *C. circinalis* but with fronds narrower and pinnæ closer.—*C. Normaniana*, Muell., intro into the U. S. from France by W. T. Swingle, a species with oblong-obovate lvs., having numerous linear pinnæ in long Austral.—*C. Ruminiana*, Regel. St. rather stout lvs. bright green, erect, spreading in a vase-like crown, the pinnæ fine-pointed. Philippines 1111 405. W. E. SAFFORD

CYCLAMEN (classical name, probably from the Greek word for circle, in allusion to the spirally twisted peduncles). *Primulaceæ*. Herbaceous and low plants, with a flatish tuber or corm, grown sometimes in the open and one of them much prized as a florist's and window-garden subject.

Flower single, on a scape, with usually 5-parted calyx and corolla (the parts strongly reflexed), 5 connivent stamens, with pointed sessile anthers, 1 style and stigma, and a 5-splitting caps. lvs cordate or reniform, long-petioled, entire or sinuate-dentate: fls nodding or declined, purple, rose or white.—About 20 species of the Medit. region, extending to Cent. Eu. *C. persicum* is the source of the standard florists' cyclamens. Most of the other species are essentially outdoor plants. They are little known in outdoor planting in N. Amer., however. The European catalogues list several species aside from *C. persicum*, and they are here described; and others are included in the supplementary list that are recently mentioned in horticultural literature. Old English name sow-bread, from the tubers being sought by swine. Consult Fr. Hildebrand, Die Gattung Cyclamen, Jena, 1898; also Pax & Knuth in Engler's Pflanzenreich, hft. 22, 1905.

All cyclamens are very beautiful, and would be much

more popular were they hardy in our eastern climate. On the Pacific slope many of them probably would be perfectly at home as outdoor plants, producing a great number of flowers above the bare soil in the depth of winter before the leaves are developed.—It is, however, with the Persian cyclamen (*C. persicum*), which is tender, that florists have had the greatest success. There is no common winter-flowering subject of as much value for duration in bloom, variety of coloring, or wealth of color. It is preferable at all times to begin the culture of Persian cyclamen with seeds, sown in the early winter months. Grow on without any check for the following year. They should bloom freely about fifteen months from planting. Old tubers, such as are offered in fall with other florists' bulbs, rarely give satisfaction as compared with a packet of seeds. It is not the nature of the plant to have all its roots dried off, as if it were a hyacinth or tulip. Our summers are rather too warm to suit cyclamen perfectly, and it will be found that the most growth is made in the early autumn. It is best to give the plants a little shade in the hot months, such as a frame outdoors near the shade of overhanging trees at midday. This is better than growing them under painted glass, as more light is available, together with plenty of fresh air on hot days. It will be found that cyclamen seeds require a long time in which to germinate,—often two months.

This is due to the fact that the seed produces a bulb or corm before leaf-growth is visible. As soon as two leaves are well developed, place the plants around the edge of 4- or 5-inch pots until every one is large enough for a 3-inch pot. The roots are produced sparingly in the initial stages, and too much pot-room would be fatal at the start. By the middle of summer another shift may be given, and in September all will be ready for the pots in which they are to flower,—5- or 6-inch pots, according to the vigor of the plants. It will always be found, however, that there will be a certain percentage that will not grow, no matter how much persuasion is used. These may be thrown away, to save time and labor early in the season. In the house they should have the lightest bench. It is impossible to grow them in a warm, shady house. About 50° at night is the ideal temperature when in flower. The best soil is a fresh, tufty loam, with a fourth or fifth of well-rotted horse-manure, to which add some clean sand if the soil is heavy. At all times, the pots should be well drained.—The giganteum strains of the Persian cyclamen produce the largest blooms, but at the expense of quantity. For the average cultivator it is better to try a good strain that is not gigantic. There is a recent departure in the form of crested flowers. Cyclamens come true to color from seeds, and one can now buy named varieties that will reproduce themselves almost to a certainty.—Of recent years cultivators have had much trouble with a tiny pest or mite that attacks the plants and renders them useless for bloom. Its work is done mostly after the plants are taken into the greenhouse and when about to mature into blooming specimens. If the first flowers come deformed or abnormally streaked with colors that are darker in shade, it is a sure indication that the pest is present. Frequent light fumigation with hydrocyanic acid gas as soon as the pest is discovered will in time eradicate it, but being very small, and able to hide under the divisions of the calyx, seldom coming out except on bright days, makes the pest a difficult one to fight. The gas cannot be used during sunshine. Tobacco stems used freely between the pots is a good preventative measure. Greenfly is likely to attack the

plants at all stages of growth. In the frames the plants may be plunged in tobacco stems, and in the greenhouse they must be fumigated or vaporized with some of the nicotine extracts. Great vigilance must be exercised in growing cyclamens. (E. O. Orpet.)

A. Plant blooming in spring (or in winter under glass).

B Corolla-lobes not eared.

1. *pêrsicum*, Mill. (*C. hederæfolium*, Sibth. & Smith. *C. indicum*, Linn *C. latifolium*, Sibth. & Smith. *C. macrophyllum*, Sieb. *C. pûmicum*, Pomet. *C. pyrolæfolium*, Salisb.) Fig 1183. The common greenhouse or Persian cyclamen, in many forms: tuber large, flattened endwise, corky on the outside:

lvs. appearing with the fls, ovate, crenate-dentate, base deeply cordate, usually marbled or variegated with white fls. on scapes 6-7 in high, large, scentless, white, purple-blotched at the mouth, but with rose-colored, purple and spotted forms, the segms. oblong-spatulate in shape, not eared or lobed at the base: pedicel not coiling in fr. Greece to Syria. The large-fld. cult forms are grouped as follows by Pax & Knuth: Var *album* (*C. aleppicum*, Hort.). Pure white. Var. *giganteum*. White with red throat; very large. Var. *magnificum* (var. *punctatum*). White, speckled with red, large. Var. *rubrum*. Red. Var. *sanguineum*. Light blood-red, large. Var. *rosea-superbum*. Brilliant rose-red, large. Var. *purpureum*. Purple with bluish markings, large. Var. *violaceum*. Violet-red. Var. *atro-rubrum* and var. *splendens*. Dark red, large. The var. *gigantæum* (*C. gigantæum*, Hort.) is the common large-fld, improved form of the florist's cyclamen. There are also double-fld. forms (R.H. 1886, p 250); also fimbriate or crested forms, *C. Papilio* (I.H. 43:63. G.F. 5:235. G.C. III. 21:71; 23:173). Other portraits of *C. persicum* are: B.M. 44. I.H. 35:43. Gn. 47:378; 48:182. J.H. III. 34 578. Gt. 44, p. 203; 45, p. 164. F.S. 22:2345. A.G. 14:390-2; 17:261. A.F. 7:521-5; 11:1176-9; 12:499. The species is frequently figured in the trade catalogues.

2. *côum*, Mill. (*C. verum*, Sweet). Tuber smaller than in the last, globose or flattened: lvs. with or preceding the fls, nearly orbicular or round-reniform, entire, firm, not marbled nor variegated: fls. small, scentless, half or less as large as those of the last, purple and spotted in the throat. S. E. Eu. to Persia. B.M. 4. L.B.C. 2:108. F.S. 22:2345.—There is a white-fld. form (*C. album*, Hort.).

3. *ibêricum*, Goldie (*C. côum* var. *ibêricum*, Boiss. *C. elegans*, Boiss. & Buhse. *C. vernale*, Koch) Dwarf: lvs. appearing before the fls, ovate-orbicular and rounded at the apex, entire or obscurely undulate, more or less zoned with white above fls purple with a darker colored throat. Caucasus.—Perhaps a geographical form of *C. coum*. *C. Atkinsii*, Moore, is *C. coum* x *C. ibericum*, Hildeb. Lvs. reniform, apex rounded, more or less shining; deep green, spotted silver-white, the corolla-lobes pale rose or white and usually lined or spotted red. F.S. 23 2425.

BB. Corolla-lobes eared.

4. *libanoticum*, Hildeb. Tuber globose with a cork-like covering: lvs. autumnal, the blade obovate, sinuate, dentate or crenulate or rarely entire, marked with white above, deep violet or purple beneath fls fragrant; calyx-lobes oblong-acuminate, the margin lightly undulate, 5-nerved, corolla-tube somewhat globose-campanulate, the lobes lightly eared at base and broad-ovate, entire, pale or deep rose-color with a deep red T-form mark at the base, style exserted. Lebanon

AA Plant blooming in summer and autumn

B. Corolla-lobes not eared.

5. *europæum*, Linn (*C. Clusii*, Lindl *C. æthiun*, Park *C. cordifolium*, Stokes *C. floribundum*, Salisb *C. orbiculatum*, and *C. purpurascens*, Mill.)

Tuber with corky exterior lvs ovate-orbicular or reniform, entire or nearly so, with a deep and narrow basal sinus, more or less white-marbled

above, purple-tinted beneath. fls on scapes 4-5 in high, bright red and very fragrant, not spotted, the corolla-segms oblong-spatulate ($\frac{2}{3}$ in or less long), calyx glabrous pedicel spirally

coiling in fr. Cent. and S. Eu. BR 1013.—Lvs appearing with the fls, more or less evergreen. Variable

6. *cilicicum*, Boiss & Heldr. Much like *C. europæum*: tuber hairy: fls pale rose, with purple at the mouth, about twice larger; corolla-lobes elongated; calyx puberulent. Sicily. G.C. III. 23:81

BB Corolla-lobes eared.

7. *africanum*, Boiss & Reut (*C. salsense*, Pomet). Large: tuber large: lvs ovate-cordate to reniform, coarsely toothed, pale beneath, dull and pale green marbled above: calyx pubescent, the lobes broadly ovate-acuminate, corolla nearly white, faintly rose- or purple-tinged, the segms 1 in long and deep purple at the base; calyx-lobes lanceolate. Algeria. B.M. 5758. F.S. 8:841.—Little known in this country, but sold by the American agencies of the Dutch bulb houses.

8. *neapolitanum*, Tenore (*C. autumnale*, Boos *C. ficariaefolium* and *C. subastatum*, Reichb *C. hederifolium*, Ait *C. vernale*, Mill.) Tuber very large, black, thick-rinded: lvs. variable, from hastate to round-reniform, more or less wavy-plaited on the edges, green or somewhat parti-colored: calyx small; corolla pink or rarely white, the segms. short and twisted and the edges raised and white-edged at the base; calyx-lobes triangular to oblong. S. and E. Eu. B.R. 24:49. Gn. 51, p. 37

1183. Cyclamen persicum. Showing a flower of perfect form, and the crested variety. (X½)

C. xanthicum, Hildeb. Intermediate between *C. graecum* and *C. pseudo-graecum*, from the former it differs in its small fls. and other parts and from the latter in having more rounded lvs. Greece. — *C. graecum*, Link. Autumn-flowering, lvs. obovate, irregularly cartilaginous-crenate; corolla lobes lanceolate or oblong-lanceolate, armed at base, rose-colored with deep purple at base. S. E. Eu. — *C. aemale*, Hildeb. Winter-flowering lvs. round-reniform, bright green and silver-zoned, fls. purple with deep red in the throat, corolla lobes round-ovate, not eared. Asia Minor. — *C. Jans.*, Hildeb. Differs from *C. neapolitanum* in its more slender fls. with longer lobes of calyx and corolla. Asia Minor. — *C. maritimum*, Hildeb. Lvs. variable in form, mostly ovate, brown-green fls. in Sept., uncommonly white, with uncolored throat, the corolla lobes rounded. Asia Minor. — *C. Mitrakini*, Hort. = *C. graecum*. — *C. pseudo-graecum*, Hildeb. Differs from *C. graecum* in having filaments and anthers longer, the latter 3-angled and acuminate, corolla pale rose or almost white. Asia Minor. — *C. pseudo-litricum*, Hildeb. Spring-flowering lvs. obovate, rounded at base and top, the margin cartilaginous-crenulate, deep green and spotted silvery white fls. violet, spotted with darker color, white at base, corolla lobes oblong-ovate, not eared, petals of spiral fr. Probably Asia Minor. — *C. pseudomartium*, Hildeb. Differs from *C. maritimum* in lvs. being lanceolate-acuminate, calyx lobes rounded and corolla lobes long-acuminate. Asia Minor. — *C. repandum*, Sibth. & Smith. Spring-flowering tuber small lvs. cordate, undulate-lobed, the lobes usually mucronate. fls. beautiful purple, the throat constricted and deeper-colored. Cent. and E. Medit. basin.

L. H. B.

CYCLANTHÈRA (Greek, *anthers in a circle*). *Cucurbitaceae*. Annual- or perennial-rooted herbs, one of which is sometimes grown for its ornamental character.

Climbing by tendrils, glabrous or pubescent; lvs. entire, lobed or 5-7-foliolate; fls. monoecious, minute, yellow, greenish or white, with their parts in 6's, stamen 1 with a 1-celled anther. The plant is a climbing half-hardy annual of easy cult. The seed should be started indoors early. The genus is near *Echinocystis* and *Elatenor*, and has more than 30 species, all from Trop. Amer.

pedata, Schrad. Annual. st. glabrous lvs. pedately 5-7-foliolate, the lfts. sessile or nearly so and lanceolate or oblong-lanceolate, serrate; tendrils 3-4-parted; male fls. small, in panicles equaling or exceeding the lvs.; fr. nearly sessile, somewhat soft-prickly or smooth, oblong and attenuate at base, green becoming yellowish white, 2-locular. Mex. south. — A strong ornamental climber. *C. exfoliata*, Naudin, with somewhat 3-lobed lvs. and short spiny explosive fr., may be in cult. L. H. B.

CYCLANTHUS (*flowers in a circle*). *Cyclanthaceae*. A Trop. American genus of 4 species giving name to a small order which is allied to the palms. They are acaulescent palm-like herbs with a milky juice; lvs. long-stalked, entire or bi-furcate, the segms. lanceolate, 1-nerved; fls. fragrant. The species are not in the American trade. Cult. of Carludovica (which see). *C. bipartitus*, Poir., of Guiana, has lvs. sometimes divided into 2 long narrow lobes, the petioles being 3-6 ft. long spatula straight and cylindrical, in a 4-lyd. yellow spathe, the scape 2 ft. long. G. W. S., p. 153; 15, p. 610. *C. cristatus*, Klotzsch, of Colombia, has short-stalked bifid lvs. with the parts falcate and connivent; spadix about 8 in. long. G. W. S., p. 202. *C. discolor*, Hort., has young lvs. streaked with brown-orange; lvs. bifid, the parts lanceolate, acuminate, the margins frilled. Probably S. Amer. *C. Godseffianus*, Hort., exhibited in 1892, "has noble lvs. of a rich green color, oblong, obovate, tapering to a sheathing stalk," Sander.

CYCLOBOTHRA: *Calochortus*.

CYCLOLÔMA (Greek for *circle and border*, from the encircling wing of the calyx). *Cenopodiaceae*. One weedy herb, *C. atriplicifolium*, Coulter (*C. platyphylum*, Moq.), of sandy soils from Minn. west and south, which was once into as the "cyclope plant," since the plant is a tumble-weed or rolls before the wind when it is matured and becomes detached from the soil. The plant is a much-branched rank-growing annual, 1-2 ft. high, pubescent or nearly glabrous, with narrow but flat and sinuate lvs., and bractless fls. in an open panicle. The fls. are very small, perfect or sometimes

lacking the stamens; calyx 5-lobed, the lobes strongly keeled and becoming winged and inclosing the seed. Plant not fleshy or jointed.

CYCLOPHORUS (Greek, *circle-bearing*). *Polypodiaceae*. An E. Indian and Malaysian genus of simple-lyd. ferns, related to some species of *Polypodium*. The genus is characterized by having creeping scaly root-stocks, simple lvs. usually densely covered with star-shaped scales, at least on the back. The sori are round, naked, and placed so closely together as to appear often completely to cover the back of the lf. The venation consists of a very fine close network difficult to distinguish. Often listed in trade under *Polypodium*.

Lingua, Desv. (*Niphobolus Lingua*, Spreng.) Lvs. 6-12 in. long, on short stalks, the lf.-blades thick, leathery, narrowly oblong, 4-8 in. long, 1-2 in. broad, densely covered beneath with rusty white scales. Var. *corymbifera*, Hort. A form with the tips of the lvs. much forked, making the blade much broader than in the type. Var. *variegata*, Hort. A form with "light yellow lines about 1/4 in. wide and 1/4 in. apart, running across the fronds at right angles to the midrib." See also *Polypodium*.

R. C. BENEDICT.

CYCNOCHES (Greek, *swan's neck*, referring to the shape of the column). *Orchidaceae*. Epiphytic orchids, requiring warmhouse treatment when growing.

Pseudobulbs fusiform: lvs. plicate; fls. of 2 sexes, the perianth alike, the lip entire, or that of the staminate very different, with the sepals and petals narrower, the lip clawed and with finger-like projections from the side, the column much elongated and arched; pollinia 2. Both sexes may be produced in the same plant. A third form of fls., usually perfect, occasionally appears; this is intermediate between the others. — About a dozen species of Trop. Amer.

A. *Perianth alike in both sexes; lip entire*.

chlorochilion, Klotzsch. *Pseudobulbs* 5-7 in. tall, lvs. lanceolate; raceme erect, 2- or 3-fld.; fls. 4-6 in. across; sepals and petals yellowish green, acute, the lateral sepals broader than the dorsal, lip obovate or elliptic, acute, a dark green depression near the triangular erect callus. Venezuela. G.C. III 3:145 I.H. 35:65. R. 1:39. J.H. III. 35:285. Gn. 49, p. 403; 51:172.

ventricosum, Batem. *Pseudobulbs* 8-10 in. tall: lvs. lanceolate; raceme drooping, 4-6-fld.; fls. 4-5 in. across; sepals and petals yellowish green, acute, the petals broader than the sepals, lip white, cordate, acuminate, clawed, a black callus at the junction of the claw with the lip. Guatemala.

AA. *Perianth differing in the sexes; lip with finger-like lateral projections*.

aureum, Lindl. Male racemes pendulous, 8-12-fld.; fls. 2-3 in. across, yellow, red-spotted; sepals and petals similar, the former spreading, the latter reflexed; lip clawed, the dilated middle giving rise to a number of projections, forked at the end. Cent. Amer. J.F. 3:264.

pentadactylon, Lindl. Male racemes usually pendulous, many-fld.; sepals and petals greenish yellow barred with brown; lip white, red-spotted, with 5 finger-like projections; female racemes erect, few-fld.; sepals and petals broader than in the male fls., foveated; lip ovate, entire. Brazil. B.R. 29:22. J.H. III. 62:305. O. R. 8:312.

peruviana, Rolfe. Male racemes pendulous, many-fld.; sepals and petals light green, copiously brown-spotted; lip, with its projections, white. Peru. Lind. 7:301.

C. densiflorum, Rolfe. Male racemes pendulous, many-fld., the fls. greenish with purple blotches, female racemes short, erect, 2-fld., the sepals and petals green, the lip ivory-white. Colombia. O. R. 17:204, 20-31. B.M. 8288. — *C. maculatum*, Lindl. Male racemes pendulous, the sepals and petals light yellowish green, spotted with red-purple, the lip white. Mex. O. 1910 104 O. R. 17:273, 20:315.

GEORGE V. NASH.

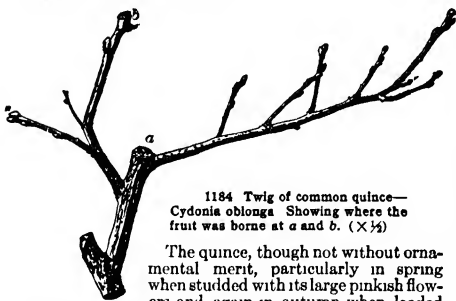

CYDISTA (Greek, *kydistos*, most glorious; alluding to the beautiful flowers). *Bygoniaceae*. Ornamental vines, grown for their beautiful flowers.

Evergreen shrubs, climbing by lf-tendrils. lvs. opposite, with 2 lfts., the rachis elongated into a simple slender tendril, sometimes wanting fls in terminal or axillary panicles, sometimes 2, calyx campanulate-turbinate, truncate or with 5 short teeth; corolla funnel-form-campanulate, with imbricate lobes, stamens 4, inclosed, with spreading anther-cells, disk wanting; ovary linear, with numerous ovules in 2 rows caps. linear, septiced, with numerous, nearly orbicular, winged seeds—One or 2 species in the W. Indies and 5 Amer. Closely allied to *Bygnonia*, but easily distinguished by its simple slender tendrils, by the paniculate fls, the usually truncate calyx and the wanting disk. Suited for cult in tropical and subtropical regions only and as a stone plant in the N. For cult. and prop., see *Bygnonia*.

æquinoctialis, Miers (*Bygnonia æquinoctialis*, Linn.). High climbing lfts ovate to ovate-oblong, obtuse-acuminate, undulate, lustrous, reticulate, 3-4 m. long; petioles $\frac{1}{2}$ - $\frac{3}{4}$ in long. calyx campanulate-turbinate, truncate; corolla white or pink, with dark pink or purplish veins, $2\frac{1}{2}$ in long W. Indies, Brazil—The *B æquinoctialis* var. (B. R. 9:741) with yellow fls in elongated racemes is *Anemopaegma Chamberlayni*, Bur & Schum (*Bygnonia Chamberlayni*, Sims B. M. 2148. F. S. 3:235. P. M. 14 3) See page 502. ALFRED REHDER.

CYDONIA (the fruits known to the Romans as *Mala Cydonia*, apples from Cydon, now Canea, in Crete). *Rosaceæ*, subfamily *Pomeæ*. QUINCE. Shrub or small tree, grown for its fruit, which is much used for preserves and sometimes baked.

Branches unarmed: lvs. deciduous, alternate, petioled, stipulate, entire fls white or light pink, rather large, terminal on short leafy branchlets, petals 5; stamens numerous, styles 5, free, ovary 5-celled, cells with many ovules: fr a 5-celled, many-seeded pome.—One species from Persia to Turkestan. The genus *Chaenomeles*, often included under *Cydonia*, is easily distinguished by the serrate or crenate chartaceous lvs. and the connate styles.

1184 Twig of common quince—*Cydonia oblonga*. Showing where the fruit was borne at a and b. ($\times \frac{1}{2}$)

The quince, though not without ornamental merit, particularly in spring when studded with its large pinkish flowers and again in autumn when loaded with its golden fragrant fruits, is rarely planted as an ornamental shrub, but chiefly, though not very extensively, grown for its fruit which is made into preserves. It is of slow growth and prefers heavy and rather moist soil. It may be propagated by seeds stratified and sown in spring, but is usually increased by cuttings of one- to four-year-old wood, taken in fall and stored until spring in sand or moss in a cellar or frame; also by layers and budding, or by grafting on vigorous growing varieties. See *Quince*.

oblonga, Mill. (*C. Cydonia*, Pers. *C. vulgaris*, Pers. *Pyrus Cydonia*, Linn.). QUINCE. Fig 1184. Shrub or small tree to 15, rarely to 25 ft., with slender, spineless

branches. lvs. oval or oblong, rounded or slightly cordate at the base, acute, entire, villous-pubescent beneath, 2-4 in long; fls. white or light pink, 2 in across; fr. large, yellow, villous, pyriform or globular. May; fr in Sept. and Oct. Cent and E. Asia. Gn. 33, p. 491. FSR 2, p. 379: 3, p. 283. Seeds have mucilaginous and demulcent properties. Var. *pyriformis*, Rehd. (*C. vulgaris* var. *pyriformis*, Kirehn.) Fr. pear-shaped, the typical form. Var. *lusitanica*, Schneid. (*C. lusitana*, Mill.) Fr. pear-shaped and ribbed lvs. larger, of more vigorous growth. Var. *maliformis*, Schneid. (*C. maliformis*, Mill.). Fr. apple-shaped. Var. *pyramidalis*, Schneid. Of pyramidal habit. Var. *marmorata*, Schneid. Lvs. whitish and yellow variegated. For pomological varieties, see *Quince*.

For *Cydonia japonica*, Pers., C. Moult, Moore, and C. *antensis*, Thoun, see *Chaenomeles*.

ALFRED REHDER.

CYMBIDIUM (*boat*, from the Greek, referring to the shape of the lip). *Orchidaceæ*. Handsome epiphytal, rarely terrestrial orchids, requiring warmhouse conditions.

Stems pseudobulbous or not so; lvs. coriaceous, long, rarely short, persistent. sepals and petals sub-equal, labellum usually tri-lobed, adnate to the base of the column, column erect; pollinia 2.—Species 30 and more, tropical or subtropical, found on mountains at high elevations in Asia, and a few species in Afr. and Austral.

These are among the most decorative of orchids when in bloom, and are attractive all the time owing to the graceful foliage seen on well-grown specimens. There are now many handsome species and varieties and these in their turn have produced, at the hands of the hybridizer, many fine decorative plants, so that a house of cymbidiums produces flowers most of the time, and these last many weeks in full beauty. There are few orchids whose flowers last so long, and the spikes of bloom, often 2 to 3 feet in length, are useful for decorative purposes of all kinds, either on the plants or cut. The recent species, *C. insignis*, is the most beautiful of all and has already lent itself to hybridization, so that to the very many known hybrids *C. insignis* will soon add its influence and coloring.—Cultivated cymbidiums are terrestrial, with thick fleshy roots best contained in pots. A portion of tough fibrous loam should be added to the osmundine, about half of each with plenty of broken charcoal to keep the whole porous. The plants will do well for years without disturbance at the roots, but when this is necessary, great care must be taken not to injure them. Division is, in fact, very difficult to accomplish when the pots are full of roots, and it is best practice to pot the plant in a larger receptacle if the roots are healthy, washing out loose earth and removing dead portions of roots first. Cymbidiums may be grown in a temperature of 50° as a minimum in winter, must not be subjected to strong sunlight after March, and never allowed to become dry at the roots, as these are more or less active, even in winter. Being terrestrial, weak manure-water may be applied during active growth. Many species thrive well when planted out in large palm and fern houses among rocks arranged in a natural manner, and when the plants are placed so that the flower-spikes are on a level with the vision, they have a charming effect for many weeks when in bloom, and the environment suits them well. Of the few well-marked species, there are many forms that have been collected and when flowered in cultivation, proved distinct. These in some cases have been called new species, but are now being better understood; some prove to be natural hybrids, others are varieties. (E. O. Orpet.)

A. Fls. white.

obursum, Lindl. Sts. tufted: lvs. distichous at base, 1 or 2 ft. long, linear or lorate, bifid at apices:

peduncles not so long as the lvs., few-fl.; fls. about 3 in across, ivory-white, sometimes tinged with rose; sepals and petals oblong-lanceolate; lip 3-lobed with a golden yellow ridge running down the center. *Khasia Hills*, at an elevation of 5,000-6,000 ft. B.R. 33-67. B.M. 5126. Gn. 46, p. 398. G.C. III, 35-99. Var. *Goodsonianum*, Hort. Fls. white, with broad rose-purple band down middle of lip. Var. *Dayanum*, Hort. (*C. Dayanum*, Reichb. *C. eburneum* Day, Jenin.). Lvs. longer and narrower; lip with a row of purple spots each side of disk.

Lowianum, Reichb. Pseudobulbs oblong; lvs. 2-3 ft. long, linear-acute, recurved racemes many-fl.; fls. about 20 in number, 3-4 in across, sepals and petals oblong-lanceolate (lateral ones sub-falcate), greenish yellow marked with brown, lateral lobes of lip yellowish, midlobe reflexed, purple-maroon, margined with yellow. *Burma* Gn 48, p. 263. Gng. 5.73 A.F. 34 1089 R.B. 30 276. Var. *Mandaiianum*, Hort. (*C. Mandaiianum*, Hort.), has yellow fls.

EE Middle lobe of lip yellow, spotted.

giganteum, Wall. Fig. 1185. Fls. dull purple (brownish, or yellowish green striped with purple), sepals and petals oblong, the petals narrow and shorter, midlobe of lip reflexed, yellow, spotted with red, lateral lobes yellowish green. *Nepal* B.M. 4844 P.M. 12-241

Traceyanum, Hort. Pseudobulbs and foliage as in *C. giganteum*; racemes 3-4 ft. long, ascending, 15-20-fl.; fls. 4-5 in across, sepals and petals greenish yellow, lined with crimson; middle lobe of lip oblong, reflexed, crisped, cream-white, crimson-spotted. *Burma* C.O. 4 R.B. 29-25.—By some considered a natural hybrid between *C. grandiflorum* and *C. giganteum*.

DD Ground-color of sepals and petals white, flushed rose insigne, Rolfe (*C. Sanderi*, Hort. *C. insigne Sanderi*, Hort.) Lvs. up to 3 ft. long; infl. long, ascending; fls. rosy white; sepals and petals elliptic; lip marked with lines of purple dots, the middle lobe short, obtuse, emarginate; disk yellow. C.O. 10 B.M. 8312 O. 1911. 64. R.B. 33-53. R.H. 1907-496. G.C. III 37-115.

CC. Sepals and petals not veined.

tigrinum, Parish. Lvs. oblong-lanceolate; peduncles slender, 3-6-fl.; sepals and petals linear-oblong, acute,

green, spotted at base, petals often paler and with more spots than the sepals, lip with yellow, red-brown striped lateral lobes; midlobe white, transversely streaked with purple. *Burma*. B.M. 5457. A.G. 22 715

grandiflorum, Griff. (*C. Hookerianum*, Reichb. f.)

Lvs. about 2 ft. long, acute, peduncle arching above, erect at base; fls. from 6-12, large, sepals and petals oblong, greenish, lip yellow, spotted with purple. *Sikkim*. B.M. 5574.

BB. Infl. pendulous.

pendulum, Swartz. The leathery lvs. distichous, 2-3 ft. long, broadly linear; fls. yellowish; side lobes and midlobe of lip rose-color; the disk more or less white with yellow crests; sepals and petals narrowly oblong, with a purple median line. *E. Indies*

Finlaysonianum, Lindl. (*C. pendulum*, Lindl.) Lvs. ensiform raceme many-fl.; sepals and petals linear-oblong, obtuse, dull yellow, sometimes with a reddish median line, lateral lobes of lip crimson; midlobe white, tipped with crimson. *Malaysia*. Var. **atropurpureum**, Hort. Lvs. narrower, racemes longer, with larger fls. sepals and petals purplish, front lobe of lip white, spotted with purple. *Borneo*
